5031. Now, in the import trade from India to this country, does the merchant there run a risk to the same extent as he does in the import trade from China?—No, he can more readily sell to arrive here; for instance, wheat; he can telegraph home that he has bought wheat there. Probably it is sold before he buys it. As a rule it is sold before he buys it in India.

5032. So that in the case of imports from India to this country, the merchant can protect himself from fluctuations in just the same way as in the case of exports?—Yes.

5033. (*Mr. Birch.*) I think that is specially the case with regard to wheat; you can sell wheat upon sample so much better than you can tea. They would not buy tea to arrive?—No, they must see the tea.

5034. (*The Chairman.*) Then may we take it that, as regards the export trade from this country, the mode of dealing through the banks and the position of the merchants is precisely the same as in the China trade, save that the transactions between India and this country being more constant in both directions than between China and this country, the merchant can carry through the transaction at less burden to himself?—Yes.

5035. But as regards the import trade from China and India respectively, whereas as a rule from China the merchant has to bear the risk of fluctuation, from India he can, as a rule, protect himself in the same way that he can in the export trade?—Yes.

5036. (*Mr. Barbour.*) I suppose that the necessity for fixing exchange beforehand does hamper trade between the two countries?—It does; it makes business a little more difficult.

5037. And has there ever been a panic about the exchange between England and India, or England and China?—There was last year. It began in August, I think, and lasted for two or three months.

5038. And that interferes a good deal with business?—Yes, it did then.

5039. I suppose the panic arises from the fact that people do not know at what rate the exchange is about to settle?—Yes.

5040. If they knew that it would settle at or about a certain price in the course of a short time there would not be that panic?—Certainly.

5041. Do you find it very easy to forecast from time to time what the rate of exchange will be?—I am sorry to say we do not; we just work from hand to mouth.

5042. And I suppose there is a certain difficulty in always getting cover; that is an inconvenience, is it not?—It is much more easy to get cover in India than China.

5043. But it is a difficulty?—Yes.

5044. I saw in one of the financial papers some time

ago that the banks were talking of giving up the system of buying and selling forward; that they thought it was too risky and not satisfactory; is there any truth in that report?—No.

5045. Was the capital of your bank raised in gold or silver?—Silver.

5046. By keeping a portion of your capital in the East you do not suffer any loss from depreciation?—No, all our capital is in the East.

5047. Some of the banks have their capital raised in gold?—Nearly all of them.

5048. They would be rather afraid to keep any considerable amount in the East, in silver?—I should think they would not keep anything.

5049. They reduce the amount that is kept there as much as possible on account of the possible depreciation?—Yes.

5050. And consequently the supplies of silver, say in Calcutta and Bombay, would not stand any considerable extra demand upon them that came suddenly?—No. The banks keep no money there at all.

5051. And has the result of that been that a very slightly increased demand in Calcutta and Bombay raised the rate of interest for the time very seriously?—Yes.

5052. I believe quite recently it was as high as 10 per cent.?—9 per cent. It may have been 10 per cent. outside the bank, but the bank rate was 9 per cent.

5053. And, of course, that is an inconvenience to trade?—When you have dear money it interferes with trade.

5054. And I suppose, if people were confident that the portion of their capital in Calcutta and Bombay would not be depreciated, the supply that would be kept there would be rather larger?—Yes; they would send out money there to invest.

5055. And does the same cause that prevents the banks from keeping a larger portion of their capital in the silver countries prevent people from investing there too?—Yes, it operates in that way.

5056. (*Mr. Birch.*) I gather from what you said that the difficulty is rather in imagination than in reality for the banks, inasmuch as the export and import bills balance themselves pretty well?—Yes.

5057. And that with regard to the difficulties in dealing with China rather than with India, I suppose the Indian Government bills come in to your assistance very materially?—Yes.

5058. That is an element which you have not got in China?—No. Well, we use the Indian bills on account of China also.

5059. But not with the same facility?—No.

5060. Has your bank anything to do with countries using a forced paper currency?—No.

5061. But I suppose you would agree with me that banks dealing with a forced paper currency would have a much greater difficulty than those dealing with a silver-using currency?—Decidedly.

5062. And that, with regard to buying and selling forward, the merchant has his risks, independent of the exchange, because he may buy forward, and when the goods are delivered they may have fallen considerably from the price at which he bought. Supposing I buy wheat for future delivery at 30s., it might be at 26s. before I got delivery of it. It is one of the mercantile risks?—Yes; but it assumes that you very likely have resold it.

5063. Of course it must be very much easier for a bank to deal with a country which has exactly the same standard, because they know that they have only got the expense of moving the metal in case the exchange goes against them?—Yes.

5064. (*Mr. Chaplin.*) I think you said that the wheat in India was often sold here in England before it was actually purchased there?—Yes, very often.

5065. Then how is the operation carried out? Is it bought by corn merchants here in England, and do they send out an offer for a certain quantity of wheat of a certain quality?—Yes, and if the offer is sufficient the wheat is shipped.

5066. Some witnesses have told us that the rate of exchange between India and England acts like an export bounty or bonus upon the wheat sent from India to England. Is that your opinion?—I think the fall in exchange has encouraged the export of wheat from India very largely.

5067. And every additional fall acts as a bonus?—Yes. For instance, in China in the last 10 years many different exports that we never heard of before, such as straw-braid, and camels' wool, are brought in owing to the fall in exchange.

5068. The rupee is worth how much in England at the present moment?—1s. 4 $\frac{3}{4}$ d.

5069. And is it the fact that in India it retains its purchasing power of 2s., or something of that sort?—Yes, I believe it does.

5070. Then is the position of the corn merchant this, that he can with 1s. 4d. of English money buy a rupee, and therefore practically buy 2s. worth of wheat?—No.

5071. (*Mr. Barbour.*) You say the fall in exchange has largely encouraged the export of wheat from India, in your opinion?—Yes.

5072. Do you think if exchange went back to the old rate of 1s. 11d. or 2s., or whatever it might be, that the wheat trade would be seriously affected?—Well, I am not prepared to say; I fancy it would.

5073. And you think that the fall in exchange has stimulated the export of wheat from India?—Yes, there is no doubt about it.

5074. (*Mr. Courtney.*) Do you think that that will be an abiding stimulus?—I think so. I think it will go on increasing.

5075. I mean, supposing the rate of exchange remains at what it is now, that stimulus would continue to be as active as it is now?—Yes, I think more so. I think that as India is opened up with railways it will bring more of the country into cultivation.

5076. But you are there pointing to an increase of the export due not to the change of the rate of exchange, but to the opening up of railways?—I think it has more to do with the exchange. If the exchange had been 2s. I do not think you would have had so much wheat.

5077. The present rate of exchange is 1s. 4d. or 1s. 5d.; supposing it remained at that rate during the next 10 years, do you think that it would operate as an increasing stimulus to export during that 10 years?—I think the stimulus would be exhausted.

5078. You said that the rate of interest paid by a merchant buying a bill on China did not exceed very much, you believed, what was paid to Australia?—About 6 $\frac{1}{2}$, sometimes 7 per cent.; I should think to Australia it is between 5 and 6 per cent.

5079. And the rate to China does exceed the rate to India?—Yes, by about a half per cent.

5080. So that the rate to India and the rate to Australia would be about the same?—It is probable that the rate to Australia would be a little lower. Of course you have no risk.

5081. But an extremely trifling difference?—Yes.

5082. (*Chairman.*) As regards the increased opening up of the country by railways and such works, do you think that has been stimulated or diminished by the low exchange?—No.

5083. Do you think that with the rupee at 1s. 5d., the railway works in India are likely to be more extensive or less extensive, or the same as with the rupee at 1s. 10d.?—I should think they would be able to raise more money for railways if the rate of exchange was low.

5084. Yes, but the money raised for railways is mostly in gold debt in this country, is it not?—In rupee loans as well.

5085. As regards the money raised by gold debt in this country there would be no advantage from the low rate of exchange?—No.

5086. (*Mr. Courtney.*) In respect of China I think I understood you to say that you could always get

*Mr.
D. McLean.*
16 May 1887.

Mr.
D. McLean.
16 May 1887.

bills there, speaking generally?—Yes, as a rule we can get them.

5087. Against bills here?—Yes; the slackest time in the Chinese business is between February and the beginning of May.

5088. That depends in fact upon the crops?—Yes.

5089. But the trade with China is goods against goods?—Yes.

5090. And they very nearly balance one another?—Yes.

5091. But in the case of India there is a large annual payment made by India to England?—Yes.

5092. And therefore the goods from India must always largely exceed the goods to India?—Yes.

5093. And hence the trade bills one way must be largely in excess of the trade bills the other?—Yes, that is covered by Council bills or silver, or both.

5094. But mainly by Government drafts?—Yes. I think we export 6,000,000*l.* or 7,000,000*l.* a year to them of silver in addition.

5095. And that difference is an element in determining the rate of exchange?—Yes.

5096. (*Sir T. Farrer.*) You said that the effect of the present state of things was to cause very little silver to be kept in India, and that that raised the rate of interest?—By the English banks there.

5097. What sort of enterprises does that affect?—It affects loans on goods. You know, the merchants are not able to raise money so readily.

5098. And that would rather tend to check exports if it had any effect at all?—Yes, but we do not find it does.

5099. And I suppose that that raising of the rate of interest would not apply to raising capital for railways; it would be merely for temporary purposes?—Yes.

5100. (*Mr. Houldsworth.*) In answer to Mr. Courtney you said that you thought the stimulus to the wheat trade, for instance, would be exhausted if exchange was to remain as it is. Could you explain by what means it would be exhausted; how you think the present stimulus would not continue?—The country is opened up as much as it will be now, unless further railways are made to open it up. The ground is occupied.

5101. Then you think that the stimulus at present is due to the effect that is produced by the opening up of India?—Yes.

5102. Is there no stimulus by the difference between gold prices and silver prices?—No doubt that has had a great effect.

5103. But is that a direct effect, or is it only through the opening up of India?—Through the opening up of India, I should say.

5104. What are your opinions of the probability of exchange remaining as it is between the two countries?—I do not think there is any hope of it remaining as it is unless something is done to fix the value of silver.

5105. You think silver will fall?—Yes.

5106. (*Mr. Birch.*) May I ask you why you think silver will fall?—Unless the exports of India increase enormously we are frightened to buy silver.

5107. Do you know anything about the statement that China is going to coin a large amount of silver?—That is a very small business. It is for the province of Canton; not for the Pekin Government.

5108. But China still takes a great quantity of silver, does she not?—Oh, yes; but we export a large quantity of silver also from China. For instance, from the month of February to now, we send a large quantity of silver from China to India.

5109. Could you throw any light upon the circumstance I heard related about a large amount of silver pillar dollars coming from China, that had been formerly current there, and sent to Spain?—Yes, very large.

5110. What replaced them?—Mexican dollars. The Spanish authorities in Manilla have allowed the

Mexican dollar to go in there, and so reduced the rate of exchange in Manilla from 3*s.* 10½*d.* to 3*s.* 3½*d.*

5111. By the introduction of Mexican dollars to take the place of Spanish dollars which formerly circulated at 3*s.* 10½*d.* to 3*s.* 11*d.*?—Yes.

5112. (*Mr. Fremantle.*) Did the pillar dollar circulate at the higher rate because of its scarceness?—No, it was because there was no other dollar allowed in Manilla.

5113. (*Mr. Birch.*) And the Mexican dollar has only now been introduced into Manilla?—Well, in fact, it is smuggled in.

5114. But I am dealing more particularly with China, because you will remember many years ago the Spanish pillar dollar was at a very large premium in China?—These have disappeared altogether.

5115. The ordinary Spanish dollars now have been replaced by Mexican dollars?—Yes.

5116. (*Mr. Fremantle.*) But the reason of that is, is it not, that the pillar dollar has been withdrawn from circulation by the Spanish Government?—Oh, no.

5117. Does the pillar dollar remain in Manilla?—Yes, they will not allow them to be exported; indeed the only place you could export them to was Madrid; now they have stopped that.

5118. (*Sir T. Farrer.*) I should like to ask if you know anything of what is doing with the American trade dollar in China?—Those are all sent back to America.

5119. In consequence of their being remonetized by the recent law?—Yes.

5120. Were there many of them held in China?—Yes, a great many, but they have been gradually finding their way back.

5121. But the remonetizing of them has given them an additional value, I suppose, in America?—Yes.

5122. Consequently, the people who held these dollars when they were remonetized made a good thing of it?—Yes.

5123. Do you know at all what the rise in value was in consequence of the remonetization?—15 per cent.

5124. So that the people who held those dollars made 15 per cent. in consequence of the American law which remonetized them?—Yes.

5125. (*Mr. Birch.*) How long have you been in the banking business with China?—28 years.

5126. Do you find that many more bills now are drawn upon Germany and France and the continent generally than there used to be?—Yes.

5127. Replacing bills that were formerly drawn upon London?—Yes.

5128. To what do you attribute that?—It is cheaper for one thing; the merchant on the continent wants his goods imported direct, and he finds the banks willing to meet him.

5129. Because one of the questions that we have had before us is as to whether there was any particular advantage considered abroad in having credits on England, by reason of people knowing that those bills would be paid in gold, and that if they were drawn on Paris or Germany they could not be certain of what they would be paid in. Do you attach much importance to that?—No.

5130. (*Mr. Barbour.*) Does the Secretary of State for India draw bills to the amount of from 13,000,000*l.* to 16,000,000*l.* sterling a year on India?—It was 13,000,000*l.* last year and 16,000,000*l.* this.

5131. Suppose he stopped drawing for one or two or three years, what would be the effect on the rate of exchange?—Oh, upwards.

5132. It would go up very high?—Yes.

5133. And that would be a great disturbance to trade?—It would.

5134. Have you any idea how high it might go?—It is impossible to say.

5135. It might go to 1*s.* 10*d.*, I suppose?—Yes, very easily.

5136. Do you not think it is possible that some of the silver countries that have over-valued silver might

Mr.
D. McLean.
16 May 188

take advantage of that to get rid of that silver?—I think they would at the present moment.

5137. And when the Secretary of State began to draw again he would have to draw still more, by reason of the money that he had borrowed in the meantime to meet his debts?—He would.

5138. So that you would have a reverse operation?—Yes.

5139. Have you any idea what exchange would go down to in that case?—It is impossible to say.

5140. That would be a great disturbance to trade?—Yes.

5141. Would it not be better to have a fixed ratio between gold and silver, supposing it to be practicable, than to be subject to these great risks in the future?—I think it would.

5142. What do you think would be the effect of the repeal of the Bland Bill?—It would be very disastrous if that silver was to be forced on our market.

5143. It would largely increase the wheat trade from India?—Yes, it would tend that way.

5144. What would be the effect if, in addition to the repeal of the Bland Bill, the Americans sold the 50,000,000*l.* of silver they have got coined?—They simply could not sell it.

5145. What do you think would be the effect on the rate of exchange if they tried to sell it?—It is impossible to say.

5146. (*Mr. Chaplin.*) I want to clear up the question about the bounty on wheat, which I confess I do not quite understand at present. I understood you to say that a rupee in England is now worth 1*s.* 4*d.*, or a little more?—Yes, 1*s.* 4½*d.*

5147. A sovereign, therefore, will buy 15 rupees?—Yes.

5148. I understand you to say that the rupee in India still retains its purchasing power of nearly 2*s.*?—Well, no, not quite. The rupee, to the native, is a rupee; he does not care anything about exchange, and I suppose a rupee will buy as much rice to-day as it did when the sterling was 2*s.*

5149. Or as much wheat?—Yes, or as much wheat.

5150. It retains its purchasing power for wheat at 2*s.* Then I understand you to say that the wheat in India is bought by the corn merchants here in England?—Yes.

5151. Therefore it comes to this, that a corn merchant with a sovereign can buy 30*s.* worth of wheat; in other words, that for 1*s.* 4*d.* he is able to buy 2*s.* worth of wheat?—No.

5152. Well, will you explain how not?—Assuming that the quarter here is worth 30*s.*, the native knows the price in London as well as you do, and you pay him more rupees probably.

5153. But you told me just now that with a sovereign you could buy 15 rupees, and that the rupee retained its original purchasing power of nearly 2*s.*, as far as wheat was concerned?—Yes.

5154. In other words, that with a sovereign you could buy 30*s.* worth of wheat?—It does not though.

5155. I understand you to admit that the sovereign will buy 15 rupees?—Yes, at the present rate of exchange, about that.

5156. Well then, in India, how much wheat would 15 rupees buy?—It would buy about 20*s.* worth, that is all.

5157. Then how do you reconcile that fact with the statement that the rupee, in India, retains its original purchasing power of nearly 2*s.*?—I say it has

not fallen so much. A native can buy as much rice with his rupee, at the present value of 1*s.* 4½*d.* to the foreigner, as he could do when the exchange was 2*s.*

5158. He can buy, that is to say, nearly 2*s.* worth?—The equivalent of 2*s.*

5159. Either wheat, or rice, or any other commodity, and, I suppose, if a native can buy that, people who are not natives can buy that with the rupee; a corn merchant is not a native, and, according to you, he could buy nearly 2*s.* worth of wheat with a rupee?—But the rupee is not worth 2*s.* here; you fancy the rupee is worth 2*s.*

5160. You assured me that a sovereign could buy 15 rupees?—If you came here with a rupee you cannot sell it at 2*s.*

5161. But out there you said you could?—I said you could buy as much rice as you could when the rupee was at 2*s.*

5162. However, I understand you plainly to admit then, that with the sovereign you can buy 15 rupees at the present time?—Yes, about that.

5163. And those 15 rupees, in India, will buy nearly 30*s.* worth of wheat?

5164. (*Mr. Birch.*) They will buy exactly the same quantity of produce that they did before, and here you would have to give less money for it?—Yes, less gold.

5165. And, as Mr. Chaplin says, the benefit would be in the shape of a bounty; it is a difference in exchange which has the effect?—Yes.

5166. (*Sir T. Farrer.*) Do you mean that you think that the native exporter gets the whole benefit of the difference between the rupee at 2*s.* and the rupee at 1*s.* 6*d.* or 1*s.* 5*d.*?—No, no.

5167. (*Mr. Courtney.*) Mr. Barbour asked you a question as to the convulsion that would happen if the Secretary of State suspended drawing and the convulsion that would happen again if he resumed drawing?—Yes.

5168. How could the Secretary of State suspend drawing?—He could only do it by borrowing money here. The money has to be paid here and he would have to borrow here to pay his way.

5168*a.* Well, what would be the result upon the finances of India of that, I mean on the financial administration of India; I do not mean on the exchange?—I do not think it would benefit them.

5169. Would it merely mean *pro tanto* a declaration of insolvency on the part of India?—No.

5170. Well, it could not pay from year to year, or for some reason or other declined to pay from year to year its annual obligations?—I think the more exports from India we get the natives are better able to pay the taxes. The more we get from India, I think, the better able they are to pay.

5171. (*Mr. Barbour.*) With regard to the question of the Secretary of State suspending drawings; if there were a great war in India do you think the Government could borrow 20,000,000*l.* sterling in India in one year?—No.

5172. It would have to be borrowed at home?—Yes.

5173. And the Secretary of State would suspend his drawings for the time?—Yes.

5174. (*Mr. Birch.*) And, supposing the commodities to be shipped to the same extent, the vacuum in the bills would be filled up with silver?—With silver, if they could get it.

5174*a.* You must pay for what you buy?—Yes.

The witness withdrew.

Mr. HENRY HUCKS GIBBS recalled and examined.

Mr.
H. H. Gibbs.

5175. (*Sir T. Farrer.*) When we left off last time we were approaching one of the most difficult points in our inquiry, and I should like to ask you a preliminary question. You will admit that it is a serious thing to alter the existing standard of value?—Yes,

every legislative action affecting commerce is a very serious thing, whether it has its origin here or elsewhere. The alteration which took place in our standard of value in 1873 was exceedingly serious.

5176. And any such alteration necessarily causes

Mr.
H. H. Gibbs.
16 May 1887.

changes in methods of business, alterations in the effect of contracts, and in the relative positions of different classes?—You can judge of the importance of the changes which might take place in consequence of another alteration, by considering the changes which have occurred since 1873. I do not think there have been or would be any changes on that score in methods of business.

5177. But the other alterations, at any rate you admit generally, are things not to be undertaken lightly?—Certainly.

5178. Well, the position of London as a great financial centre and clearing house of the world makes it necessary for England to be especially cautious in making such changes?—England should be cautious in making any changes. She has not always acted on that wise maxim. Caution does not necessarily imply refusal to change. I have no doubt myself that England is the financial centre and clearing house of the world; but it is probable that our kinsmen on the other side of the water may have a like belief as to New York. I do not know that there is any evidence that the commercial position of that city has been affected for good or evil by the various changes in the monetary legislation of the United States. I do not think either Berlin or Paris had the same claim to that position; but I wish they had exercised more caution when contemplating the changes of 1873. They did more harm than any change on our part can do. England has surely shown great caution. An important change took place in 1873, to which attention was called as soon as its effects became visible. Part of those effects were considered in the Commons Committee of 1876, then came the Paris Conference of 1878, to which delegates were sent but forbidden to join in any vote on the subject. The Paris Conference of 1881 was attended with much the same result; and now, at last, after 14 years of cautious waiting, this country is happily giving a cautious consideration to the subject, and I must hope not without good results.

5179. At any rate, you admit that the burden of proof lies on those who propose any such alteration?—The burden of proof lies on anyone who proposes any alteration.

5180. Now the evils to which our attention has been directed are twofold; (a) evils arising from fluctuation in exchange on which I need not trouble you further; and (b) the appreciation of gold, an ambiguous expression, and which is perhaps better described as a fall in prices which is said to be causing depression in trade and agriculture?—Yes, those first evils, those that you say you have heard a good deal about, arise from absence of a common measure; and that, together with a fall of prices arising from many causes, has had a malign influence on trade and agriculture. Among these causes is a failure in the supply of gold to keep pace with the demands of one sort or another which have been made upon it. That is a better phrase, it seems to me, than appreciation of gold.

5181. Appreciation of gold is the same thing, is it not, as a general fall in prices; they are synonymous?—Yes, in one sense they are.

5182. An appreciation of gold must mean a general fall in prices. It is not simply a fall in some prices, but a fall *pro tanto* in all prices?—Yes, a fall *pro tanto*. It assumes that a certain depressing effect has been felt by all commodities.

5183. Not only by all commodities, but by everything which is measured by or exchanged against gold?—Yes, I include in commodities everything of that kind excepting securities, which, being promises to pay gold, are of course not affected adversely by the dearness of gold.

5184. (The Chairman.) By all commodities in the like proportion?—*Pro tanto*, of course, by everything. Things may have occurred and may be occurring which would alter the price of any particular commodity; that is to say, all need not be lower in price, of course, than they were before, but they will all be

lower in price than they would have been had gold been plentiful.

5185. (Sir T. Farrer.) What it means is this, that a given quantity of gold buys more goods or other things, or a given quantity of goods buys less gold?—Yes.

5186. It differs from the expression “fall of prices” in assuming the fall to be general?—Yes.

5187. Fall of prices is very often used of only a partial fall?—Yes, it may be so.

5188. Then a fall of price of any article may arise either from increased abundance or diminished cost of production of the article on this one head, or from a diminished supply of gold on the other, or from both?—Certainly.

5189. Is not the effect of the fall absolutely different, according as it proceeds from the one cause or the other?—I do not see that the effect of the fall is so very different. It should be nearly the same; but the operation of a rise in the purchasing power of the precious metals, caused by their scarcity, is more occult than that which is caused by increased abundance of commodities. I have heard it said that in the latter case there is no need to interfere. I should rather say that interference is scarcely possible. If, for example, the earth, here or elsewhere, produces more wheat, we cannot prevent its doing so, and if, whencesoever it comes, it is, on balance, advantageous, we shall not desire to interfere with it.

5190. My words were, “Is not the effect of the fall absolutely different according as it proceeds from the one cause or the other.” If it proceeds from increased abundance of the article sold it is an advantage to the world and there is no need to interfere with it?—That is what I had in my mind when I said that if, whencesoever the additional abundance comes, it is, on balance, an advantage to the world, we never can interfere; at all events, if we can interfere we do not desire to do so. I say “on balance,” because there may be other things which might counteract the advantage.

5191. But I presume the increased abundance of an article that the people desire to consume is an advantage to the world?—It is, but there might be disadvantages attendant upon it.

5192. There may be disadvantages to certain persons who may suffer from competition, but, on the whole, increased abundance of the things which men desire is an advantage to the world, is it not?—At the moment; not of necessity afterwards, because if the effect of its action upon those people who have to produce certain articles, becomes prejudicial to the world it may be ultimately compensated, so to speak, or annulled. What I will answer is this, that for the present, at the present speaking, it is an advantage to the world.

5193. It is an advantage to people that they should get more of the things which they desire at a less cost of human effort and human labour?—Certainly; all other things being equal.

5194. (Mr. Courtney.) Could you illustrate that effect which you think might annul it?—I will suppose, for the sake of argument, that we might come to receive all our supplies from abroad, food, clothing, all the necessaries of life, at a very cheap rate, and that our own land was thrown out of cultivation, our own factories closed. We might be living, as it used to be said was at one time the case with Holland, on our means, every industry of the country being destroyed. I am not using this to argue that such a state of things is probable, but only as an imaginary illustration. That, I think, would be a condition of things that might annul that temporary advantage which it would have no doubt gained by the cheap production of the necessaries of life.

5195. (Sir T. Farrer.) At any rate, for the purpose of our present argument that is not an evil which you would wish to interfere with by any legislation with respect to currency; you would not wish to attempt to prevent increased abundance of the commodities which people desire to consume?—Certainly

not, if that were all. I have always said that the alteration of prices which might ensue is a subsidiary and doubtful accident of the proposed measure.

5196. Let me take two articles; let us say that cotton goods are produced at a much less cost than they were by reason of improvement in manufacture?—Yes; I suppose you mean in a foreign country.

5197. Let us say that wheat is brought to this country at a very much less cost in consequence of the opening up of railways and the cheapening of steam communication?—Yes, which it is, no doubt.

5198. In such a case you will have a very great fall in the price of both these articles?—Yes; supposing that the improvements of which you speak cause an increase of production and consequent competition.

5199. That fall is not a fall with which you would think it necessary to interfere by currency legislation?—Certainly not; no natural causes should be interfered with in any such way.

5200. You and I agree on that; some persons would not. At any rate you would not interfere with that cause by any currency legislation?—No.

5201. Then having got so far, it rests, does it not, with those who propose an alteration, first of all to prove that there has been a general fall in prices?—No, I would hardly say that. It does not rest with anybody to prove that there is a general fall in prices; it suffices to prove that there is a scarcity of gold, because a scarcity or dearth of gold is a fall in prices, therefore the point to be proved for this particular purpose is that there is a scarcity of gold or dearth of gold, which is a fall in prices.

5202. Then you would say if you prove a scarcity of gold you may assume a fall in prices?—I may assume *pro tanto* a fall in prices.

5203. Then we may put out of consideration all the evidence we have had before derived from the index numbers of *The Economist*, and things of that kind. I want to know whether you do not think that that is one of the steps in the argument that those who wish for a change ought to prove?—Of course, you might begin at either end of the staircase. You might show that there was a fall in prices, and then you might inquire as to what had been the causes of that fall, or you might say there was a dearth of gold caused by a deficient supply and an increased demand for gold, and that necessitated a certain fall in prices. What I want to say is that to prove that there is a fall in prices would not at all suffice, for a fall in prices might have arisen, and has arisen, from many other things, whereas if you prove that one point, that there is a deficiency in the supply of gold compared with the demands that have been made upon gold, you prove by that very fact that there is a certain fall in prices, that is that there is a certain adverse effect produced upon prices.

5204. That there is a certain cause which ought to produce a general fall of prices, and probably does?—I would say more than that, that involved of necessity a general fall in prices, even though other circumstances may have occurred to annul the fall and even to raise the price.

5205. May I ask you whether you think that a general fall in prices has been proved as matter of fact?—Yes, I do.

5206. Will you tell me on what evidence you rest that?—Well, I take it on Mr. Giffen's evidence, amongst others. I take the evidence of those who have been most opposed to me in this matter; they almost all agree or have agreed.

5207. You have not seen Mr. Giffen's evidence before this Commission?—No, I have not.

5208. I think he told us that upon a great many things which are measured in gold we have no evidence whatever that would justify us in saying that there has been a fall in prices?—But then, in those very things in which Mr. Giffen would say, and quite rightly say, that there is no fall in prices as compared with the prices that were before, I say there

is and must have been a lessening of the price which would otherwise have been reached.

5209. Must have been is a different thing?—No, excuse me, the expression is just. If gold has been scarce and dear, prices diminish *pro tanto*; but the price of wheat may have diminished at some time or another 35s., and it may be at another time 36s., and yet there would have been an adverse action on the price of wheat.

5210. I only wish to get from you whether you think that it has been proved that there has been an actual fall in prices of all the things which are exchanged against gold, or are measured in gold as a matter of fact? If you will say that you have not exhausted that part of the subject that is quite sufficient for me?—Then, in order to make it clear, let me say a general reduction of prices, if you will understand the difference which I mean to make between that and a fall; I mean that the measure being shortened whereby we measure the prices of commodities, it is inevitable that, to a certain extent, those prices have been reduced. Do you see what I mean?

5211. (*The Chairman.*) You yourself have said that you may begin at either end of the staircase. Sir Thomas Farrer is saying, beginning at that end which has to do with fall of prices, do you think there is such evidence of general diminution of prices (which does not mean necessarily that the price of everything is lower) as to afford evidence from that fact, if there were nothing else, that gold has appreciated?—Yes; it is an extremely difficult question to answer, because even though there should not be on the whole range of prices a fall, which is, I suppose, what Sir Thomas Farrer means, yet I say that the dearth of gold, from something belonging to gold, must inevitably have made a reduction of the price, and if it were not that gold were scarcer in the sense that I mean by scarce, then the general average of prices would have been higher than it is.

5212. (*Mr. Courtney.*) Would you conduct it in this way? Take the range of prices of 1,000 articles. You find, let us assume, for the sake of argument, that in 700 there has been a fall in prices, in 200 prices have been stationary, and in 100 prices have gone up. You examine the causes of production as roughly or as nicely as you can of the different articles, and you find some special reason to explain why the 100 have gone up, you find some other special reason to show that prices would have gone up if there were not a disturbing cause bringing them down. Then, surveying the whole range of 1,000, you come to the conclusion simply from the observation of phenomena that there has been a cause depressing prices generally. Sir Thomas Farrer asks you whether you have made that survey?—Well, I will not say that I have done it with the care and accuracy that a professed statistician does, but I have in some sort made that survey because I have read what other people have written about it, and have taken it on trust from Mr. Giffen and others.

5213. (*Sir T. Farrer.*) Have you read what German and American statisticians have said about wages in Germany and America?—I cannot say that I have.

5214. Have you seen any evidence at all as to the price of land in gold-using countries?—Yes, I have seen and known evidence of the price of the land in this country.

5215. Agricultural land in this country, no doubt; but the price of land generally in this country, and the price of land in America, which is just as important?—No, I cannot answer upon those points, except so far as to say that the only thing of importance to our subject is the chrematistic, as opposed to the apolaustic, use of land; that is to say, land bought for reproductive profit, as against land bought for enjoyment. The purchase of the latter at extravagant prices, if that has anywhere taken place, is no more an indication of general values, than the giving 10,000*l.* for a picture or an opera-box.

Mr.
H. H. Gibbs.
16 May 1887.

Mr.
H. H. Gibbs.
16 May 1887.

5216. Do you know whether we have any distinct evidence about retail prices?—Yes, I should say we had evidence before us on the Commission on the Depression of Trade on that matter.

5217. Anything that we can rely on as a general result?—How could one tell? It will depend upon the credibility of the various witnesses, and the estimate which you may form of them. We have got their evidence before us. We can study that. My impression, as I said before in this examination, is that wholesale prices have fallen more than retail prices have fallen. Retail prices have very little bearing on the point. See the passage which I have already quoted from Mill, Q. 4531.

5218. Have you ever considered this point, that the evidence we have of wholesale prices is confined to this country, and that the whole object of legislation in this country is to make wholesale prices cheap?—No. I should say that when I was in Germany I heard that, at least as regards agricultural prices, there had been a very great fall in wholesale prices there.

5219. But you do not know that we have no statistics of foreign countries, even to the same extent as we have here?—I do not know whether we have or not, but inasmuch as England is the mart of the world, I think prices may fairly be gauged by the English market.

5220. Then we will go to the other part of the subject. The evil that is alleged and the remedy it is proposed to apply, only relate to a fall of prices if that fall is due to what we may call "scarcity of gold"?—Yes, that part of the evil.

5221. Or "diminished supply of gold," or failure of gold to meet the demands upon it?—Yes, the evil that is alleged, so far as it consists in falling prices, and so far as the fall is due to the failure of gold to meet the demands upon it, would be partly or wholly remedied by the proposed measure.

5222. When, therefore, we are told that wholesale prices in England have fallen, it rests with those who would apply a remedy to show that the fall has arisen from a "scarcity of gold"?—It rests rather with them to show that there is such a scarcity or such a failure. If there is, the reduction is a necessity.

5223. It is therefore important, is it not, to understand how a scarcity of gold affects prices, and especially wholesale prices?—Yes. I have been quite content to accept the authority of all the great writers on economics, who all show that "the value of money is increased in an inverse ratio to its quantity." I do not except Mr. Tooke, for though he set himself to prove the reverse, he very ingeniously refuted his own arguments. Hear what Mr. Torrens says about it in the "Principles and Practical Operation of Sir Robert Peel's Bill of 1844 explained," page 86. "It will be unnecessary to refer to further authorities for the refutation of Mr. Tooke, inasmuch as Mr. Tooke has been completely successful in refuting himself. He has written volumes on the influence of quantity on price, and has shown, by the most elaborate details, that on all the remarkable occasions on which an advance or decline of prices has occurred, the advance or decline was occasioned by a decrease or increase in the quantities of the commodities respecting which the variations occurred. Gold is a commodity governed, as all other commodities are governed, by the law of supply and demand. If the value of all other commodities in relation to gold rises and falls as their quantities diminish or increase, the value of gold in relation to commodities must rise and fall as its quantity is diminished or increased. But gold is the standard of our money. An increase in the quantity, and fall in the value of gold in relation to commodities is the same thing as an increase in the quantity and a fall in the value of the currency in relation to commodities is the same thing as a rise of prices. Mr. Tooke's History of Prices is a magazine of historical facts demonstrative of the

"fallacy of the principle that 'variations in the quantity of the circulating medium do not affect prices.'"

5224. Now, I want to ask you to go back to the prices of wholesale commodities. Is any appreciable amount of gold used in England in ordinary wholesale transactions?—Yes.

5225. Where, and how?—Every transaction is based upon gold, and gold is used in it.

5226. "Based upon gold" is an ambiguous expression; does any gold pass?—In every case gold passes. It does not necessarily involve the actual handling of the metal, but every cheque you draw is a transfer of gold or notes, and every note you give in payment is the actual transference of the ownership of a certain number of grains of gold supposed to be lying in the vaults of the Bank of England from yourself to the person to whom the note has passed, and if it were not absolutely certain that he did acquire the ownership of the gold, commerce would stand on a very different footing from that which it now stands on. For the purposes of this argument, therefore, we may treat notes as identical with gold. I say "supposed to be" in the vaults of the bank, because they are not all there; but they are all obtainable by the bank, and available for the conversion of the notes.

5227. (*The Chairman.*) Might not the amount of cheques which went through the Clearing House tomorrow be doubled, and yet the result, namely the transfer of balances from one banker with the Bank of England to another be precisely the same, and the amount of bullion at the Bank of England be precisely the same?—Certainly.

5228. (*Sir T. Farrer.*) You told me the other day that gold was not a metaphysical thing; that it was a physical thing?—I do not remember saying that, but I daresay I did.

5229. I want to know whether gold is used physically in wholesale transactions; we are now talking of the quantity of that particular metal in the world?—My answer to that is, that every time you sign a cheque you do exactly the same, as regards ownership, as you would do if you had to pay 5*l.*, and instead of paying 5*l.* by cheque, you handed it over to me. You sign that cheque; the gold at the Bank which it represents is yours. When you have passed that cheque to me the gold is mine, but, as Lord Herschell says, the multitude of cheques may be repeated, not infinitely, but may be continually repeated, all day long.

5230. But do you mean to say that if I draw a cheque for 100*l.* upon my banker, and pay it to you, that that is exactly the same thing in its effect upon the demand for gold in the world as if I took 100 gold sovereigns out of my pocket and paid them to you?—Most certainly not, because otherwise all what we have called banking expedients would be of none effect; but we know that they are of very great effect; when however you speak of gold not passing, I say gold does at that moment pass from you to me.

5231. Well, I ask you where it passes?—It seems to me that it does not matter whether it passes from your waistcoat pocket to mine, if that which has become mine in the bank becomes yours in the bank.

5232. But we are now talking of the demand upon this physical substance, gold?—Yes.

5233. Where does that physical substance appear?—In the bank.

5234. And how many of all the cheques that have been drawn in London to-day could be paid by all the gold that is in England?—They could not, of course; that is the very thing I say; they for the most part cancel one another; but each cheque effects a change of ownership not involving practical handling.

5235. (*Mr. Houldsworth.*) If the cheques were immensely increased would it have any effect?—None of any importance. The cheques, for the most part, cancel one another.

5236. Then the same quantity of gold might be the basis for double or 100 times the number of cheques

up to a certain point?—The number of transactions bear no necessary proportion to the gold.

5237. Till credit began to give way and there was a fear that there would not be enough gold to pay?—Yes.

5238. Therefore the quantity of commodities and the number of transactions has nothing to do with the quantity of gold that is required to carry them on?—I do not say that. There you have added in words which alter the meaning very considerably. You say “the quantity of commodities.”

5239. (*Sir T. Farrer.*) Do you consider currency to be, as the books tell us, a “medium of exchange” in wholesale transactions. Is it not rather a “standard of value”?—Currency I understand to be a tool of exchange, entirely distinguished from the abstract idea of a standard.

5240. (*Mr. Courtney.*) What is currency?—The money circulating.

5241. (*Sir T. Farrer.*) Let me drop the word “currency” and use instead the expression “gold,” and let us consider that notes and gold are equivalent in this country. Well, do you consider that gold is a medium of exchange in any wholesale transactions to any and what extent, or is it not rather a standard of value?—It is a standard of value, but of course its actual operation, the way in which it works, is as a medium of exchange, though it is a standard of value. A standard of value must be itself liable to rise or fall in terms of the commodities which it measures. Gold could not work as such a standard or measure if it were all melted into one vast pyramid. It has a dynamical as well as a statical value. It must be capable of passing as a medium of exchange.

5242. But it is practically used as a medium of exchange?—I think we are getting somewhat metaphysical now. I should say it is. My former answers would show that in what way I consider it to be so.

5243. Because it seems to me that this idea of scarcity of gold is largely founded on the opinion that it is used as a medium of exchange, and that in consequence the demand for gold must increase in proportion to the quantity of commodities and the number of transactions, and I want to know whether that is the case?—No. I demur to the number of transactions bearing a proportion to the needed amount of gold; that is the point on which we are all agreed, viz., that banking expedients make the number of transactions almost unimportant; the quantity of commodities does bear a proportion to the gold required. Gold, saving the economy of it by banking expedients, is, I consider, the medium of exchange in this country, and it is also the standard of value over all gold-using countries.

5244. You would agree, then, with this well-known passage out of Hume’s essay on money: “It seems almost self-evident that the prices of everything depend on the proportion between commodities and money. . . . It is the proportion between the circulating money and the commodities in the market which determine prices. . . . Great undertakers, manufacturers, and merchants can deal in nothing but specie.” That is the way in which he goes on to illustrate his position. “Can deal in nothing but specie,”—specie is the basis of it all?—That is what he means, and I agree with it.

5245. Here is another passage I find in Mill. Chap. VII., Book 3: “The supply of money is all money in circulation. The demand for money consists of all the things offered for sale. Every seller of goods is a buyer of money, and the goods he brings with him constitute his demand. . . . As the whole of the goods in the market comprise the demand for money, so the whole of the money constitutes the demand for goods. The money and the goods are seeking each other for the purpose of being exchanged.”—Certainly.

5246. You think that that expresses the truth?—I think it does.

5247. (*The Chairman.*) But as to the quotation

that has been given from Mr. Mill, would you agree that it is accurate if by money is meant merely gold coins?—Oh, no, I do not mean gold coin only; certainly not.

5248. Gold coin or the bullion held by the Bank?—Gold; that is to say, in gold-using countries whatever gold is available for meeting liabilities. Bullion in the Bank is practically coin, both because it is coinable *ad libitum*, and because it is in actual circulation in the form of notes.

5249. (*Mr. Courtney.*) Let me put it to you in this way for the purpose of ascertaining whether we do understand one another. Supposing there is now in the Bank and in private persons’ hands 80,000,000*l.* of gold; do you consider that that is the quantity of coin which is said to be seeking commodities or against which this quantity of commodities is said to be seeking money, or would you add to that 80,000,000*l.*, 15,000,000*l.* more, representing the credit issue of the Bank of England?—I should say, in answer to that, that I do not limit it to those 80,000,000*l.* that you speak of, because there is that sum of 15,000,000*l.* or 16,000,000*l.* which depend for their conversion into gold upon a portion of the gold in the rest of the world, inasmuch as, in order to be able to meet all those notes, provided you had to meet them, it would be necessary to attract gold to this country. You could not do it; nor, as a matter of fact, would you ever need to do it, inasmuch as they never could all be presented, both because of the physical impossibility, and because long before matters came to that point, the Bank, by the sale of securities, would draw in its notes, diminish its liabilities, contract the circulation, and raising the rate of discount as the consequent demand for loans increased, would bring in gold from abroad; and this bringing in shows that the presence of the material substance gold is a real necessity.

5250. Still those 15,000,000*l.* are all the credit issue in addition to the precious metal issue?—Yes; they are a part, you may say, of the expedients, not banking expedients, but currency expedients of the world.

5251. And you include in the volume of money seeking commodities that which rests ultimately upon the credit of this country, as against the world?—It must rest upon gold somewhere. It is not the credit of this country only, although the credit is what you and I have to rely upon, if we hold a certain portion of the notes.

5252. The possibility of getting those 15,000,000*l.* by some means or other, at our will, converted into gold?—Yes.

5253. Well then, would you add any other forms of credit which are circulating among us, besides Bank of England notes, which depend also upon the possibility, in the case of a general liquidation, of being converted ultimately into gold. Supposing you had circulating here Treasury bonds of the Bank of France?—Well, if I am to consider that, which, however, seems to me to be somewhat removed from our question, that would in that case be a part of the currency expedients of the world. One might even add a further thing, one might add the inconvertible currency of other nations. I suppose you might add that, because had they not that inconvertible currency it is probable that they themselves would also need one or other of the precious metals to serve as a medium of exchange and measure of value in their own country, which would be a further drag upon the precious metals existing in the world.

5254. All this extension of the range of the meaning of money seeking commodities and determining the price of commodities, diminishes the importance of the element of gold?—All banking and currency expedients help to make it possible for us to transact that vast business which we now do transact, and which, if we had no such banking expedients, we certainly could not transact with any comfort, upon the basis of the existing quantity of gold. They do not diminish the importance of the element of gold. They obviate the necessity for the

Mr.
H. H. Gibbs.
16 May 1887.

Mr.
H. H. Gibbs.
16 May 1887.

employment of so great a quantity of specie as would otherwise be needed. The importance of that which is needed is rather increased than diminished.

5255. Well now, might we go a step further, and, in addition to these supposed notes or bonds of a foreign country, might we assume that if the bank here held at its reserve the stocks of a foreign country, which it would convert, if necessary, by sale, in order to satisfy the demands upon itself; supposing there was a run upon it by its creditors, would those stocks of a foreign country represent part of the volume of money seeking commodities?—They would not. There can be no difference between them and any other investment of the bank. The bank would pay for them in notes; if the bank wanted the money it would sell them for notes. I fear I do not follow the sense of your questions. Such investments are no more money than a house would be, if the bank should buy one.

5256. (*The Chairman.*) Part of your position, as I understand, is that in the 10 years preceding 1873 prices rose and were rising up to that time?—Yes, there was a general tendency to rise, I suppose; I will not answer for it.

5257. During those 10 years there was a very large increase, was there not, in the supply of commodities, speaking generally?—There may have been; it is certain that there has been a continuous increase in the facility for bringing commodities to this country; but whether that began to any great extent in the decade preceding 1873, I am not sure.

5258. In fact, there was a great increase generally of production, if you take commodities as a whole?—I should be inclined to doubt it. The Franco-German war took place in that decade, and war both stops production and consumes commodities.

5259. I wanted to take 10 years for a particular purpose, not to go further back; during the 10 years prior to 1873, was there anything like the same increase in the production of gold as there was in the production of commodities generally?—The gold produced in that decade was 30 millions less than in the previous decade; but it was still very large, and I have no evidence that it bore a diminished proportion to the commodities. I should say there was probably a proportionate increase in the gold-using countries; I have not compared them, nor would it be at all easy to compare them.

5260. From 1863 to 1873; I expressly confined my question to the 10 years prior to 1873?—As I have already said, there was a very considerable increase in the production of gold; it went on increasing.

5261–2. There was some increase each year. But suppose the increase in the volume of commodities was greater than the increase in the volume of the currency, if prices depend upon the measure of commodities against the money that is seeking commodities, if there was a much greater increase in the commodities than the money that is seeking commodities, you would expect prices to fall and not rise?—Yes; but there is one certain factor in the comparison which we have omitted; while one at least of those which you have taken into account, the increase of commodities, is uncertain. War raises prices, that war especially, where the French issue of notes threw eighty millions of gold into the gold-using countries. Set those 80,000,000*l.* against the 30,000,000*l.* diminution of which I have spoken (Qu. 5259), and you have 50,000,000*l.* increase of production. But when we speak of the increase of commodities, we are speaking of what I really do not know, what I much doubt any one else knowing with any accuracy. Did commodities in those 10 years increase? Did they increase to that extent?

5263–4. (*Sir T. Farrer.*) May I put the same thing again in this way. I have seen a statement that not one per cent. of the whole commercial transactions of this country are really carried on with gold or notes, that 99 per cent. at least are effected through the medium of banks, cheques, clearing houses, and so on?

—I should think that is quite right—quite true; because the clearing house is a great office for the mutual cancelment of cheques, for reducing gigantic transactions to very small proportions. Such transactions also include large dealings in securities, which have nothing at all to do with the relation of commodities to the measure of value.

5265. It would probably be the case, would it not, that at the time when Hume wrote the passage which I have mentioned, that that would have been far from being the truth. Probably a very large part of the transactions would be actually carried on with gold as a medium of exchange?—Yes.

5266. Consequently, there seems to be in all advanced nations, does there not, a continued sparing of the use of gold, and a continual return to something like a system of barter, with gold as the measure of exchange?—Yes, I think so—I think that is quite true; but I would say, when you make that comparison between Hume's time and ours, that the comparison does not at all militate against what he said, because, although it is a matter of necessity that as time goes on and production increases, and commerce increases, and the transactions increase in magnitude, some such development of currency and banking expedients should take place; yet that which is the basis of all of them is the gold to which they refer in plain terms; exactly in accordance with what Hume says. Dr. Johnson gave a practical answer to your question, writing in Hume's time. "Why, no, Sir. The reason why eggs are sold for 6*d.* a dozen in Scotland, while they cost a penny a piece in London, is not because eggs are plentiful in Scotland, but because pence are scarce there."

5267. What I wished to get at was this, that an increase in the quantity of commodities to be exchanged, or an increase in the number of transactions by which they are exchanged, does not necessitate a proportionate, if any, increase in the quantity of gold used in those transactions?—Yes, I think the increase in the amount of commodities at any moment (the dealings in a certain increased amount of commodities) does require more gold; not perhaps more gold measured by the quantity of commodities, without dealings.

5268. Or by the number of exchanges?—Nor by the number of exchanges. That the clearing houses settle without requiring any great addition to the quantity of gold. That would be necessitated by the increase in the quantity of commodities to a proportionate amount.

5269. (*The Chairman.*) A certain additional percentage probably to what we call the reserve, on which the transactions rest?—Yes, that is what I mean.

5270. (*Sir T. Farrer.*) Is it not a fact that the most advanced commercial nations use by far the smallest proportion of gold in proportion to their dealings?—Certainly, because of the increase in the banking and currency expedients.

5271. Then may it not be the case that gold is ceasing, in advanced countries, to be a medium of exchange, and is coming to be used more and more only as a measure of value. That is the statement of Mr. Jevons; he says, for instance, in his book on "Money," chap. xv., "No sooner have a people fully experienced the usefulness of a good system of money, than they begin to find that they can dispense with it as a medium of exchange and return to a method of traffic closely resembling barter. With barter they begin and with barter they end; but the second form of barter, as we shall see, is very different from the first. . . . Purchases and sales continue to be made in terms of gold and silver coin, but equivalent quantities of goods thus estimated are made to pay for each other. If ownership of gold or silver intervenes at all, it is in the shape of warrants or representative documents with which gold can be procured if desired, but which are seldom used to procure it?"—Mr. Jevons's opinion is deserving of all possible respect; but his words "dispense with it as a medium of exchange" must

not be taken too literally. His description of the course of commerce is most accurate, and shows the effect of all our banking expedients, especially that of the clearing house; but I am sure he would have been the last to deny that the gold basis was a necessity of the system, which rested entirely on a proportionate gold reserve, serving as the material foundation of every exchange. No one will assert that this reserve can be wholly "dispensed with," nor will venture to define how much or how little is needed. Banking economies may be augmented and improved, and the quantum of the gold basis may thus bear to be lessened; but be they as great or as little as they will, it must bear some proportion to the quantity of commodities dealt in, and I must still think that the gold being the foundation of the old structure, every new dealing in commodities is a new dealing in gold.

5272. Requiring an additional amount of gold?—In proportion.

5273. In the world generally?—Yes. As commodities increase so you will need more specie.

5274. I want to know what is the relation between the increased demand for gold and the effect of expedients for saving gold?—Merely this, as it seems to me, that in so far as gold is not economised by banking expedients, the relation between that gold and the increased quantity of commodities will be marked by a change of prices; that is, it is prices that are affected.

5275. Might not wholesale dealings in this country be doubled without any more gold?—Certainly wholesale dealings might be increased, that is if you mean wholesale transactions, not including more commodities, but merely payments, however large, which are all concentrated in the day's work of the clearing house. A payment for a cargo can be cleared as easily as that for a ton; but he who has to pay for a cargo must needs have a larger balance at his bankers than he who has to pay for a ton of the same commodity; the banker must needs have a larger balance with the Bank of England, and the Bank of England a larger reserve of notes, involving the necessity of a proportionately larger stock of gold.

5276. (*Mr. Barbour.*) Would not that tend to increase the liabilities of the banks; would not the amount of bills discounted, and so forth, be very much greater?—Yes, the liabilities would increase, as stated in my last answer; and as to the bills, that is for people to consider how far their wisdom will allow them to take those bills, if there is any fear. There is no doubt that when business is brisk and discounts large the banking department must be the better provided with reserve. But I may observe that there is often an inexact use of the word reserve. You, I think, have in your mind the stock of coin and bullion in the Issue Department. But the reserve means the amount of notes (with a small amount of coin) which we as bankers, acting as any other bank does, keep in our till to meet the demands of our customers. The stock of gold held by our other selves in the Issue Department always equals the total amount of notes held by us, other banks, and the rest of the public, minus 15,750,000*l.* of fiduciary issue.

5277. The reserves of the bank must bear a certain proportion to the transactions, must they not?—The greater the transactions the more is the possibility of bad debts.

5278. You would require a larger reserve?—A larger reserve in proportion to the liabilities that we have.

5279. That is to say, you could not carry on the transactions of England without a greater reserve than would suffice for a bank in Jersey?—No; because the liabilities of your Jersey bank would not be anything to demand such a reserve.

5280. Well then, it comes to this, that, other things being equal, the greater the magnitude of the transactions, the larger must be the reserve; you are always liable to be called upon for gold?—Only in the Issue Department of the Bank of England are we liable to pay our notes in gold. The larger the deposits the

more reserve must the Banking Department keep—reserve of notes. It can pay its liabilities in notes as well as the rest of the world.

5281. That is, the more gold you would need, because the notes represent gold?—If there are more notes there is necessarily a greater reserve of gold in the Issue Department, that is all.

5282. (*Sir T. Farrer.*) You were asked whether wholesale dealings might not be multiplied indefinitely without the need for using a single additional ounce of gold?—If so, the converse must be true, and the stock of gold may be indefinitely diminished without impeding our wholesale dealings. But if that is so, how far may we go? Will you put no limit? Will half a dozen ounces suffice? Why not have an inconvertible currency at once? It is quite true that even that would not impede wholesale dealings; cheques and the clearing house would still exist. But the reduction of the stock of gold in the world, or its increase, would affect prices, however little the mechanism of wholesale dealings might be touched.

5283. I am not at all denying that the quantity of gold has a bearing upon prices, I am only now analysing wholesale dealings, and I want to know how far the increase of wholesale dealings increases the demand on the physical stock of gold in the world, and on that, I think, you stated that it depends on the increase in the quantity of dealings?—Of commodities, not of dealings; that is really a different thing; the increase in the quantity of commodities is one thing, the increase of dealing with the same commodity over and over again in the same day is a different matter.

5284. I am now talking of gold as a medium of exchange, and unless there is dealing, there is no use for gold as medium of exchange?—There must be dealing, of course.

5285. Then if an increase in the quantity of goods to be sold, or of sales, does not create a demand for the use of an increased quantity of gold, can you explain what is the exact connexion between the supply of the standard metals and prices? How does an increased or diminished supply operate?—I have nowhere said that an increase of the quantity of goods to be sold did not create a demand for the use of an increased quantity of gold. I said just the reverse. But I said also that an increase of transactions in the same goods did not involve the necessity for an increase of gold. Under a perfect or good system of banking transactions of great magnitude can be cleared as easily as much smaller ones, at the cost of a little more clerical labour and without the cost of additional gold; but a great addition to the number and mass of commodities to be dealt with, and to the population which has to deal with them would, in fact, alter the proportion between the gold and the commodities, and cause either a demand for more gold, or a greater demand, involving an enhancement of price for the existing gold. For it must be admitted, as I have said, that every cheque causes a transfer of ownership of a certain quantity of sovereigns, and that the same sovereigns cannot be simultaneously transferred from A to B and from C to D. Suppose all commodities in England to change hands at one moment, and to be but 10 in number, represented by 10 equal cheques of 5*l.* each, transferring the ownership of the 50 sovereigns in the bank; it is clear that 10 additional commodities of the same intrinsic value, to be dealt with at the same time, would either need additional cheques for an additional 50 sovereigns, or else the 20 cheques must be for five half sovereigns apiece instead of five whole ones. That is to say, prices would fall. For England read the whole commercial world. For 10 commodities and 50 sovereigns read the whole mass of commodities and the whole mass of gold. Suppose the commodities doubled, and the relation to the mass of gold will be seen to follow the analogy of that above supposed. The actual case is different, because the gold in the bank does not equal the cheques which can be simultaneously drawn and presented for cash payment. The question how, in the way of distribu-

tion an increased or diminished supply operates has been already answered under Question No. 4675.

5286. (*Chairman.*) When A transfers money to B by cheque, you say he transfers the ownership of so many sovereigns, but the number of sovereigns so transferred exceeds, does it not, the amount that you would suppose to exist? I do not know how you could transfer the ownership in non-existent things?—You do not; but of absent things you may. The physical substance which the uncanceled cheques transfer is partly present and partly absent.

5287. I draw a cheque that transfers from me to him the ownership of five sovereigns, and so in the case of every transaction, but the sovereigns which are thus transferred from one person to another each day in London do not exist, and nothing like that quantity exists?—Surely they do at any given moment; not that the whole quantity is present in England, but just that proportion of it which is affected by the difference between the coin and bullion in stock, and the total issue of Bank of England notes. But if you have received an open cheque for 100*l.* on the Bank of England, you know that nothing can prevent your demanding and receiving first, notes, and then, if you desire them, 100 sovereigns. The same is the case with each and every recipient; as a matter of fact they do not demand notes, because they, or their bankers, owe about as much as they are owed. We may take it that every cheque assumes a balance at the bank on which it is drawn. Against such cheques the banker must keep a sufficient reserve in notes payable at the Bank of England; and those notes, as just now said, are represented by bullion there existing or easily procurable. If it be answered that the reserve of notes kept by the banker supposed to be drawn on is but a small portion of the credits which his customers have with him, which credits are also for the most ultimately secured by the same bullion, so that the cheque in question has a hold on only a small portion of it, it must be replied that however that may be, he would have an indefeasible claim to, and could at pleasure receive, the 100 sovereigns which have been made over to him; and this could only be accomplished in case of pressure by our augmenting the stock of gold in our vaults. But none of this discussion really touches the question of the necessity of our store of bullion, and its effects upon prices. We all know that it is necessary, and we know the immediate and temporary effect upon the rate of discount and upon prices, produced by its diminution or increase from time to time, but that is a very different thing from the ultimate effect of the increase or diminution of the measure of value in the world, as described by Mill. My position is that when a cheque passes from one to the other, sovereigns pass from one as owner to another as owner, though not from hand to hand, the successive owners acquiring the absolute right to demand them. Of course, those same sovereigns can afterwards by another transaction be passed to somebody else. I am now speaking only of the simultaneous action; that is to say, you cannot but transfer sovereigns every time that you give a cheque. They need not be different sovereigns; on the contrary, if it is a transfer from A to B, and then again from B to C, of course they may be called the same sovereigns.

5288. (*Mr. Courtney.*) Suppose at any one moment of time every person who had acquired by transfer and possessed at that moment of time a right to sovereigns said, "I should like to have them in my pocket," what would happen?—Physically, they could not, because the Bank of England could not hold the applicants.

5289. (*Mr. Houldsworth.*) Does it not come to this, that the same ounce of gold supports several times its own transaction?—Certainly, a myriad of times, inasmuch as the cheques cancel one another.

5290. (*Sir T. Farrer*) The cheque that you speak of is a right to five sovereigns?—Yes.

5291. But it is a right which by custom and use is never, or scarcely ever, exercised; is that not so?

—Very little, but rather by necessity of business than by custom.

5292. But in wholesale transactions it is never exercised?—In point of fact, it is seldom exercised in home transactions in the sense of handling the gold, because the movements of bullion from the Bank of England are for the most part international movements rather than internal movements. Bullion has, of course, to be actually moved to Tower Hill sometimes, for coinage purposes, and sometimes to Scotland and Ireland and the provinces.

5293. So that we came to this, that bullion is not used in the wholesale transactions of commerce?—Is not handled, usually, except for export, and for special purposes. Then your cheque is actually paid in sovereigns or bars.

5294. You say it is a right which is seldom exercised; but, I suppose, it might be exercised at any moment, and you must therefore keep a certain reserve in case it should be exercised?—Yes, that is why we should keep a stock of gold, even if the law did not compel us. The Banking Department keeps a reserve, mostly notes, sufficient to meet the demands upon it; the Issue Department has, of course, a reserve of gold sufficient to meet the notes held by the bank and by the rest of the public.

5295. As a matter of fact, except in case of extreme panic, you never do come near the point where people do require the gold?—Even then it would not be that they required the gold instead of notes for their business; they would require it only in consequence of their fears. The hoarding, however, that has occurred in my time has been note-hoarding, not gold hoarding; but the effect of either would be nearly the same.

5296. They are afraid that it may come to the point at which they may be obliged to ask for it?—That is it.

5297. And the amount which you are obliged to keep at the bank depends really, or very much, upon what people think it necessary should be kept there in order to alleviate their fears?—Yes, we have, no doubt, to keep more (if you are referring to our banking reserve), owing to the publication of the accounts of our banking department. The public would know nothing about it if it were not for that. The stock of bullion in the Issue Department is held in accordance with the provisions of the Act of 1844.

5298. Well, now come again to the point how an increased or diminished supply of the precious metals operates. Would it operate on sales through the cash in the hands of the public, or through the gold contained in the bank reserves, or does it only operate indirectly by altering the value of gold considered as a standard of value?—I should say its ultimate operation is through the mass of gold considered as a measure of value. Its immediate operation is through spending power, by which I mean not extravagance only, but all spending, and especially reproductive spending. The stock of gold in the bank is only a cistern. Increase or diminution of production of gold affect it for the moment, but they do not at all govern the level at which it is kept.

5299. Then I would only ask you, if the operation of an increased or diminished supply of gold is indirectly, but only indirectly, felt in wholesale transactions, whether it ought not to be felt more directly in retail transactions and in payment of wages, where gold is really used, should it not, than in wholesale transactions, where it is not used?—No, I should say it ought not. Wages are not raised by means of currency, that is, of cash going about in the hands of the public, but by an increase of the wage fund.

5300. Then you do not think that the increased or the diminished supply of gold operates on prices through the circulating medium in the hands of the public?—It operates by the spending power. The fact of the public wanting more cash at one moment to meet its engagements at a certain time, as in Scotland for example, does not affect wages; wages affect that rather.

5301. But I am speaking now rather of an increased or a diminished supply of the precious metals?—By increase of power of spending, not by the presence of this or that quantity in the hands of the public.

5302. Will that not depend upon circumstances?—Yes.

5303. In Australia the increase of the quantity of gold increased miners' wages, and that was the beginning of the rise of all prices, was it not?—In Australia it increased everything, not wages only; nor did it begin with wages. It began by the man who was wont to earn wages leaving his work and going to find gold, and finding better pay by working for himself than for his quondam master. Then the master found that if he must have his horse groomed he must pay higher wages. I have explained before how it affected the rest of the world. Q. 4675.

5304. But I want to know what would be the effect in this country, suppose you have an increased quantity of gold. Would it affect retail prices directly or only through wholesale prices?—No, only through wholesale prices, I should say.

5305. Where is the gold to be found in England?—In the vaults of the Bank of England it is most in evidence, but there has been said to be 100,000,000*l.* in coin in England. It is doubtful whether there is so much.

5306. That is partly in circulation, and goes to pay retail prices and wages?—Yes.

5307. And you have said that you think that the effect of an increased or a diminished supply of gold would not be felt directly in that portion of it?—I say it would not be felt in that way. Wages do not rise in Europe by the mere fact of gold being found in Australia, but by the gradual increase of spending power. It is probable that the coin in the pockets of the people would be again approaching its normal amount, which is now said to be diminished; but that depends on activity of business.

5308. And more cash at the bankers would not make wages rise?—More cash in that particular deposit would not of itself make them rise.

5309. Therefore it is not to the use of the gold in the hands of the public that we are to look for the effect of an increased or a diminished supply upon prices. The gold that acts upon prices you would rather expect to find in the banking reserves?—No; I have already said that it is not by the mere presence of gold in the hands of the public. It is by their having more at their credit to spend. If they consequently paid more wages, they would, as a further consequence, have more money in circulation.

5310. I want to know whether it is to the whole amount of gold in the bank that we are to look for an effect upon prices; we are now dealing with the quantity of gold, and I want to know whether we are to look to the bank cellars for the effective quantity?—You are looking in vain for some great reservoir which should be permanently filled by a great find of gold, or depleted by the falling off of production. I have explained that the action is one of gradual diffusion. What I mean is this: suppose there are 120,000,000*l.* of gold found in Australia, Africa, or elsewhere; it comes to the Bank of England; that is the natural course. That of itself does not increase wages merely because it is there. It may have a momentary effect upon the rate of discount and so a momentary effect upon prices, but what it will do is to leave something behind it. It either belongs to some person here who has made a speculation in Australian mines, or it is a certain amount of commission which remains from the sale of that commodity, gold, which may have been consigned to him, giving him in either case increased spending power. That is the way in which the thing operates.

5311. And in that way the bringing of silver to the assistance of gold would place a larger amount of standard metal in the bank reserves, and in that way would operate upon business in the way which you have described?—Yes, but that is only a temporary

operation, acting, as I have said, upon the rate of discount. It might be more easy if gold and silver were both of them money here, to withdraw gold or silver from another country, thus giving an additional facility for bringing bullion to this country; but I say it is not the fact that the discovery of the precious metals operates ultimately through the stock of gold in the bank; it operates through the change of proportion between the commodities existing and the bullion existing.

5312. It operates as a standard of value?—As a measure of value.

5313. At any rate, if we are to look for the quantity of gold which is available, it is to the banking reserve that we should look, is it not? If we are to look for any standard or mode of testing the quantity of gold that is available for the purposes of raising prices, we should look to the bank reserve, and not to any other place?—No, I should say not. The gold in the Issue Department of the Bank of England (which is what I suppose you to mean by the bank reserve) is not the thing that regulates or is even an index of the quantity of gold as a measure of commodities. I think the largest amount of gold in the bank was somewhere about 1876, when certainly the production was not much greater.

5314. I want to get to this point; if there has been a physical scarcity of gold, that scarcity ought to be seen somewhere or another; I want to find the actual fact of a scarcity of gold. Where shall we find that; how can we test the quantity of gold?—We can test the quantity of gold simply by knowing how much is produced, and what is the amount of wear and tear.

5315. Then there is no reservoir in the world?—No, certainly not; because the only gold that may be said to be in reservoirs is that which goes back again, so to speak, into the mines, as I have frequently said; that is to say, goes into hoards, or may go into hoards.

5316. Is it available when it is in hoards; does it alter the standard of value when it is in hoards?—It may be said to be put back into the mines, with only this difference, that the mine is one that is extremely easily worked. Just in proportion as it is easily worked, so it must have an effect on prices.

5317. But, for the moment, it has not an effect upon prices?—Not unless it is, as I say, very easily to be had.

5318. We have seen that it can be got at?—Yes.

5319. But in their immediate effect upon a standard of value we might put hoards out of consideration, might we not?—I think we might; some hoards, certainly. Let me instance it by one thing. It is said that the German Government has in Spandau some 12,000,000*l.* sterling. You may call that a hoard if you like, but at the same time, in the event of an outbreak of war, that would cease to be a hoard.

5320. Would you say that that hoard affected gold as a standard of value?—It is extremely difficult to measure; it is the degree of its attainability, and the knowledge of it, which would determine that.

5321. But there are certain commercial reservoirs in which the gold is known to be available, and in which it certainly has a commercial value?—Yes, the gold is not only available but in use.

5322. Have you examined the state of those reservoirs before and after the time of the demonetisation of silver?—Yes.

5323. I think Mr. Soetbeer gives us the total gold reserves of the principal countries of the world. In 1877 it was 144,500,000*l.*, and in 1885, 252,000,000*l.*?—Yes.

5324. Therefore the available reserves of gold in the world had very much increased during that time?—The amount of reserves of gold in banks and elsewhere do not clearly bear upon the question. The visible stocks of gold may have increased, inasmuch as there seems to be a tendency, at least on the Continent, to centralise more and more the gold in the country in the reservoirs of the banks. Here, again, supposing that we issued 1*l.* notes against gold,

Mr.
H. H. Gibbs.
16 May 1887.

Mr.
H. H. Gibbs.
16 May 1887.

the reserve in our tank, the Issue Department, would be increased, but the total amount of gold in England would be unaffected. The amount of reserves in banks depend, as I have said, on many things besides the quantum of the measure of value. The 12,000,000*l.* which Mr. Pierson says exists in Spandau as a reserve for war purposes is in the nature of a hoard, and probably does not affect the mass of the measure, and consequently, prices. Now, the average stock of gold in the Bank of England in both departments in 1879 was 32,000,000*l.*; in 1880 it was 26,000,000*l.*; in 1881 it was 24,500,000*l.*; in 1882 it was 22,000,000*l.*; in 1883 it was about the same; in 1884 it was 22,000,000*l.*; and in 1885 it was 24,000,000*l.* The fiduciary issue of notes in the whole country has been reduced, or the gold would have been less.

5325. At any rate you will admit this, that taking the whole of the available reserves that we know of, according to the best statisticians, the whole of these reserves which are known to be available for the purposes of commerce and exchange, they are larger considerably now than they were in 1877?—Dr. Soetbeer says so. I cannot say of my own knowledge. I can only tell what the case was in the Bank of England, where they were much larger then than now.

5326. In the Bank of England the reserves are as large as they were?—No, they are not. In 1876 the stock of gold in the Issue Department was very much higher. The average was about 20,000,000*l.* and the highest point 34,206,000*l.*

5327. They were just temporarily, but taking the period before the demonetisation of silver and the present period, the reserves are as large now as they were, are they not?—It was not temporary; the stock of gold in the Issue Department was 25,000,000*l.* in April 1876, and 34,200,000*l.* on September 1879. The highest point in the several successive years, 1878–86 was in round numbers 26, 34, 28, 27, 23, 24, 34, 27, and 22 millions. It is now 23 millions, not differing greatly from the average of the years before demonetisation. The highest points in 1867–75 were 24, 22, 20, 22, 27, 25, 24, 23, and 29 millions respectively.

5328. Well, then, I come to a further question. You protect your gold by raising the rate of interest?—Certainly.

5329. Have you had any greater difficulty in doing this since the fall in silver began than before?—No, there is a difference in the rates which will be successful in getting gold from France, but there is no difficulty at all.

5330. Have you had to raise the rate of interest higher?—No, it is lower, as is always the case in a depressed state of trade. The average of the decade ending 1872 was 4*l.* 2*s.* 10*d.* per cent., and of that ending 1882, 3*l.* 7*s.* 10*d.*

5331. (Mr. Courtney.) How do you get those averages?—I take them from our returns.

5332. What I mean is this, do you take into account the time during which your rate runs?—It is an average rate.

5333. Supposing you had got a 3 per cent. rate of discount for nine months in the year and 4 per cent. for three months in the year, what is the average rate in the year?—I cannot say off hand; I have taken the average.

5334. (Sir T. Farrer.) Since the demonetisation of silver the rate of interest has on the average been lower than it was before?—The rate of interest here has been lower than it was before.

5335. Has the rate of interest been more frequently changed than it was before the demonetisation of silver?—No, the changes in the decade ending 1872 were 103, and in that ending 1882, 90. The rate of interest has, I consider, no practical significance in the question before us. It is, however, remarkable that the changes in 1873 were 24, very much larger than in any year since 1844.

5335*a.* That was the time of the special German demand for gold, was it not?—Yes.

5336. The rate of interest is the weapon with

which different countries “struggle,” as it is said, for gold?—It is one of the weapons, and one to which we constantly resort. It is not at all necessary that rates should be high to protect our reserve. It suffices that they should be higher here than in other gold-using countries, taking into account the normal rate of interest in each.

5337. Then do you find that there has been any greater difficulty in maintaining this reserve, that we have had to pay rather a higher price for it since the demonetisation of silver than before?—No, I have shown that it is less.

5338. So that there has been no difficulty whatever in maintaining the reserve?—No, none at all.

5339. The rate of interest in the event of a scarcity of gold is the price that is paid for the use of gold?—Is the price that is paid not so much for the use of somebody else's capital, as for the use of your own capital earlier than you have a right to have it.

5340. (Chairman.) Is it not that he gives you his gold, he getting the right to receive your gold at a later date?—Of course, that is another description of the same thing.

5341. (Mr. Courtney.) A more accurate one?—Yes, perhaps it is; but the Chairman's phrase is the description of a mere borrowing with no security. “Here is something,” you say, “that is due to me on the 1st of July. Please let me have it before the ‘1st of July,’” the banker does so, and you pay him in accordance with the time.

5342. (Sir T. Farrer.) Whichever is the better description, the rate of interest is the price which you pay for the use of the gold in the meantime?—For the temporary use of the capital.

5343. Well, the price of a thing is generally the measure of its scarcity, is it not?—Yes, but there is the fallacy into which you are falling. You say, rightly, the rate is the price you pay for the use of the gold; and then, premising that the price of a thing is the measure of its scarcity, deduce from the low price of the accommodation the conclusion that the gold *itself* is not scarce, that gold is cheap and not dear. If there were but two ploughs in a district, ploughs would cost the same, and be as scarce and dear, though by reason of the ploughing season being nearly over, and most of the land being turned into pasture, the demand was slack, and the charge for their hire little. You speak of the scarcity of gold, whereas it is not the scarcity of gold that is in question at all in respect of the rate of interest. There may be an abundance of gold, and yet you may have to pay a large price for the accommodation you want. There may be an abundance of gold in the world, but yet to borrow the money wherewith to pay your bills you may have to pay a large price, depending on the demand that there may be all through, depending upon the means that your bankers have to help you over that stile.

5344. (Mr. Birch.) Surely one of the objects of raising the rate is to attract gold?—Certainly, that is what I say.

5345. Yes; but I think you said that you only attracted it before its time. Sometimes the object of the Bank of England in raising the rate is to produce this effect, that securities fall, and money comes to be invested in this country, other people's money from abroad too?—I said nothing about attracting it before its time. I said that in sending in bills for discount, I obtained before its time a sum due to me. What you say is right, but it is quite another thing.

5346. It is attracting the gold?—Yes; that is the action of the Bank of England. I was speaking of what the operation was of obtaining payment of a bill under discount. It is not the *gold* that we buy in discounting our bills; it is the accommodation that we buy, and facts show us, as clearly as possible, that it does not depend upon the amount of the stock or production of gold in the world what the rate of interest is.

5347. Not the amount of the production of gold,

but the amount of gold that there is available to come over here if we want it. Does not raising the rate attract gold?—Certainly; but that may be perfectly the case, although gold may be deficient in England, yet gold in one or the other part of the world may be abundant, and may come here. The rate of interest may be higher here, and, therefore, people will send the gold if they have it in their possession, even though the quantity in the world is small in proportion to the demands on it.

5348. You know we are speaking of gold as a measure of value, that is a comparison between the amount of gold and commodities?—The question has now been turned upon the rate of interest, upon the greater or less demand for the temporary use of the commodity. It is not only I, but every economist has said the same; the rate of interest has nothing whatever to do with the scarcity of the precious metals. It has to do with the scarcity in your pocket when you want to borrow, but it has nothing to do with the scarcity in the world.

5349. (*Sir T. Farrer.*) It is notorious that under many circumstances the rate of interest has absolutely nothing to do with the supply of gold; but it is no less clear that there are certain periods in which you want that particular commodity, gold, and in those times you get it by paying a higher price for the use of it, is that not so?—You speak here of gold as if it was a commodity which you wanted to buy. How much, then, do you give for a hundred sovereigns in such a transaction as that of which you speak? The rate of interest is 2%, but the 40s. is not the price of the 100 sovereigns. You say quite rightly in the same question that it is what you pay for the use of them. It is credit, not gold, that you want. You want to pay your bills, that is all, and you have got no money. It is the Bank, not the merchant, that wants gold to replenish its reserve of notes; and it gets it, not by paying (as you think) a higher price for the use of it, but by charging a higher price for its discounts.

5350. Well now, what are the means which you employ for getting gold when you want it, or keeping gold when you wish to prevent its going away?—We (I mean the Bank of England) are not obliged to lend. By raising the rate we say, in effect, "we will not lend." Somebody may say, "I must have the loan." Then we say, "well, you must pay for it," that is, pay for credit, pay for having some more money put to your credit. Your contention is all the less tenable by you because it is an argument that in borrowing money we buy gold, whereas in former questions you have maintained that even when we sell commodities and do buy gold, no gold passes.

5351. I am asking really for information. What is the effect and operation of your raising the rate of interest in getting gold from foreign countries?—I suppose one may say it is that then the rate of interest is better for them here than it is abroad. That is the ultimate result of it. They send gold because they will be able to dispose of the money more advantageously, but there are manifold steps and lines through which that passes. It is sent here as an exchange operation. That is, gold may be sent without any special intention of investing that gold, or it may be sent with an intention of investing the gold, but from the belief that the gold will be wanted, and from the belief on the part of the sender, the man who operates in bullion, that a good exchange operation can be made by sending it. That is to say, that the bills will be sent to him as a counter-remittance under advantageous circumstances.

5352. But if there was really this scarcity of gold or a difficulty in obtaining it, and if there was, as we have heard stated, a "struggle" for gold, would you not expect that since this demonetisation of silver which is said to have caused the scarcity of gold, you would have had a greater difficulty in getting it, and that you would have had to pay more for it?—Yes, if it were really a purchase of gold; but I repeat that it is no such thing; and I repeat what

I have already said, that the rate of interest depends not upon the quantity of gold in the world but upon the briskness or slackness of business. Business ever since that time has been extremely slack, therefore, as has been always the case in slack times of business, the rate of interest is low. Even if the effect of the scarcity, *i.e.*, its more extended use, in Italy, Germany, and elsewhere, should naturally have been to make the price of the temporary loan of capital greater, this would be counteracted by the slackness of business.

5353. But then I thought you told me that the business was slack because there was a deficiency of gold?—Yes, amongst other causes.

5354. We are talking of appreciation of gold alone now. You told me that the depression in trade is due to a want of gold?—Yes, in part. I should put it, more correctly, to a diminution of the measure of value in the gold-using countries, as compared to the commodities measured.

5355. And then when I point out that there is no want of gold, and that there is an abundance of gold, you say that the abundance of gold is due to depression of trade?—I must reply that you have not pointed out that there is no want of gold, or that there is abundance of gold. You have urged that there is a lack of demand for loans, and a consequent cheapness of accommodation, which is a wholly different thing. Interest will always be low when trade is bad. I say that depression of trade is partly caused by a falling off in the amount of gold in the world; by the failure of gold to meet the demands upon it.

5356. Then when I point out that so far as we can see in any possible quarter there is abundance of gold, and that there is not the least difficulty in maintaining that abundance, you tell me it is due to depression of trade?—But I do not say, and I repeat that you have nowhere shown, that there is an abundance of gold. You say, look at the stocks of gold in the Bank of England and in other countries, and you assume that to be an index, but I deny that that is an index; it is not the least an index of the amount of gold in the world.

5357. Then I ask you where do we find this scarcity?—You find the scarcity in the fact that the needful amount has not been produced, and that there have been greater demands on the commodity.

5358. You find the effect in the fall of prices, but you do not find it in any visible reserves, or in any difficulty in maintaining those reserves?—There is no difficulty in attracting gold, but that gold must come from somewhere else, it must be taken away from somebody else. If at any given time we have a large stock of bullion, it does not follow that other people have a large stock also. You cannot take the stock held by the one bank or the other as an index of the gold in the world. The stock of gold in the Bank of England is really an index of the need of the public for notes. The point is that gold is not being produced in large quantities, and is more in use than it was.

5359. I am not talking about the production now; we are talking about the visible supplies throughout the world?—Well, I say I cannot answer about visible supplies, because I do not think the stocks of bullion held by any bank are a sufficient ground for building any superstructure of that kind, and I very much doubt your finding any one who knows anything about the working of the Bank of England, and who will tell you that they are.

5360. Then you do not think that there is any place in the world in which we may look for the quantity of gold existing, in order to test the allegation that there is a failure in the quantity of it to meet the demand?—How is it possible that there should be anywhere such a permanent reservoir which should be an index of the amount existing in its own and other countries? I look at the returns of the gold that comes in, and I see that there is a failure, there is less produced than there used to be, in proportion to what is needed.

Mr.
H. H. Gibbs.
16 May 1887.

Mr. H. H. Gibbs. 5361. There is no evidence of there being any great "struggle" for gold between the nations?—I think there is.

16 May 1887. 5362. But not more since 1873?—Yes; France locks up its gold and does not part with it. You say the rate of interest is the weapon with which the nations must struggle. It is one of the weapons; but it is not the only one; a strong lock and key is another.

5363. I am glad you mentioned that point. The gold in the Bank of England is thoroughly available for commercial purposes?—Surely.

5364. Except so far as it is required to be kept against notes which are out?—That gold also is thoroughly available, and is in fact continually employed, through notes, for commercial purposes.

5365. Can the gold in the Bank of France or the Bank of Germany be got at in the same way as the gold in the Bank of England?—Not quite with the same ease, because gold is not only a legal tender in this country as it is in those, but is the only legal tender in this country.

5366. With the exception of the gold in Spandau, the gold in Germany is in the banks?—It may be so, but I do not know it.

5367. And it is so in the United States?—I do not know how it may be in the United States, but in France it cannot be absolutely demanded because it is a bimetallic country, and they have a right to give which metal they like.

5368. (*Mr. Fremantle.*) But the United States is also a bimetallic country now?—The United States is, like France, a bimetallic country with a lame standard. I am told that they withhold their gold, which would otherwise flow hither; but I cannot say for certain. I wish to read, as to Sir Thomas Farrer's qualification of what I said about the rate of interest having nothing to do with it, a few lines of what Mill says:—"The rate of interest bears no necessary relation to the quantity or value of money in circulation. The permanent amount of the circulating medium, whether great or small, affects only prices, not the rate of interest. A depreciation of the currency, when it has become an accomplished fact, affects the rate of interest in no manner whatever. It diminishes, indeed, the power of money to buy commodities, but not the power of money to buy money."

5369. (*Mr. Birch.*) If Mill had been alive in 1873 I think he would have thought differently, would he not?—He might have thought differently in many things, but I do not think such speculations on dead men's progress of opinion will really help us.

5370. (*Mr. Courtney.*) You lay stress upon the qualification, "when it has become an accomplished fact"; these are the important words in the statement?—They are not the only important words. I, however, made the very same distinction, because I said all increase or diminution of the currency comes primarily in that way; it is poured into that cistern, gets distributed, and when distributed acts uniformly upon prices.

5371. (*Mr. Birch.*) Under certain circumstances the question of the commercial demand has nothing whatever to do with it. You may remember, in the year 1873, the Bank of England, finding that bills were drawn in France, in Switzerland, and in other parts of the world upon England, recognised that this was the means France was adopting to obtain gold to pay her indemnity to Germany; it had nothing whatever to do with trading operations. To avoid losing too much gold we raised the rate continually; we refused to discount some of these first-class bills; we put the rate at 9 per cent. and that had the result of checking this class of operations, and we held our own afterwards?—I was deputy-governor at the time of which you speak, and I am therefore thoroughly cognisant of the circumstances. I make no question, of course, that there were many financial bills; but when you say they were not commercial bills, you speak in a re-

stricted sense of the word. I speak of the whole commerce of England, whether of goods, produce, securities, finance, or of anything else, and of that commerce these bills certainly formed a part. They must have involved indebtedness, and formed an item in international indebtedness of England.

5372. They were what we call financial bills?—But even these must have been drawn on indebtedness, indebtedness past, present, or future, of A to B. There are plenty of "kites" that rest on nothing and mean nothing when they are issued, but a time comes when they must mean something, and must be paid.

5373. At that time the process was this: they drew bills on England to obtain gold on credit, and had to repay when the bills fell due?—But they must have been drawn upon merchants or traders, and formed part of the commercial transactions of those merchants or traders.

5374. (*Sir T. Farrer.*) You referred very frequently to the falling off in supply. I want to ask you a question or two about that. The question of supply is not one of annual supply, is it?—No.

5375. It is a question of the stock which remains?—Certainly.

5376. Since it is not consumed as other articles are?—Certainly.

5377. I find in Dr. Soetbeer and other authorities that during the period from 1493 to 1850, which was 358 years, there were 660,000,000*l.* of gold produced. I also find that from 1851 to 1885, which was 35 years, or about one-tenth of the previous period, 890,000,000*l.*, that is nearly 900,000,000*l.*, of gold was produced. In other words, during the last 35 years about $1\frac{1}{2}$ of the whole previous supply was produced. Well, now, of the stocks in existence during the earlier period a very considerable portion must have gone, as you say, back in to the mines, in some way or other lost, hoarded or consumed, and much more during that longer period of 358 years than during the shorter period of 35 years?—Yes, if your figures are right.

5378. Consequently, the real proportion of the addition to the world's stock of gold during those last 35 years must have been very considerably more than $1\frac{1}{2}$, probably 200 per cent. The exact amount is, of course, uncertain, but it was an enormous addition. We have thus got some notion of the supply. Now the demand is, first of all, for the use in arts and in hoarding; secondly, for use in currency; and those are the ordinary demands; and, with regard to currency, we have had a long discussion upon expedients to save currency which I will not go into again; then as regards extraordinary demands we have what is so much relied on by those who think that there is a scarcity of gold, viz., the demands made by Germany, the United States, Italy, and other countries, and those are put by the statisticians we have had before us at about 200,000,000*l.* Well now, supposing we treat that 200,000,000*l.* as a wholly new demand, and supposing that we treat it as absolutely absorbed and taken away; and suppose we deduct it from the 890,000,000*l.* added to the stock of gold between 1850 and 1885, it leaves us 690,000,000*l.*, or a good deal more than the whole amount produced in the previous 358 years, to meet the growing ordinary demands of the last 35 years. Now, do you think those figures look like a failure in the stock of gold to meet the demands upon it?—Dr. Soetbeer's calculation is not universally accepted, but we may take it to accord with your figures. They relate to production of the metal; but the computation of the gold money (coin and bullion) existing is more germane to our question. Seyd gives the total at the beginning of 1878 as 830,000,000*l.*, by which time 220,000,000*l.*, or more than one-fourth of the whole, had been set to do new work in Germany and elsewhere. But be the figures of production or of money what they may, my view is this: We may presume that the stock between 1851 and 1873 was, at some time, sufficient for the needs of commerce in the then gold-using countries; and I urge that since

that time the production has been little more than enough to compensate for wear and tear, and to supply the demand for use in the arts, leaving scarcely anything to meet the increase of population and trade, and that as a great additional demand for money purposes has arisen the proportion between the

measure and the things measured has been gravely altered. It may be well to add here an independent calculation of the stock, as well of the precious metals as a whole, as of the quantity in use as money. It is taken from the Journal of the Institute of Bankers, Vol. VII., pt. 3.

Mr.
H. H. Gibbs.
16 May 1887.

ESTIMATED STOCK OF GOLD AND SILVER IN THE WORLD, being a combination of Sir Hector Hay's estimates of production since 1848, with Mr. E. Seyd's estimates prior to that date.

	£	£	£	£
Prior to 1429. Stock of money (gold and silver) supposed to be in existence in the world in the year 1492, according to Mr. Seyd.			180,000,000	
1493 to 1848. Production of gold and silver during this period according to Mr. Seyd.		Gold. 640,000,000		Silver. 1,200,000,000
Estimated cost of coin, &c. in 1848, including previous stock and allowing for use in manufactures, loss, &c., according to Mr. Seyd.		400,000,000		580,000,000
1849 to 1885. Production of gold and silver during this period, according to Sir H. Hay.	810,000,000		480,000,000	
Less, estimated consumption in manufactures, loss, &c. at the rate of 8,000,000 <i>l.</i> a year of gold and 4,000,000 <i>l.</i> a year of silver.	300,000,000	510,000,000	150,000,000	330,000,000
		910,000,000		910,000,000
Or, gold and silver together - -			1,820,000,000	

This whole argument touches only the question of fall of prices, and leaves untouched that of the destruction of the common measure.

5379. Well, you propose to do what would raise the value of silver to the present holders of that metal by, say, 25 per cent. ?—Yes, I should say it would, measured in gold. For example, supposing I held 1,000 ounces of silver, I should be so much the richer if I sold it then than I should be if I sold it now, and the person who bought it would be just in the same position as myself afterwards; my silver would have got more purchasing power, which would be as available in his hands as it had come to be in mine.

5380. We have heard from a witness that the remonetisation of the trade dollar in America has put 150,000 dollars into the pockets of the holders of silver ?—I do not know anything about that. I should like to see the account made up with interest.

5381. The man who told us said that he himself had done it ?—Even then I should like to see the account, because I should like to see whether he had debited himself with interest all the time he held the trade dollar.

5382. (*Mr. Fremantle.*) He did not hold the trade dollars; he had them in his business in China where they were circulating. As soon as he could get the price for them in America he sent them back there. Was not that the case ?—In any case the question of interest comes in, and the question of the purchasing power of the trade dollars in China, *i.e.*, what they had cost him. Those broad statements of what one has made always require to be scrutinised.

5383. (*Sir T. Farrer.*) Then you would alter existing contracts to whatever extent you alter the value of gold ?—Well, as regards the alteration of existing contracts there is a great deal to be said, I think. In any case where you are altering a positive contract and can show that an absolute loss has been incurred by somebody, a thing that you know well beforehand, of course the State must take continual care not to do harm to one party to the contract, or, if it does do him harm, to make compensation; but even in that case our rulers have not always been so extremely careful upon the subject, because where there have been absolute contracts, the *salus populi*, or what has at the time seemed to be *salus populi*, has induced the State to do things which otherwise, I suppose, they would not have done; but when it is a case such as this is, where the loss or gain in the matter of price, and of increase of the

purchasing power or diminution of the purchasing power of the metals concerned is merely conjectural, when nobody can say what it is and what it is not; then I think one must look with very different eyes upon the supposed alteration of contracts. I said before that in 1797 and in 1816 there were acts done by this country which obviously and clearly did alter contracts, some of them more and some of them less. Every legislative act has a tendency to alter contracts. When free trade was established that undoubtedly must have altered contracts. You must not bring back protection if it is immoral to alter contracts, not only because protection may be unwise and immoral in itself, but because you are altering contracts. You ought not to endeavour to get rid of the bounties on foreign sugar, because you may very considerably alter contracts in this country if you succeed in doing it, and yet every successive Government has done its best to get them abolished. You must not make war either, because that alters contracts extremely, and if you have made war, you have certainly no right to make peace, because the peace will certainly alter contracts. You must not issue a new loan in consols, because that will alter contracts, nor must you reduce the interest on the national debt, because that again must alter contracts considerably. A Chancellor of the Exchequer who proposes to pay off the national debt by so many millions a year alters many contracts in consols; so does he who finds reason to refuse to do so; both act alike immorally, if that argument is good.

5384. Would you say that the establishment of bi-metallism operates to put an end to the advantage which the Indian producer is said to gain by the fall in exchange, and would that, in your opinion, be an injustice to India ?—I wished you to ask me that, because I said a good deal, I think, in my first day's examination upon the effect on the producer in Chili of the depreciated currency, and I argued from that, and I suppose I rightly argued from that, that that same effect in a different degree must be produced in India on the producer on account of his having a depreciated currency. Well now, it has been urged, and not infrequently urged, that you must not make this bi-metallic law, because you will do away with that advantage. I say, then, am I to consider that it is an advantage to India that the producer should gain? If so it is an advantage which he gains simply by the depreciation of the currency, and I do not

Mr.
H. H. Gibbs.
16 May 1887.

think we will find any economist in this country say that it is an advantage to the country at large to have a depreciated currency. Is it an advantage to Chili?—The Chilians think not. The Chilian producers think it is a great advantage to them. I have been one of them, but the people in Chili themselves do not think so, and I learn since my former evidence that they have passed a law for the prospective resumption of specie payments there. But if it is a good thing, and if it is an advantage to have a depreciated currency in silver, so it is in paper, and so also it must be an advantage to have an inconvertible currency, and if in Chili, then here also; and that I think the objectors will shrink from maintaining.

5385. (*Mr. Birch.*) But how would you separate the producer in Chili from the Chilians. He is a Chili man?—Yes, but he is not the whole country. The question is whether the depreciation of currency is a benefit to the country at large, and I say most certainly it is not; but if it is, let us have an inconvertible currency here. We should very soon ruin the trade of the country, but we should give perhaps some temporary advantage to trade. I say it is not a gain to a country to have a depreciated currency, but it is a gain to individuals at the expense of their neighbours, and the moral of that is that I do not think that we should listen to the argument that it is an unjustifiable thing to do away with the depreciated currency, and incumbent on us to reject a measure which might have that effect.

5386. (*Chairman.*) Are the two cases precisely parallel of a country which has a currency which is of less value in relation to gold and a country which has a depreciated currency in this sense, that it is using paper based it is true upon one or other of the precious metals, but the changes in the value of which paper depend upon the changes in credit of the country very much?—Though the character and estimation of such a currency depends in some degree upon the belief that it will ultimately be redeemed in silver or gold, its value must depend upon the amount of issue; that is to say, over issues will destroy it; the two kinds of currency are not the same, but they move on the same lines, only one is further advanced than the other. Both of them are in different degrees bad remittance to a gold-using country; one is useless, the other of uncertain value.

5387. I mean the evil from a depreciated currency in the ordinary sense, paper currency, we will suppose is very much greater any than evil that may arise merely from a variation in the relation which the currency of a country which uses one of the precious metals bears to another country using another of the precious metals?—There is a great deal of difference, but they are both the same in this, that the stuff that is used for money in the country is either valueless or of less value than in others; it is only a question of degree, a very important question of degree, but still only of degree, because very often in paper currencies, in Chili for example, the difference is not nearly so great as it is in some others. In Peru for instance, the dollar is worth 2*d.*; in Chili it is worth 2*s.*, or a little more than 2*s.*; and I suppose there will be an alteration in the exchange in accordance with the proposal to resume specie payments at some distant but definite time.

5388. (*Mr. Houldsworth.*) Is there not a difference in the action of a decrease in the supply of the precious metals and an increase of demand for them for currency purposes as affecting prices? In your answer 4682 you tell us that an increased supply of gold affects prices by creating more spending power. A decreased supply therefore reduces the spending power. But how does an increased demand for currency purposes reduce the spending power?—I may best answer this question by assuming the opposite supposition. Let all demands for gold for currency purposes cease in all the world except in England, *i.e.*, let gold be demonetised everywhere else. Can it be contended that the 800,000,000*l.* or

900,000,000*l.* which would or might be poured into England would not be collectively a different measure of commodities bought and sold by us in England, from the 100,000,000*l.* or so which we now have? Would not prices necessarily rise? There would not necessarily be additional wealth in our possession, though there might be, but there would certainly be additional gold-spending power. In the case formerly supposed (4682) the spending power obviously arose from greater wealth having been poured out; but that spending power was only the agent for spreading over the world the sum added to the measure. In the case now supposed, the demonetisers of gold would have to sell the metal, getting less and less for it. They would thus lose spending power, and the purchasers of the gold would gain it. But even without that, gold would naturally converge upon England. England would be "overwhelmed" with gold, to use the language of some monometallists. In other words, prices would rise. The course of the opposite case is, perhaps, not so easy to explain, but as it goes exactly on all fours with this, it must lead to exactly the opposite result. If there were no gold in the world but that within the four seas, silver being the money elsewhere, and other nations monetised gold, is it conceivable that our 100,000,000*l.* could serve for the measure of all, without disturbance of price? Spending power would certainly be diminished in the world, for the other countries would sell the silver which was formerly their measure and served them as well as a certain proportion of gold would do, for a much less proportion, and would be heavily the losers. It has been argued that the 100,000,000*l.*, whether in gold or in bars or ornaments, does not disappear; it is still there, and why, therefore, should prices be affected? The above examples show that they must be, and make it probable that the means by which they are affected is the loss of spending power.

5389. It has been said, I think, that as population increases more gold (in a gold-using country) is wanted, and if it is not obtained prices will fall. Can you shortly explain this?—It will be made clearer if we suppose the addition to population to be the adoption of gold by a country not before using it, *e.g.*, let Ireland, having had no gold, take to using it. The quantity of gold is constant, Ireland must buy it with commodities, but England and Scotland have only what they need, and do not want to part with it, and while the Irish would bribe them with a larger amount of commodities, *i.e.*, by reducing prices, they also reduce prices and thus the gold suffices for all. I say "what they need," but it is only needed as a measure and prices being once reduced, the level once found, the smaller quantity serves as well as the larger. Now suppose the addition to be a simple increase of population, and consequently of need for commodities. The same force must act, every additional person must have something wherewith to buy; and if no more gold is to be had wherewith to measure commodities, the existing gold measure must stretch, *i.e.*, prices must fall.

5390. Take the reverse case. Suppose the amount of gold to remain the same, and suppose the population decreased suddenly by one half, would prices rise?—Yes.

5391–95. Why?—The quantity of gold is constant, and is in the hands of the remaining half of the population, and is used by them in the purchase of commodities. You must assume that half the commodities have been destroyed as well as half the population (or else you must allow time to elapse, and cessation of production to reduce commodities to that level). It is evident then that the half population, having the same spending power that the whole population used to have, will bid against one another for commodities, so that prices must rise. It is for them tantamount to a new discovery of gold, and the process shown in my answers to Q. 4675 and 4682 comes in.

5396. (*Mr. Fremantle.*) You said that the supply of gold in 1873 was only sufficient for the wants

of the world. What would have happened, in your opinion, if there had been no gold discoveries in 1850?—I did not mean to say that they were only sufficient, or even to assert their sufficiency. I meant I put that as a supposition, sufficient for the wants of the gold-using world; but if there had been no gold discoveries, what, you ask, would have been the effect? The effect would have been that prices would have gone on, steadily, steadily falling, and wear and tear and loss would have devoured the gold as the population increased, if it did increase.

5397. As there has been so enormous an addition to the stock of gold since 1850, is it not difficult to argue that there is a scarcity of gold in the world?—Unless the population has increased so as to demand more, and unless the uses to which gold has been put are greater than they were before, that is to say, unless there is now a greater amount of commodities,

a much greater amount of commodities which the same foot rule has to measure.

5398. Were there not apprehensions as to the effect of the gold discoveries in 1850?—Certainly.

5399. Was the trade of the world not much less disturbed than had been anticipated?—Very much; because all that happened was the natural production of gold; there was then no disturbance of the par of exchange between countries.

5400. Was there not a very great disturbance in the relative mass of the precious metals in the world?—A very great addition. Yet there was scarcely any effect felt in France, and the price of silver in gold countries scarcely varied. The figures that I put in have a very different bearing from those which Sir Thomas Farrer quoted. What I say is that from 1803 to 1873 572,000,000*l.* of gold and 227,000,000*l.* of silver were produced.

Mr.
H. H. Gibbs.
16 May 1887.

Witness withdrew.

Adjourned till Friday.

Twenty-second Day.

Friday, May 20th, 1887.

PRESENT:

THE RIGHT HON. LORD HERSCHELL, the CHAIRMAN, presiding.

MR. D. M. BARBOUR, C.S.I.
MR. J. W. BIRCH.
MR. J. CHAMBERLAIN, M.P.
MR. HENRY CHAPLIN, M.P.

MR. L. COURTNEY, M.P.
SIR THOMAS H. FARRER, BART.
MR. C. W. FREMANTLE, C.B.
MR. W. H. HOULDSWORTH, M.P.

MR. GEO. H. MURRAY, *Secretary*.

Mr. J. SHIELD NICHOLSON recalled and examined.

5401. (*Mr. Barbour*.) You said in your previous evidence that you thought the reason why silver fell so little relatively to gold in the 16th century, notwithstanding the large increase in the production of silver, was because silver was then freely coined in Europe. I believe that at that time ratios between gold and silver for legal tender existed in many countries in Europe. Do you think the existence of these ratios had an influence in preventing any great or rapid alteration in the relative market value of gold and silver?—I think in nearly all countries these legal ratios existed, and that would certainly be the natural effect one would expect from the existence of these ratios; but I have not investigated the subject, and I notice Dr. Soetbeer says that the legal ratio almost always followed the market ratio. I am not able to say myself whether that statement is well founded or not; but the existence of those ratios, I should think, would tend to steady the price in the 16th century.

5402. The monetary unit is generally defined to be a certain weight of gold or silver?—Yes, at present.

5403. But the essential thing in a monetary standard is stability of purchasing power, is it not?—I should think at the present time that is so.

5404. Would it not be so at all times?—At times when money was really a representative of barter, then perhaps the deferred payments were not of so much importance.

5405. Stability of purchasing power would not be of so much importance at those times; but it would be an advantage at all times?—I should imagine that it is a very great advantage at any time, but in modern times it is of the greatest importance.

5406. Of the greatest importance because there are so many deferred payments?—Yes, contracts into which time enters.

5407. Then the essential thing in a monetary standard in the present day being stability of purchasing power, would you say that the adoption of a definite weight of gold or silver as a monetary unit is based on the belief that the purchasing power of the metal chosen will remain fairly stable?—I should think that to a great extent gold and silver may be said to be survivals of the fittest, mainly on the ground that they have been shown to be most stable in the purchasing power.

5408. And the greater and more rapid the fluctuations in the purchasing power of the monetary standard the less perfect would that standard be?—Yes, certainly.

5408*a*. So long as a fixed ratio is maintained between gold and silver, the purchasing power of gold necessarily varies in the same direction and to the same degree as the purchasing power of silver?—It seems to me to follow logically as matter of course from the existence of the fixed ratio.

5409. Before 1873 England had a gold standard, Holland had a silver standard, and France had a bimetallic standard, and during that time the relative value of gold and silver was nearly constant. Would you then say that before 1873 England, Holland, in France, in so far as regards the essential quality of stability of purchasing power, had practically the same standard?—Yes, I should say so, and I was looking up some of the writings of Tooke on the subject, and I found in the volume of the history of prices, published in 1840, that in an argument advanced against bimetalism—it was proposed then also—he states that there was never any difficulty in disposing of any quantity of silver in this country, and practically there were no variations in price, so that practically it seems even in this country at that time silver was regarded as convertible into gold.

Mr. J. S.
Nicholson.
20 May 1887.

Mr. J. S.
Nicholson.
20 May 1887.

5410. (*Chairman.*) At what date was that?—That was written in the volume published in 1840. The reference is Vol. III., p. 212–214.

5411. (*Mr. Barbour.*) But since gold and silver began to fluctuate materially in relative value, gold and silver countries have not merely had standards differing in name and in the material of the standard but also in the essential quality of stability of purchasing power?—Yes, it seems to me so.

5412. I suppose a country that for the time being has a good monetary standard possesses an advantage as compared with a country which has a less stable standard?—Yes, I should think that must be so.

5413. You said in your previous evidence that if the purchasing power of the standard increased while production was not cheapened in a corresponding degree, the producer suffered while the person who had a mortgage on his industry gained?—Yes.

5414. You also said that if the purchasing power of the standard increased, owing to a reduction in the cost of production of commodities, the mortgagee gained; but the producer was not in a worse condition than before, because though he had to part with more commodities in order to obtain the gold wherewith to pay the mortgagee, he was able to produce the increased amount of commodities by a not greater amount of labour?—Yes, I admitted that as a general proposition.

5415. Do not, however, the latter question and answer assume that the reduction in the cost of production is uniform in the case of all producers of the same commodity, and may it not be the case that the cost of production is reduced for some producers of a commodity, and not for others?—Yes, I think it is necessary to introduce some qualification of that kind.

5416. In the latter case does not the producer for whom the cost of production is not reduced suffer a positive loss while the mortgagee makes a positive gain at his expense?—Yes, it seems to me so.

5417. And if the cost of production of a large number of commodities is reduced, would it not be the case that the prices of another series of commodities might fall in sympathy with them, and the producer of the latter class of commodities would suffer a positive loss owing to the increased purchasing power of the standard?—Yes, I should think that would be a good example of the qualification just noticed.

5418. To take an example of a loss of that nature. The prices of Irish agricultural produce have fallen, owing no doubt, to a large extent, to its having become possible to lay down foreign produce more cheaply in this country; but the fact that agricultural produce, like many other things, has fallen in price, does not give the Irish farmer more produce to sell to meet his rent?—No.

5419. Would you then say that the ideal or perfect standard would appear to be one under which the general purchasing power remained unchanged?—I think if that were practically possible it would be.

5420. I suppose we can never hope to get such a standard in practice?—I do not think it is worth discussing the point at present. Under the present conditions I see no prospect of getting anything like an ideal standard used practically.

5421. But the less the deviation of the standard from stability of purchasing power the better for those who have to use it?—Yes, the nearer the approximation to that stability so much the better. I was referring to the possibility of a tabular standard. I do not know whether you have had that in your mind, because it seems to me that under present conditions, at any rate, it would not be a practical remedy that could be considered.

5422. The alteration in the relative value of gold and silver in the last 14 years is, in round figures, 25 per cent., and there must consequently have been an alteration of 25 per cent. in the relative gold and silver prices of articles bought and sold for gold and silver?—That seems to follow logically.

5423. That is to say, if a commodity is produced

in a gold country and sold in a silver country, the alteration in the relative value of gold and silver must have been accompanied either by a rise of 25 per cent. in the silver price, or by a fall of 25 per cent. in the gold price, or by a rise in the one case and a fall in the other, amounting in the total to 25 per cent.?—It seems to me that there must have been a total change of that kind distributed in some manner.

5424. This change in the relative price may be exaggerated or partly concealed by an alteration in the cost of transport between the two countries, but the change in the relative gold and silver prices connected with an alteration in relative value of gold and silver is necessarily in the direction and to the extent just stated?—Yes, that seems to me always the difficulty that every particular price depends upon a number of causes, and it is quite possible, even if we take a number of relative prices, that the effect due to this currency change might be quite concealed, owing to the influence of other causes, but still it seems to me that this is a perfectly *vera causa*, and that it must operate in the way that you suggest.

5425. I believe you are of opinion that a variation in the relative value of the two standards such as has occurred in recent years would give, for a time at any rate, an advantage to the producer in silver countries, and would specially affect industries in gold and silver countries which produce the same article for sale in the same markets?—It seems to me it would be so unless silver prices rose.

5426. The variation would specially affect industries in the gold and silver countries which produced the same article for sale in the same markets?—Yes.

5427. Is it your opinion that this variation in the relation between the two standards in recent years has been sufficient to relatively stimulate production in the silver countries, and to cause a corresponding depression in gold countries?—As far as I can gather, the prices in silver-using countries have not moved upwards, and therefore it would follow that the gold prices must have moved downwards, of these articles, and so there would be a depression in the gold-using countries from that cause, through the fall in prices.

5428. I suppose this relative stimulus and depression would only be temporary, and must cease if silver ceases to fall relatively to gold?—Yes, so far as that cause is concerned.

5429. If silver continued to fall relatively to gold, the stimulus and depression would continue as long as silver continued to fall?—Of course, silver cannot go on being depreciated for ever, it must come to a stop some time, and then the stimulus and depression would cease.

5430. And if silver rose relatively to gold you would have the opposite effect, a temporary stimulus in gold countries and a temporary depression in silver countries?—Yes, that seems to me to follow.

5431. And what you think to be desirable, I understand, is that all countries should have standards which should not vary relatively to each other in purchasing power?—Yes.

5432. And you think this result would be obtained by preventing fluctuations in the relative value of gold and silver?—Yes, of course it is very difficult to describe in a brief manner the purchasing power of the standard in different countries. Perhaps I should limit myself to saying that I think it would be a good thing if the materials of which the standards of the different countries are composed should not fluctuate in relative value, and in that way you would take away one of the causes of disturbance in the purchasing power of the standards.

5433. That is, you would practically get the same standard?—Practically it would come to that.

5434. The same standard so far as stability of purchasing power is concerned?—So far, but still you will get of course local variations in purchasing power whatever standard were adopted. The same amount of gold and silver would never

command precisely the same amount in two countries one thousand miles apart.

5435. I believe you have made an investigation by a new method into the question of the purchasing power of gold at different times?—Yes, I believe the method is new.

5436. I will try to explain the principle which you have adopted, and I will ask you, if what I say is correct. In order to calculate exactly the variation of the purchasing power of gold in any country between any two dates, it would be necessary to make a complete inventory of the whole wealth of the country at the later of the two dates, and then to value that inventory according to the price prevailing for each article at that date. The next step would be to value the same inventory according to the prices prevailing for each article at the earlier date. The total value of the inventory at the prices of the later date, as compared with the total value at the prices of the earlier date, would give the exact ratio in which the purchasing power of gold had increased or decreased?—Yes, that is, theoretically, the leading idea. I was dissatisfied with the small number of articles taken on which the index members are founded, and I thought, at any rate theoretically, it was possible to give an interpretation to the ordinary definition of the value of gold as its command over things in general. My idea was to give a meaning to this phrase "things in general," and the most general and complete meaning that seemed to me possible was to take the valuation of all the wealth in the country at any particular time, if you could obtain it. Of course, the difficulty of applying that method is to calculate the general mass of wealth in any country at any time.

5437. But as a matter of theory you have seen no reason to doubt the correctness of your method?—No, I think, as a matter of theory, it would be generally admitted to be correct, in fact it is really only interpreting what has been stated in every book on political economy, namely, that the value of money is its command over things in general, not over a few particular things. Perhaps I might explain it better if I were to take it not in such a theoretical manner. I would put it in this way. Suppose you were to make a calculation of the accumulation of wealth in a country, and you found in the course of 10 years that there was a diminution we will say of 1,000,000,000*l.* in the aggregate wealth of the country, applying such a method of calculation as Mr. Giffen has adopted. That change in the value of the national wealth may be due either to a change in the quantity of the different articles, or it may be due to a change in the valuation of these articles; and it would make a great difference, for practical purposes, if it is merely a change in the value. Now if you could allow for the increase or diminution in quantity, as the case might be, then you could calculate precisely how much is due to the difference in your valuation.

5438. (*Chairman.*) I am not quite sure how you allow for the increase or diminution of quantity?—It would be very difficult to estimate accurately the increase and diminution in the quantity of national wealth, and that was the reason, theoretically, for taking the same mass of wealth, that is to the same inventory at any particular time applying two levels of prices, and seeing what is the difference. For instance, I suppose if Mr. Giffen were to make a calculation now of the wealth of the country, that he would not obtain such a high figure, proportionately, as ought to be expected, when we take into account the great growth in the volume of wealth. Well, if that were the result, it could only be that there has been an appreciation of the standard, that you are measuring your wealth in a more valuable standard.

5439. (*Sir T. Farrer.*) I thought that your plan was solely for the purpose of getting at actual prices, not for the purpose of ascertaining whether the cause was the scarcity of the standard on the one

hand, or an increased abundance of the commodities on the other?—Yes, my purpose was simply to measure the change in the value, from whatever cause it may be due.

5440. So that it has nothing to do with the cause in the change of price?—No; and if the method is not clear I think I might make it clear by a simple example, not taking the wealth of a nation, but say the wealth of a farmer. If a farmer calculated that his farming stock at a certain time was worth 1,000*l.*, and that at another time it was worth 2,000*l.*, that might be due either to an increase in the quantity or it might be due merely to a change in prices; then, if he could estimate the increase in quantity, he could estimate how much was due to the change in the purchasing power. If you could apply that to a nation, and get in the roughest manner any idea of an increase in quantity, and yet, at the same time, you do not get a corresponding increase in the nominal value of the total, then you must have had a change in the purchasing power of the standard.

5441. But supposing that his farm, with the same amount of labour, produces twice as much at the later time as in the former time, the change of prices would be obvious; but would you say that that was due to a change in the standard?—This is only a question of measurement. So far as this particular farmer is concerned I think we cannot speak of the standard. The standard applies to the whole of things in general, to the mass of things.

5442. (*Mr. Barbour.*) I understand that you attempted to ascertain the change in the purchasing power of gold, without reference to what the cause of that change may have been?—Yes, without reference to what the cause may have been. It may not be due to scarcity of gold, it may be due to abundance of commodities, efficiency of labour, or anything; but it seems to me, the best scientific meaning of the purchasing power of gold, is to take the total mass of wealth in the country if you can obtain it, and see how much that would come to at one time, and how much it would come to at another. The difference would give you the change in the purchasing power of the standard.

5443. But I understand that you found it impossible either to make a complete inventory or to obtain a complete and accurate statement of prices at either date?—Yes.

5444. And that you have attempted, while conforming, as far as possible to the general principle, to obtain an approximate solution?—Yes, I took the best figures I could; of course we cannot possibly get a complete national inventory. I may mention that I believe, in America, when the census is taken, an attempt is also made to get a complete valuation of the national wealth. Well, if something of that kind were done in this country, if at the time of the census being taken or at any other time, things were compared on the same method, then if you could allow for the quantities—

5445. I will not go into the question of the method you adopted for this purpose, but would like to know what confidence you have in the statistics you employed, and what degree of confidence this Commission may, in your opinion, place in the results you have obtained?—As to the statistics I have employed, they are partly the statistics which are quoted in Porter's *Progress of the Nation*, which is a standard book, and partly statistics collected by Mr. Giffen. I carefully took the statistics of the national wealth which had been compiled by other people, so that there might be no unconscious bias in bringing out any answer, and if those statistics can be relied upon for the purpose for which they are relied upon by Mr. Giffen and Mr. Porter in their investigations, I do not see why they should not be applied also in this case. Of course they are very rough.

5446. What confidence do you place in the results?—I should allow that in these statistics, as is pointed out by those who have compiled them,

Mr. J. S. Nicholson.

20 May 1887.

Mr. J. S.
Nicholson.
—
20 May 1887.
—

that in these statistics by which you calculate the sum total of national wealth, it is extremely difficult to arrive at anything like an exact conclusion; but if you apply the same method at different times, or get any scientific observer to apply the same method at different times, it seems to me that you can rely upon the general result. As to the question of degree, I would place quite as much confidence in this method and the results obtained by this method as in the method of any kind of index number that I have seen. I have no hesitation in saying that the result obtained from this method is as accurate and as much to be relied upon as the result obtained from the index numbers.

5447. Do you think it is a better system than the system of index numbers?—I think theoretically it is a better system, and I think practically it is as good in its results.

5448. (*Sir T. Farrer.*) Do you include in your inventory of the national wealth, labour, which is one of the things exchanged against gold or rather measured by gold?—As I explained, the comparisons that I have made were comparisons of the national wealth calculated in Porter's *Progress of the Nation*, and also by Mr. Giffen, and in neither of those calculations is labour reckoned, but theoretically, I should include, at any rate, some forms of labour.

5449. (*Mr. Barbour.*) I understand your investigations to show that in the earlier half of the present century there was a very great increase in the purchasing power of gold?—Yes, certainly.

5450. It has generally been held that between 1848 and 1868 there was some decrease in the purchasing power of gold, but I believe the result of your investigation leads you to doubt whether this was the case?—Yes, and I should say that there is a tendency to exaggerate very much the effects of the great gold discoveries in the matter of depreciation. I think, according to Jevons' own calculation, the depreciation was only about 16 per cent., and it seems to me, if you look at increase in the quantity of wealth, that probably there was some slight appreciation of the standard in that period.

5451. And I believe you consider that between 1875 and 1885 there has been a distinct rise in the purchasing power of gold, though probably, so far, it is less than that shown by the fall in the wholesale prices of the chief commodities?—Yes, I think, applying this method, taking the best statistics that I can, that at present the fall in general prices, that is, taking all forms of property, has not been so great as is indicated by the usually accepted index numbers.

5452. The results which you have obtained agree, to a certain extent, with those obtained by the system of index numbers?—The results are in the same direction, only there is a difference in degree. For instance, taking the last example of the great gold discoveries, the results obtained by the index numbers is depreciation, while I should rather put it a check to the appreciation, but still the movement is in the same direction.

5453. The objection to the system of index numbers is that, even if allowance be made for the relative importance of different articles, the articles for which prices are taken represent only one section of the wealth of the country, and the results given by them are liable to be affected by causes which do not influence, or do not influence in an equal degree, the whole of the wealth of the country?—Yes, I think, especially in *The Economist* index numbers, that far too great stress is laid upon raw materials which are subject to special causes.

5454. But judging from the results you have obtained by a different system, it would appear that the system of index numbers does indicate the general direction of the movement of the purchasing power of the standard, though it may fail as an exact measure of the increase or decrease?—Yes, I think the index numbers ought to be considered, and the result is that they do show a change in the purchasing power; and, as I say, over the periods that I have taken, the

difference is only one of degree, the direction of movement is the same.

5455. The total production of gold in the 14 years following 1871 is estimated to have been 316,000,000*l.* sterling?—Yes.

5456. And there were special demands for gold during this time on account of Germany, the United States, and other countries, which would not fall much short of 200,000,000*l.*?—Yes; those are the figures I have seen stated.

5457. And authorities have estimated that the demand during that time for hoarding and ornament in the East, and for industrial purposes in the civilized countries, would be about 180,000,000*l.*?—Yes; I have used those calculations.

5458. And that would give a demand of 380,000,000*l.* as against a total production of 316,000,000*l.* sterling?—Yes.

5459. It is possible that a portion of the demand may have been in some cases counted twice over; first in the 200,000,000*l.*, and secondly in the 180,000,000*l.*?—I am not able to say as to the calculations; I have only taken the calculations as they are usually put.

5460. It seems to me that a portion of the demand may have been counted twice over; but, seeing that these demands are, at any rate, about equal to the total production, I suppose one would naturally expect to get some increase in the purchasing power of gold since 1871; especially when we take into account the constant increase in trade in the volume of commerce, the increase in the use of metals. I believe statisticians who have occupied themselves with such inquiries put the total income of the inhabitants of the British Isles at probably 1,200,000,000*l.* sterling a year?—I believe that is Mr. Giffen's last calculation.

5461. And the total yearly production of gold at the present time is believed to be about 20,000,000*l.* sterling, or considerably less than 2 per cent. of the total yearly income of the inhabitants of these islands?—Yes.

5462. And if we were to take into account the income of the people of France, Germany, and other European countries; of India, Australia, Russia, Japan, China, the states in Central and South America, as well as of Canada and the United States, it would be evident that the value of the total yearly production of gold must represent but a very small per-centage of the total income of the world?—Yes, certainly.

5463. (*Chairman.*) The difference between the per-centage which you would have if the production of gold had gone on at its old rate, and the per-centage which you have now that gold is being produced to the extent that it is at present, would be very slight in relation to the total income?—Oh, yes; hardly appreciable.

5464. (*Mr. Barbour.*) Looking to the fact that the yearly production of gold is relatively so small it would appear that if the people of the countries named should devote even a minute fraction of their yearly income to the purchase of gold for ornament and for hoarding, the demand for this purpose alone might very easily equal the total annual production of gold?—Yes.

5465. I believe you hold that the value or purchasing power of gold, like the value or purchasing power of other things, is determined by the supply of gold and by the demands of all kinds for gold?—I think we ought to summarise the influences of gold on general prices by speaking of the supplies of gold and the demands of all kinds for gold, but at the same time it seems to me that the way in which demand and supply determine the value of gold is not so simple as with other values. If we mean by the value of gold the general level of prices, of course a great many factors operate upon the general level of prices, as for instance the great increase in the amount of commodities.

5466. That is an increase in demand?—Yes. When you abstract all the demands for other purposes than currency, then the general level of prices would

depend upon what is left over, that is on the quantity of money. This is really bringing in demand and supply, but it does not bring them in in the simple way as when applied to a single commodity of an ordinary kind.

5467. (*Chairman.*) By what is left over do you mean for coinage purposes?—Yes; what is left in existence, not speaking of the annual supply.

5568. But do you not include in what is left in existence that which is used in the arts, and what is hoarded?—No, what is really hoarded would be practically like an ornament. My general proposition is that the level of prices all the world over would be so adjusted that the total quantity of money finds employment and that corresponds to the general law of supply and demand as affecting any particular article. You say that the price of any article would be so adjusted that the quantity demanded would be equal to the quantity supplied, and so I should say as regards the money of the world, that the level of prices would be so adjusted at any time that the quantity of money would be just used.

5469. (*Mr. Houldsworth.*) Do you mean to say that, supposing you eliminated the question of any fresh supply, and also eliminated the question of any demand for other purposes than currency, the level of prices would remain the same as far as gold was concerned?—Yes, but there would come in the element of demand for gold for purposes of currency, and you might get a great change in the demand.

5470. If the bulk of the gold remained the same, any demand would only be a transfer from one place to another, would it not?—There might be an increase in the total demand for currency. Suppose for instance, that one of our colonies in the course of a few years got double the number of people, and double the wealth, and so on; then it might require double the amount of gold to circulate its commodities.

5471. Might that not be met by the use of various banking expedients?—Yes, of course that would operate also, but still, taking the world as a whole, I should say that the level of prices would be adjusted so that the total quantity of money would be used, and in that way the level depends upon the quantity of money.

5472. (*Chairman.*) It is conceivable, is it not, that the whole of the transactions in any particular nation, and the whole of the international transactions of the world might be settled without the transfer of any coin at all by a system of set-off?—I suppose it is conceivable by an effort of imagination, but I do not think it is conceivable as practicable, especially if you consider the case of a foreign drain.

5473. (*Mr. Barbour.*) The demands for gold would be of the following nature. There is a demand for gold for use in the arts, for hoarding, for ornament, as a medium of exchange to be actually passed from hand to hand, as a reserve to support credit and business transactions, and so forth?—Yes, those are the principal elements of the demand.

5474. And would you say that when gold once had been used in the arts, hoarded or made into ornaments, it would, for a time at any rate, pass out of the market and cease to be a portion of the effective supply, and would practically have no influence on prices?—Yes, it would have practically no influence on the general level of prices, that is what I meant to say when I said it was the quantity which was left over which determined the level of prices.

5475. Are you aware whether the amount of gold passing from hand to hand in the exchange of commodities has ever been very great?—I have no special information.

5476. It is in respect of this use of gold that the employment of cheques and the resort to clearing houses would effect an economy of gold?—Yes, clearly.

5477. Cheques and clearing houses would effect no economy as regards use in the arts, hoarding, or use

for ornament?—Obviously not, except as regards hoarding.

5478. Could you say whether or not the more extended use of cheques and clearing houses would tend to reduce the reserves?—I should think an extension of banking involves a certain addition to the reserve somewhere.

5479. But you could not give a decided opinion upon that question?—It would depend upon other conditions, the conditions under which the system is established. You could conceive of an increase in the use of cheques and clearing houses, leading to less reserve being required, taking the nation as a whole.

5480. Is it not the case that standard money is not merely a measure of value, but also an equivalent against which commodities, may be, and frequently are, exchanged?—I think that every exchange implies in modern times a reference to some form of money, some standard of money.

5481. You could measure a thousand yards of silk with a yard measure, but you could not buy a thousand yards of silk with a yard measure?—No.

5482. A merchant may sell commodities and be paid by cheque, and he may buy commodities and pay by cheque, and his transactions may be on a very large scale, and yet very little gold may pass through his lands?—Certainly.

5483. But though this is the case, the merchant has got the right to claim actual gold if he likes, when he sells commodities, and he is liable to have to provide gold when he buys, and consequently the reserves which support credit and commerce, must always be of a certain magnitude; you cannot do without reserves?—No, it seems to me that it is impossible practically to think of doing without reserves.

5484. And I suppose those reserves would have to be proportioned to the extent of the business, and to the risk of sudden claims being made for gold, other things being equal?—Yes, other things being the same, especially considering the kinds of claims that may be made, whether the claims are known and the possibility of the claims being suddenly made, and so on.

5485. The possibility of a panic, for instance?—Yes.

5486. So that by no elaboration of the system of cheques, clearing houses, and other similar devices, could you get rid of the necessity of keeping reserves of coin or bullion?—No, it seems to me that it would be impossible to get rid of that. The very essence of convertibility of bank notes, taking the simplest form of credit depends on a certain amount of reserve being held, and then there is also the danger of a foreign drain. Whatever great economies may be made in one country there is always the chance of a foreign drain.

5487. You are no doubt aware that it has been said that as people become wealthy they prefer gold to silver for various purposes; and if you divided the people of any country into two classes, those using silver for ornament or personal wear, and those using gold for the same purposes, it would be found, speaking generally, that the class using gold was, on the whole, the wealthier class?—Certainly.

5488. Are you aware that the import of gold into India for hoarding and ornaments has amounted in recent years to more than 3,000,000*l.* sterling yearly?—I have seen the statement.

5489. And are you aware that the yearly consumption of gold in the arts and manufactures in civilised countries in the present day is estimated as high as 12,500,000*l.* sterling by Dr. Soetbeer?—Yes those are the figures I adopted from him in a paper of my own.

5490. Of course, it is very difficult to make an estimate on this subject, and Dr. Soetbeer's estimate may be too high, but I will quote Dr. Soetbeer's own words to show what he thinks of this estimate. "I have already ventured upon the attempt to make

Mr. J. S. Nicholson.

20 May 1887.

Mr. J. S.
Nicholson.

20 May 1887.

"an approximate estimate of the application of the precious metals to industrial purposes in the civilised countries, taking an average for the last few years, of course allowing a large margin for error. I have again brought them forward, because there are applications of the metals which were then, either partly or wholly unknown to me, and which might lead to an alteration of the estimate. However considerable the colossal sum of gold annually applied to ornamental and other industrial purposes may at first sight appear, all doubt of the probable truth of the estimate will disappear when we consider how enormously the demand for gold articles and for manufactured gold goods has arisen, owing to the increase of population and prosperity." Dr. Soetbeer's great reputation would in any case justify consideration of any figures he may put forward, but I should like to know whether it is your opinion that the consumption of gold in this way must be very great?—I think there are very good reasons apart from this calculation. I was referring recently to Mr. Jacob's book on the precious metals, Vol. II., chapter XXIV., and I find that he has made several calculations showing that an enormous quantity of gold was used for the arts during the eighteenth century. He quotes a number of statistics obtained from manufacturers in Birmingham, Paris, and other places. I should think that the demand for other purposes than currency must have increased very greatly since that time, owing to the great increase in the consumption of gold in the arts and manufactures, and even at that time he found it necessary to take account of that element in estimating the amount left over for coinage.

5491. (*Chairman.*) With diminished prices, which would be likely to bring about diminished wealth, would you not expect that demand to diminish?—If prices were to fall to an extremely low level, supposing they became a fraction of what they are at present, then no doubt people would think a good deal before they bought a gold watch.

5492. But if there were a diminution of the incomes of the individuals forming a nation, would not these articles of luxury be amongst the first to be dispensed with, and consequently a diminished demand for them soon come about?—Yes, I think so; but at present, in spite of the fall of prices owing to the increase in the quantity of wealth, there is not any absolute diminution in the nominal income of the world, and so there is the same amount available. I should, however, quite accept as a general principle what you say, that the general fall of prices would so far tend to diminish the demand for gold for the purposes of the arts.

5493. (*Mr. Barbour.*) I have got here a statement showing the yearly value of diamonds and other precious stones imported into the United States for the years from 1867 to 1884. I may mention that the recorded exports are very trifling, and it is stated that there is a considerable amount of smuggling, and the value of the articles smuggled is, of course, not included in the figures. This statement shows that the average annual value for 1867, 1868, and 1869 was \$1,459,666, while for 1882–3–4 the average annual value was no less than \$8,792,704. Do not these figures indicate, firstly, that a very large expenditure is being yearly incurred on articles of value for use as ornament; and secondly, that the amount so spent tends to increase rapidly as a country increases in prosperity?—Yes, I should think that is good analogical evidence that there would be an increased demand for gold for similar purposes.

5494. From the analogy of these figures you would infer that there may have been a large increase in the demand for gold for the purposes of ornament and art?—Yes.

5495. I believe the average yearly production of gold in the first 40 years of the present century is estimated to have been rather less than 2,500,000*l.* sterling?—I think that is the calculation.

5496. And it would follow from the figures that

have been quoted that India is now taking more gold for hoarding and ornament every year than the total yearly production of gold 50 years ago?—Yes.

5497. And it would follow that for use in arts and manufactures the civilised world is now taking perhaps four or five times the total production of 50 years ago?—Yes.

5498. The total production of gold is now, of course, very much greater than it was 50 years ago; but you are no doubt aware that it is not so high as it was in the years immediately following the great gold discoveries, and that in recent years it has perhaps shown a tendency to diminish?—Yes, the figures that I am familiar with show a diminution in the production compared with the years immediately following the gold discoveries.

5499. Well, looking to the figures which I have quoted of the total yearly production of gold 50 years ago, and of the estimated consumption of gold in the present day, it would appear that there is no reason to doubt that during the last 50 years there must have been a very great increase in the consumption of gold for hoarding, for ornament, and for use in the arts?—Yes.

5500. With the limited production of 50 years ago, it would have been simply impossible to have met such a large consumption as we have in the present day?—Yes, it seems so.

5501. And looking to the fact that the value of the total yearly production of gold is now but a trifling percentage of the income of the world, to the rate at which population is increasing, to the still more rapid rate at which wealth is increasing, to the tendency to an increased use of gold which appears to accompany wealth, and to the fact that the production of gold does not continue to increase, is there not reason to fear that the consumption of gold for purposes other than currency, may at no very distant date overtake the production of gold?—That seems to me very probable.

5502. It would therefore appear that what we have to look forward, unless something unforeseen occurs, is a continuous and, perhaps, rather rapid increase in the purchasing power of gold?—That is to say, there would be less and less available for purposes of currency; and assuming, as I stated before, that the quantity of currency is, at any rate, one important factor in determining the level of prices, then we must get a fall in the level of prices, or an increase in the purchasing power of gold.

5503. Dr. Soetbeer, making what he admits is a very conjectural estimate, puts the supply of gold for money and gold reserve in civilised countries at the following figures: For the 10 years from 1851 to 1860, 1,621,000 kilograms; for the 10 years 1861 to 1870, 1,023,000 kilograms; for the 10 years 1871 to 1880, 774,000 kilograms; and for the five years 1881 to 1885, 172,000 kilograms?—Yes.

5504. Under these circumstances does it not appear doubtful whether gold is well suited to be a monetary standard if used alone, and unlinked to silver?—I think there is a great danger of the rapid appreciation of gold if it is used in that way.

5505. And I believe it is only since 1873 that we have had any experience of the use of gold as a monetary standard, unlinked to silver?—Yes; practically.

5506. And do you consider that the results of that experiment have, so far, been satisfactory?—No; I should say most decidedly not.

5507. And do you think that gold is likely to prove a better standard in future than it has done during the last 14 years?—Taking the demands that have been pointed out for gold for purposes other than currency, and the growth of trade and population, it seems inevitable that there should be a constant and rapid fall in prices if gold alone is used for money.

5508. And if people prefer gold for ornament as they get wealthier, the demand for gold would increase more rapidly than the growth of demand for silver?—I am not able, of course, to say as to the comparative

demand, because the improvement in the condition of the working classes and the more equal distribution of wealth might lead to a great demand for silver, silver watches, and the like.

5509. It has been pointed out that the total production of gold between 1493 and 1850 was about 660,000,000*l.*, and that since 1850 the total production has been about 890,000,000*l.*, while special demands within the last 15 years possibly came to 250,000,000*l.* From these facts it is argued that there cannot be a greater scarcity of gold now than there was before 1880. Have you any remarks to make on this point?—The scarcity must be entirely a relative term which depends upon the work which the gold has to do, and one of the most remarkable consequences of the great gold discoveries, it seems to me, was the expansion which took place in trade and commerce, and the consequent increase in the demand for gold. Scarcity must be always relative. As I explained, in answer to another question, there is always sufficient gold to circulate commodities, but there may not be sufficient to keep the level of prices stable.

5510. And it is your opinion that there has not in practice been sufficient in recent years to keep up the level of prices?—Yes.

5511. I wish to call your attention to some facts connected with silver. The estimated production of silver from 1493 to 1850 is 1,470,000,000*l.* sterling, and from 1851 to 1885, 430,000,000*l.* sterling. These figures, compared with the corresponding figures of the production of gold, even after allowing for the extra demand for gold in the last 15 years, would appear to indicate that looking merely to the relative supply of the two metals, silver should have risen since 1850 as compared with gold?—Yes, if you look to supply only, and it was generally anticipated, at the time of the great gold discoveries, that there would be a rise in silver.

5512. And does not the fact that silver has fallen instead of risen point to the conclusion that we must look to the demand rather than to the supply to ascertain the causes of the fluctuation in the relative value of the precious metals?—Yes, I think so.

5513. You have been asked some questions about the economy in the use of the precious metals, by the use of cheques, clearing houses, &c. These economies, assuming them to be of importance, would have much more effect in the civilised countries than in the backward countries?—Yes.

5514. And therefore they would have affected the demand for gold rather than the demand for silver?—Yes.

5515. As the civilised countries now generally use gold, does not this make it still more remarkable that silver should have fallen rather than risen?—Yes; it seems to me so.

5516. And does not the conclusion appear irresistible that the demand for gold from some cause or other has increased much more rapidly than the demand for silver?—Yes; it seems to follow.

5517. I understand you to advocate the use of both gold and silver as legal tender at a fixed ratio, in the first place because in this way we should get a standard under which the effects of fluctuations, either of supply or demand in one or other of the metals, would be moderated?—Yes.

5518. And in the second place because there appears to be a special tendency towards an increase of purchasing power in the case of the gold standard, which it is desirable to limit by the use of silver at a fixed ratio to gold?—Yes, I think that the more stable you can get the standard the better; and that this tendency towards appreciation on the part of gold would be met to some extent by linking it to silver.

5519. And in the third place because all countries would have, in the essential matter of stability of purchasing power, the same standard, and no country would be protected through the currency at the expense of another country?—So far as currency is

concerned they would have the same standard. There would be local variations in the purchasing power.

5520. So far as the general purchasing power of the standard was concerned, they would have the same standard?—So far as general purchasing power is dependent upon the currency, it would be the same.

5521. And in the fourth place because all countries would have international money, the existence of which would facilitate international trade, and in all pecuniary transactions between different countries?—I think one ought to distinguish between international money and what is proposed by a convention of this kind.

5522. The money of one country might not circulate or be a legal tender in another country; but the money of one country could be converted into the money of another country at a constant and well-known ratio?—As regards what is the most important function of money, the stability of purchasing power and the absence of any variations owing to the use of different standards, so far, they would have practically the same money, but the phrase international money might suggest other difficulties.

5523. Do you think that if the old ratio of one to 15½ were adopted, and silver rose to 60½ pence per ounce, there would be any danger of the world being injured by an enormous influx of silver?—So far as I have seen the evidence, I do not think that there would be any danger of a great influx of silver. I may mention that I consulted on this point Professor Geikie, professor of geology in Edinburgh, and he said he did not see any reason to suppose that there would be a great increase in the supplies of silver, from geological reasons, and the idea of the geologists is rather that silver is embedded in hard deep veins, and that it is difficult to get. And then it seems to me also that in spite of a number of calculations which have been made lately to show that silver can be produced for a very small sum, we do not get any great increase in the production. Surely the present price of silver, if it can be produced at 1*s.* 6*d.* an ounce, ought to make the silver mines produce as much as they could sell. The present supply of silver does not seem to me to be at all excessive, and would not lead to anything which could be called an enormous influx of silver.

5524. Have you at all considered the question of the supply of gold from a geological point of view?—Perhaps I may be allowed to read a paper given to me by Professor Geikie—

“The annual output of gold is not likely in my opinion to vary much under the present conditions of exploitation. The rich auriferous gravels, &c. from which gold used to be obtained in such large quantities are practically exhausted over many regions, the chief supplies of that metal coming now from deep mines. Gold has, in fact, to be mined for, as a general rule, in the same way as many other ores; and the experience of recent years has shown that when we take the average yield of all the gold mines of some extensive region, such as the United States of America, the annual output is found to vary but little. Of course so long as any part of the earth's surface remains unexplored, there is always the chance of readily worked auriferous soils &c. being discovered. But from all that is known of the geology of the continents, it seems hardly likely that the early experience of California and Australia will be repeated on a similar scale elsewhere.

“I should expect the output of silver to vary slightly from year to year, just as is the case with other ores; but I see no reason for believing that the production of silver will become relatively greater than it is at present. The average annual yield of gold may increase as fresh mining districts are opened up, and the same may be the case with silver. But over a number of years the relative proportion of the two metals will probably not vary much. At present it would seem as if the yield of gold was decreasing,

Mr. J. S. Nicholson.

20 May 1887.

Mr. J. S.
Nicholson.

20 May 1887.

while that of silver was increasing. But similar fluctuations have occurred in the past, and may be expected to repeat themselves in the future."

5525. Do you think that even with bimetallism at the old ratio the world would be much more likely to suffer from the short supply than from the over-supply of the precious metals?—I should think that still the tendency would be, if we restored what was the practical condition of things before 1873, towards appreciation of the double standard that is towards a general fall in prices.

5526. And you think the facts of the period immediately succeeding the great gold discoveries distinctly support that conclusion?—Yes, certainly.

5527. Now I am coming to another point. So far as regards the standards of weight and measure, every country is independent of every other country. Each country fixes its own standard of weight and measure, and no other country can interfere in any way with those standards?—Yes, that is unfortunately the case.

5528. But is that the case as regards the monetary standard?—It seems to me there is no real monetary independence, though there is nominal independence so far as the actual form of the coins and so on is concerned.

5529. But, so far as regards the purchasing power, from time to time, there is no real independence of other countries?—No; because to say that we are really independent would be to say that the prices in this country are not influenced by foreign prices.

5530. And the monetary standard of every country is liable to be affected so far as regards its purchasing power by the monetary legislation of every other country?—Yes, it seems to me that is perfectly plain.

5531. And as a matter of fact the gold standard of England has in this way been affected by the action of France, Germany, and other countries in recent years, and so has the silver standard of India?—Certainly.

5532. Does not this fact point to the conclusion that the question of the monetary standard is pre-eminently one for international agreement, and that no satisfactory solution of a permanent nature is possible without such agreement?—It seems to me to be quite clear, that so far as the essential elements of money are concerned, no nation can be independent of other nations.

5533. You advocate bimetallism because it would preserve a constant ratio between gold and silver. But I presume you would support any measure tending to prevent variations, especially rapid fluctuations in the relative value of the standards of different countries?—Yes; I simply advocate bimetallism as the best practicable remedy that is suggested.

5534. And measures of the nature I have indicated would be beneficial so far as they went, would they not?—Yes.

5535. You consider that no permanent and satisfactory solution of the present difficulties is possible without bimetallism in some form?—I do not myself think that any other remedy is practicable.

5536. (*Mr. Birch.*) In your answer to a question by the Chairman, you referred specially to the 16th century as a period when there were very slight variations between the ratio of gold and silver?—Yes.

5537. In the 17th century, I suppose you will allow, the variations were very considerable?—There was a considerable fall in the value of silver as compared with gold in the 17th century.

5538. Can you tell us to what extent?—I do not know without reference, but I referred on that point to Dr. Soetbeer's materials.

5539. Have you been able to refer to Stebbing's "Gold Coins" as an authority?—No, I have not referred to that.

5540. You do not know that he gives the variation from year to year, and he makes the variations to have been from 10 to 1 to 15 to 1?—I was under

the impression that the ratio at the end of the 16th century was about 12 to 1, but that there was a great change in the ratio in the 17th century.

5541. You stated in reply to Mr. Barbour just now that a country possessing a good stable standard holds a higher position than other countries with a more variable standard?—Yes, so far.

5542. Well, do you not think that the single gold standard in England has been a good stable standard, and very beneficial to us generally?—I cannot see what special benefit we have derived from the single gold standard.

5543. But I think you said, in reply to Mr. Barbour, that with a good stable standard a country holds a higher position than other countries?—Yes; but I do not see that if we had gone on with bimetallism as in France, that there would have been any real difference. I do not think that this country has gained by the mere adoption of the sovereign.

5544. Have you any particular information which enables you to state that there will be less gold available for currency in coming years?—I have only the ordinary quoted statistics.

5545. Have you read Mr. Michel Chevalier's work in which he stated that gold would be shortly so depreciated that the sovereign would only be worth about 10s.?—Yes; I think I remember reading that sometime ago.

5546. Prophets occasionally make serious mistakes in their prophecies as to currency?—As to the prophecies of abundance, they generally seemed to.

5547. Mr. Barbour appeared to mix up the falling off in the production of gold with the demand for Germany. He told us that 200,000,000*l.* were required for Germany and France for coinage purposes, and then that there had been a falling off in the production of gold, and he put them together and seemed to infer that the whole constituted a loss or a reduction of the currency in some way?—The falling off in the supply and the increase in demand.

5548. You do not consider that the 200,000,000*l.* has been hoarded?—Oh, no; not at all; but then to a large extent it would replace silver, and would be abstracted from the currency in some other place to some extent at any rate.

5549. But you say that a great quantity of silver has gone to replace that very gold?—No, I do not say that.

5550. Well, a great quantity of gold has gone from some of the bimetallic countries, and silver has replaced it, especially in Spain, I believe?—I was not aware of that.

5551. You are not aware then of the amount of silver that has been coined during the last few years in Spain?—No, I am not aware of that.

5552. Nor the amount of gold that was held there some 15 years ago?—No, I am not aware of that.

5553-4. (*Mr. Chamberlain.*) In what way do you consider that the people of this country have suffered by the appreciation of gold?—Well, in the first place the capitalists have suffered a loss of profit. I should think in nearly all industries there has been a great loss of profit.

5555. How does that arise?—From the want of an adjustment of the cost of production to the fall in price obtained for their product.

5556. What portion of the cost of production has not followed the fall in the article produced?—Well, I believe in manufacturing districts the wages have not followed.

5557. Therefore the artizan population will have gained, even if the capitalists have lost?—They may have gained so far as that particular cause is concerned, but I should not think that they have gained on the whole; on the contrary.

5558. Well then, if they have gained because their wages have remained nearly the same, while the cost of everything which they purchase has been reduced, in what way have they lost?—In the first place, there is always a tendency on the part of the

capitalist who has lost profit to economise the employment as much as possible.

5559. But has there been any reduction of employment in this country? Is it not the fact that the production of the country is larger now than it was at any previous period?—I am not able to give statistics as to the amount of employment of labour, but at any rate it would seem to me to follow clearly that there would be always an effort on the part of the capitalist to employ less labour and to reduce wages as much as possible.

5560. But if you found, as matter of fact, that the production of the country continually increased, then you would not urge that the artizan class had lost anything to set against the gain to which you had previously referred?—If I found it proved that the artizan class was as regularly employed and at the same nominal wages, and that there had been a fall in the price of their articles of consumption, of course I should allow that the artizan class had benefitted.

5561. (*Chairman.*) It has at least been suggested that the increased production has arisen from improved machinery, with smaller amount of labour; do you know at all how that is?—I cannot speak as to the question of fact.

5562. (*Mr. Chamberlain.*) If there were a smaller employment of labour at the present time than at any previous time, would not that be likely to manifest itself in the returns of pauperism?—Yes, but it seems to me a relative question; and though we may have had no great want of employment, it does not follow if, under a better condition of things, capitalists obtained some profit that labour would not have been better employed and at higher rates.

5563. Permit me, that is a new contention; I asked you what the artizans have lost, and you suggest that they have lost because they have lost employment. I then put it to you that all the figures show that we have more employment now; I understand you to say, *non constat*, that they might have had still more employment if the circumstances had been different?—I am not able to speak of the statistics of employment in the manufacturing districts.

5564. Do you confine your contention to this, that the artizan class have lost, but that probably under altered circumstances they might have gained more?—I am not able to give any answer as to the question of fact owing to the extreme difficulty of getting any reliable labour statistics; but, taking the causes one by one, it seems to me that if the capitalist has lost profit,—and that is generally admitted,—that he at any rate will attempt to reduce wages or to make employment less regular, and that so far the labouring classes will suffer.

5565. It does not follow, does it, that he would attempt to reduce employment. He might attempt to get wages at a lower rate if that were possible, but he would not gain anything by reducing the number of hours, for instance, that his mills worked?—I do not know how much loss a capitalist would submit to before he decided not to employ labour.

5566. You know the common commercial maxim that it is the quantity that pays, and manufacturers endeavour to keep their works fully employed in order that the interest of capital may form as small a proportion of the cost as possible?—Yes, I am quite aware of that.

5567. But after all it is as you say a question of fact, and will you not admit that if it were the fact that there was any large increase in the number of persons out of employment, that must show in the pauperism returns?—Yes, so far, unless that is neutralised by other causes; for instance, there have been great accumulations on the part of the working classes. It is quite possible that they may have been living on their own savings to a large extent.

5568. But this appreciation of gold has been going on for a considerable number of years, 12 years at least; surely in the course of 12 years, if you assume that during that period there has been a great want

of employment it must have told before now on the hoarded earnings of the working classes and upon the returns of pauperism?—But I do not think I said, I did not mean to say, that there had been actually a want of employment. I said there was always that tendency on the part of the capitalist to reduce employment, and that aggregate wages were not so good as they otherwise would be.

5569. Well, I put it to you if there has as matter of fact been any considerable diminution of employment; and if there has been no considerable fall in wages while at the same time the prices of all commodities have been reduced, surely the condition of the artizan has been improved?—Yes, that is quite possible.

5570. Well then, in that case, besides the capitalist, whom do you suppose to have been injured in any way by the appreciation of gold?—But is there any objection to my putting in the qualification that I think the condition of the working classes would have been much better if it had not been for this depression. If we take the condition of the labouring classes 12 years ago, and compare it with what it is now, we ought to expect in the natural course of things great progress, and not only mere stability. The period has been one of very great prosperity. There has been no great war, nor any great political disturbance. There have been enormous improvements of all kinds, and a great increase in the efficiency of labour and capital, and we ought to expect a constant increase in the prosperity of the working classes.

5571. Can you say that there has not been such constant increase in the prosperity of the working classes?—All I meant to say is that the improvement in their condition, and I am alluding only to the manufacturing districts, is not so great as it would have been if the capitalist had at the same time been earning profits.

5572. How do you prove that statement?—Well, I argue from general principles.

5573. During the whole of that time, the deposits in the savings banks have very largely increased; that is generally assumed to be an indication of the prosperity of the working classes, is it not?—The point I wished to insist upon is this general principle, that if the capitalists are also gaining profits, then the working classes will be gaining better wages than if the capitalists are not gaining profits, and whatever view you take of the determination of wages, it seems to me that must follow.

5574. I am endeavouring to test your theory by facts. I have asked you about the savings banks which are generally considered to be a test of the savings of the working classes. Then take the consumption of articles of food, such as tea, coffee, and tobacco; has not the consumption per head steadily increased during the whole of those 12 years?—Yes; I believe there has been progress on the part of the working classes.

5575. Then it is only a theory of yours that that progress would have been still more marked if gold had not appreciated?—Yes. It is only a theory, but I think it is a theory that would not be seriously disputed. I was only alluding to the wages in the manufacturing districts.

5576. You have not yourself made any statistical investigation into the question of wages?—No statistical investigation, but I have always inquired when I have been in any large town as to the condition of the labouring classes, and I think that what I have said is quite true. The working classes do feel, to some extent, the depression of trade.

5577. You must admit, I think, that it is rather a curious thing, if they feel it, that it is not shown in any of the statistics which usually are held to test the condition of the working classes?—If that is so, I should take the single cause as it is. You may show an improvement on the part of the working classes, but I should say that it ought to have been more, but for the absence of this cause.

5578. But then I understand your position to be

Mr. J. S. Nicholson.

20 May 1887.

Mr. J. S.
Nicholson.
20 May 1887.

this, that in spite of the facts that the savings of the working classes have increased continuously during the past 12 years, and that their power of purchasing, as shown by the consumption per head of the articles chiefly consumed by them, has also increased during that period, you would think it desirable to make a great alteration in our currency system, with the hope of still further increasing their prosperity?—Yes, that would be one element; and I should certainly think that the result would be an improvement in the condition of the working classes.

5579. And how do you think that their condition would be immediately benefited by it?—Well, in the first place, I should think that better trade with the silver-using countries of itself would tend to improve their condition.

5580. That is to say, that the silver-using countries would suffer, and that we should gain in proportion?—No; I rather meant that you would take away simply a disturbing element which depends purely upon money.

5581. But at present, I think your view is that silver-using countries have an advantage?—Yes, but it is a temporary stimulus due to monetary causes simply.

5582. You would take away that advantage from them?—So far, yes.

5583. And therefore your view is that the operatives of Manchester for instance would benefit, and in proportion the operatives in Bengal or Bombay would lose?—Well, I cannot say how far the operatives in India would lose if this stimulus were removed.

5584. But if they did not lose then the operatives of Manchester would not gain?—You must take into account prospective loss and prospective gain, that is all.

5585. But whatever is to be done it is in the nature of a transfer from one country, or from one class to another?—It is in the nature of a transfer of a certain stimulus; that is so, but at present a certain number of factories have been actually established in India, and it does not follow that if this system were adopted these factories would not go on simply through their own natural advantages.

5586. But if they did continue to exist through their own natural advantages, the operatives of Manchester would not be benefitted?—But you may go on rapidly increasing these factories in India, giving an undue stimulus to production by that action, and afterwards the reaction may come.

5587. But then to whatever extent that stimulus is given it is an advantage to India as long as it lasts, although it is a disadvantage to Great Britain?—Yes; as long as it lasts.

5588. Still, if it is only to last a very short time, it is not necessary to take it into account at all, probably?—It is very difficult to say how long it will last. I used temporary as opposed to permanent.

5589. But if it would last without the alteration, and would cease the moment the alteration which you suggest takes place, it is a fact, is it not, that your proposal would benefit, if it succeeded according to your expectation, the English operative to the disadvantage of the Indian operative?—Prospectively, that is to say. I have taken the opinion of some people who know something about India. They tell me that they do not think that the factories already started would be stopped by the adoption of this bimetallism.

5590. But the future development of India would be retarded by the change that you propose?—But then after all international trade, what is produced by one country and sent to another, must depend on something more solid than mere monetary conditions; it must depend on comparative natural and industrial advantages in the main.

5591. If that is so, if Indian competition is due to natural advantages, why meddle with currency?—Because I say Indian competition at present is not due merely to natural advantages; it is receiving a stimulus

in one way in exports, and receiving what is practically a protective duty on imports. It is not natural advantages only; there is also a purely monetary disturbance, which is influencing the trade of India.

5592. Well, then, so far as you deal with that monetary disturbance by legislation in this country, you will be injuring the operatives of India for the advantage of the operatives of Great Britain?—Yes, but I think on the whole both of them would gain by the adoption of what I have proposed, taking a term of years.

5593. The appreciation of gold is due to the large production of silver and the small production of gold, is it not?—I do not think so. That is only considering the element of supply.

5594. But that is the first cause, the primary cause?—It is one cause that must be taken into account.

5595. And by artificial legislation you could alter that and establish a fixed standard?—But it seems to me that the annual supply of the precious metals is only one element and sometimes a very small element in changing the relative values.

5596. What other elements do you take into account?—All the elements of demand. The principal demand being for coinage, it makes a very great difference if you allow or do not allow these precious metals to be coined. If for example all the nations in the world ceased to coin gold, that would have a very great effect upon the value of gold. The value of gold depends upon artificial causes quite as much as upon natural causes, and the natural production of gold is only one of the elements to be taken into account.

5597. But the chief reason for the present comparative depreciation of silver is its enormous comparative production with gold, is it not?—Not the chief reason, and by no means the true reason. I thought it was admitted in the report of Mr. Goschen's Committee on the Depreciation of Silver, that the additional supply of silver was not sufficient to account for the depreciation that then took place. My own opinion is most strongly that the depreciation is entirely due to the changes in the demand. If the old monetary relations had continued the changes in supply would have made absolutely no difference to the relative values of the precious metals.

5598. Then do you mean by the alteration in the demand the greater demand for gold for such purposes as Mr. Barbour suggests for hoarding and ornament, and uses in trade?—Well, we must take into account all the elements of the demand. There would be the demand for currency as well as the demand for purposes of the arts.

5599. Well, all those demands are in the nature of ordinary and natural causes, for the appreciation of gold?—Quite so, but then the principal demand always for the precious metals has been the monetary demand, and the monetary demand is purely an artificial thing, purely the product of legislation.

5600. But at the present time the people of India benefit, and the operatives of Great Britain in your opinion suffer, owing to the natural increase in this demand and the other causes to which you have referred. Do you think that you are justified by legislation in taking away from India this advantage, and in conferring it upon their fellow subjects in Great Britain?—Well, I think so far as India is concerned that there are a number of compensating advantages which would accrue to India, and it is not certain that there would be any positive loss at all by the adoption of this method. For example, capital would flow to India and the rate of interest would fall.

5601. But you have admitted that unless there is a positive loss to them there can be no positive gain to the operatives of Manchester?—I was looking rather to the future. It is quite possible that in the future, if this depreciation is allowed to go on for a term of years, India might develop certain trades which otherwise she would not do, and then I think that a reaction

would afterwards occur. As far as possible, we ought not to allow any trade to be determined purely by currency causes.

5602. (*Mr. Chaplin.*) Mr. Chamberlain referred you to statistics, and to the fact for instance that savings have increased, and that the consumption of commodities has largely increased as a proof that the condition of the working classes here has not been seriously affected by the present system; may that not be owing to some extent to the great improvement which has been made within the last few years in the compilation of statistics?—Yes, I think that is an element that ought to be taken into account.

5603. You were asked just now whether it was not the fact that there had been no considerable fall in wages, and no considerable diminution in employment so far as the working classes are concerned, and if that was the case, what their loss had been. I want to know if you have any knowledge of these facts of your own. Do you know for yourself that there has been no considerable fall in wages and no considerable fall in employment?—No, I do not; I do not know the statistics of that question.

5604. You are not able to say for yourself, then, whether the evidence which was given by a witness on the last occasion to this effect was true or not. What he said was that our towns had been crowded with unemployed people, and “I never saw such ‘continuous distress in Liverpool as in the last few years.’” You could not say of your own knowledge anything as to that?—I have no means. I can only go on general statistics and statements, and statistics as to labour are not in very good condition.

5605. Your general experience would lead you to believe that there probably has been, I understand, a fall in the prices of their wages and some loss in employment?—Yes, I think so; but in the manufacturing districts not such a fall in wages as might perhaps have been anticipated at present.

5606. You suggested that this loss of employment might not be shown possibly in the pauperism returns, because they might have been living to a certain extent upon their own savings?—That is a statement that I have often seen made.

5607. And when you were asked whether the fact that gold has appreciated during the last 12 years, would not, before this period, have consumed all their savings; do I understand that the effect of that appreciation has been felt during the whole of that period, or has it not been coming on gradually, and only been felt acutely within the last few years?—Well, that is a question which involves the degree of the general depression of trade. I am not able to say in what years depression began to be most keenly to be felt.

5608. Let me ask you one question as to India, and the effect upon the operatives there. I understood Mr. Chamberlain to ask whether the adoption of the remedy that you suggest would not be injurious to the operatives in India, although it might be beneficial to the operatives in England. But is it not the case that it may be said that the present system, at all events as far as the wheat industry is concerned,—I will limit it to that for the moment,—is making the fortunes of the rajahs and the ryots in India, while it is ruining the agriculturists and the agricultural labourers in England?—I think there is no doubt of the injury to the agricultural classes in this country. Of course I have no information as to the matter of fact in India, though I should think that the present state of things gives a great stimulus to the production of wheat in India, and it is quite possible that part of that stimulus may take the form of exceptional profit to the producers in India.

5609. And that stimulus, as I understand you, is afforded by the rate of exchange between England and India, which has been brought about entirely by foreign legislation since 1873?—Yes, I think that the stimulus is due to the fall in the price of silver, which operates upon and is shown through the Indian

exchange, and that the fall in the price of silver is due to legislation.

5610. Are you aware whether England is responsible at all or not for the legislation which was adopted at that time?—As far as I know, England did nothing directly, but I suppose there is not much doubt that England refused to make an agreement which other nations would be willing to make. So far there was a want of legislation upon our side. It would have been better, it seems to me, had England agreed to a convention at the former conference.

5611. We have had evidence given before us to the effect that England could not be said by any means to be free from a share of responsibility in the matter; I wanted to know whether that is your opinion?—That is my opinion; in that indirect way.

5612. (*Mr. Barbour.*) Are you aware whether or not England or some authority in England recommended the French to adopt the gold standard?—No, I do not remember that.

5613. (*Mr. Chaplin.*) You were asked in question 3971, whether there had been an universal fall in prices, and that was what at present there was no sufficient evidence of. I understand you have no doubt upon that point, have you?—No, I have no doubt that there is a general fall in prices, but I ought perhaps to explain that that does not mean that there is an uniform proportional fall in prices in every case.

5614. Did I understand you to say this morning that there had been a difference of 25 per cent. generally in prices?—I do not think I quoted figures. The estimate founded on the index numbers gives a fall of from 25 to 30 per cent., I believe.

5615. At all events, whatever the fall may be, you date that fall from the time that silver was demonetised by foreign legislation?—Yes, there has been a fall since that time.

5616. Can you trace it partly to that cause?—I should certainly trace it partly to that cause.

5617. In the reference to this Commission we are instructed to inquire as to the effect of the present system upon the internal trade and industry of the United Kingdom. Are you of opinion that the internal trade and industry of the kingdom has been injured in any way in all of its branches?—Well, there again I should repeat the answer that I gave before, that the loss of profit to the producers must have acted detrimentally upon that important interest, at any rate, the interest of the capitalists, and indirectly upon other classes.

5618. I should like to take the agricultural industry. Are you of opinion that that has been injuriously affected?—I should think the agricultural industry has been most injuriously affected of any.

5619. And in what branch chiefly?—Well, again it is difficult to give the facts of the case; but I should think, especially on the analogy of other trades, and from general principles, that in the first place the farmer would suffer, then the farmer would throw some of the loss upon the landowner, and some of the loss upon the labourers. In the first place the loss would fall upon the farming profits, that is what I should think; then it would fall upon the landowner, then it would fall on the labourer.

5620. (*Mr. Courtney.*) Do you discriminate between farmers, between producers of different kinds of produce?—Yes, I think that the grain farmers have suffered more than the stock farmers.

5621. (*Mr. Chaplin.*) Several witnesses, or some witnesses at all events, have given evidence to the effect that the present state of things acts exactly like an export bounty upon the wheat that is exported from India to England; is that your opinion?—That is my opinion, under present conditions.

5622. Would you state how that arises?—Well, the fall in the price of silver enables some one in India to sell the same amount of wheat for a less amount of gold than before, because in return for

Mr. J. S. Nicholson

20 May 1887.

Mr. J. S.
Nicholson.
20 May 1887.

this less amount of gold the same amount of silver is obtained. The general position is that silver prices in India have remained practically steady, and as a consequence, so long as the same amount of silver is obtained for the wheat, for instance, the producers in India are satisfied; but owing to the fall in silver, this same amount can be obtained for a less amount of gold, and that causes a fall in the price of the wheat on this side, and in that way it seems to me to operate exactly like a bounty. The general effect of a bounty is to make a fall in the price of the article in the country to which it is sent.

5623. And to give a great artificial advantage to the grower of wheat in India?—So far as he can keep that advantage; so far as competition does not take from him that advantage and lead to the fall in prices on this side. I cannot say how the advantage is precisely distributed.

5624. At page 334 of the Third Report of the Royal Commission on the Depression of Trade, there is a table to which I want to call your attention. Mr. Palgrave says: "By examining this table, it appears that, speaking generally, every fluctuation of a penny in the rate of exchange is equivalent to an alteration of 1s. 5d. in the price of the quarter of wheat in England." Are you able to verify that statement; do you agree with it?—I remember reading the figures and quite agreeing with the general statement that the result may be such a fall in the price.

5625. But the effect of that statement as I understand it is this, that the price of wheat in England would rise and fall with the price of silver?—Yes.

5626. And you believe that to be so; you agree in that opinion?—Yes, so far as the Indian production influences the market, and at present, I suppose, it largely does so. I should like to refer to my answer in my first day's evidence to question 4147.

5627 Well, Sir Thomas Farrer asked you on the last occasion whether in the case of the appreciation of gold the loss did not fall on the capitalists and the producers chiefly?—Yes.

5628. I do not want to ask you any further questions with regard to the artizan working classes, but I want to know if you have any knowledge with regard to agricultural wages at the present time, whether they have fallen considerably or not?—Well, I made some inquiries myself since I was last examined here as to agricultural wages in the north of England, and I gather from a very trustworthy source that the wages there have fallen 20 to 30 per cent. in the agricultural districts. The person who gives me that information is a man who holds several large farms in Northumberland under different owners, and who also knows very generally about agriculture in the north, and that is certainly the case with the labour that he employs. He gives me his own figures, showing a reduction of 25 to 30 per cent. in the wages.

5629. Is it not the case with regard to the agricultural labourers that the greatest mischief is not the actual fall in their wages, but the fact that a vast number of them have lost their employment altogether?—Yes, I think that there has been a great loss of employment in the agricultural districts.

5630. Then in that case the chief loss is not limited by any means to the capitalist or the producers, but that the working classes are injured equally also?—The agricultural working classes are certainly injured.

5631. Now, with regard to other commodities, does this system act as a bounty also upon them as well as upon wheat?—Yes, as regards other exports from silver-using countries it seems to me under the conditions so far as we know them of silver prices remaining practically the same in those countries that it must operate as a bounty upon those exports, but whether the bounty will lead to a corresponding fall in prices always or whether it may lead first of all to an increase of profit it is impossible to say in every case.

5632. Well, then with respect to commodities sent from England to India, how are they affected; does

that act as a protective duty against them?—I should say that was the best way of describing it, that it really acts as a protective duty.

5633. That is, in fact, the English producer is hit in both ways?—Yes.

5634. And this is not owing in any way to natural causes?—Purely to a monetary disturbance.

5635. In consequence of legislation?—In consequence of a change in the monetary policy of different nations.

5636. Well, you have told us what is the remedy that you suggest. I want to ask you what would be the general effect of your remedy, firstly, on the prices of all commodities, and secondly, on the prices of the commodities which are specially affected by the rate of exchange between England and the silver-using countries?—Well, as regards the effect on the prices of all commodities, the general level of prices, I should not be inclined to suppose that so far as this cause was concerned there would be any great inflation of prices. I should rather say that if we return to the condition of affairs which existed before 1873, the utmost we could expect in the rise of prices would be a rise to the normal level before that time; but then when we take into account the great increase in trade and population and the great demand for currency of all kinds, then I should expect that we could not quite attain that level again; the result of this would be a check to the further appreciation rather than a restoration even to the old level.

5637. That would be the case with regard to the prices of commodities generally?—Yes.

5638. What do you say with regard to the prices of those commodities which are specially affected in the way I have described?—I should imagine that the effect on the prices of those commodities which have been influenced by the depreciation of silver must be a rise.

5639. Well, just to sum up what you have said. I understand you would be of this opinion, that if the remedy you propose were adopted it would be beneficial to trade, and it would be beneficial to agriculture in England?—Yes.

5640. And that as far as the agricultural labourers are concerned it would improve their position also?—Yes.

5641. Would you say the same thing with regard to the artizans in the towns?—Yes, I should expect a general improvement in their condition. Perhaps I might mention, as there seems to be some fear of an inflation of prices from abundant supplies of silver, if silver is made a standard metal, that I think it is generally admitted that the persons who gained most altogether in the great gold discoveries were the labouring classes. It is quite possible that if there was an abundance of silver, sufficient to produce a corresponding rise in prices, that the labouring classes would gain very much.

5642. Do I understand you that the labouring classes were the first to gain formerly in consequence of the great gold discoveries, or that in the end they were the chief gainers?—Yes, the impression on my mind from reading Tooke's History of Prices, where great attention has been given to the subject, is that there was an immediate rise, as far as could be calculated, in wages of 20 to 25 per cent. as the effect of these great gold discoveries.

5643. (*The Chairman.*) Was not that in part because the gold discoveries in Australia led to a great many people leaving this country to go to Australia and to their having increased spending power and consequently increased activity arising in commerce generally, shipping and other respects?—Do I understand that the rise in wages was due to the falling off in the supply of labour in this country owing to emigration?

5644. In part to the falling off in the supply of labour in this country owing to emigration, in part to the increased demand for commodities produced by the increased spending power of the people who had

gone to Australia to work for gold, and the necessity for transporting articles of commerce from this country to Australia, which again increased the prosperity of the shipping and other trades?—Yes, I should think all those causes operated. There was certainly a large increase in emigration from this country to those countries. There was a special difficulty in getting sufficient agricultural labour in the country.

5645. I mean those causes would operate, and operate quickly, quite independently of an increase in the volume of the currency?—But then I should not suppose that if the same amount of wealth had been produced in some other form in Australia that that would have produced the same effect as it did, taking the form of gold. I think that the effect of a great discovery of the precious metals is altogether different in kind, and in directness from, supposing it were possible, the discovery of a similar amount of other wealth. In support of this view I may quote a passage from Tooke, Vol. VI., p. 190. “A suddenly increased supply of no other commodity would produce effects so decided and rapid for the simple reason that (say) a tenfold quantity of no other commodity could find an instantaneous and impatient market.”

5646. (*Mr. Chaplin.*) Then I understand you that if the result of the remedy that you propose was to cause a certain rise in prices that the working classes would distinctly be gainers, in your opinion, by that operation?—Yes, I think that this check to falling prices would benefit the working classes, and I think that follows from the generally accepted view now as to the way in which wages are determined. Both wages and profits are really paid out of the price which is obtained for the product. If prices fall the whole of this fall in prices cannot be continually taken out of profits, especially considering the small proportion relatively of profits; it must ultimately fall on some form of labour.

5647. Well then, you say it would help trade and agriculture, which are the two great industries of the kingdom, and that it would benefit the working classes also?—That is my opinion.

5648. Would it injure any other classes, and if so, what class, and how?—The answer would depend upon the extent of the rise in prices. If there was, as I do not suppose there would be, a very great inflation of prices, the people who would suffer principally would be those in receipt of fixed incomes. Those classes would suffer who were enjoying the benefit of former contracts. Middlemen also might suffer, and so far the consumer would not.

5649. Those enjoying the benefit of former contracts would lose because, to some extent, gold might lose part of its purchasing power?—Yes, and that is the way in which they would lose.

5650. They would be, I presume, then a very limited number of people compared with those whom you anticipate would gain?—I think the number of those whose incomes would not be raised by a rise in prices must be very small compared with the mass of the people of the country. The incomes of the mass of the people of the country feel very soon movements in prices, but it is only a comparative few who obtain fixed salaries, and so on.

5651. It has been urged by some witnesses that there are considerable objections to be raised to your proposal, some contend that it would vitiate contracts; others that the gold would leave the country; and again, others maintain that there would be an immense difficulty in maintaining a fixed ratio between gold and silver. Do you believe in any of these objections. Have you any apprehension of consequences of that kind?—Well, these are objections which I have very carefully examined, and on which I have published papers, and I do not think myself that they are of any force. I would answer them, if you wish, more in detail, but that is my general conclusion.

5652. (*Mr. Courtney.*) I understand you to say that the effect of either a greater production of silver and the diminished production of gold, or else of the

dislocation of the relation between silver and gold in consequence of the cessation of free mintage has operated in India by way of a bounty to the producer?—That seems to me the best analogy, yes.

5653. Whereby wheat can be brought from India and sold here at a less cost than would otherwise have prevailed?—Yes.

5654. And you lay down the principle that that is an injury to the people of this kingdom?—I admit that getting wheat cheaper than otherwise they would do benefits the consumers of wheat, as long as it lasts.

5655. No doubt the consumers of wheat, but the kingdom, I said?—Well then, on the question of the kingdom, it seems to me that we have to take into account a summary of all the various interests affected, for instance, the interests of the agricultural labourers that I have just been asked about.

5656. Well, I wish you to take into account in your own mind all these interests, and to answer the question whether the operation of that cause which produces the effect that wheat is sold here at a less price than it otherwise would have been sold at is an injury to the inhabitants of this kingdom?—I think that when we take into account the loss sustained by agriculture, and the probability that the wheat, at any rate, would never rise to any great height if this change took place, the change would be an advantage. On the whole, I think the change would be an advantage.

5657. On the whole, what change would be an advantage; the introduction of wheat at a less cost would be an advantage?—The change which would neutralise this cheapness due to the depreciation of silver.

5658. Wheat is imported into England and sold in England at a less cost owing to the operation of a certain cause, than otherwise it would have been imported and sold at; is that an injury to the people of this country?—Well, it is not an injury to the consumers of wheat, that is all. It is impossible for me to add up all the different effects and give you an answer to the sum after it is added up. I must take them one by one. I say the agricultural labourers are injured by it; the farmers are injured by it.

5659. And you cannot venture upon an estimate of the effect upon the general well being of the mass of the inhabitants?—I cannot make a reasoned summation at a moment's notice, it is impossible.

5660. Suppose twopenny loaves rained like manna from Heaven every morning, would that fact be injurious or beneficial to the people of this kingdom?—I do not quite see the meaning of the question. I acknowledge, of course, that cheapness is a good thing for the consumers of certain articles. We must also consider producers of the same articles. It is very difficult to estimate the gain of the one and compare it with the loss to the other. Suppose, for example, that the cheapness only lasts sufficiently long to ruin the agricultural interest of the country, that land goes out of cultivation, and buildings and improvements are not kept up. The nation might pay very dear in the end for this temporary cheapness.

5661. (*The Chairman.*) I suppose you would say that if the same cause which produced this cheapness was operating at the same time to reduce the purchasing means of those who could purchase, that that must be taken into account in estimating the total result?—Yes, so far there might be no gain.

5662. (*Mr. Chamberlain.*) Would you entertain the same doubt as to the general result of the imposition of a 5s. duty on corn. That also would, according to your view, benefit the agricultural labourer and the farmer, would it not?—Yes, I suppose it would.

5663. And you would feel yourself unable to say whether or not the destruction of our free trade theory and the imposition of a 5s. duty on corn would be a good or a bad thing for the country?—Well, there again I should have to reckon up what would be the danger of admitting any exception to all free trade principles, what would be the practical effect of the abandonment of a general policy. If I might say

Mr. J. S. Nicholson.

20 May 1887.

Mr. J. S.
Nicholson.

20 May 1887.

anything about the question of free trade, I think, theoretically, it is quite possible to conceive of certain exceptions, but taking the whole question you have a general impression that the policy is so important for this country that you would have to consider very carefully before you ever thought of making any change of that kind. Continental nations are applying protection to wheat.

5664. But if you are convinced that the effect of a change in the currency which would increase the price of wheat in this country, would be good for the labourer and the farmer, and you are uncertain whether on the whole it would not be a good thing for the country, I suppose exactly the same answer would apply to the proposal to put a 5s. duty on corn?—There would certainly be benefits. By a 5s. duty on corn there would be benefits to the agricultural interest certainly.

5665. (*The Chairman.*) I suppose you would say that the 5s. duty on corn would not affect the general spending power of those who purchase corn, in the same way as you say changes in the currency might?—Well, it is very difficult to trace the indirect effects of any duty; possibly the effect would be to lessen the spending power whilst the proposed change in currency would increase it.

5666. (*Sir T. Farrer.*) On the same ground you would doubt whether the making of the Suez Canal, the cheapening of freights, and the opening up of India by the railways, by which corn has been introduced so cheaply into this country, is a benefit to this country or not?—Yes, I think it might be doubted, just as it is quite possible that owing to some change of that kind which benefited the world as a whole, one particular country might lose its commerce. It is said, for example, that the discovery of the Cape route to India ruined the towns of northern Italy.

5667. We being the great purchasers of the commodity which is so cheaply produced?—But then we are also producers of that commodity. Agriculture is still our most important industry.

5668. (*Mr. Barbour.*) May I ask you one question? Do you think that under any circumstances it can be a good thing that the producer in one country should have a bounty as compared with the producer in another country?—I think that the system of bounties for the world at large is certainly a great source of mischief.

5669. Do you think a bounty on wheat from India would be an injurious thing to the Empire as a whole, including both India and England?—Anything in the nature of a bounty or a monetary disturbance which acts like a bounty is prejudicial to this country and to India, taken together. If it is not it would be a good thing for the Empire if all our colonies gave export bounties or adopted a silver standard.

5670. (*Mr. Courtney.*) Mr. Barbour called your attention to the great increase in the production of gold between 1850 and 1873 in relation to the production of silver and to the steadiness of the relative price of gold and silver during that period; and he asked you whether you agreed in the conclusion that the price of gold and silver depended rather more on the demand than on the supply?—Yes.

5671. And you did agree with his conclusion?—Yes.

5672. (*Mr. Barbour.*) I think my exact words were that we were to look for the causes of the variations in recent years rather to the demand than to the supply?—Yes, I should put it in that way; we must always consider the supply as well as the demand.

5673. (*Mr. Courtney.*) There were variations in supply between 1850 and 1873 which did not produce a variation in the price of gold and silver?—Yes.

5674. There has been a variation in the price of gold and silver since 1873, and that must be ascribed to the variation in demand, and not to the variation in supply?—I think it is due to a variation in demand; that is to say, a change in supply that has occurred

would not, if other things had remained the same, have produced a change in the relative value.

5675. You think those questions and answers are exhaustive in that part?—Not in that brief form in which you have put them now.

5676. Is it not very necessary to take into consideration the existence during the first period of free mintage in France which has not existed since; so that the effect of the variation that has arisen since 1873, which did not arise before 1873, may be ascribed to the cessation of free mintage?—Certainly; I mentioned that as one of the causes that I thought did operate.

5677. (*Mr. Barbour.*) Would you look upon the cessation of free mintage in France as an alteration of demand?—The difference is between using silver really as token money and coining any quantity brought to the mints as standard money.

5678. But may I ask if you look upon cessation of free mintage as a reduction in demand?—Yes, it is equivalent to a reduction in demand. I should look on it in that way.

5679. (*Mr. Courtney.*) Now, the prime factor in determining the value of the precious metals is its use as money?—Yes, certainly.

5680. A prime factor in determining the amount of the precious metal which is produced is the combined possibility of its use as money?—Yes, I think that operates, certainly.

5681. And if the nations united together to agree that gold and silver should be equally applicable to the payment of debts in the relation of 15½ to 1, that would have a considerable influence on the production of gold and silver?—I think that the condition of things would be like it was before the change took place.

5682. (*The Chairman.*) But I thought since the change in demonetising silver took place you had not had less silver produced but more, and not more gold produced but less?—Well, so far of course I would say that, owing to the fall in the price of silver relatively to gold, there has been or there may have been a contraction of the production of silver, and so far there may be an increase again in silver. As regards gold there can be no such increase, and there might possibly be a further slight falling off in the production of gold, owing to this cause. I should certainly admit that if you raise the price of silver reckoned in gold you tend to get greater supplies from the mine, so far as that cause may operate, but I do not think that the effect would be very great.

5683. (*Mr. Courtney.*) Well, the miners are speculative people, but even miners will not carry on mines at a loss?—We must take into account the differences in the relative production of the various mines, and it is only the mines on the margin of mining, or whatever the phrase you choose to describe it, that would be affected. The good mines and the more productive mines would still continue to produce whatever the prices were, within any reasonable limits.

5684. Mines are abandoned and opened?—Yes.

5685. Abandoned because they cease to be profitable, and opened because they promise to be profitable?—Yes.

5686. If you had a general law amongst civilised nations, that silver should be to gold in the proportion of 1 to 15, you would have silver and gold produced roughly under conditions that the gold cost 15 times as much labour to put upon the market in a civilised country as silver?—I do not think that follows at all, because it may be that the gold can be produced for nothing at all, and yet, owing to the limited quantity of it, it might still be of that value. I do not think that the cost of production element enters in, in the way you suggest.

5687. But there is neither gold nor silver as the amount that can be produced absolutely fixed; there is a margin of production?—There is a margin of production, yes.

5688. You can always get more with greater labour?—Yes, a certain amount.

5689. Well, is not that margin of production one or other, speaking roughly; would not that be fixed by the law of ratio established in the market where both are brought for sale?—No doubt the margin to which the mining was carried would depend partly on the ratio. If, for instance, silver measured in gold, were to sell at 60*d.* per ounce instead of 46*d.* per ounce, that might lead to the opening up of some silver mines.

5690. Or possibly to the shutting up of some gold mines?—Or possibly to the shutting up of some gold mines, though that, I think, would be much less likely.

5691. But why now, if you declare that 15 ounces of silver shall be of the same use in London as one ounce of gold, and you can produce now 20 ounces of silver and bring it to London at the same cost as one ounce of gold, is it not clear that the people would come to the silver rather than to the gold, and that the producers of gold would be put to a disadvantage, and would gradually work off their less profitable workings?—But I cannot understand how the cost of production could possibly operate in that manner. It is not as if it were open to the workers in gold mines to go and work in silver mines, and produce silver instead. You cannot get a transference of capital from gold mining to silver mining; it could only operate in a very indirect manner. There would be an encouragement to invest capital in silver mines rather than gold, and I do not see that it could operate to a greater extent than that.

5692. A gold mine would find that its cost of labour and materials relatively to what the produce was, was continually increasing, that the enterprise was less profitable, and it would gradually diminish, and ultimately might be abandoned?—Yes; but so long as the gold mine yielded any profit at all the gold mine would be worked. I should imagine that the greater part of the return to the owners of gold mines is really a form of rent, and until the whole of that had disappeared there would be no cessation of the gold mining.

5693. But are you at all acquainted with the circumstances of gold mining in Australia. You suggest that the greatest part is in the form of rent?—I say that the production is under different circumstances. If you take the first effect of any change then you would only operate upon that part which was produced under the most unfavourable circumstances. I presume, in taking gold mining on the whole, that gold is produced with different degrees of cost, and you would only operate upon that element which is produced at the greatest.

5694. No doubt "the margin of cultivation," to use a classical phrase, would feel it most, but gradually there would be a contraction of gold production?—Unless there was such an effect on general prices as to raise the wages of the gold miners and the cost of machinery, and so on, there would be no contraction of gold production.

5695. But is it not reasoning in a circle to say that differences in supply do not affect the relative price of the metal when in truth the differences in supply are determined by the relative price of the metal?—I do not see any difficulty. I can quite understand how the differences in the annual supply depend upon not only the relative differences in gold and silver, but the general level in prices. That seems to me quite clear, and yet the annual supply operating through the infinitesimal addition to an immense stock has a very small influence.

5696. Mr. Barbour spoke of the possibility of a general increase in wealth leading to a greater consumption of gold in ornaments in domestic use and a consequent still greater appreciation of the standard?—Yes.

5697. But would not the greater increase of wealth be a function of the quantity of gold used for domestic use and ornaments, or rather, would not the quantity of gold used for those ornaments be a function of the general increase of wealth?—Certainly, that is what

I understood Mr. Barbour to mean, that the amount of gold used for the purposes of the arts, ornaments, and so on, would be a function of the growth of wealth in the community.

5698. And under a natural system, would not there be the same movement in the standard; would not that be a function of the general wealth of the community?—I am afraid I do not follow.

5699. Supposing the general increase of well-being is such that people with the same quantity of labour, so to speak, could go to the sacrifice of providing themselves with a gold watch, ought not, on the other hand, those who have a claim to a sovereign, or the possession of a sovereign, expect that that sovereign would in the same way represent a varied command of the use of labour?—That is, we ought to expect a variation in the purchasing power of the standard.

5700. Do not the two things go together? They depend on the same causes?—Yes, they depend upon the same causes, but operating in different ways.

5701. Is there anything to object to in the two operations being conjoined?—Well, the difficulty, as I understand it, is that you abstract from the available supply of gold for currency a certain amount, and use it for the arts and so on. At the same time you get a constant increase in the demand for currency, if you are to keep prices at the same level. Well, the supply is not forthcoming, and so prices fall; then you have the difficulty of a changing standard, and I should say the less change you get in your standard the better.

5702. (*Sir T. Farrer.*) I do not think I quite understand what you look to as the ideal or *summum bonum* in the standard. Is it that the same quantity of the standard should at all times be exchangeable for the same quantity of the same commodity?—I do not think that, because that would imply that you would get no change in the relative prices, that prices would always remain permanently fixed in the same manner. That is impossible, I should think.

5703. But in order to follow up Mr. Courtney's question concerning the relation of wealth to the standard, let me ask you this, supposing gold to be the standard and supposing further that we had only one commodity—wheat, that the supply of gold remained absolutely constant, but that the supply of wheat was doubled from improvements in agriculture and transport, should you think it the *summum bonum* of the standard that the same quantity of it, say 2*l.* or 40*s.*, should exchange for one quarter of wheat?—It is very difficult for me to look upon the standard as measured by one commodity.

5704. But I want to get at what you were looking for when you were talking about an ideal standard?—Well, I would illustrate it perhaps best in this manner, that I think nothing can be worse for a country than the adoption of inconvertible paper. It leads to a fluctuating premium on gold, and that really means a fluctuating purchasing power, which is the worst thing that could happen to a country. Well, so far as gold approximates to that, gold is a bad standard.

5705. Let us make a further hypothesis; supposing that all the commodities exchangeable against gold, or measurable in gold, which is perhaps a better phrase, are doubled in quantity at the same cost in labour or human effort, while the quantity of gold remains the same, should you think it a defect in the standard if the same quantity of gold then purchased double the quantity of commodities?—That is to say, should I think it a disadvantage if prices fall away to increased production?

5706. Yes?—No, certainly not, because I should say that any relative fall in prices due to decreased cost of production must be shown in that manner.

5707. (*Mr. Barbour.*) But do I understand you to mean that if production is cheaper it is still better for the world if the standard keeps pace with the cheapening of production, so that prices are always the same?—But then my difficulty is whether I am

Mr. J. S.
Nicholson.

20 May 1887.

Mr. J. S.
Nicholson.

20 May 1887.

to understand all commodities to be increased in the same proportion, which is a very difficult position to take up, or if I am to understand that you get some particular commodity cheapened. I think it is necessary that any diminution in the cost of production of a particular commodity should be shown by a fall in its price and so over a large number of commodities.

5708. (*Sir T. Farrer.*) I wanted rather to illustrate Mr. Courtney's proposition about the wealth of the country. I want to know whether, supposing the wealth of the country doubles, that is to say, suppose all the commodities which people use are doubled with the same expenditure of human labour, while gold remains the same, and the same quantity of gold consequently buys twice as much of every commodity, whether you would consider that a defect in the standard?—Well, then I should think that it would be better if everything were doubled, and the number of transactions were doubled, and the number of people were doubled, it would be better for gold also to be doubled.

5709. It would be better that the foot rule should be doubled as well as all the other things that are measured by it?—I should think so.

5710. (*Mr. Barbour.*) Do you think the change should be described as a doubling of the foot rule. There is no close analogy between the measure of extension and the measure of value; is it not rather that the foot rule should remain the same?—It is very difficult to seize the exact point of any analogy at once, but I do not see that there would be any objection theoretically if you suppose everything doubled to have the quantity of money doubled also. In that case nominal wages would remain the same, in the other they would be halved.

5711. (*Sir T. Farrer.*) You spoke rather positively about the effect of this depreciation of silver upon the price of Indian commodities, and especially upon wheat, have you examined the data that we have had before us, papers by Mr. O'Connor and others, as to certain causes which have cheapened Indian commodities, such as transport and railways, freights, &c.?—Well, I have looked into these papers, but I certainly did not mean to express myself positively at all as to the influence on the final price of wheat; all that I was doing was to take the effect of one particular cause, and to say that, so far as that was concerned, it ought to operate in that way; it may be neutralized by other causes.

5712. You have not looked at the other causes which operate, to see whether those causes are sufficient in themselves to account for the fall in Indian wheat?—I should take it up analytically that if you have a fall in the price of silver that of itself does permit of the Indian wheat being sold at a cheaper rate.

5713. But you have not looked into the actual causes which operate to see whether there are not other causes which ought also to operate to make them fall?—I can only refer to my former answer to question 4147.

5714. Now, let me take a statement you have written with care, and therefore I would rather take it than what you have said to-day. You say: "Observe now the consequences which follow from the failure of Indian prices to move in correspondence with the fall in silver. Prices in India being the same, or indeed a little less, the producer of wheat, or any other Indian staple, will gain quite as much as before, as well as have the same real income in India, if he obtains the same number of ounces of silver as he did. If, however, in London, an ounce of silver, reckoned in our currency, is worth 25 per cent. less than it was, the Indian can sell his commodity for a gold price, less by that percentage, and yet obtain his usual or profitable number of ounces of silver." Now I want to ask you whether that does not assume that a rupee is worth 1s. 6s., or 1s. 6d. worth of commodities in London, and 2s.

worth of commodities in India, at the same time?—I adhere to the quotation you have made.

5715. Well now, does not that assume that a rupee is worth 2s. worth of commodities in India and only 1s. 6d. worth of commodities in London. I want to know whether it is possible that a rupee shall be worth 1s. 6d. worth of tea or wheat in London, and, at the same moment, worth 2s. worth of wheat in Calcutta?—I am afraid I have not followed the point in your question as bearing on this assertion of mine, because what I say is that the effect will be the reduction in this gold price on this side, so that, so far as the wheat is concerned, you would get the same price.

5716. (*Mr. Birch.*) Would you allow me to put the real meaning of it. It is this: he sells for 1s. 6d. in gold, that is the difference. It is 1s. 6d. in gold, not 1s. 6d. in silver, because 1s. 6d. is simply token coin, whereas the 2s. in India is a real coin; that is the difference?—I agree with Mr. Birch's statement.

5717. (*Sir T. Farrer.*) I perfectly understand that. I am speaking of 2s. and 1s. 6d. as fractions of a sovereign. I want to know whether I am right in my construction of your paragraph. Whether that construction is true, and if not where is the bounty?—The point that I wish to bring out by saying it is a bounty is that it leads to a reduction in price, like every other bounty.

5718. You told us that you did not know where the extra sixpence went to, whether it was the profit of the Indian rajah or ryot, or where it went, but there is, according to your account, sixpence to play with, and I want to know where that sixpence comes from. Is not the real fact this: the man in England spends 1s. 6d. on his rupee, but that 1s. 6d. is gold, and, gold having risen, it is as much as 2s. was before?—Yes, that is the monetary position.

5719. Therefore, the real thing is that gold has risen in England. He buys his rupee; the rupee is worth 1s. 6d., and he buys with his rupee the same quantity of wheat that he could originally have bought with 2s., it is true, but it is because that wheat has fallen from other causes in the same way in which the silver has fallen. You do not think it possible that a rupee can be worth one quantity of a transportable commodity in London and worth a separate and a different quantity of the same commodity in India?—No, not more than by the cost of carriage and other reasons of that kind.

5720. (*The Chairman.*) I understood your position to be this; that owing to the change in the value of silver, as compared with gold, a lower gold price here gave to the producer the same silver price there?—Yes, that is my position.

5721. That he was content to get the same silver price because he paid wages in silver, and the other burdens that fell upon him were payable in silver?—Yes.

5722. And so his position, being to him, apparently, the same, getting as much silver as he did before, he was content to sell at a lower gold price than he would have been?—Yes.

5723. (*Sir T. Farrer.*) That is on the assumption that gold is appreciated?—I think we can separate the direct effect of the depreciation of silver from that of the appreciation of gold.

5724. In that case the producer in England will also have had his expenses reduced; gold will have appreciated against all things in England as well as in India?—But I do not see that we bring in the question of the appreciation of gold at all. This is an illustration of the effect of the direct operation of the depreciation of silver.

5725. (*The Chairman.*) Supposing that he gets a lower gold price here (which is the hypothesis), which brings him the same number of rupees that he got before, I am not quite sure that I can see how that stimulates production there. If he, owing to the change, got the same gold price, and therefore, more silver rupees, and therefore made the transaction more profitable, I can understand that stimulating production; but if

the net result is to bring the gold price down, by reason of his being content with the same number of rupees as before, I do not see what there is to stimulate production?—When it arrives at that limit, there would not be any stimulus of that kind; but it seems to me to operate just as bounties on production or on exportation from foreign countries. In the first place, there is an attempt on the part of the producer, or on the part of the importer, or on the part of those who have to handle the corn, to keep the bounty to themselves; but then this constant attempt to keep that bounty to themselves is finally defeated by competition.

5726. But then, when it has arrived at that point, there ceases to be a bounty?—When it has arrived at that point there ceases to be a bounty; but any further fall would act again as a bounty.

5727. (*Sir T. Farrer.*) Then what you mean is, what we have heard before, and what other witnesses, when pressed, have come to, that the bounty really consists in this, that pending the adjustment of prices, the producer in England has to pay the same nominal wages and expenses as before, but which, owing to appreciation, are really larger than before, while the producer in India had to pay no more than he had before?—That is the real adjustment.

5728. But when the adjustment is effected, then that bounty ceases?—Supposing all the elements in cost of production are adjusted, then it would cease.

5729. I want to ask you one question with regard to the figures which Mr. Barbour put to you. He put these figures, I think, that from 1493 to 1850 there had been 650,000,000*l.* of gold produced on the whole, out of which, of course, a very large amount must have been wasted or consumed before 1850; that from 1850 to 1885, 890,000,000*l.* had been produced, of which also a certain quantity must have been consumed. Well now, supposing your remedy is adopted, and you bring in silver to the assistance of gold, remonetize it, the amount of silver, I think, produced from 1850 to 1885, was 480,000,000*l.*?—Yes.

5730. Now, if I understand the effect of bimetallism, it would not be to raise the value of silver as money by more than one-fourth, or more than it has fallen, would it?—No.

5731. Therefore, what you would bring in to the assistance of gold would be certainly not more than one-fourth of the 480,000,000*l.* as compared with the 890,000,000*l.*?—Yes.

5732. Well now, if the demands upon gold have been so great during the last 15 years that we want a very much larger quantity of money for our standard, how long and to what extent will this addition of silver to the gold have any such effect as you desire?—All that I said was that it would operate to a certain extent in assisting gold and in preventing this appreciation, but I tried to bring out the fact that the effect would not be very great. We should still get the appreciation going on even if we had the two metals.

5733. So that it would be only a very small depreciation, would it, of the present value of gold. If, during these last 15 years, we have so largely consumed gold as to make the 890,000,000*l.* produced since 1850 insufficient for our wants, then the present addition of about 100,000,000*l.*, which would be the additional value given to silver, would make uncommonly little difference, would it not?—Then there is the other fact to consider, of making the two standards.

5734. But that is quite a different point. My present question is only with regard to the scarcity of gold?—Yes, the position that I have always taken up is, that even with the two metals together, we shall still have appreciation going on.

5735. It is a very difficult thing to distinguish between what you can look on as being hoarded and used for ornament, and what you have available for currency purposes; it is very difficult to draw the line?—In the operation upon prices.

5736. You cannot tell when the French peasant may be tempted to bring his gold out of his stocking or the Indian peasant take off his wife's bangles to be

coined?—We cannot tell that, but till they do so they cannot operate upon prices.

5737. (*Mr. Barbour.*) I think you said that the general level of prices depended upon the amount of gold left over as currency, after all other demands had been satisfied?—Yes.

5738. And probably the amount left over as currency may be very much less than the total production of gold, since 1850?—Yes, certainly.

5739. Then if the amount left for currency happens to be very much less than the production, an addition of not very many millions to it might make a considerable difference in prices in the future?—Yes, it might do so, certainly.

5740. (*Sir T. Farrer.*) Have you thought what would be the effect of adopting bimetallism with a ratio of 15½ to one in India, first of all, on the supposition that India were included in the bimetallic League, and secondly, on the hypothesis that India were excluded. Let me ask you first, would you include India in the Bimetallic League?—Well, I have never thought out very carefully the different points in that question; naturally I should be inclined to include India.

5741. Suppose India were included, what would be the effect of adopting the ratio of 15½ to one upon India and upon the currency in India?—I should not think there would be any difference on the currency of India. I should think it would still mainly consist of silver.

5742. You do not think gold would go there any more than it does at present?—I cannot see any reason why India should change its actual currency from silver to gold.

5743. I was not asking so much with reference to that as to what would be the effect on the value of the Indian currency. Would it raise it by 20 or 25 per cent.?—Would the total mass of Indian currency rise in value, supposing India had so many millions of silver?

5744. Yes?—It would compared with the present prices on this side; it would raise it, but not in India.

5745. You think it would make no difference there?—No, no difference.

5746. But it would make a difference in its value for the purposes of export?—For purposes of export.

5747. And that would raise the value altogether, I suppose, would it not?—I do not think the adoption of bimetallism would make any difference on the general level of prices in India, because India would still use silver, and have the same amount of it.

5748. But you think it would make a difference on the level of prices here?—General prices on this side would rise to some extent.

5749. Why on this side and not on the other?—Because India already has silver, and it would not affect the currency of silver.

5750. But if it made the silver much more valuable for export in India, would it not cause an export from India or prevent an import of silver into India?—But I do not think the condition of trade would ever be such as to lead to the export of silver from India.

5751. But how could it have an effect on one side and not upon the other?—I am afraid perhaps I have not understood the question you put as to the value of the currency.

5752. Let me put it again more clearly. If I understand you, the adoption of the bimetallic system would have the effect of raising the purchasing power of silver in this country, at any rate?—Yes, silver would at any rate obtain more gold, and unless commodities rose in equal proportion, more of them too.

5753. And would it have the effect of raising the purchasing power of silver in India?—I think the general level of prices in India, being silver prices, would remain the same, and silver would fetch the same as before.

5754. (*The Chairman.*) You say that the change from 15½ to 1, to 20 to 1 in the relative value of silver and gold, has not affected silver prices in India, as a matter of fact?—Apparently not, as I understand it.

Mr. J. S.
Nicholson.

20 May 1887.

Mr. J. S.
Nicholson.

20 May 1887.

5755. (*Mr. Birch.*) But would it not affect them, supposing prices remained here the same? Prices would have to fall in India to meet a rise in the exchange?—I do not follow that. I do not think prices on this side would remain the same.

5756. The so-called bounty would disappear?—In my view the so-called bounty has caused a fall of prices on this side, not a rise in India.

5757. (*Sir T. Farrer.*) I am taking England as a gold-using country, and India as a silver-using country, as a case on which to try the bimetallic system, and I want to understand what would be the effect; do you think that the adoption of this bimetallic system would be slightly to raise the level of prices in England, or make it higher than it would otherwise have been?—Yes.

5758. Would it have any, and if any, what effect on the silver prices in India?—Unless silver were sent to the East, general prices in India could not rise. Of course, articles of trade between the two countries would be the same, allowing for transport.

5759. It would make silver slightly more valuable here, and therefore it would make it a less desirable article of export?—So far.

5760. That would diminish the supply of silver for India?—It might not be sent to India in such quantities, so far.

5761. And in that way it ought, theoretically, to cause a fall in prices in India, ought it not?—So far.

5762. (*Mr. Barbour.*) There is a great deal of silver sent to India at present, is there not?—Yes.

5763. And there is good reason to believe that a large proportion of that silver is hoarded?—Yes, I have seen that stated. Of course I have no information.

5764. Assuming that to be the case, that silver would have no effect upon Indian prices?—No.

5765. But if that silver instead of being sent to the East had been coined in France, it would probably not have been hoarded to the same extent, and would have had an effect on prices in the West.

5766. (*Mr. Fremantle.*) I understood you to infer, in answering Mr. Chaplin, that the failure of the Paris monetary conferences was due to the action of England?—That was my impression, that England refused altogether to have anything to do with any international convention.

5767. And are you aware that the resolutions which were passed at the Conference of 1878, and which did not recommend the adoption of bimetalism, were proposed by M. Léon Say, the President of the Conference?—Well, I have not read the report recently.

5768. The third resolution ran as follows: "That the differences of opinion which have appeared, and the fact that even the States in which the double standard exists, find it impossible to enter into any engagement with regard to the unlimited coinage of silver, precluded the discussion of the question of establishing an international relation of value between the two metals"?—I cannot recall the resolutions which were come to, but my general impression from reading the evidence was that it was the refusal on the part of England to entertain the proposal at all which made it impossible for the proposal to be adopted.

5769. Well then, at the Conference of 1881, no resolution whatever was proposed?—It was well understood, at least I gathered so from the report, that the English commissioners were instructed to entertain no proposal.

5770. Apart from that, there has not been any thing like a consensus of opinion on the part of foreign nations in favour of the adoption of bimetalism, as shown at the conferences?—I am not able to say that there has been; but still I should have been inclined to think that at the present time the United States, France, and Germany, if England agreed, would

also be willing to agree, but I have no special information.

5771. Do you not think that it is rather for foreign countries, some of which have had experience of bimetalism already, to raise this question, than for England to come forward with offers of new arrangements?—I do not know whether it is for England to take the lead in such a measure. I am not able to give an opinion merely on a question of policy. It would be quite enough, I should think, if England were to express no unwillingness to entertain the proposal.

5772. (*The Chairman.*) You exclude from the volume of currency which would affect prices all gold, supposing that to be the standard, which is used for ornament or hoarding?—Yes.

5773. You include all the rest?—Yes, I think so.

5774. Well, the gold that is not used for the purpose of ornament or for hoarding would be gold, either turned into coin, or held as reserves by banks?—Yes.

5775. Now, when this special demand for gold arose in Germany, can you tell us whether that diminished the coinage in gold-using countries or diminished the reserves?—I have no information as to the exact sources from which the supply of gold came for Germany.

5776. Supposing that gold went from France to Germany, and the gold that went from France to Germany were replaced in France, if not by coined silver by silver reserves, that would have no effect upon the volume of the currency, would it, at all?—No, so far I should think there would be no effect on general prices. So far as that was concerned, it would be merely the substitution of one metal for the other between two countries.

5777. When the transaction was completed, Germany had so much less silver, so much more gold; is there any evidence to show that, taking all the countries together, the volume of the currency in the sense in which you have explained it, that is, coinage and what was held in reserve, was less than it was before?—That the volume of the currency was less?

5778. Yes?—I am not able to give any statistics; that was my impression.

5779. It would not necessarily be less, would it?—Not if the gold were drawn from silver-using countries. If the gold were drawn from bimetallic countries, which would take silver instead, then it would not necessarily be less.

5780. But it must have come in some such way, must it not, unless you have had an actual diminution of the coins in use by some country, or an actual diminution of the reserve?—Well, I thought it might come, to a large extent indirectly from undeveloped countries, because those countries were indebted to countries on this side. That was my impression, but then I am not able to quote definite evidence in support of that view; but that is one way in which it seemed to me that the diminished gold might act upon prices.

5781. Or do you think it possible that, to a certain extent, it was got by diminished supply at the time, for the purposes of ornament?—I do not think it could be obtained in that way.

5782. Or hoarding?—There again it possibly might come from hoards. I do not know whether the French peasants hoard gold as well as silver.

5783. So far as it came from hoards it would not affect the volume of the currency, in fact, so far as it came from hoards, it would be so much brought into currency, which did not form part of the currency before?—Yes; but then it would displace silver, which would become a commodity.

5784. But that would leave things as they were?—It would so far leave things as they were. I am only able to give a theoretical opinion on the possible sources of the supply. I cannot say as to the facts where the supply really came from.

The witness withdrew.

Adjourned till Monday.

Twenty-third Day.

Monday, 23rd May 1887.

PRESENT :

THE RIGHT HON. LORD HERSCHELL, the CHAIRMAN, presiding.

MR. D. M. BARBOUR, C.S.I.

MR. J. W. BIRCH.

MR. HENRY CHAPLIN, M.P.

SIR T. H. FARRER, BART.

MR. C. W. FREMANTLE, C.B.

MR. GEO. H. MURRAY, *Secretary*.

Mr. HENRY HUCKS GIBBS recalled and examined.

5785. (*Mr. Birch.*) I believe that to carry out your bimetallic scheme you consider it imperative that there should be an accord of nations, and have stated in some of your writings on the subject that such a thing is clearly possible, and that all doubts raised by people of the contrary opinion have no foundation?—I never like to say that other people's opinions have no foundation whatever, but I think that whatever the foundation, the superstructure they build is incorrect, for I have no doubt whatever that such an arrangement could be made.

5786. I do not know if you have read an article on "Coin and Coinage," by Rice Vaughan, 1675, published in "Select Tracts on Money." I was struck by a paragraph which bears on this subject, and I wish to ask what you have to say with regard to it. He says: "Amongst all the remedies propounded against the alterations of moneys there is none more specious than this, nor more frequent in mention, both in provisional edicts, which are made for the reformation of moneys, and in considerations held for the purpose, for it is said to advance it. That if we contract with other nations for a certain and stable standard of moneys which may be equal, then we shall avoid all the inconveniences that do grow by the raising of moneys, because we shall never raise them; and we shall avoid all the inconveniences that do grow by the not raising of moneys, because other nations shall not raise theirs. Besides for this remedy there is alleged the example of former ages, wherein it appears that in many treaties with foreign nations our kings did contract for the mutual standard of their moneys. But however the propositions be, specious and frequent, yet, of all other remedies, if it be thoroughly examined, it will appear the most difficult, or rather impossible to be effected." He then gives certain reasons, and goes on: "But suppose it was possible to draw all those countries to a certain contract, what would be the use of it? I did, in a former chapter, observe that most countries, and particularly France and the Low Countries, do seldom or never raise their moneys; but when people by custom and general use have raised the money beforehand beyond the publick declaration, and the State is forced to follow the people, whom, in this case they do not master, to what end is it then to contract with those nations for that which is not in their power to observe? And that which is alleged for the course of contracting, with foreign nations, out of the example of former times, doth clearly convince the vanity of this proposition, for it is manifest, as I have showed in former chapters, that notwithstanding these contracts, the money was continually from time to time raised"—Rice Vaughan's article has, I think, merely a literary interest. The state of things, politically and otherwise, is so wholly different now from what it was in 1675, that it is impossible to cite then-existing difficulties as appli-

cable to our present question. He and his contemporaries would have thought the making and maintenance of a postal convention, a copyright convention, an extradition treaty, a Zollverein, quite as impossible or fruitless as a treaty against "raising of moneys;" yet all these things have been done, and done successfully, in our own time. But even the contract which he thought it so impossible to maintain would be easier to maintain now, though still most difficult. You have not, I think, rightly apprehended what that contract was, and how totally different it was from that which I propose. Your extract relates not to the question of a fixed ratio between gold or silver at all, but to the fixed standard of the metals which were used as monies, that is to say, that the alloy should be so much or so much, and the weight of the coins so much or so much, not that this or that metal should be used. That is the meaning. It was recognised at that time, and always understood when monies were talked of, that the two precious metals were the monies that they meant, not the particular metal gold, or the particular metal silver, though silver in one country, perhaps, and gold in another, was the metal ordinarily used. Vaughan is speaking of the foreign *coins*, which, as you know, were commonly current in England, and it was obviously important to Englishmen that they should be of the weight and fineness recognised by law; whereas it was notorious that both here and abroad coins were frequently deficient in one or the other or both. "Raising of monies" was causing them to pass for a higher value than their true contents indicated. I have known war made, even in modern states, for this *teterrima causa*. My remark on it is that one could quite well understand that by cupidity and bad faith, which were not infrequent in Governments in those times, an attempt should be made in many cases to over-value their coins, that is to say, to diminish, in the case of such and such a coin, its true weight and fineness; but it does not seem to me to affect the proposal that I have made, that is, that there should be a definite ratio agreed upon by all of the principal commercial nations between gold and silver. What has troubled people in former times has been the badness of coinage rather than the difficulty of an agreed ratio, the coins have been clipped, good coins have been issued, and the bad coins have remained and the good ones have left the country; but none of those evils would happen in the case of an agreement for a certain ratio. I see nothing there that at all militates against what I have said before, viz., first that the other nations would be willing to make such an agreement; secondly, that there would be no inducement to them to break that agreement, the only possible inducement being that of self-interest; and I have shown that self-interest would cause them to keep to it rather than to break it; whereas it is obvious that self-interest, or what they deemed to be self-interest, induced kings in those days to "raise" their coins, and thus put money into their pockets

Mr.
H. H. Gibbs.
23 May 1887.

Mr.
H. H. Gibbs.
23 May 1887.

They could make their coins what they would, but they cannot make gold other than gold, nor silver other than silver.

5787. Then what have you to say with regard to Professor Stanley Jevons, when he makes the following observations. He says:—"The perpetual maintenance of this supposed convention is the only safeguard against the most serious inconvenience to some of the parties to it. The convention would resemble a chain, the breaking of each link of which would throw an increased strain upon the other links. There exist, indeed, a good many international conventions, relating to postal intercourse, extradition of criminals, copyright, and so forth; but in none of these cases would the breaking or suspension of the convention result in any ruinous consequences. There would be suspension of benefits rather than occasion of evil. But should war break out among some of the countries involved in the monetary convention, the probable effect would be to throw the mass of silver coin upon neutral nations. This might be done without any express breach of the convention, simply by the issue of paper money, a measure which we cannot pretend to consider unlikely, seeing that the chief difficulties of the present monetary situation arise out of efforts for the withdrawal of recent paper money issues?"—This last suggestion as to paper money is perfectly true, and I have met the objection long ago. There is no doubt, in the first place, that anybody could withdraw from the convention; in the second place, that a state of war might make it necessary for one or more, not to withdraw from the convention (there would be no longer for the time any question of convention with such a nation or nations) but to issue paper money as they have done heretofore. Then the question is, what would be the effect upon themselves and what would be the effect upon other nations, and in what would the case differ from the present state of things that we now have. The effect upon themselves would be that it would put them for the time, in fact though not in law, clean outside of the convention, as if it had for them never existed. It would do no more harm to themselves than it would now. The effect upon other nations would be, not as Jevons says, that silver only would be thrown upon other nations, but that whatever coin, gold or silver, or silver and gold, they were using, would be thrown upon the other bimetallic and monometallic nations. What would be the difference between such a state of things, and the same course of action in the present monetary status? If France and Germany went to war and chose to depart from their present system, it might be that they would go to an inconvertible paper currency. The gold that is used in their money would be thrown upon the gold-using nations; if it is a harm to the gold-using nations to have the gold thrown upon them, the result of which would be nothing but an increase in price, that harm would be suffered. The silver would go to silver-using nations if any existed; that is to say, it would go back to Mexico or be thrown upon India; one does not know where it would go; but the gold would go to the gold-using nations and the silver would go to the silver-using nations. I do not see myself that any great harm would happen, but most certainly no greater harm would happen under a bimetallic convention than under a monometallic system, but rather less. So much for that. When Jevons speaks of the strain that would be put upon the others, no doubt there would be a strain if all nations but one retired from a bi-metallic convention, one nation or group of nations; that we know by experience already. We have seen that France and the Latin Union were left alone in their bimetallic condition, in the face of gold and silver-using nations. As I have said before, when I was examined on this subject, I do not think, and very many people in France did not think, that any harm would have been suffered by them; but, at all events, they were afraid of it and they gave it

up. But that is the case of one nation left alone. To make Jevons' fear at all germane to the matter, you must have all nations withdrawing but one; because, if France for 70 years, and with a most extraordinary difference in the production of gold and silver, could maintain a bimetallic law, much more than could two nations, and if two nations could do it, very much more could three, and still more could four, in greater proportion.

5788. I believe you have something to say with regard to the disposition of the Netherlands to join a convention?—I knew nothing before about the Netherlands; I knew what was the disposition of the United States; I could form a very good idea of what was the disposition of France, and of the Latin Union, except Switzerland of whose present disposition I know nothing, and of Germany too; but I happened to meet Mr. Pierson the other day, the Governor of the Bank of the Netherlands, and Professor of political economy there (whom I have already quoted), and he tells me that the opinion is very strong in the Netherlands, and very widely spread, in favour of the bimetallic agreement. I saw also, a few days ago, a charter which has been granted to the Bank of Amsterdam by the King, and there the charter reserves to the Government the power of enforcing upon the Bank of Amsterdam the taking of gold and silver at a mint price, if a bimetallic agreement should be entered into, and if such enforcement should be made upon the chief banks of the other nations, parties to the agreement; so that it seems it is not only desired by the people, but in contemplation by the Government of that country.

5789. (*The Chairman.*) You have spoken of the tendency of the depreciation of silver in relation to gold to stimulate production in the silver-using country, as, for example, in the case of wheat from India. Suppose you had a fixed relation between silver and gold, that stimulus would still exist in the case of a wheat-producing country, with a depreciated currency?—With a paper currency you would say.

5790. With a paper currency; I was thinking of Chili?—Certainly it would, and since I spoke of that, I learn that, much to the displeasure of some interests in that country, the Government of Chili has passed a law for the gradual redemption of their paper money and resumption of cash payments, calling in and destroying \$100,000 a month from the 1st of January last, till the issue be reduced to \$18,000,000. In 1887–88 \$1,200,000 will be spent in silver, and \$1,500,000 in following years, to be deposited in the mint against legal tender notes. The Act was passed March 14, 1887.

5791. You said in your evidence, in answer to question 3054, with reference to the risk of fluctuation being guarded against by arrangements made by the merchants with an exchange bank, that the arrangement made by the merchant with the banker only transfers the risk; some one must suffer. Well, suppose that the banker could arrange at the same time, or knows that he could arrange at the same time, a reverse transaction; in that case nobody need suffer?—I must again say that I am talking of what I do not personally know. The point arose out of questions relating to India, with which country I have little commerce. In the trade of Chili, which has also a depreciated currency, and with which I am familiar, the same operations would also be possible if the banks there were exchange banks, but as a matter of fact they are not, and the merchants have to bear each his own risk, guarding himself as best he can. In the case supposed by you, if or when it occurs, the banker need not suffer.

5792. Nobody need suffer in that case?—No; that does not follow, because the risk must be there, and must be paid for, in meal or in malt.

5793. But surely, supposing that I know that A has to pay 1,000*l.* in gold in London on a particular day, and has to arrange for that, and B has to receive 1,000*l.* in gold in London on a particular day—the

same day—and has to arrange for that, it does not matter whether gold goes up in relation to silver or goes down in relation to silver, the transaction will be precisely the same. I do not quite see in that case where any risk exists?—The risk to the merchant may be compared to that of the perils of the sea, which you do not annihilate by opening a policy of insurance. The banker makes an arrangement with him and charges him so much for it. At the same time, according to your supposition, the banker makes an arrangement with another merchant, on whom a like risk presses, and frees him, as he freed the other, from the risk of fall or rise in the exchange, taking the two risks upon himself, and exacting a compensatory turn in the exchange from both; and that is how the banker lives. But you think that he has cancelled the risks, and runs none?

5794. The only risk to the bank might possibly be, in that case, the solvency of the person who had agreed to make the bank the future payment?—It would be so in that one case, but the rate may fluctuate every moment.

5795. How, in that case, is there any risk of fluctuation? The same sum has to be received and paid in the same metal on the same day?—Business could not really be done in that way. The bank must be paid for relieving the merchants of their risk.

5796. Yes, but is not the one risk exactly a set-off against the other? Are there not two contrary risks which exactly balance one another?—There are in the case you suppose; but then as between A and the bank, and B and the bank in each case a risk has to be got rid of and paid for; they put that risk upon the shoulders of the bank, and the bank may be willing to take it, but if it does it must certainly be paid.

5797. But do they put any risk upon the shoulders of the bank?—What is to them a risk.

5798. Do they put any risk upon the shoulders of the bank if the risks are equal and opposite?—What to them is a risk, and, except in your supposed case, is also a risk to the bank.

5799. Yes; but then you said that some one must suffer. I cannot quite see how anyone suffers there?—Yes they do, because they have to pay a premium to the bank for taking upon itself what, by your present example, indeed, is no risk to the bank, but which is in any case a risk to the person paying the bank, for which he has compounded.

5800. Your expression was “that is only transferring the risk; someone must suffer.” Of course I understand your view, that however small the risk, or even if the risk is nothing, the banker will charge something for being at the trouble of the transaction; but I did not quite see how any risk was transferred if the bank can so arrange as that it has two reverse operations at the same time?—If there were no risk the banker would charge, as you now say, some slight commission for the trouble of the transaction. In point of fact, the bank charges a very considerable sum, because, to each person who has to come to the bank there is a certain but an undefined risk, and the bank either will or will not take that risk and arrange it. But at the moment of its making the arrangement with the first man it has taken his risk on its shoulders, and if exchange goes against it, it makes a real loss. In the meanwhile it may possibly have made an exactly opposite arrangement with another man, but it may not. The exchange may have altered in half an hour, and the transaction may leave a loss in both cases. Sometimes the bank will not take the risk at all from either, as I think I mentioned in one of my answers. When I gave the answer first, I told you, or I told the Commission at the time, what the amount of exchange was that the Indian bank charged; when I spoke of it again a few days afterwards I had to say that at *that* date the bank would not take the risk on any account whatever.

5801. I was not in the least questioning that in many cases there was risk, and the bank would take

that risk, and would charge for it; but what I did not quite understand was your view that in all cases, in the case of every transaction, there must be risk. It struck me that there were some cases where there would be no risk?—There are some cases in which, by the good management of the bank or the fortuitous demand and supply on both sides, the bank itself may on balance have incurred no risk, but the merchants A and C have both of them incurred a risk upon their shoulders which they have been able to transfer to the bank. Those two risks, by your hypothesis, have neutralised one another; but that would show no gain to the bank when it came to make up its accounts at the end of the year, for whereas it had often made a loss, and whereas it had often made a gain, that time there would indeed be no direct loss, but there would be no gain. Business, as I said, could not be carried on in that way. An equal transaction such as you imagine, though showing no loss in itself, is a dead loss to the bank. Take the case supposed in Q. 5793. The bank, it is true, pays and receives R. 10,000 and gives and takes a bill for 1,000*l*. Why should it do so? It is there for the very purpose of making gains in such transactions and to take contrary risks, balancing one another would be to stultify itself and starve its business. What really happens is that it takes a risk from the first merchant, and charges such an exchange as it hopes will give it a good profit. Its risk is that the exchange, which varies every hour, may fall away from it, and that future transactions may reduce the other to the blank you suggest, or to a loss. You must bear in mind also that as to the merchant's risks, he may expect to arrange with the bank but may not be able to do so. The exchange may vary while he is thinking about it.

5802. Yes, but if, as a rule, owing to the course of trade between the two countries, the bank can arrange counter transactions, so that there is only a comparatively small balance left over in relation to the total of transactions, the risk undertaken by the bank would be on the whole small?—But the profit gained by the bank is, on the whole, considerable enough for the bank to live by it, and it must, as you say, be commensurate with the risk.

5803. That would depend on the charge they make, and I do not quite see if the risk is small why competition in that as in other things should not make the charge small also?—You see small is a relative term. Whatever it is, it is that which measures the risk, and, as I said before, the banks live by it. If the risk were small, competition would regulate their compensation for it, as it does now. But their compensation is sometimes very large, therefore so must the risk be. I am speaking now of what I do not practically know, because I am not an Indian merchant, nor am I in the sense of residing in South America and doing the business myself as a South American merchant; but from what I hear from my partners it is a really definite and certain risk (though its amount is indefinite and uncertain) which is incurred by the merchant and borne by him. In the case of India there is the same risk which is or may be taken over by the banker, and the profit of the banker exists in the clever management of that branch of his business. The bank receives a rate of exchange from this man and a rate of exchange from that man, on both of which he hopes to make a profit, and by the manipulation of those two customers, whether it is on the one side or on the other, it minimises its own risk; but risk there certainly is, for the exchange is constantly varying, and those exact compensatory transactions which you imagine and which would annul both risk and profit can seldom exist, and then only by accident. My point is that, if there is a risk in a paper-using country where (barring further excessive issues) the exchange depends on the more or less demand for bills, much more must there be a risk in a silver-using country where the exchange is liable to sudden fluctuations caused by the fall or rise in the gold price of the metal.

5804. There is one answer you gave that I should

Mr.
H. H. Gibbs.
23 May 1887.

Mr.
H. H. Gibbs.
23 May 1887.

like to ask you a question upon. You were speaking, in question 3069, of the stimulus given to the growth of wheat owing to a decrease in the initial cost. You say that "so much has it done so that I may safely say that if the exchange" rate rises to 36*d.* or 40*d.* no wheat would be grown for export. Now, I do not quite understand why you fix that price?—I asked my partner, Mr. Low, whose paper you have before you—I asked him what sort of rate would make a sufficient alteration to stop the growth of wheat for export, and he said, "I should think 36 or 37 would quite suffice; I do not think there would be another acre grown."

5805. That would depend, would it not, upon the condition of things in other wheat-exporting countries, because the theory is that the fall in exchange stimulates the growth of wheat, and at the same time produces a fall in prices in the country to which the wheat is exported?—Yes; but it is not the fall in exchange which has any *direct* effect on the prices on this side. Prices are lowered both by the temporary lessening of the initial cost of production which enables the recipient of the wheat to sell cheaper, and by the increase of production which breaks down the price by competition.

5806. Well, would not the contrary transaction—a rise in the exchange—have a contrary effect and produce a rise in prices, and if there was a rise in prices would it not become profitable to you to export wheat produced at a greater cost?—If there was a rise in prices, the rise in prices would take place because of the non-competition. If India and Chili ceased to send wheat to this country, of course the natural consequence would be that there would be a rise in prices in this country, and a point might be reached when again, notwithstanding the rise in sterling value of the cost of production, it might be profitable to grow wheat there; if, for example, it got up to 60*s.* again.

5807. If the proportion of wheat exported from Chili as compared with the wheat exported from India and elsewhere was large, that would have a tendency, would it not, to bring prices up, and therefore, to make production in Chili profitable, at a cost of production which would not make it profitable before?—You mean, I think, if I understand you, this: if the production of Chili were sufficient to make an important difference to the grower of wheat in England, or to the grower of wheat in other countries, then the price here would so rise that the Chilian would be again able to resume the growth of wheat. Yes, I suppose it would be so. It is therefore extremely difficult to fix a particular exchange that would make a difference.

5808. There is a question I should like to ask you upon your answer to question 3080. The question is this: "Let us consider the case of a silver-using country which is isolated, and not trading with a gold-using country at all. There, if the currency depreciates, the manufacturers are stimulated"?—"Yes." Why is that the case if it is not trading with a gold-using country?—There I am talking the language of other people rather than my own, but I imagine it to be this, that the Indian sending goods to China knows exactly that the value of the silver in China will be to him the same as the value of the silver that he has got in India, it will differ only by the fluctuations of exchange consequent on supply and demand. If he sells for a certain number of grains of silver he will get that silver in his own country, which will buy him the commodities that he desires. If, on the other hand, he has to deal with a gold-using country, there is no fixed relation between the two metals.

5809. Has that answer relation to a silver-using country trading with a silver-using country?—Yes, I mean that.

5810. It speaks of its being isolated; I suppose it meant to refer to its internal trade?—I do not know why the Chairman used the word "isolated"; if he meant to refer to the internal trade of the country, I misunderstood his question. If it had no trade with

gold-using countries there would be no stimulus caused by the fall of silver in terms of gold.

5811. Supposing it is a silver-using country trading with a silver-using country, the stimulus given arises from a totally different cause and is of a totally different character from the stimulus you have spoken of to a silver-using country trading with a gold-using country?—Certainly. I should say it is not a stimulus at all; It is a different thing altogether from that that we spoke of just now.

5812. I do not see quite why it is a stimulus at all if it is a silver-using country trading with a silver-using country. Whatever depreciation there is, is a depreciation in both alike?—Yes, it is exactly the same, in both.

5813. Why is there more stimulus than if both of them stood still?—It is exactly the same as England dealing with Australia. You send your goods there and you know you will get so many shillings, that is to say, so many twentieths of a gold piece, and the currency being the same you know what you have got. I have said that I think the word "stimulated" in Q. 3080 was incorrect.

5814. If there is a depreciation it will be in both alike? Why should that give more stimulus than if both had remained without any stimulus at all?—I do not think it does; except as compared with the dealing between countries that have not identity of money. I cannot see myself that it is a stimulus in any other sense than that. They are able to deal with more ease of mind. Their trade is diverted to the silver-using country, because they know what they can do with it, whereas they are afraid of dealing, as I think I have before said, with the country having a different money.

5815. I do not think that is clearly brought out by the answer. I understand you to be speaking of the comparison between a silver-using country dealing with a silver-using country, and dealing with a gold-using country?—Yes.

5816. With reference to that point, that high prices have a tendency to stimulate trade, and low prices to depress it, is not that likely to be very temporary. If high prices stimulate trade, are not they likely to lead very rapidly to over-production, which will cause a reaction?—Certainly they are likely to produce a reaction if trade is stimulated to the point of rash speculation; and therefore it is that I do not speak of high prices as being in themselves a good. All that I have said really comes to this, that a condition of continual falling of prices is depressing to the trader and depressing to trade.

5817. Of course a large business at small profits might be more profitable than a small business at large profits?—Certainly, small profits will do just as much as large.

5818. And low prices may bring into the market so many additional consumers as to make the total trade done larger in volume and as profitable to those engaged in the enterprise?—It might; but there again if you mean altogether low prices it comes to the same thing; it is the falling condition of trade which is hurtful. I speak historically rather than theoretically there; as a matter of fact we know it has been so, we know that a period of falling prices has been usually coincident with short supplies of the measure of value, and with depressed trade.

5819. In questions 3508 and 3509 you are asked: "Is not the distinction really to be found in this that in the case in which there is a forced currency running side by side with gold, gold is wanted by those who have to make foreign payments, whereas in a truly bimetallic country it is a matter of perfect indifference to the inhabitants of the country, whether they take gold or silver for their purpose." And your answer is "Yes." Well, that would not be so, would it, unless the country in which the payments have to be made is bimetallic and at the same ratio as the country which has to make them?—Certainly, but that I have fully

gone into afterwards. (Q. 4588.) They must be of the same ratio or else it would seem very greatly to import to the remitter whether he remitted one metal or the other.

5820. I should like to ask you one or two questions about the demand for gold arising from Germany changing her monetary system. Do you take the same view as Mr. Nicholson that the gold which one has to look to in the country that has a gold standard as increasing the volume of the currency is only that which is coined or which goes into bank reserves, and therefore is in the same position as gold actually coined, excluding, I mean, gold that is hoarded or which is used for the purposes of the arts?—I think I have expressed in a former answer that you may consider all those things, the hoarding, the use in the arts, as in some sort a relegation of the gold to the mines, the difference being that the original mine is difficult to be worked; the mine of hoarded money is easy to be worked, and in proportion to the ease in which the gold or silver in hoards or in the arts is attainable, so is that indirectly effective in the question of price, but that I think which really is the main regulator of price is the quantity of gold or silver presently coined or coinable.

5821. Therefore, so far as the gold which was required by Germany and by Italy came out of hoards, that would make no difference with reference to the volume of the currency?—I should think not.

5822. So far as it was diverted from use for the purposes of the arts also, it would make no difference?—In perhaps a differing degree it would be so. There has been, I think, as matter of fact, no such diversion; one can see no evidence of it.

5833. Then, if after Germany had supplied itself with gold, the total currency of the world, whether in gold or silver, was as great as before, you would not expect that to produce any effect upon prices, would you?—Yes, I should, in gold-using countries; because the price is the relation of the mass of gold to the mass of commodities measured by the gold.

5824. Not as to the gold, because Germany and France were still using silver; therefore, I say if the total volume of gold, plus silver, that was either in the form of coinage or in the form of gold or silver in the bank reserves, was as great as before, you would not expect any change in prices, although the distribution of the gold and silver amongst the civilised countries might be different to what it was before?—If the only change that took place was that Germany and Italy used gold, whereas it had theretofore used silver, and the gold, though taken away from its occupation in other countries, was replaced by silver which was to do the work which the gold did there before, there would be, I suppose, no change in prices on that account; but in point of fact that was not so, because, in the first place, Italy—that was not a very great quantity, but in Italy it replaced paper. It was the converse of that which Mr. Birch asked me about just now, that is to say, a nation that should leave off the use of the metallic currency and take to paper, whereas this left off the use of paper or diminished the use of paper and took to a gold currency. Then again, silver did not take the place in the other countries of that quantity of gold that had been taken away from them. Silver, to the extent that I mentioned in an answer to one of Mr. Birch's questions before, lies unused in many parts. The mints of Germany and France are now closed to silver, which, if opened again, would put more into the category of coin or coinable metal.

5825. But did not a large quantity of the gold go from France to Germany, in 1873, at the time of the demonetization of silver by Germany?—At the time of the demonetization, yes.

5826. And in France was not that, to a considerable extent, replaced by silver?—I take it, it must have been so. I have not before me the figures of the replacement, but I think it must have been. As to the movement of the gold, in part it was a movement direct of gold, but a great deal of it was done by

bills, of course, and by claims of France upon other countries which they had to satisfy to Germany by delegation from France.

5827. Of course that would make no difference in the volume of the currency?—That would make no difference at all, but so far as it was the actual movement of gold, that must have caused a contraction of the currency in France, and that contraction of the currency would doubtless have been filled up by silver coming in, so long as the mint was open.

5828. And so far as it was filled up by silver coming in it would make no difference?—Not at that time. France would feel the contraction of the gold measure as much as we should, except so far as silver would supply its place. When the mint was closed to silver the gold would alone bear whatever fluctuation might happen. But at first it would make no difference to France.

5829. Or to the total currency of the world?—Not so far as silver was used. Silver was used in France instead of being used in Germany, that was all. So far as it went, a great deal was still used in Germany, but so far as it was a mere exchange of the yellow metal for the white metal, of course it made no difference.

5830. But where did the gold go from to Germany?—A great deal of it was taken out of our vaults here, but that must only have been because England owed it in some way or other. It caused a great multitude of fluctuations of the rate of discount of the Bank of England, of which I spoke last time.

5831. Is there any reason to suppose that our currency, including in that the coinage and the reserves, is less than it was?—It is very difficult to answer, but it is said that it is; that is to say, it is said that there is less gold in this country than there was; as to the gold in the Bank of England, one knows perfectly well how *that* is. I think in 1876 there was 30,000,000*l.* odd of gold; now there are 23,000,000*l.*; but the slackness of trade has no doubt diminished the necessity for the use of the metal; that is, they have reacted upon one another.

5832. I was rather looking upon the effect in and subsequent to 1873, to see if one could ascertain whether the total currency of the world had become diminished, or whether the distribution of the different precious metals had really been altered?—I think, taking into account the increase of population, and the increase of commodities, which, after all, fills the other scale, that the active money metal of the world has been diminished. Silver, as I said in former answers, lies unused, but it is very unlikely that the silver portion of the world's currency should have diminished. I do not see how it touches the matter before us to ascertain whether both the measures of value in the world have lessened in quantity. My contention is that gold is lessened in quantity for the work it has to do, and that, as gold is alone our money, *that* is what touches us nearly.

5833. (*Sir T. Farrer.*) But the quantity visible in the reserves of the banks of the world has, on the whole, largely increased?—No, I gave you the figures. It was 30,000,000*l.* odd in gold, in my time, when I was Governor of the Bank of England; it is now 23,000,000*l.*

5834. (*Mr. Birch.*) I think the gold in the Bank of England has not increased?—No, not at all.

5835. If you take the Bank of France, the gold in the Bank of France in 1873 was 27,000,000*l.* sterling; it is now 52,000,000*l.* sterling?—Yes, but you must remember that the Bank of France was not everything in France, as much as it now is. I wish to explain how that is, so far as I know. I am not so well acquainted with those matters, but I am told that the Bank of France has very much more in the last decade gathered to itself the gold of the country; and the other banks in France, owing to the use of cheques and so forth, do not keep the same amount of gold. I do not give that at all of my own knowledge.

5836. In silver she held, in 1873, 6,000,000*l.*; she now holds 45,000,000*l.*?—Yes.

Mr.
H. H. Gibbs.
23 May 1887.

Mr.
H. H. Gibbs.
—
23 May 1887.

5837. And the whole of that is issued; it is represented by paper; it circulates exactly the same?—Yes, that is what I argued; it is absolutely in use, that is, and had been in great measure I am told withdrawn from the provinces.

5838. But surely you are aware that there is any amount of silver now in France?—No doubt there is, if you say so, but that is in people's pockets; but what I mean is that in banks and in the tills of merchants and in the tills of traders, I am told that there is not nearly the same store of gold and silver as there used to be.

5839. (*Mr. Barbour.*) You think the tendency of the modern system has been to accumulate money in the banks; consequently you may see more in the banks, but it does not follow that there is more in the country?—In the chief banks the tendency, I think, has been to accumulate.

5840. And I think there has been a tendency to use notes more largely?—Abroad, certainly.

5841. And, I suppose, that would be a reason for more gold appearing in the banks?—As Mr. Birch says, the silver is represented by notes, which may be said to be actually the specie current in the form of paper.

5842. (*Mr. Birch.*) You were talking about notes just now. Supposing that France and the Latin Union came to some arrangement for the issue of notes, internationally between those countries, would you advocate our entering into the union?—Certainly not, unless based upon the precious metals; and I do not see my way to any international arrangement for so basing them. In any case I am not at all inclined to enter into any arrangement for an inconvertible currency, such as that indicated.

5842a. Not even if there were a complete accord of nations?—Inconvertible currency would obviously not be affected by any possible accord of nations; it is a wholly different matter, because, if you have an inconvertible currency, unless you have an absolute accord between all nations whatever, and with everybody to whom you may have to remit, you would not at all regulate the value of the metal which you would have to remit to such a country as was excluded. It would not help you in the matter of remitting to China.

5843. But supposing you had accord as far as Europe is concerned; and, say, that a note of the Bank of France, for instance, was equivalent here to so many pounds sterling, and a note for so many pounds sterling was equivalent to a note for so many francs in France, they might be interchangeable on a basis if you secured the accord of nations?—You mean upon specie, do you not?

5844. I mean a pound sterling in paper should be recognised for so many francs in France, and a note of the Bank of France should be worth so many pounds in English notes here?—But it must be either convertible or inconvertible.

5845. Well, inconvertible, or whatever you like to call it, a certain arrangement has been made by each country, and those notes are circulated freely in each country?—My answer is, that if they were to be inconvertible notes it would be absolutely impracticable, and bad policy if practicable.

5846. Naturally notes would be a much more convenient mode of discharging international obligations than specie, and it is conceivable that France, Germany, and other great nations of Europe might combine to say that in each country their notes should be reciprocally current at such and such a ratio. Would you advocate that England should enter into such a combination for the general benefit?—What I desire is an agreement between nations that the metals which are recognised in all the civilised countries of the world as money, should be used as money in those agreeing nations. There can be no question of *ratio* between inconvertible notes nor between two promises to pay the same thing. The idea of ratio is lost, though it is conceivable that a

nominal par of exchange should be established even between inconvertible notes issued by two countries. But if behind your question there is the meaning which your use of the word ratio implies, that the contracting countries should mutually recognise the two metals, at a fixed ratio, as the basis for their interchangeable notes, then the plan would have its advantages; but the world is not ripe for it, and, I doubt, never will be. It would be an international development of Ricardo's plan of deposit of bullion on which notes should be issued. But international confidence is not sufficiently developed to allow of notes issued on deposits in a foreign country becoming legal tender in neighbouring nations. Imagine German and French notes legal tender in England, and a war breaking out between those nations. I fear there might be a possibility of either nation, under stress of war, laying, at least temporarily, hands on the specie.

5847. (*Sir T. Farrer.*) I think you said in one of your former answers that the present state of things makes it dangerous for gold-using nations to speculate in silver-using countries. You have, I think, some particular instances that you wish to mention:—Yes; I stated before that, as a general rule, it was dangerous to attempt industrial enterprises in silver-using countries (except on a gold contract), but I had no particular instance to give you. Now I will mention that the Mexican Railway report is just published, and the loss on the difference between the price of silver as it was computed—it is only a computed price like that of the 2s. to the rupee; it is 4s. to the dollar—the loss is something between 90,000*l.* and 100,000*l.*, that is, more than 46,000*l.* for the last half-year.

5848. The loss to whom?—The loss to the enterprisers; to those people who sent their money there to make the railway.

5849. The loss to English shareholders?—The loss to English shareholders.

5850. Who have to be paid in gold?—Of course they are paid in gold, when they are paid anything at all.

5851. But the earnings are in silver, and it is the turning of that silver into gold that causes their loss?—The silver is remitted hither and sold, and that is the loss.

5852. (*The Chairman.*) If the depreciation of silver has stimulated production there, may not that more than have compensated the railway company for the loss in exchange?—No, I think not; very far from it. Of course it would have some effect, and that effect is now beginning to be felt. The downward traffic of that railway, that is to say, the traffic in the goods produced in the country, is very much larger, but not as yet for export in any quantity. Very little wheat has been exported. Some sugar has been exported, and some other commodities; but the shareholders have had no compensation hitherto; the compensation may be in the happy future.

5853. But what I do not quite understand is this; if production is stimulated, then more, probably, is carried by the railway?—It is so; it is beginning in this year.

5854. You mean that it has not gone on to an extent sufficient to neutralise the fall?—It has only just begun this year, and there is no hope whatever that the stimulus can act so strongly and so long as to make the freight on the additional produce, whatever it may be that is attributable to this cause, anything more than a crumb against the whole loaf lost in exchange. The total increase in the freights of local produce carried by the railway in the last half year has been 10,900*l.* gross, say 5,000*l.* net, of which increase by far the greater part is due to the now settled condition of Mexico. What is that to a net loss of upwards of 46,000*l.*?

5855. Have silver prices risen in Mexico?—Not much; much the same as in India.

5856. (*Sir T. Farrer.*) But if gold is appreciated in this country the gold that is received here by the shareholders is worth more than it was?—Yes; to the extent that the gold that is received is worth

more, it is to the good of the recipients, but it is a very trifling benefit, and is nothing appreciable in comparison to a loss of 90,000*l.* or 100,000*l.* a year. Of course it is a very small compensation, a compensation that none of them perceive.

5857. Then you mean that the gold prices of the things that they buy in this country, compared with what they receive, have not fallen in proportion at all to the fall of the gold price of silver?—Certainly not; they may have fallen, but fallen from other causes, which causes would have benefited the shareholders all the more if their earnings had not been so mulcted by the fall of silver. That which would have been for their good, whether silver had fallen or no, cannot be counted as a compensation for the fall; but they have not fallen in that degree.

5858. That would depend very much upon what sort of things these particular people want to buy?—Oh, yes, but they are the ordinary things; they want to buy what everybody else does; they want food, and coals, and coats, and horses, and chariots, and other things. I am sure your own experience will not tell you that you buy all these things retail at very much less than you used to do.

5859. But the general statement of those who complain of the appreciation of gold has been that the prices of goods, and the price of silver, have fallen pretty well together?—Wholesale things?

5860. Wholesale?—Yes, they have fallen together; it may be because silver is a commodity like others, and silver has been affected in the way that others have been affected. It is impossible to say that one commodity shall have fallen exactly in the same way as any other, because there are many circumstances that affect the several commodities in different ways.

5861. Then, if the people who ought to have received this gold have not received what in commodities was of as much value as it ought to have been, it would have been for one of two reasons, either because the particular things which they wanted to buy have not fallen as much as silver has fallen, or because the profit has remained with the retailer by the way?—Some of it. But there is yet another very important thing. You must consider that whereas you speak of the gold which these people have received as having purchased more commodities than it did before, the fact is that some of them got none at all. The ordinary shareholders are all left without anything at all; it has gone to the debenture holders and to some of the preference. It is very little consolation to a shareholder who has received not a penny of dividends, to persuade himself that the sovereigns received by his creditors have a little more purchasing power than they had. It is a very common story now-a-days; the mortgagee devours the rents of the estate.

5862. I should like to ask you one general question. You were a member of the Commission on the Depression of Trade?—Yes.

5863. And that Commission came to the conclusion which I think is a conclusion come to by all the economists in all countries that have written upon the subject, that a good deal of the complaints we hear from traders and manufacturers arises from the fact that wages have taken a larger share of the whole production of industry than they did in former times?—Yes, but I should put it in rather a different way, a way which accords with all that I have said here, and which, I think, we found pretty well established before the Commission, that the wages are now taking a greater per-centage of the profits than they were before, because the fall in prices has not reached wages; has not reached individual wages.

5864. But are not the opinions of all the greatest economists and, I think, the evidence that was taken before your Commission, to the effect that long before the fall of prices began there was a process under which the wage earner obtained a larger share of the whole produce of industry than he did before?—Yes, he did; the pendulum was swinging that way.

5865. And that progress has been accelerated by the fall in prices?—I do not see how.

5866. Because wages have not fallen as fast as prices?—Yes; that is, the increase of the per-centage of their wages on their employers' profits has been increased by the fall in prices, because the other end of the scale has been touched, by the lessening of the profits; but that has neither accelerated nor positively increased the rise of the wages of the people.

5867. But, on the whole, independently of the fall of prices, one of the most striking phenomena in the progress of industry during the last 50 years has been that the wage earner has obtained a larger share of the products of industry and the capitalist less?—The pendulum has swung up in this way, but the counter swing is now in progress.

5868. Perhaps; but is there not apparent a secular progress independently of the rise and fall in prices. Does it not seem as if the wage earner was constantly receiving a larger and larger share of the products of industry?—Yes; and this was the cause, as I think I drew out from a witness at the Trade Commission. The conscience of the people was awakened in that respect; the wage earner was in evil case, and it became a necessity, not having anything to do with the fall or rise of prices, but owing to the greater knowledge of the condition of the labourer, produced by the greater practical nearness of the great towns arising from the existence of railroads, all men had the opportunity of ascertaining what was happening, and it thus became necessary to alter and improve the condition of the labourer. But this does not date from 1873, but from long before, as you say.

5869. And that is a secular change which has been taking place all over the civilised world, has it not? I do not know whether you have consulted M. Leroy Beaulieu's and M. Chevallier's works in France, Mr. Atkinson's "Distribution of Products" in America, and Mr. Giffen's and Professor Leone Levi's essays in this country. They all agree in this that there has been a secular change going on by reason of which the wage earner has been receiving a larger and a larger share of the whole products of industry?—Yes.

5870. I was going to ask you whether you do not think that some of the complaints that we have had about depression arise from the fact that the capitalist does not receive under that secular change as large a share of the products as he formerly did?—I think it is certainly the case that the labourer received higher wages, but as you have justly said, that secular change began long ago, and cannot have had much to do with the complaints of the capitalist, who was himself also doing very well while the condition of the labourers was improving, but who in the last 10 or 12 years has found the new causes of complaint on which I have been insisting, and the consequence of this is that there is less disposition to put capital into industrial undertakings, and that consequently it will be so much the worse for the wage earner.

5871. The change may go too far?—Of course it will be much the worse for the wage earner when it comes to that.

5872. (*Mr. Chaplin.*) I just want to ask one question about the price of wheat. Assuming the Indian exporter to get 2*l.* a quarter, or something like that for his wheat, before the price of silver had fallen, how many rupees could he get at that time for his 2*l.*?—He could get some 20 rupees. I am not so familiar with the exchange as to do that sum immediately, but he would get them at the rate of 1*s.* 10½*d.*, or something more perhaps.

5873. In round numbers nearly 2*s.*?—You may call it 2*s.* for the purpose of calculation.

5874. He would get 20 rupees in round numbers?—You may call it so. It would be really 21½, at 1*s.* 10½*d.*

5875. Now to-day he sells his quarter of wheat for 30*s.*; how many rupees will he get for that 30*s.*

Mr.
H. H. Gibbs.
—
23 May 1887.

Mr.
H. H. Gibbs.
23 May 1887.

now, assuming that the rupee is now worth 1s. 4½d.? —He gets about 22 rupees; more accurately, 21·81.

5876. He would get about 22 rupees to-day?—Yes, and before the fall of silver he got half a rupee more.

5877. So that as matter of fact it comes to this, that while the price of wheat in England has fallen to 30s. a quarter, and the English producer has to accept that lower price, the Indian producer is actually getting, owing to the rate of exchange, more for his wheat than he did before?—Yes.

5878. The substance is the same, that the man gets more?—The Indian producer gets more, but not, perhaps, quite so much more as you put it in your calculation.

5879. But assuming that the calculation had been made exactly correct as regards the figures, the fact remains that although the price of wheat has fallen

very considerably since the price of silver fell, the Indian producer also gets more now for his wheat than he did before?—Yes; and you may add that the Indian producer having got more, he gets exactly the same amount of commodities for each rupee, so that it is an absolute profit to him.

5880. (*The Chairman.*) There is only one other question I have to put. You have given us your evidence, being one of the directors of the Bank of England; are the Commission to understand that you represent in any respect the views of the Bank of England. I mean in this sense that you represent the preponderating views amongst the directors?—No, certainly not. I think I am in a small minority; but it will be no new experience if the advocates of a sound and healthy policy have a long road to travel before they convert the minority in which they find themselves into a majority.

The witness withdrew.

Mr. S.
Smith, M.P.

Mr. SAMUEL SMITH, M.P., recalled and examined.

5881. (*Sir T. Farrer.*) You have no special evidence, have you, of the actual fact of a general fall in prices, except that contained in *The Economist* list and other similar lists?—No evidence. I have a general knowledge which all men of business have of the very great fall of the articles with which they are connected. I also know from my own personal knowledge of the heavy fall in the prices of land and houses, ships, factories, and indeed every form of property in this country.

5882. Have you any knowledge of the state of things in other gold using countries?—Not intimately.

5883. In America, for instance. You stated that there had been a great progress in America which there had not been in this country?—There has been a very considerable revival of trade in America in the last year or two.

5884. (*The Chairman.*) As to the fall in the price of ships, there has been an enormous increase in the tonnage of existing shipping between 1873 and 1885, has there not?—Yes.

5885. Then with the depreciation do you think that the shipping now is of greater or of less value than the shipping in 1873?—It would be difficult to give an exact answer to the question, but a friend of mine, who is largely acquainted with shipping, estimates the depreciation in the value of shipping in this country at 50,000,000*l.* sterling.

5886. Calculated on what basis?—Well, I presume from the the value of, say, a few years ago. Will you permit me to give you one or two facts within my own knowledge. Take Liverpool as the chief centre of the shipowning industry in England. The chief lines of steamers in Liverpool ply between Europe and America; the chief of these lines is the Cunard Company. The Cunard Company was taken over a few years ago from a private concern, and the shares were issued at 10*l.* The 10*l.* paid up shares are now selling at 3*l.* 10*s.* Take another instance. The Inman Company was a very prosperous line at one time; it sunk lower and lower, till at last it was broken up as a bankrupt concern last year, and the whole capital, amounting to 900,000*l.*, was found to be lost, and the borrowed money, mortgages, &c. had to be paid off at the rate, I think, of 7*s.* 6*d.* in the 1*l.* Take another line of steamers with which I am acquainted, the National Line. The shares, within my knowledge, stood, at one time, at 15*l.*, they were 10*l.* paid up. At the present time, if I am rightly informed, they can be bought for 2*l.* each. That is a sample of a large portion of the shipping property of Liverpool.

5887. Can you tell me what were the respective numbers of vessels trading between this country and America in 1873 as compared with 1885?—No, I could not, of course, offhand give you those figures. They can be got.

5888. But there has been a very large increase?—A very large increase.

5889. And if you have a very large increase in the number of vessels seeking employment without a corresponding increase in the amount of trade going, necessarily the value of shipping must fall, must it not?—Of course we are quite familiar with that fact, but we had a rapid and steady increase in the number of ships owned in this country from 1850 up to 1873 without this corresponding depreciation.

5890. (*Sir T. Farrer.*) And long after 1873, was it not; it culminated about 1880 or 1881, I think?—Yes, it culminated then.

5891. And there was nothing, perhaps, in the country in which there had been so great an increase or so great an expansion?—I would partly agree with that.

5892. It went on after other industries had begun to flag, did it not?—I will, undoubtedly, own that over-building and over-stocking of the market went on, but that does not adequately account for the enormous and excessive depreciation.

5893. And there is probably no property in the country which requires such a constant addition and such a constant watching, and such a constant expenditure of money upon it to keep up its value; is not that the case?—Quite.

5894. And a ship which is first-rate to-day, may, by reason of some improvement, fall into the second rank to-morrow, and become of comparatively little value?—Quite.

5895. Well, all those circumstances tend to very great fluctuations in the value of shipping, do they not?—I have been acquainted myself with five or six periods of depression in shipping, and I should think none of these lasted more than two or three years. None of them have been at all equal to the present depression in virulence or the length of time which it has lasted; in fact, shipping has passed through the same process as every other trade in the kingdom. The recent depression in all of the trades has been much more acute and much more long continued than any other period of depression that I can remember.

5896. (*Mr. Birch.*) I want to ask you one question on that point. Previous to that period you had not the enormous competition that you have now from Germany, particularly in the trade to New York. There are now three or four German companies started which are running in competition with ours at lower freights?—Probably there is more competition, but on the other hand, we have had less competition with America. In my earlier years there was great competition with the United States, and a large part of the American trade was done by American vessels in competition with the English.)

5897. (*Sir T. Farrer.*) Then I will go back to what I was asking you before. You say that you know that most kinds of property in this country, or

a great number of kinds of property in this country, have fallen in value, and you say that you do not know so intimately what is the state of things in America?—No.

5898. Did you say there has been a revival in America; and that there is progress in America which there is not in this country?—Yes.

5899. Well, America is a gold-using country, is it not?—Except for the 4,000,000*l.* sterling of silver which they coin every year under the Bland Bill.

5900. And therefore, if scarcity of gold or depression of gold prices were the cause of the general depression in trade, you ought, so far as that cause is concerned, to find it in America as well as in this country?—Well, the reply that I would give to that is that America being a large, progressive, new country, has many elements of progress which an old country like ours has not got, and it would be a foolish thing to attribute all changes of trade in America purely to currency. I should never do anything of the kind, but I would say that if you take the period in America from 1873 onwards till now, they have had a much larger period of depression during that time than they have had in any previous period in America.

5901. And do you attribute that to the state of the currency?—I attribute that largely to the very heavy fall in prices that took place after the civil war, and to the resumption of specie payments which, for several years, brought about great suffering in America during the period when prices were falling.

5902. Was there not a tremendous inflation and time of speculation in America subsequently to the civil war?—Certainly.

5903. Probably greater than any that has taken place in this country?—Probably. One reason was, as you know, that the dollar was depreciated at one time so much that it took 250 paper dollars to buy 100 gold dollars.

5904. There were a great many causes which it is not worth while going into, but there was a period of very great speculation in America, and a very severe relapse?—Certainly.

5905. And since then there has been a very considerable recovery?—Since then there has been a very considerable recovery, especially the last few years, but I would never venture to say; indeed it would be a very foolish thing to say that the sole causes of all movements in the trade of a country are currency causes; that the sole causes of prosperity and depression are connected with the currency. He would be an extremely ignorant man who would make such an assertion as that, but what I do say is that a contraction of the currency, or an appreciation of the currency spread over a long period of years, and causing a long continued fall in prices, as has been the case in Great Britain since 1873, is very disastrous to a country, and causes great suffering to nearly all classes in the country. I say nothing more than that.

5906. If we are to look for evidence of what is called appreciation of gold, that is to say, to a fall in prices due to a scarcity in gold, we ought to look beyond this country, ought we not? I am now speaking without reference to the question of depression. I am speaking only of the evidence of the fact that prices have fallen in consequence of a scarcity of gold. If that is so we ought to find that, ought we not, in all gold-using countries?—Yes, I think so, and I think in all gold-using countries, as far as I know, there has been a great fall of prices.

5907. Do you know whether there has been a great fall in prices in America?—Yes, I do.

5908. But I mean one that has not been recovered from?—Yes, prices in America are much lower now than they were 10 or 15 years ago.

5909. Are wages lower now in America than they were?—I could not answer that question.

5910. Because such evidence as is open to us in the commercial newspapers shows that they are quite as high as they ever were, and the people are as well employed?—Yes, the people are well employed

just now, and the rate of wages is good, but the price of cotton, with which I am more immediately connected, has been very low in America for the last three years. The price of corn we all know has been so low that the cultivators have been hardly able to go on growing wheat.

5911. Do you know anything at all about the price of land in America?—I am not able to answer that question.

5912. Probably if you took the period since 1873 the price of land has very largely increased, has it not?—Well, the great increase of population always raises the price of land, especially in the neighbourhood of cities.

5913. What I wanted to get at was that the evidence drawn from *The Economist's* figures, on which so much reliance has been placed, is rather an imperfect induction to rely upon with reference to a general fall of gold prices?—I think they are perfectly correct. As far as England is concerned, they correspond with my own experience.

5914. (*Mr. Birch.*) What proof have you of the contraction of the currency to which you have referred on several occasions; what evidence is there of a contraction of the currency?—That is a very large question, and it would require a speech to answer it.

5915. Can you give me any indication?—Well, I would have to go over the ground of most of my previous examination, but I am quite willing to do so if you wish it. You will not see in England any scarcity of currency. I explained that already by stating that wherever you have small supplies, very small supplies of money coming into existence for several years, prices fall and adapt themselves to the smaller supplies, so that there remains as much currency to transact the business of the country at the lower range of prices as there was at the higher range of prices. The two things adapt themselves mutually. But as to the actual fact of the amount of money available for currency, I would make this reply: during the prosperous period of trade which lasted from 1850 to 1873, we had coming into existence every year an average of 25,000,000*l.* of gold and 10,000,000*l.* or 15,000,000*l.* of silver, practically about 40,000,000*l.* a year of the two metals, which was all available for currency in some part or another of the world, because the mints of many of the countries in Europe were then open to coin silver as well as gold, so that virtually there was 40,000,000*l.* a year of new money, as it were, pouring into the world, and being rapidly converted into coin, subject, of course, to a deduction for what was used in the arts. Well, since 1873 that volume has been greatly restricted; the gold supplies have fallen off. They have only averaged about 20,000,000*l.* a year. Silver has been demonetized, or at all events is no longer coined as money throughout Europe, and out of that 20,000,000*l.* a year of gold, one-half at least is consumed in the arts, and disappears altogether from use as money, and of the other 10,000,000*l.* that remains, India takes 4,000,000*l.* upon the average, reducing the total amount available for Europe, America, and the Colonies to 6,000,000*l.* a year. That is altogether too little. And during that same period several countries that were previously upon inconvertible paper have been filled up with coin which has been drawn out of the stocks existing in the other countries of the world. These various causes have really very much reduced the amount of available currency since 1873.

5916. I mean in this country; in England you do not know any scarcity of currency?—No, I would not say that it is visible.

5917. (*Mr. Chaplin.*) In reference to the price of land in America, you have no knowledge, I understand, of your own, that there has been any increase in the price?—My impression would be that in Manitoba and the wheat-growing countries generally, there has been a reduction in the value of land, because wheat can scarcely be grown at a profit; it can scarcely be grown so as to cover cost at present prices.

Mr. S.
Smith, M.P.
28 May 1887.

Mr. S.
Smith, M.P.
—
23 May 1887.

5918. You have given us some instances of the great fall in the value of shipping property. Can you give us any instances of the depreciation of any other kinds of property that you are acquainted with?—Certainly, I can give several. If you will allow me, I would be very glad to give you two or three samples of this immense depreciation I have spoken about. I will give you one in Manchester, the sale of a large concern that took place in Manchester a few months ago. The firm was R. Smethurst and Company, of Chorley, a very large spinning and manufacturing concern. The head of this firm was high sheriff of the county a few years ago, and greatly respected. Their property was valued by a professional valuer some 10 or 12 years ago as worth 144,000*l.* About six or seven years ago, after Richard Smethurst died, his capital became a claim on the concern, and the firm, consisting of his brothers, became insolvent, and met their creditors in May 1885. A valuation was then made, and placed before their creditors, with a view of making a composition. That valuation was 74,000*l.* They paid a composition of 7*s.* 6*d.* in the pound. They spent on new machinery during the last seven years 13,000*l.* The entire plant, in complete working order, was sold in December last for 28,000*l.*

5919. (*The Chairman.*) But are you aware that in recent years there have been great changes in the character of the machinery used in the cotton trade which has been the cause of great economy in manufacture?—Perfectly.

5920. And are not the mills that were used for the former character of machinery unfit to be used for the new machinery without such alteration as would make it almost necessary to rebuild them?—That I am perfectly familiar with, because I am interested in two concerns myself, and we have laid out an immense deal of money in the last 10 years in rebuilding and changing the machinery; but we have suffered great depreciation of our property, notwithstanding this outlay.

5921. But that might account for a very great depreciation in such a case as you have called attention to?—It would not adequately account for it. I will give you two or three other instances of depreciation of various kinds of property in Manchester. I will repeat that the first one I quoted was a fall from 144,000*l.* to 28,000*l.*

5922. What was the valuation of 28,000*l.* made for?—It was actually sold at that a few months ago.

5923. Yes, but you could, perhaps, hardly compare the price at which it was sold with the valuation as resting upon the same basis?—I presume the valuation was considered a fair one at the time. Here are some actual sales of property in Manchester. Central Buildings, Manchester, cost 41,000*l.*, mortgaged for 27,000*l.* seven years ago, sold the other day at 25,000*l.* Here is another case, 27,500*l.* cost, sold 18,000*l.* Here is another case, a large dwelling-house cost 11,000*l.*, just sold for 2,050*l.*; another dwelling-house cost 9,000*l.*, offered for 1,900*l.*, and no buyer. These are a few samples of Manchester property.

5924. Were those dwelling-houses in Manchester?—In the neighbourhood; and my experience of Liverpool property is much to the same effect.

5925. (*Mr. Chaplin.*) And do you say that is to be taken as a fair specimen of the fall of Manchester property generally?—I should hardly think those dwelling-houses are, but the Central Buildings show the general fall.

5926. (*The Chairman.*) The fall in the price of dwelling houses might depend on change of fashion?—Only partly; that only partly explains it.

5927. I do not know if you are aware that there has been a change in the value of property in Manchester arising from a change in the habits of the industrial classes, in this, that they now live largely out of Manchester and come in by railway to their daily work?—No, I do not know that I could speak from experience there. If you will allow me I will give you one other instance. A large Lancashire cotton spinner

died some years ago, leaving property in mills in one of the best manufacturing districts in the county, going well, and valued at his death at 200,000*l.* The property was left to his two sons, who continued to manage it after, as they had before, his death. It was charged with 80,000*l.* at interest to a married daughter and 1,000*l.* per annum to the widow of the deceased. At the present time, so greatly has the value fallen and so onerous are these charges upon it, that the two brothers are now contemplating resigning the property to the daughter and widow altogether, as the charges represent more than its value to-day. I quote that as typical of a vast amount of Lancashire property. It is a very common thing to burden a property with annuities and jointures for the benefit of widows and daughters, and within my knowledge there are many cases where the sons who inherited the property subject to a certain amount of charges, have found at last that they were bankrupt, and they have had to give up the property altogether for the benefit of those who had received jointures upon it, the depreciation has been so great. During the last few years the number of concerns that have paid well are a mere bagatelle; the great bulk of the trade has been labouring under intense depression, and at the present moment there is hardly a single mill in Oldham that is paying. It is in Oldham that these mills are that you referred to; it is there that these improvements have been carried out to a large extent. I went over carefully a share list of the Oldham Joint Stock Mills about six months ago and analysed it, and I came to the conclusion that if the entire property were put up to sale by auction it would not have left, taken all round, a single sixpence to the shareholders. The whole of the capital was virtually lost, and the property would not have been sufficient to cover the charges upon it.

5928. (*Mr. Chaplin.*) What, all the manufacturing property in Oldham?—I went over a share list during the great depression last year, and that was the conclusion I came to, and I believe most competent valuers would have arrived at the same conclusion.

5929. And even in the case of the new mills there is this great loss too?—I am taking the property as a whole, "lock, stock, and barrel." The mills varied amongst themselves; some there were, very few, whose shares were still standing near par, but the bulk of them were standing at a heavy depreciation, and, what is still more important, the mills were all grossly over-valued. The capital had not been depreciated at the rate at which it was necessary to depreciate it, and if they had been sold off at the market value of the day they would not have paid off the mortgagees and the loan holders. There would not have been anything left to the shareholders, taking them all round as a body. That was the conclusion I came to in examining the list in August of last year.

5930. (*The Chairman.*) That was setting good ones against bad ones, and bad ones against good ones?—I am taking them as a whole, and they are the best mills in Lancashire, the bulk of them being new mills, or nearly new mills.

5931. (*Mr. Chaplin.*) Have you any other instances that you want to give to the Commission?—Well, these are sufficient, I think, for the manufacturing districts. With regard to the agricultural districts, I stated already that I have an admirable statement prepared by Mr. Squarey, one of the largest land agents, drawn from his experience over a great part of England.

5932. Do you consider that the great fall of prices which you speak of, and the distress that you believe it has led to, has had any tendency to increase socialistic feelings?—I think very decidedly. I think in England, as in all countries where you have had several years of falling prices and great depression, there has been a serious outgrowth of socialism and discontent in connexion with it, and I should like to put in evidence before this Commission a letter I have from a gentleman who has devoted

much attention to working class questions, namely, Professor Foxwell.

5933. Do you think that the present state of things is giving rise to any feeling or desire for a return to protection?—I think there is not the slightest doubt in the world that the heavy fall in prices in the last 10 years has given a great stimulus to protectionist policy all over Europe and America, and is producing a very strong current of opinion in England in the same direction.

5934. Among whom do you mean, among the working classes or the capitalists?—Amongst the industrial classes, I should say, generally. The agricultural classes in France and Italy and Germany have all demanded and got protection; and the duties have been largely increased this present year; and we find that our colonies are moving more and more in the same direction; and it is only to-day that I was applied to by a deputation about a rise of the Canadian duties in iron amounting to 150 per cent., which has just been decided upon in Canada, and which will destroy altogether our trade with Canada in iron unless it can be averted.

5935. That is an increase in the iron duties that you speak of, is it not?—150 per cent. in Canada on the duties already existing.

5936. When you speak of the industrial classes do you mean us to understand that from your own experience the desire for protection in consequence of the present state of things is spreading among the manufacturing artisans?—I think widely. I found it very strong in Liverpool the last few years. They cry out against cheap goods coming into this country and competing with our manufactures, when they are in such a very depressed state themselves.

5937. (*Sir T. Farrer.*) Does their desire go to the extent of protection to corn?—It applies more, I think, to protection against foreign manufactured goods; those countries are doing as much as they can to shut out our goods, and they think it is very unfair to take their goods in return free of duty; but I think it also applies in agricultural districts also, as we all know.

5938. (*Mr. Chaplin.*) But as far as you can gauge the feeling that you speak of among the working classes, is their desire for protection so great that they would assent to it even if it included a duty upon corn?—I could not answer that question. I do not think the movement has gained such strength yet as to carry the country; all I say is that the long continued depression has very powerfully shaken the confidence of many classes in this country in the efficacy of free trade.

5939. But I gather that what you mean is this, that though the artisans may to a great extent desire to have a duty imposed upon manufactures, that if it came to placing a duty on corn they would hold a somewhat opposite opinion?—I think that is very probable.

5940. I mean if the duty on corn were to be the price of obtaining a duty on manufactures, then they would object to it?—Probably.

5941. One question as to the future of silver. What do you apprehend is the future of silver likely to be, assuming that nothing is done to restore it to its former position?—Well, the view I take is that we cannot remain where we are; we are upon an inclined plane. Silver must either be a monetary metal, or else it will cease to be used altogether as money; and undoubtedly if this conference breaks up and pronounces an adverse judgment, I think that further demonetisation of silver will take place within a few years, which will push it to a still lower level. I can see no limit, in fact, to the depreciation of silver if it ceases to be used as a monetary metal by the principal nations of the world.

5942. And if that occurred it would aggravate to that extent all the evils which you attribute to the fall in silver up to the present time?—Certainly.

5943. As regards other countries have you any reason for believing that they would join with England in any project of the kind that you suggest for the adoption of a bimetallic system?—I think there is hardly a doubt that if England was to agree to adopt the bimetallic system in concert with France, Germany, and the United States, the United States and France would respond at once favourably, for they have offered to do so again and again at the conferences which have been held, and I was informed last week by the President of the Bank of the Netherlands, who is intimate with the German financial authorities, who said that there was no doubt in his opinion that Germany would join the league.

5944. Assuming your suggestions were adopted, you see no difficulty in maintaining the ratio between the two metals?—None whatever if that large union of countries were to adopt it. The ratio was virtually maintained by France alone, and latterly by a union of States called the Latin Union, without any great difficulty for 70 years, and I have no doubt whatever that if a large union such as that contemplated were effected, the ratio would be perfectly observed for any length of time that the union desired.

The witness withdrew.

Adjourned till Friday the 10th of June.

*Mr. S.
Smith, M.P.*
23 May 1887.

LIST OF APPENDICES.

	Page
I.—Table put in by Mr. S. Pixley, showing the monthly fluctuations in the price of silver in London from January 1833 to October 1886 - - - - -	306
II.—Tables put in by Sir Hector Hay, showing, for (a) gold and (b) silver, the estimated production of the world, the imports and exports in England and India, and the coinage of the principal countries of the world from 1852 to 1885 - - - - -	308
III.—Tables put in by Mr. Giffen, showing total estimated production of gold and silver, by weight and value, since 1493 ; detailed estimate of production in the several countries since 1851 ; amount of gold in the Banks and State treasuries of various countries since 1872 ; amount of gold and silver coined down to 1885 ; imports and exports of gold and silver in China since 1858 ; and a record of prices in the New York market since 1825 - - -	310
IV.—Papers put in by Mr. A. Sauerbeck, showing course of prices of commodities in England from 1846 to 1885, and prices of principal articles of home consumption or manufacture -	317
V.—Papers put in by Mr. Barbour relating to the subject of hoarding in India ; and wages of postal runners from 1855 to 1885 - - - - -	322
Diagram showing fluctuations in prices of commodities and price of silver.	
VI.—Paper prepared by Professor Roberts Austen for the use of the Commission on the subject of the cost of producing silver - - - - -	325
VII.—Papers put in by Mr. Birch with regard to the currency and circulation in France, Germany, Italy, Spain, Switzerland, and Belgium - - - - -	329
VIII.—Papers put in by Mr. Waterfield :	
A.—Note and tables showing details of Indian home charges - - - - -	333
B. to D.—Tables relating to the trade of the United Kingdom and of India - - - - -	338
F.—Monthly exports of silver and of cotton manufactures to India in 1885 and 1886, with value of Council Bills - - - - -	338
G.—Table showing difference between estimated amount of rupees required for payment of home charges and amount actually realised from 1874–5 to 1885–6 - - - - -	339
H.—Table showing excess expenditure due to fall in exchange in each year since 1874–5 on old and new contracts - - - - -	339
K.—Extraordinary expenditure (famine, war, &c.) of the Government of India since 1874–5 - - -	339
L.—M.—Details of net revenue and expenditure of Government of India since 1875–6 - - -	340
N.—Prices of Indian Government securities - - - - -	342
O.—Comparison of the financial position of the Government of India in 1880–1 and in 1885–6, with note by Sir John Strachey - - - - -	342
P.—Statistics of jute and cotton mills in 1876–7 and 1884–5 - - - - -	345
Q.—Joint stock companies in India in 1885 - - - - -	345
IX.—Papers put in by Mr. Barclay :	
1. Progress of Indian mills during the past 22 years - - - - -	346
2–5. Exports of cotton yarns and manufactures from India and the United Kingdom - - -	346
6, 7. Effect on Lancashire cotton industry of Indian competition - - - - -	348
X.—Papers put in by Mr. Gibbs :	
1. Note on Exchange v. Freights as a local influence on exports - - - - -	349
2. Note on the influence of the currency of Chile on its export trade with the United Kingdom -	349
XI.—Papers put in by Mr. A. Provand, M.P. :	
1. Table showing prices at Shanghai from March to August 1886 - - - - -	351
2. Table showing results of 56 transactions completed with Shanghai between January 1886 and May 1887 - - - - -	351
XII.—Correspondence between the Treasury, the India Office, and the Government of India on the silver question - - - - -	353

APPENDIX I.

(Statement put in by Mr. Stewart

A TABLE showing the MONTHLY FLUCTUATIONS, in LONDON, in the PRICE

Years	January.	February.	March.	April.	May.	June.	July.	August.	September.	October.	November.	December.
1833	58½	58½	58½	58½	58½	58½	59½-59½	59½	59½	59½	59½	59½

* Including bills on China for this year only. (The East India Company had the monopoly of the trade with China up to 1833.)

APPENDIX I.

Pisley. See Question 139.)

of BAR SILVER per Oz. Std. from January 1833 to December 1886.

Yearly Average.	Silver coined in England.	Amount of Bills and Telegraphic Transfers drawn in England on Indian Governments.	Export of Silver to the East.	Imports of Silver in Bars and Coin.	Average Bank Rate of Discount.	REMARKS.
59 $\frac{3}{8}$	£ 145	£ 55,510*	£ 1,895,023†			Continuance of East India Company. Slavery abolished; compensation to owners, 20,000,000 <i>l.</i> Renewal of bank charter; bank notes a legal tender. Great importation of gold into New York. Substitution of metallic currency for paper in the United States. Extinction of United States national debt. Bank of United States wound up, owing to refusal of congress to re-charter it. Banking and commercial embarrassments in United States. Spanish Civil War.
59 $\frac{1}{2}$	432,775	398,253	2,146,465			Commencement of panic in London. Discounts refused. Many houses trading with the United States stop payment. Accession of Queen Victoria. Rebellion in Canada. Resumption of specie payments in United States. Famine in various parts of British India. Afghan War.
59 $\frac{1}{4}$	146,665	732,803	2,086,167			Banks in United States suspend payments in specie. War with China.
60	497,719	2,045,254	2,610,101			Misunderstanding with France. Treaty of London for settlement of Eastern question.
59 $\frac{9}{16}$	75,385	2,042,232	3,010,190			Great depression in every branch of manufacturing industry.
59 $\frac{1}{2}$	174,042	1,706,184	1,945,264			Peace with China. Income Tax Act passed.
60 $\frac{1}{4}$	390,654	2,346,592	1,786,253			Treaty of commerce opens China to all nations.
60 $\frac{1}{2}$	207,900	1,439,525	1,841,335			Bank Charter Act passed. Consols 101 $\frac{1}{2}$. Prior to September this year the bank never reduced the rate below 4 per cent. Railway mania. Sikh War.
60 $\frac{3}{4}$	89,641	1,174,450	3,143,292			Commercial and railway panic. Repeal of corn laws.
59 $\frac{7}{8}$	192,852	2,589,288	4,794,678			Year of panic. 10,000,000 <i>l.</i> granted for relief of famine in Ireland. Gold discovered in California.
59 $\frac{5}{8}$	239,580	1,197,438	3,752,472			Sikh War.
59 $\frac{1}{2}$	610,632	2,801,731	2,495,959			First importation of Californian gold into England. Annexation of the Punjab.
59 $\frac{1}{4}$	647,658	2,516,951	2,939,922			Average of Consols 96 $\frac{1}{2}$.
59 $\frac{1}{8}$	559,548	3,065,709	1,973,391			Discovery of gold in Australia.
59 $\frac{1}{16}$	125,730	3,097,042	4,204,503			Consols touched 102, and averaged 99 $\frac{1}{2}$.
59 $\frac{1}{32}$	35,442	1,541,304	3,396,807			Australian Mint established.
59 $\frac{1}{64}$	119,592	1,889,195	3,811,809			Russian War began.
60 $\frac{1}{16}$	129,096	2,935,118	5,052,059			Loan of 16,000,000 <i>l.</i> Fall of Sebastopol.
61	87,868	3,236,458	1,715,100			Russian War ends.
60 $\frac{1}{2}$	189,596	2,777,523	2,447,450			Panic. Suspension of Bank Act. Indian Mutiny. Loan of 1,000,000 <i>l.</i> to East India Company.
61 $\frac{1}{4}$	701,544	3,317,122	3,117,980			End of Indian Mutiny.
61 $\frac{1}{2}$	140,580	3,850,565	3,095,490			Loan of 5,216,528 <i>l.</i> to East India Company.
61 $\frac{3}{8}$	195,510	3,669,678	6,431,733			Commercial treaty with France.
61 $\frac{1}{4}$	462,528	1,484,040	12,113,991			Financial depression in India. American Civil War begins.
61 $\frac{1}{8}$	373,230	2,819,711	16,731,915			Great distress in cotton manufacturing districts. Panic.
61 $\frac{1}{16}$	445,896	628,499	4,753,933	£ 6,700,000		Large exports of gold to the continent to pay for silver.
62 $\frac{1}{16}$	647,064	25,901	14,828,521	14,772,460		13,000,000 <i>l.</i> silver exported from France.
61 $\frac{1}{8}$	218,408	4,694	8,478,739	10,394,000		Close of American War.
60 $\frac{1}{2}$	209,484	797	6,824,807	6,590,000		Commercial and Joint Stock Companies panic. Bank declined to sell bar gold.
61 $\frac{1}{16}$	148,518	1,193,729	10,091,460	11,753,000		Great decline in export of silver; only 2,500,000 <i>l.</i> sent from France.
61 $\frac{1}{32}$	161,172	6,641,576	8,263,011	10,888,130		Abyssinian Expedition.
61 $\frac{1}{64}$	535,194	8,979,521	6,254,004	10,827,300		Distress in Lancashire.
61 $\frac{1}{128}$	501,732	6,789,473	3,598,058	6,980,000		Franco-Prussian War. Panics.
61 $\frac{1}{256}$	493,416	6,998,899	2,365,626	10,778,000		8,500,000 <i>l.</i> gold exported to Hanse towns. Peace between France and Germany
60 $\frac{1}{16}$	193,842	5,613,746	642,912	8,020,000		8,050,000 <i>l.</i> gold exported to Hanse towns. Commencement of decline in price of silver.
60 $\frac{1}{32}$	301,366	4,137,285	1,635,642	7,716,420		10,000,000 <i>l.</i> gold exported to Hanse towns. German Government announces the demonetization of silver.
60 $\frac{1}{64}$	76,428	3,705,741	2,362,943	6,730,000		Enormous increase of bullion in Bank of France, 22,000,000 <i>l.</i> , mostly gold.
60 $\frac{1}{128}$	336,798	6,980,122	1,579,473	10,649,000		Heavy commercial failures. Large export of gold to Germany. Continued decline in price of silver.
60 $\frac{1}{256}$	701,514	8,443,509	3,712,473	16,520,000		Remarkable fluctuations in rates of Indian exchanges and bar silver, the latter having touched the lowest price on record.
59 $\frac{1}{2}$	1,243,836	10,310,339	5,654,451	11,140,500		Great famine in India. Russo-Turkish War.
59 $\frac{1}{4}$	1,081,674	13,939,095	2,497,576	12,302,220		General depression in trade. Large bank failures. Russo-Turkish War ended.
58 $\frac{1}{2}$	890,604	13,285,678	7,092,726	11,797,990		Suspension of sales by German Government. Marked diminution in production of Californian mines.
56 $\frac{1}{2}$	594,001	10,841,615	3,714,404	9,506,767		Consols touched 100 $\frac{1}{2}$. Reported existence of large quantities of gold in South India.
52 $\frac{1}{2}$	222,354	11,513,233	10,914,407	13,585,608		Meeting of conference in Paris respecting bi-metallism, which adjourned without coming to any practical conclusion.
54 $\frac{1}{2}$	420,948	8,637,530	17,007,458	21,625,632		War with Egypt.
52 $\frac{1}{4}$	613,998	13,978,584	5,842,577	11,453,105		Completion of Italian order for gold.
51 $\frac{1}{2}$	549,054	14,705,700	7,034,987	10,520,012		War in Egypt; income tax increased. Franco-Chinese complications.
52 $\frac{1}{4}$	761,508	15,482,092	6,135,520	6,827,471		Suspension of the coinage of the Bland dollar, recommended by the President of the United States.
51 $\frac{1}{8}$	997,128	16,273,677	4,288,009	6,902,210		Great depression in trade.
51 $\frac{1}{16}$	209,880	12,053,665 to 2nd Jan. 1883.	6,423,270	9,243,375		
50 $\frac{1}{2}$	1,274,328	18,909,000	7,125,454	9,468,002		
50 $\frac{1}{4}$	658,548	16,966,112	8,418,522	9,546,496		
48 $\frac{1}{2}$	720,918	11,018,000	8,010,925	9,377,601		
45 $\frac{1}{2}$	417,384	11,791,000	5,846,222	8,166,249		

† The above totals from 1833 to 1850 include exports from other countries as well as England, from 1851 to 1875 from Southampton only, from 1876 shipments *via* Southampton, Venice, and Marseilles.

APPENDIX II.

Tables put in by Sir Hector Hay. See Questions 290, 295.

* Average of 1871-77 only.

† Higher average, probably on account of changes in the classification; prices have certainly fallen.

(E.) SUMMARY OF RESULTS.

The following statement gives the result of the three tables (B, C, and D). As regards the value of sundry small articles, and of manufactured goods, the home production of the former, and the home consumption of the latter has not been included, as no sufficient data are available. The sum of 80,000,000*l.* has, however, been added for beer, spirits, and other articles, which are presumed to have fallen on the average only to a moderate extent, say 5 per cent., and it may fairly be assumed that any articles

not comprised in these lists have, on the average, followed very much the same course as those given.

It will be seen that the average decline of all the 157 descriptions of commodities according to index numbers is 22½ per cent. as compared with the average of 1867-77; but allowing for quantities according to the importance of each article, it amounts to 26 per cent., which is only 2 per cent. less than that of the 45 principal commodities treated in the general tables.

	According to Index Nos.		According to Quantities.		
	Total Index Nos., 1885.	Average. 1867-77 = 100.	Value on the Basis of the Average Prices of 1867-77, Mill. £ and dec.	Value, 1885. Mill. £ and dec.	Ratio, 1885. 1867-77 = 100.
45 principal articles - - -	3,234	71·9	617·4	439·7	71·2
61 sundry articles - - -	5,175	84·8	69·4	59·5	85·7
Beer, spirits, &c. - - -	—	—	84·2	80	95·
51 manufactured and partly manufactured articles.	3,751	73·6	182·7	128·8	70·5
157 articles - - - -	12,160	77·5	953·7	708	74·2
Average decline in 1885 as compared with 1867-77.	—	22·5 %	—	—	25·8 %

The index number for the 45 principal commodities in 1886 is only 69 (1867-77 = 100), and the ratio according to quantities only 68·1. The index number for silver is 74·6, or 25·4 per cent. below the former normal point. Taking all the above 157 articles together and allowing for quantities the fall in 1886 as compared with 1867-77 will amount to 29 per cent.

APPENDIX V.

Papers put in by Mr. Barbour.

(A.) See Question 1136.

The silver remittances from treasuries in the plains to Simla and Kasauli (a sub-treasury of Simla) during the last 25 years have been as follows :—

	Rs.
1861-62 - - -	12,10,000
1862-63 - - -	18,34,500
1863-64 - - -	20,70,000
1864-65 - - -	26,65,000
1865-66 - - -	25,04,000
1866-67 - - -	16,88,400
1867-68 - - -	27,35,500
1868-69 - - -	23,82,000
1869-70 - - -	21,77,000
1870-71 - - -	24,15,950
1871-72 - - -	19,75,200
1872-73 - - -	22,62,000
1873-74 - - -	19,67,000
1874-75 - - -	19,12,000
1875-76 - - -	27,97,000
1876-77 - - -	24,72,000
1877-78 - - -	36,23,000
1878-79 - - -	44,10,000
1879-80 - - -	37,90,000
1880-81 - - -	32,93,000
1881-82 - - -	32,00,100
1882-83 - - -	32,88,200
1883-84 - - -	41,15,000
1884-85 - - -	31,48,000
1885-86 - - -	24,68,000
Total - - -	6,64,02,850

The amount of silver brought to Simla, otherwise than in remittances on account of Government, may be neglected. European and native bankers and traders replenish their resources when necessary by currency notes, which the Simla Treasury is always prepared to cash.

The amount of silver brought by visitors is insignificant. Remittances of coin to the plains are never made, either by Government, or bankers, or merchants. Remittances are made either by currency notes or by treasury bills on Bombay, Calcutta, Umballa, Lahore, and Delhi, which the treasury is always prepared to grant. The currency notes supplied to the Simla Treasury during the last three years have been—

	Rs.
1883-84 - - -	8,34,000
1884-85 - - -	13,45,000
1885-86 - - -	15,41,000

The treasury bills issued by the Simla Treasury during the last three years have been—

	Rs.
1883-84 - - -	7,80,700
1884-85 - - -	14,75,400
1885-86 - - -	19,69,500

The aggregate of these notes and bills represent remittances on account of banking, trading, &c. made to the plains.

A portion of the silver sent to Simla by Government eventually returns to the plains. The Simla market is supplied with cattle, grain, and miscellaneous supplies largely from the plains. A large portion of these supplies is brought by itinerant dealers, who take back cash with them for fresh purchases in the villages where currency notes would not be accepted. I have not been able to procure any satisfactory information from the Simla octroi returns, as it is impossible to make any accurate distribution of the amount of business done by large dealers, who would not remit cash, and by itinerant traders with small capital, who would take back cash. Most of the grain supply of Simla is brought up by zamindars from Ludhiana and Ferozepore, who take back coin. The retail grain dealers are mostly Hoshiarpore and Kangra men, who come to Simla for the season, and are believed to take back their profits in coin. The cost of carriage of supplies is also considerable, and nearly all of it is taken back in cash. So are the savings of carpenters, masons, and domestic servants from the plains. Looking to the class of people who take back coin, and to the fact that it is certainly not taken in large quantities at a time, I do not think that it can

exceed one third of the amount sent to Simla by Government, or about 11 lakhs yearly. Applying this to the results of the past six years, it may be taken that the present annual absorption of silver by the hill population is about 22,00,000 a year. This result is the more curious when it is considered how sparse the hill population is, and that the Thibet traders ordinarily take back grain and not silver. I think that the hill population is acquiring wealth rapidly. It is certain that many of the hill Rajas, notably those of Rampore, Busahir, and Bilaspore, have accumulated large stores of silver; and it cannot have escaped observation how the fact of growing wealth is reflected in the amount of silver and gold ornaments now worn by hill women. It is nearly 10 years since I first came to Simla, and the change in this respect in that period is sufficiently striking.

(Signed) E. J. SINKINSON,
Simla, Accountant General, Punjab.

(B.) See Question 1145.

LETTER ON THE SUBJECT OF THE HOARD OF THE MAHARAJAH OF BURDWAN.

Bun Abash, Burdwan,
16th September 1886.

MY DEAR,
IN reply to your letter of day before yesterday's date, I have the pleasure to send the following information that I have been able to procure. It is very difficult to answer all the questions satisfactorily.

Through fear that the Marhattas might take away whatever they found in the house, and that the householders would have nothing to fall back upon, it was thought necessary in those days to keep a large amount of savings under ground for the time of need. Besides, in the time of the Mogul Emperors, the country was not so safe as it is now-a-days under the British rule, and there was no other way of investment than buying landed property, precious metals, jewels, &c.

So they used to have large sums in cash, and also because the people of those days did not have the same confidence in the Government of the country as they have now; they preferred keeping their savings in hard cash within easy reach, and in the shape of precious stones and metals.

Ladies of the Hindoo household were, as a rule, uneducated in those days (and the majority of them are still no better), and for their benefit it was not thought proper to invest in securities, as when there was no male member in a family, it would be hard for the uneducated ladies to deal with the securities or other investments which might necessitate their appearing in court and undergoing some expenses to get their just dues from the court, in addition to the degradation they would have to submit to.

Another reason why people (especially poorer people, who cannot save more than 100 or 200 rupees, and have some ornaments) like to leave for their wives and families behind them hard cash and ornaments, is that they cannot afford to have iron safes or strong boxes to keep their money in in the shape of currency and promissory notes. They generally put their things within *brass lotas* or *Bahugunas*, and then bury them under ground somewhere in the room they sleep in; as a rule they prefer the ground below their beds for that purpose.

With reference to the description of the several treasure houses in the estate, their dimension, and their contents. There are three rooms which are known by the name of *Toshakhana*—

(a.) One large room measuring about 48 feet in length, 14' 6" in breadth, and 13' 9" in height, where gold and silver ornaments and ornaments set with precious stones are kept. These articles are kept in almirahs and boxes of all descriptions, and also some gold plates and cups, *Thalees* and *Katorahs* as well as washing bowls, jugs, &c.

- (b) There is another room where silver *Thalees* and *Katorahs*, *Rakabees*, *aterdan*, *golappas*, *nemokdan*, glass cups,* *gharras*, *lotas*, washing sets and all other things for ordinary use are kept, the room measuring L-17-9, B-15-6, H-13-9.
- (c) There is a third room where silver plates and dishes, forks, spoons, silver-handled table knives, tea sets, &c., are kept (English dinner and breakfast sets), measuring about L-15, B-10-6, H-13-9.

The rooms marked (a), (b) are under lock, and the doors of the rooms having been bricked up, and we having no list to show what they contain, I cannot give an idea as to the value of the contents. Of the contents of the latter room we have made an inventory, and they would come up to about 80,695 tolahs of silver, valued at Rs. 80,695.

There are four other rooms :—

- (a.) One of these has been lately fitted up since the estate came under the court, and contains gold and silver ornaments, and ornaments set with precious stones, gold ornaments and throne, &c., would come up to about 10,142 tolahs valued at Rs. 1,62,278 (at the rate of 16 rupees per tolah). The room is about L-6-6, B-12-9, H-12-3.
- (b) The second and the third rooms (known as the under-rook room or reserve treasury. One for the zamindari property and another for Debutter) are the treasury where current collection of the estate is kept as well as the Government securities and debentures (the size of the zamindari treasury is L-22-9, B-12-9, H-12-3, and that of the Debutter treasury is L-6-9, B-15, H-12-3).
- (c.) The fourth room measures about L-22-6, B-15, H-12-3, where there are two large sized vaults prepared for hoarding the current silver coin, and since the year (1267, B.C.) some money was from time to time put in and taken out by the Maharajah Mahtab Chund Bahadoor, for the expenses of emergent and extraordinary nature, such as the late Maharajah Aftab Chund Bahadoor's marriage, Lala Bun Behari Kapur's marriage, and buying landed properties. When he died about one lakh was left in one of the vaults. In the time of Maharajah Aftab Chund Bahadoor that sum was taken out and placed at the reserve treasury, so there is no money in them now. There is one small vault in the room supposed to have contained some 9,990 or 10,000 gold mohurs of all descriptions, one kind known as *Joypoori*, another *Moorshidabadi*, and sovereigns worth in all about Rs. 1,60,000. The accumulation of these coins was begun by the Maharajah Tage Chund Bahadoor, and continued up to the time of the Maharajah Mahtab Chund, who made this vault and kept them in it; this room has also been locked, and the door is bricked up; this room is known as the *Kona Hawze*. All these above treasure rooms are situated in the apartment known as "Raj Mohal," at present occupied by the Maharanee.

- (d.) There is one toshakhana situated in another apartment called "Rung Mohal," where ornaments belonging to different gods of the family are kept, and silver *Thalees*, *sapias*, &c., for the religious purpose, the value of which is not known to us, as it is one of those rooms that have been locked up and sealed.

- (e.) *Baru Hawze*, or the room which contains several vaults, is situated in the apartment called *Jattrakhanda*, measuring about L. 32, B. 25, H. 12-9. As this room is locked up and its doors are bricked up, and I do not remember how many vaults there are in the room, and how much money in silver they contain, I am sorry I cannot give you any information on these heads.

The amount known to have been drawn from these vaults during the times of the Maharajahs Mahtab Chund and Aftab Chund Bahadoors is about Rs. 23,00,000 and out of this sum about Rs. 10,75,000 has been invested in landed properties, Rs. 5,00,000 in Government securities, and Rs. 200,000 in Himalayan Railway Debentures.

It is believed that these silver coins were hoarded by the Maharajah Tej Chund Bahadoor and his wife Maharanee Komul Coomari, Thacoranee, after him year after year, beginning from (1211, Bengali era) that is from the time when the puttani system was first introduced. According to the custom of the Burdwan Raj family the custody of these valuables was left to the Maharanee for the time being, but the vaults were never opened except in the presence of the Maharajah.

When any sum was drawn out, only some relations and trustworthy servants were admitted into the room and vault. Treasurers and Dewans used to be present outside

the room or apartment, where the sum drawn was sent out (female guards being placed in the passage) for the purpose of weighing, counting, and bagging it before it was sent to the Mint.

A part of the above-mentioned gold coins and all the silver coins bear as date the 19th year of Shaha Alum's reign. They were all coined at Moorshedabad.

I hope, in conclusion, that though I have not followed the question in due order, I have given exhaustive answers to them, all which I hope you will find useful, in spite of the rambling way in which they have been put.

Yours sincerely,

(C.) See Question 1147.

EXTRACT FROM A REPORT OF 5TH OCTOBER 1886
BY PANDIT SALIG RAM, OF THE POSTAL DEPARTMENT.

A very remarkable case of this gold-hunger came to my notice in the course of my inquiries in * * * * * district, and I think I may safely mention it here, as there seems to be no fear of this memorandum being ever published. I was told on the most reliable authority that His Highness the * * * * * of * * * * * has set apart a very large sum of money (in silver) for conversion into gold, and that every month between 40 and 45 thousand rupees' worth of gold mohurs are purchased by agents in Calcutta, Bombay, and certain other places, and sent to the * * * * *. That this has been going on for some years. A certain proportion of this gold comes by post. But parcels are very seldom addressed to the * * * * * or directed to * * * * *. The * * * * * treasurer is a native banker of * * * * *, and the parcels usually come to his address at * * * * *. The gold received is taken to * * * * *, and there deposited in a strong treasure vault or room specially set apart for it. If inquiries are made at * * * * *, the above statement will probably be contradicted, but I have not the least doubt of its correctness. Who can say that the * * * * * example is not being followed by rich men all over the country? If inquiry were made, it will most probably be found that this is really the case; but the mischief which such an inquiry will cause, by exciting distrust and suspicion of the real intentions of the Government, will be serious, and should not, I think, be risked without urgent reasons, and then only with great caution.

(D.) See Question 1150.

STATEMENT showing the AMOUNT of NATIVE COINS and ORNAMENTS tendered for coinage in the BOMBAY MINT from 1854-55.

Years.	Native Coins.	Ornaments.	Total.
	Rs.	Rs.	Rs.

APPENDIX VI.

MEMORANDUM by PROFESSOR ROBERTS AUSTEN, F.R.S., Chemist to the Royal Mint, on the Cost of Production of Silver.

There is some conflict of opinion as to the exact influence on the price of silver of the actual outlay involved in obtaining it from the earth, in the metallurgical operations incidental to its extraction from the ore, and in placing it upon the market.

M. Cernuschi indeed says "that the cost of production does not determine the value of gold and silver; that value is determined by two elements—the employment and the quantity." On the other hand, the late Mr. Bagehot* maintains "that the value of gold and silver is determined by the cost of production, just like that of all other things; that in their case, as in all other cases, what is more cheaply produced than usual would be more plentifully produced than usual, and that the purchasing power in consequence will be no doubt less." He elsewhere observes,† in discussing the Report of the Select Committee on the Depreciation of Silver (1876), that the price at which silver will settle down will in part "be determined by the cost in the least good mine which pays to keep at work."

The difficulties of an inquiry as to the actual cost of production are considerable, and arise from—

- (1.) Varying conditions in different localities.
- (2.) Irregularity and incompleteness of returns, and the indifference or reluctance of proprietors to publish full statements as to cost.

It is, moreover, very difficult to estimate the amount that should be added to the actual cost of mining and milling in consideration of the price paid for and capital invested in mining property.

The question as to whether the search for silver and its actual production does or does not afford a remunerative return for the capital expended on it has not been considered here. An attempt has simply been made to point out what are the several metallurgical processes by which silver is extracted, to collect such statements as are published dealing with cost of production, and to state the results for each of the principal processes; it being necessarily assumed that the data so collected admit of application to the total amounts of silver estimated to be produced by each of the respective processes. Sufficient allowance has, it is believed, been made for the cost of mining and transport.

The uncertainty attending any generalization as to the precious metals is indicated by the fact that, in 1875, the Director of the United States Mint, after a most careful examination of all the conditions likely to arise, gave it as his opinion that the "total production of all the mines on the Cornstock may safely be estimated at not less than 50,000,000 dollars per annum, about 45 per cent. of which will be gold." In 1884, however, when I visited the district, the mining and milling works were suspended. In the report to which reference has just been made the late Dr. Linderman observed of the mining and metallurgy of California, "The business is one of uncertainty and hazard, and, taking one year with another, the expenses no doubt equal, if they do not exceed, the production."

In previous official investigations but little attention appears to have been paid to the influence of the cost of production on the market price of silver; thus, the evidence upon this point given before the Select Committee on the Depreciation of Silver (1876) is practically limited to the statement of Mr. Pixley's belief‡ that silver is got out in certain mines in Mexico "at about 1s. 6d. an ounce," and to the expression of Mr. Bagehot's opinion, already quoted, as to the price being regulated by the cost of production under the most difficult circumstances.§

The following table gives the total production of silver in the world for 1883, that being the latest year for which complete returns are available:—

TABLE I.

	Ounces.
United States of America - -	35,737,908
Mexico - - - -	22,872,732
Germany - - - -	7,417,642
Austria - - - -	1,568,562
Spain - - - -	2,395,481
Argentine Republic - -	325,045
Colombia - - - -	587,873
Bolivia - - - -	12,376,860
Chile - - - -	4,119,125
Other countries producing less than 300,000 ounces - -	953,505
Total - - - -	88,354,733

Table II. gives the estimated amount of the silver extracted by each of the principal methods. The approximate cost of the mining and metallurgical operations involved will be given subsequently.

TABLE II.

Section.	Method by which the Silver was obtained.	Weight in Ounces.
I.	Refining of native gold - -	508,000
II.	Desilverization of lead - -	30,726,000
III.	Desilverization of copper and cupriferos products.	7,200,000
IV.	Treatment of silver ores - -	49,920,733
	Total - - - -	88,354,733

The metallurgical processes involved in the extraction of silver from its ores, although very complex, nevertheless admit of being classified in the four sections shown in the preceding table. The amounts into which the whole annual production is divided, as given in the third column, can only claim to be rough approximations. The reasons for the adoption of the figures given in this column will now be considered in some detail.

Section I.

Such silver as forms a natural alloy with gold being extracted in conjunction with that metal, and the deposit in which both metals occur being worked for gold, the extraction of the silver entails, practically, no expense over and above that which is involved in the extraction of the gold, as the silver is obtained incidentally. It would usually be necessary to purify the gold to convert it into ingots of the standard fineness met with in the market, and the cost of such parting and refining is the utmost metallurgical cost involved in the production of the silver. As this amount has to be distributed between the silver and the gold it is safe to assert that the extraction of one ounce of silver contained in gold does not exceed the cost of parting. The average official charges of the American mints for parting and refining silver and gold of the average standard of native gold is about 2½d. per ounce. The quantity of silver present in native gold varies considerably; but it has been estimated by King* that the mean fineness of the native gold of the United States is 876 parts in 1,000, and this may be taken as the average fineness for native gold generally. The alloying element is, in nearly every instance, silver, with but small quantities of copper and other metals, and these may be disregarded. Every 1,000 parts of native gold yield, therefore, 124 parts of silver. The total quantity of gold produced throughout the world in 1883 is estimated at 4,548,550 ounces,† of which 1,451,250, or nearly one-third, were produced in the United States. Nine per cent. was‡ derived from the refining of lead. Allowing an additional 1 per cent. to have been derived from cupriferos and other materials treated otherwise

‡ Ibid., p. 413.

than by lead, but by processes not involving the use of mercury, there remains 90 per cent. as native gold* in one form or another. Assuming this to have been originally of the fineness above stated, it would have yielded as a bye-product 161,960 ounces of silver; calculating the total production of gold in the world on the same basis, the amount of silver obtained from it would be 507,618 ounces.

Section II.

A large proportion of the silver produced in the world is derived from association with lead ores, from which it is extracted by suitable treatment. Certain argentiferous materials are also melted with lead ores, the precious metal being in all cases collected in the lead so produced. The reduction of the silver occurring in lead ores will be effected without any extra cost beyond that requisite for the lead itself, provided that the state in which the silver is present does not necessitate any modification of the treatment demanded for the extraction of the lead alone, and this also holds good with respect to such silver ores as are added to the furnace charge, except that in this case it may be necessary to use more flux, and, consequently, more fuel and labour will be required. With these exceptions, the sole cost of the extraction of the silver from these argentiferous ores is connected with its separation from the lead produced. This is done either by crystallising out lead poor in silver from a richer alloy—the Pattinson process—or by the use of zinc—the Parkes process—or by these processes jointly. The cost of refining and desilverising the ton of argentiferous lead at Chicago in 1883 was, in the case of the Horn Silver Mining Company's lead, about 8 dollars per ton.† If, therefore, the lead be the main object of the smelting, and the silver merely a valuable bye-product, the amount of silver which must necessarily be present in the lead to pay for the cost of extraction must be of the value above stated, as in the case of the galena produced in the United Kingdom, which averages about 8·5 oz. silver per ton of lead.‡ When, however, as is usually the case, the production of lead is not the main, but rather a secondary, consideration, the above data are not applicable. This is more especially true with regard to those countries where the mines are situated far from the market or from deposits of fuel, with inefficient means of transport, and where labour and other expenses are high. Lead, in countries such as these, would not, by itself, pay to produce, and consequently ceases to be the main object of the mining and smelting operations, for the lead becomes the bye-product which serves primarily as a vehicle for the collection of the precious metals in the ores. These considerations are specially applicable as regards the American continent. At the date of publication of the "Mineral Resources of the United States for 1883-84," of the total quantity of argentiferous lead which had been desilverised in 1884, 119,965 tons, returns had been received which related to 117,608 tons. From this quantity had been obtained 21,505,248 ounces of silver and 146,830 ounces of gold. A certain proportion of this was derived from silver ores worked by lead smelters, but it is estimated § that fully 19,000,000 ounces of silver and 125,000 ounces of gold were obtained from the lead ores produced in the Rocky Mountain states and territories.

Owing to the small number of mines which are directly connected with smelting works, and to the want of published information as to cost, it is difficult to estimate the expense of mining and reducing these silver-lead ores, but in the report already referred to, two instances are given which would appear to be fairly typical. In the first case, that of the Horn Silver Mining Company, Utah,|| the ore produced was comparatively rich, and the cost of production was about 100 dollars per ton of argentiferous lead.

The detailed cost was as follows:—

	Dollars.
Cost of mining -	17·25
„ smelting -	48·43
„ desilverizing -	7·95
„ freight -	18·00
	<u>91·63</u>

It would probably be safer to take the cost of the ton of argentiferous lead at 100 dollars.

From a comparison of such other statements as to cost of production as occur in these reports, it would appear

that the cost of mining and smelting the ton of ore did not, on the whole, differ greatly from that of the Horn Silver Company. The ore produced, is, however, frequently much poorer, and in the case of the Eureka Consolidated Mining Company* the average amount of lead in the ore is about 10 per cent. At this mine and works the total cost per ton of argentiferous lead is as follows:—

	Dollars.
Cost of mining -	51·00
„ smelting -	138·20
„ desilverization and	
„ freight -	59·37
Total -	<u>248·57</u>

Taking into consideration the poorness of the ore and the heavy cost for freight, it would appear that this expenditure of 250 dollars per ton is rarely exceeded. It would further seem fair to assume that the mean cost of extraction in the United States would be shown approximately by taking the mean of the costs at the two works $\frac{100 + 250}{2} = 175$ dollars. The

price of lead at Chicago in October last was 4·10 dollars per cwt., 82 dollars per ton, while silver sold at 98 cents the ounce. The cost of working the ton of argentiferous lead being taken at the above mean, 175 dollars, it is possible to calculate the amount of silver the lead should contain in order to meet this cost, and it will be found that each ton weight of argentiferous lead must contain 95 ounces of silver; the gross value will then be made up of—

	Dollars.
Value of silver -	93·1
„ „ lead -	81·7
Total -	<u>174·8</u>

Thus, to admit of its being smelted, the ore should, on the mean, be of such a richness as to yield a lead containing 95 ounces of silver. To 117,608 tons of refined lead there were, however, 21,505,248 ounces of silver and 146,830 ounces of gold, so that each ton of argentiferous lead produced in the United States contained nearly 183 ounces of silver and $1\frac{1}{2}$ ounce of gold. Taking the relative weight of silver as 20 times that of gold—the present market value—the ton of argentiferous lead contained on the average over 200 ounces of silver. It need only have contained 95 ounces to cover the working expenses, so that, as regards argentiferous lead, the price of silver might have been less than half the market price and yet have entailed no loss on the working.

The 4,000 tons of lead produced in Mexico, South America, and Australasia may be fairly considered as having been of the average richness of the lead produced in the United States, and the cost of production may, without prejudice to the conclusions arrived at, be assumed to be the same.

The present cost of desilverizing the ton of rich lead at Freiberg amounts, as shown by results recently obtained,† to about 25s. per ton, or about 1d. per ounce of silver produced. Including the cost of refining, the expense of desilverization would still be well below $1\frac{1}{2}d.$

Nearly the whole of the silver produced in Europe is obtained from the smelting either of lead or of copper. Of the former metal the production is about 337,000 tons; and of the latter about 77,000 tons.‡ It is evident, therefore, that the larger proportion of the silver produced must be due to the smelting of lead ores, and of such ores, &c. as are added to the lead smelting charge. With regard to the amount of silver produced in the treatment of copper ores, the quantity produced at Mansfeld,§ in Prussia, in 1884 from ores which yielded 12,774 tons of copper was 74,132 kilogrammes, about 186 ounces to the ton, and as the copper obtained at these works contains an unusually large proportion of silver, it is probable that the total quantity of silver found to be worth extracting from copper ores in Europe does not exceed twice the production of the Mansfeld works, say, 150,000 kilogrammes. Of this quantity probably some 10,000 kilogrammes were produced from copper ores treated in connexion with lead ores. The total quantity of silver produced in Europe amounted to about 388,000 kilogrammes. Subtracting from this the quantity estimated to be produced from copper ores by methods other than those connected with the use of lead, the quan-

§ Zeitschrift für das Berg-, Hütten und Salinenwesen im Preussisch en Staate, 1885, p. 190.

tity is obtained which is produced in the smelting of this latter metal, 238,000 kilogrammes.

As to the relative cost of production in Europe and in the United States, it is evident that, owing to much cheaper labour, nearness to the market, and greater facilities for transport, the cost of production in Europe would be much less than it is in America, were it not that the mines, as a rule, are deeper and less rich. The lead ore produced in Europe is, as compared with that of the United States, comparatively poor in silver. In the United Kingdom the lead ores contain on the average about 8.5 ounces of silver to the ton of lead. In Spain* 331,164 tons of lead ore, of little value as regards silver, and 26,047 tons of argentiferous lead ore properly so called were produced. The quantity of silver contained in this latter may be estimated from the fact that the desilverization of 3,587 tons of lead gave 4,102 kilogrammes of silver, about 36 ounces to the ton. Some rich ore is, however, exported.

In Italy† 31,191 kilogrammes of silver were produced from the desilverization of 15,000 tons of argentiferous lead, about 67 ounces to the ton.

As in these two countries only native ores are treated the results are typical of at least a portion of the lead ores of the Continent. In Germany and Austria the lead ores are usually comparatively rich in silver, but foreign ores are also imported, and as the compositions of these are not stated, the results of the treatment of the native ores are not directly obtainable.

Thus, although the European lead ores are poorer in silver than those of the United States, cheaper labour and transport, and greater facilities for smelting, render it probable that while the cost of production may be considerably less than in the United States, it cannot well exceed it.

The cost of production of the ounce of silver obtained from the desilverization of lead ores is therefore about 2s., and the total amount of silver produced from the smelting of lead ores is about :—

	Ounces.
United States - - -	21,890,000
Europe - - -	8,036,000
Elsewhere - - -	800,000
Total - - -	30,726,000

Section III.

Argentiferous Copper Ores.—The amount of silver present in copper ores is much less than in lead ores, and in the latter the precious metal is frequently the main object of the smelting, while in copper ores it is usually a valuable bye-product.

The quantity of silver present in copper ores varies greatly, and no statistics relating to the average amount are obtainable. That the amount derived from this source is comparatively small is evidenced by the fact that the cost of extraction of the silver from copper is much greater than from lead, and the quantity of copper produced annually is relatively small. The greater cost of extraction is forcibly shown in the case of the Oker Works, Germany.‡ The copper produced at these works is, by a metallurgical process, divided into two approximately equal portions, one of which contains 21 ounces of silver to the ton of copper, and the other 53 ounces. The first portion does not pay to treat, while the latter does. The cost of extraction of the silver may be taken to lie between the two, possibly a mean, 37 ounces, or, at 4s. per ounce, 7l. 8s. per ton of copper. This is, moreover, the cost per ton of copper at the Mansfeld Works§ and by the electrolytic process the expense will probably be about the same.|| Other methods of treatment of argentiferous copper ores are more expensive, and the increased cost of labour, &c. in America and elsewhere would cause the mean cost of extraction to be higher than the above estimates. It is not probable, however, that it would be greater than 50 ounces, 10l.

With regard to the richness in silver of the materials treated, the silver obtained at Mansfeld is, as already stated, about 186 ounces per ton of copper; at Oker the quantity present was 53 ounces, and "bottoms," which are worth desilverizing in other parts of the world, generally contain at least this amount. The mean amount of silver present in the ton of copper desilverized may be taken to be somewhere between the 50 and the 186 ounces in the cases mentioned, probably nearer the former than the latter, and 100 ounces per ton may be taken as a maximum. The cost of extraction of the silver present in copper ores must, when these latter are treated together with lead ores,

be but small, as the additional cost of smelting would be so, as would also be the extra cost connected with the purification, &c. of the lead. The cost of the silver produced by wet methods is somewhat more difficult to determine, but it is stated* that the cost of recovering the precious metals by the Claudet process is about 8d. per ton. The ores treated by this process in the United Kingdom in 1885 contained† a little over two grains of gold and about three-quarters of an ounce of silver per ton of ore. Gold being of the value of about 2d. per grain, the cost of extraction of the three-quarters of an ounce of silver also present was about 4d., or at the rate of 5d. per ounce. The 328,000 ounces of silver obtained in this manner in Great Britain were mainly a bye-product, costing about 5d. per ounce to produce. This is not true, however, as regards silver obtained by other methods, but if the cost of production of the ounce of silver obtained by wet processes generally be placed at 1s., this is probably a high estimate. As regards the cost of desilverization of the copper, or of the "regulus," produced during the smelting of copper by the dry way, this has already been estimated at one-half the value of the silver produced, or about 2s. per ounce. Next, as to the quantity of copper desilverized. The total quantity of copper produced in 1885 amounted to about 222,000 tons.‡ Of this quantity, 14,880 tons were produced in Great Britain from ores which had been treated, with a view to desilverization, by the Claudet process, the quantity of silver obtained being 328,000 ounces. Allowing an equal quantity of silver and copper to have been produced elsewhere by this and other wet processes (giving a total of, say, 650,000 ounces), and placing the amount desilverized by lead at 10,000 tons of copper, containing 50 ounces of silver per ton (producing 500,000 ounces), there remain about 222,000—40,000, or 182,000 tons, as the quantity of copper produced by the ordinary dry smelting processes. Now, considering the comparative poorness in silver of copper ores as compared with lead ores, and the necessity for an average contents of 50 ounces of silver per ton of copper, as previously estimated, to pay for the extraction, it is safe to assume, without prejudice to the final conclusions, that of this quantity not more than one-third was actually desilverized.

Supposing this amount to have been of the average richness estimated (100 ounces of silver per ton of copper giving $\frac{182,000}{3} \times 100$ or about 6,050,000 ounces of silver), the silver produced from copper ores and the cost in accordance with the data above given will be as follows :—

	Annual Production of Silver.	Cost per Ounce.
	Ounces.	s. d.
From Copper ores desilverized by wet processes exclusively.	650,000	} 1 0
From Copper ores desilverized by lead.	500,000	
From Copper ores desilverized during the ordinary smelting of Copper.	6,050,000	2 0
Total - - -	7,200,000	Mean 1 11

Section IV.

Silver Ores.—These ores are of very varied composition, and when not treated in connexion with the smelting of lead or of copper are treated either by amalgamation or by wet methods. By far the greater quantity of the silver is obtained by the former of these, and as wet methods are, on the whole, not more expensive than amalgamation,§ they need not be separately considered. The quantity of silver thus produced is found by subtracting the silver obtained by the processes already considered from the total production, which will give 49,920,733 ounces. This amount is mainly produced on the American continent. The ores treated are mostly true silver ores, but in some cases other metals are present in such quantities as, in conjunction with a low yield of silver, to render their mining and metallurgical treatment possible, provided local conditions are favourable. The silver ores occurring in the State of California are both surface ores and ores obtained by deep mining. The cost of mining and milling the former is

† Mineral Statistics of the United Kingdom for 1885, p. 74.

‡ Estimated by H. R. Merton & Co., London.

§ See Stetefeldt: Comparison of amalgamation with Russell's lixiviation process. Precious Metals in the United States, 1883, p. 745.

about 6½ dollars per ton.* A good example of the cost of deep mining is given in the case of the "Bonanza King"† Mine, which is situated near the highest peak of the Providence Mountains. The mine is 520 feet deep, and the ore has to be hauled for a distance of two miles. The cost of mining, hauling, and milling the ton of ore was 25·7 dollars, and it yielded silver to the value of 179 dollars. The value of the silver ore treated in California varies from 50 to 500 dollars per ton, a great portion yielding in the mill over 100 dollars per ton.‡ As a considerable proportion was produced at a cost of only 6·5 dollars per ton, it is not probable that the mean cost of extraction exceeded that at the "Bonanza King," say, 25 dollars per ton.

Comparing these results with the numerous other instances mentioned throughout the annual reports of the Director of the United States Mint on the Production of the Precious Metals, 1883 and 1884, it would appear to be reasonable to accept these statements as giving approximately the average richness of the ore treated, and the cost of mining and milling.

The cost of the ounce of silver so produced was therefore about 1s., corresponding to an expenditure of 25 dollars to obtain 100 dollars worth of silver.

In Mexico and South America cheaper labour tends to compensate for less efficient methods. Those in most general use are the Patio and Cazo processes. The cost of treatment by the Patio process has been variously estimated § at from 16 to 27 dollars per ton of ore, and by the Cazo at about 7 or 10|| dollars. Adding to this the cost of mining, say, 7 dollars, the total cost per ton varies from about 14 to 35 dollars. The ore treated contains from a few ounces to several thousand ounces per ton, and it seems probable that 25 dollars per ton may be taken to be the average expenses, and, from a comparison of various estimates,¶ it seems probable that 70 dollars for yield, or somewhat less than the average of the United States, is not far from the truth.

The final conclusions as to the actual cost of production by each of the principal methods of extracting silver would, therefore, appear to be as follows, the figures relating to the amounts produced being, for the sake of clearness, repeated from Table II. :—

Section.	Fine Silver, in ounces.	Cost per ounce of fine Silver.
I.	508,000	s. d. 0 2½
II.	30,726,000	2 0
III.	7,200,000	1 11
IV.	49,920,733	1 5
Total	88,354,763	Mean 1 8

The mean cost of production of the ounce of fine silver was, therefore, about 1s. 8d., corresponding to 1s. 6½d. per ounce standard.

GENERAL CONCLUSIONS.

It was stated at the outset of this inquiry that it was necessary to regard the data collected as to cost of production as applicable to the total amounts of silver estimated to be produced by each of the respective processes. It will therefore be well to examine the foregoing results as a whole with a view to determine what degree of confidence may be placed in the general conclusions.

Section I.

With regard to Section I., it may be safely assumed that the cost of extracting the whole of the 508,000 ounces of silver from native gold is not inaccurately represented by the 2½d. per ounce assigned to it. The amount so extracted constitutes, however, a very small proportion of the total production of silver.

Section II.

Section II., on the other hand, includes one third of the total amount, and it is not possible to obtain direct evidence as to the cost of production of the whole of these 30,726,000 ozs. It will be observed that the evidence mainly rests on the statements as to cost of production at two works in the United States. These produce between them one sixteenth of the total amount of silver classified under this section, and there seems no reason to doubt that they may be considered respectively to be typical of the maximum and minimum cost of production in the United States, which itself produces no less than two thirds of the total amount of silver comprised in this section. It may be added that the mean cost per ton of argentiferous lead, 175 dollars, is nearly three times the selling price of the argentiferous lead extracted in the United Kingdom.

Since the evidence was given, the report for the year 1886 of the Broken Hill Mine, Barrier Ranges, New South Wales, a mine of very considerable importance, has been published. It states that during the year the smelting of 10,397 tons of ore yielded 1,991 tons of lead and 871,665 ozs. of silver, at a cost, including mining charges, of 4l. 12s. 0½d. per ton of ore, or at the rate of 1s. 1d. per oz. of silver produced, if the lead be considered to be of no value. The cost of production will, it is stated, be considerably reduced.*

Section III.

The amount of silver produced annually in the treatment of copper ores is estimated at 7,200,000 ozs.; of this quantity, 6,050,000 ozs. were obtained during the ordinary smelting of copper ores, and 2,382,000 ozs. of this latter amount, or one third of the total, were produced at Mansfeld at a cost which is stated to be 9½d. per ounce. Of the remainder, 328,000 ozs. were produced in Great Britain by the Claudet process, at a cost not exceeding 5d. per ounce.

Silver in this section being mainly a bye-product, mining charges of the copper ore which originally contained it are disregarded. This leaves an amount of 4,490,000 ozs., or two thirds of the total production under this section, to be accounted for, and in the absence of more precise evidence it does not seem unreasonable to account for them in the manner set forth. Although it is probable that the evidence respecting this section is the least satisfactory, it may be observed that the amount in question is small when compared with the total annual production.

Section IV.

This section, dealing with methods that involve the use of mercury, comprises more than half the total amount of silver produced annually. The figure, 25 dollars, which has been taken to represent the cost of mining, milling, and transport of the silver contained in the ton of ore is supported by a considerable amount of evidence. As regards the United States of America, an eminent authority, Professor Egleston, of the School of Mines, Columbia College, New York, stated in 1879, that "the cost of treatment to large mill companies at the Comstock Mill would not usually be as high as 8 dollars; at the Brunswick Mill the average for the year 1874 was 7·76 dollars;" he adds, however, that "the mill companies rarely charge less than 12·5 dollars on large and long contracts," and he points out that the mill companies almost always declare large dividends, while the mines are often not worked at a profit."

Another writer, Mr. Rothwell, states that the prices paid for milling Comstock ores have varied from 11 to 20 dollars per ton.

The amounts to which Professor Egleston's figures refer are very large and apply to a considerable proportion of the ores treated by mercury in the United States of America; moreover, no evidence has appeared that would lead to the supposition that the cost of extraction has varied materially since the above figures were given.

In regard to the 22,900,000 ozs. produced in Mexico, the bulk of which involved the use of mercury, there is much reason to suppose that the cost of production is fairly stated at 25 dollars per ton of ore.

Various authorities estimate the cost of the metallurgical

* Money Market Review, 5th May 1887.

processes involved in the extraction of the silver in Mexico at from 11 to 21 dollars per ton of ore, not including the cost of mining. Mr. R. E. Chism* estimates the cost of treatment by the old Mexican process at about 27 dollars per ton of ore, which includes a charge for profit to the owners of the works, but does not include superintendence or interest on cost of plant.

In a recent paper C. A. Stetefeldt,† referring to the year

1883, gives the total cost of reduction of a poor ore as 8·12 dollars per ton.

It is possible that the estimated yield of 70 ozs. to the ton of ore in Mexico may be too high. If, however, a minimum estimate of 50 ozs. per ton be adopted, the mean cost of production under Section IV. would be increased to 1s. 8d. per oz. standard, but this may be taken as the limit of error.

APPENDIX VII.

PAPERS put in by Mr BIRCH with regard to the Currency and Circulation in France, Germany, Italy, Spain, Switzerland, and Belgium. See Question 1378.

A.—BANK OF FRANCE.

MAXIMUM and MINIMUM AMOUNT of GOLD and SILVER held at various dates, with the Notes in Circulation.¹

Amounts stated in millions of pounds sterling.

Year.	Gold.		Silver.		Total Bullion.		Notes in Circulation.		
	Maximum.	Minimum.	Maximum.	Minimum.	Maximum.	Minimum.	Maximum.	Minimum.	
1868 - -	35·1	26·5	19·1	12·4	52·6	39·1	53·1	44·9	
1869 - -	29·2	23·5	23·7	18·9	50·7	42·6	57·6	51·8	
1870 - -	29·6	17·3	23·2	2·8	52·7	20·2	72·6	54·4	On the 13th September 1869 commenced the forced currency of notes. Siege of Paris, September 1870 to March 1871. During these years notes of 25 francs and 20 francs were issued. In 1871 notes of 5 francs were authorised. By the Law of 15th July 1872 the maximum circulation of bank notes was raised to 128,000,000l. from 112,000,000l., at which it had been fixed on the 27th December 1871. In this year notes of 5 francs were issued. Demonetisation of silver by Germany. Last instalment of indemnity of 200,000,000l. paid. During this year notes of 20 francs and 5 francs were called in. No notes of 25 francs were issued during this year. Latin Union wholly discontinued coinage of silver. International Monetary Conference at Paris. On the 1st January 1878 the forced currency of bank notes ceased. In December 1880 it was determined to issue notes of 50 francs. The Governor of the Bank of France in his report for 1881 refers to the efforts made to increase the stock of gold, and stated that it had been brought about in great measure by enlarged issue of small notes.

* Mining and Scientific Press, March 17, 1882.

† Trans. Ann. Inst. Min. Eng. xiii. (1884-5), p. 370.

B.—GERMANY.

Berlin, 4th November 1886.

I BEG to answer your inquiries of the 26th ultimo as follows :—

1 and 2. Of the silver coin demonetized there has been sold on account of the empire 7,102,862 lbs. fine silver, and remains unsold 339,353 lbs. No sales have taken place since May 1879.

3 and 4. The extent and composition of the money in circulation and the momentary supply of bullion in Germany at the end of 1885 are taken about as follows :—

	£	Marks
Gold coinage of the empire (exclusive of 120 million marks in the War Treasury), about -	77,500,000	1,550,000,000
Bar gold and foreign coin in the Reichsbank -	9,700,000	194,000,000
German and Austrian thalers (highest estimate) -	22,500,000	450,000,000
Silver coins of the empire -	22,100,000	442,000,000
Nickel and copper coin -	2,000,000	40,000,000
Total -	133,800,000	2,876,000,000
Treasury notes of the Imperial Treasury -	6,900,000	138,000,000
Bank notes not covered -	18,050,000	361,000,000
Total -	158,750,000	3,175,000,000

Per head of the population (46,840,000) this amounts to M. 37·20 in gold coin, in old silver coin and token money M. 10, in credit notes M. 10·7; altogether means of circulation about M. 68 per head (not counting M. 300,000,000 balances with banks which are to be considered with the circulation of notes) against M. 58·50 in 1870.

The fifth question, as to the amount the average of inhabitants carry about with them, I have been quite unable to get answered, and I do not know by what method a somewhat reliable estimate can be arrived at.

C.—ITALY.

1^{re} Question.—A la fin du 1^{er} semestre 1886 le trésor de l'Etat possédait—

	Lire
En or entre propres fonds et fonds de l'emprunt -	215,522,105
En argent (écus) -	6,586,515
En petites pièces -	16,596,796
Total -	238,705,416

Outre cette somme il y avait en monnaies d'or et d'argent pas décimales lire 76,675·16, qu'on ne pouvait pas considérer comme faisant partie de la circulation, parce qu'elles étaient hors cours.

A la même date les six instituts d'émission du royaume possédaient dans leurs réserves—

	Lire
En or -	299,700,000
En écus d'argent -	51,800,000
En petites pièces d'argents -	12,960,000
Total -	364,460,000

aux quelles il faut ajouter 330,000l. en or pas décimales.

Ainsi la circulation du pays pouvait être déterminée par ces deux parties soit—

	Lire
Une -	238,705,416
L'autre -	364,460,000
Ensemble -	603,165,416

Il faut pourtant unir à ce total les montants métalliques chez les particuliers pour les quels on n'a pas de dates positives; excepté pour les petites pièces ecuses par l'état en 170,000,000 qui se trouvent sans aucun doute, pour la plus grande partie, en circulation dans le pays.

Or ces dernières on pourrait les calculer environ à 140,000,000 lire sans tenir compte des sommes qui sont chez les instituts d'émission et chez le trésor, calculant l'importation égale à l'exportation.

De telle manière le chiffre susdit serait de 743,165,416 lire.

Quant à l'or et aux écus qui peuvent circuler entre les particuliers, les instituts de crédit et les banques mineures, il nous manque, comme nous avons déjà dit, des dates sûres pour en fixer le montant.

La rélation parlementaire du député Simonelli, du 3 Juin 1885 pour le dessein de loi pour la prorogation du cours légal des billets des instituts d'émission, calculait à 60,000,000 de lres l'or qui existait alors chez les particuliers, et à 50,000,000 lire les écus d'argent; en tout encore 111,000,000 lire qui porteraient le total de la circulation a 854,165,416 lire.

Il faut pourtant tenir compte que ces derniers chiffres ayant été le résultat de simples appréciations indirectes et déductives donnèrent lieu à des vives critiques qui en diminuèrent assez l'importance.

Pourtant on peut les accepter sans trop croire d'être éloignés du vrai, surtout après un an et demi; dans laquelle période l'or et les écus ont eu le temps de s'enraciner davantage dans la circulation.

2^{me} Question.—A cette question répond la ci-jointe circulaire imprimée du 22 Mars 1886.

3^{me} Question.—Il nous manque tout élément pour répondre même à peu pris à la troisième question.

STATISTICS of GOLD shipped to ITALY in 1881-1883.

	Gold taken at Weight.	Coins which were legal Tender in the Kingdom.	Total.

	Lire - 491,000,000·08

D.—SPAIN.

All the calculations which can be made as to the supply or stock of money have much of an arbitrary character, and even more so in Spain, where we do not know what quantity of money exists of the ancient coinages, how much is melted, how much is exported, or how much is re-imported. We have no other basis for an estimate than the ascertained coinings, and the opinions put forward by sundry authorities.

According to the well known "Diccionario de Canga," Arguelles (Vol. 2, page 331), in 1772 the Spanish money in circulation was estimated at 1,221,557,233 pesetas. But according to the report of the "Direccion General de Consumos, Casas de Moneda y Minas," published in 1862 (page 67), the quantity of gold and silver remelted in 1792 reached 317,057,235 pesetas, a figure which represented the whole, or at least a great part, of the specie current in Spain.

In 1814 the same "Canga" Arguelles (Diccionario, Vol. 1, page 440), says that without exaggeration the total of money circulating in Spain might be estimated at 1,618,369,210 pesetas. In 1830 Senor Borrego calculated our wealth in specie at 1,725 millions of pesetas. It is since that time that commerce has most developed, and population increased; and the perfection reached in documents representing credit being very recent, it may well be asserted that an approximate sum of specie is necessary.

Senor Surra y Rull, in 1870, calculated the specie circulation of Spain at 2,150 millions of pesetas; of which 1,600 millions were in gold, 50 millions in large silver, and 500 millions in small silver. (Enquete sur la circulation monétaire, Vol. 2, page 112). Senor Sansoma ("The Monetary Conference in 1881," page 33), estimates the specie in circulation at 1,200 millions of pesetas, of which 700 millions were in gold, and 500 millions in silver. The Director of the United States Mint calculated in 1881 the specie circulation of Spain to be 650 millions in gold, 200 millions in large silver, and 150 millions in small silver; total 1,000 millions of pesetas. M. Haupt ("Arbitrages et parités," 6th edition, page 8), estimates that at the end of 1883 the specie currency of Spain was composed of 760 millions in gold, 350 in large silver, and 160 in small silver; total 1,270 millions of pesetas. The same authority ("L'histoire monétaire de notre temps," page 417), is of opinion that the money in circulation in Spain in 1885 was composed of 470 millions in gold, 420 in large silver, and 180 millions in small silver; total 1,070 millions. Alph. Allard ("La crise, la baisse des prix la monnaie") estimates at 682 millions of pesetas the gold circulating in Spain, and 367 millions the silver; total 1,050 millions.

In view of such diverse opinion, let us now look at what is shown by the mintages which have been effected.

From 1824, until the law of 1868, 824 millions of pesetas were coined in gold, and 227 millions in silver; total 1,051 millions. Later on, although with the same die, 328 millions in gold were coined, which make, with the previous coinings, a total of 1,152 millions of pesetas in gold; but 660 millions of these having been presented for re-coining, there would remain a maximum in circulation of 492 millions in gold.

Under the law of 1868, 934 millions were coined, so that the maximum amount of gold in circulation will be 1,424 millions, without taking into account the gold of a prior date to 1824, of which there still remains some in circulation.

Senor Tutan, at the conference held in the "Atenes Barcelonés" in February 1886, estimates at 600 millions the gold which has been exported, leaving, therefore, 800 millions of pesetas in circulation, a figure probably below what would result from following the calculations of Senor Surra, and certainly above what may be deduced from those of the Director of the Mint of the United States, of Haupt, and of Allard, bearing in mind, in support of this inference, that our coinings from 1824 to 1868 hold a proportion of 80 per cent. of gold to 20 per cent. of silver.

With respect to the silver circulation, it is already shown that the amount coined from 1824 until the law of 1868 reached 227 millions of pesetas; and, there having been re-coined 28 millions, there remain 199 millions, which, added to the 610 millions coined subsequently, make up 809 millions, from which are to be deducted the amounts exported to the Colonies, Algiers, and other places, where our money circulates. The maximum figure of 600 millions fixed by the said authorities might well be accepted, making a total specie circulation of 1,400 millions of pesetas. This amount is smaller than that calculated by our authorities for 1830 and 1870; but the increased use of documents of credit, so much more general in these latter years, must be taken into account.

On the other hand, the proportion of 85 pesetas per head of the population, resulting from the total of 1,400 millions of pesetas in specie in circulation, appears more reasonable than the lower figure which would result from the estimates of other authorities, comparing the said sum of 85 pesetas with similar estimates for other nations, after duly taking into reasonable consideration their economic conditions.

In conclusion, we believe that the figures most approximating to exactness are those of 800 millions of pesetas in gold, and 600 millions in silver, as composing our specie circulation.

E.—SWITZERLAND.

1^{re} Question.—A combien estime-t-on le montant d'or et d'argent en espèces en circulation en Suisse?

Avant d'aborder les chiffres, il convient d'observer que la circulation fiduciaire tend à prendre de plus en plus d'importance en Suisse ainsi que le démontre le tableau suivant de l'émission des banques Suisses pendant les cinq dernières années.

1881	-	-	99.4 millions de francs	} d'après Mr. Otto Scherer.
1882	-	-	98.3	
1883	-	-	102.2	
1884	-	-	114.8	
1885	-	-	123.4	

La faveur de plus en plus marquée dont joint le billet de banque auprès de notre public tient à plusieurs causes—

1. La multiplicité des banques d'émission, grâce à laquelle les billets qui circulent dans chaque partie du pays sont en grande majorité ceux d'une banque locale que le public connaît parfaitement.
2. Les précautions presque exagérées prises par la loi, en ce qui concerne la couverture en espèces des billets émis par les banques.
3. Enfin la conviction générale que sous le régime actuel de multiplicité des banques il ne serait pas possible, en aucune circonstance d'établir le cours forcé.

Voici maintenant, d'après l'Inspecteur Fédéral des Banques d'Emission, Mr. Otto Scherer, une des personnes les mieux qualifiées en Suisse pour traiter cette question, quelle était à la fin de 1885 la circulation monétaire du pays—

—	Or.	Argent.
	Francs.	Francs.
Dans les banques -	48,000,000	18,000,000
En circulation -	22 à 32,000,000	22 à 32,000,000
Total -	70 @ 80 millions	40 @ 50 millions

sans tenir compte de la monnaie d'appoint.

Il est intéressant de comparer ces chiffres avec ceux de Mr. Ottomar Haupt (également pour la fin de l'année 1885)—

—	Or.	Argent.
	Francs.	Francs.
Dans les banques -	49,000,000	21,000,000
En circulation -	30,000,000	50,000,000
Total -	79,000,000	71,000,000

plus 18 millions en monnaie d'appoint.

On voit que Mr. Haupt fait au stock argent une plus large part que Mr. Scherer.

Mr. Ad. Soetbeer, qui est généralement connu comme l'un des premiers, sinon le premier, des statisticiens en cette matière, attribue au stock or de la Suisse une beaucoup plus grande importance absolue et relative, et considère comme minime les chiffres suivants, tout en faisant observer qu'il est fort difficile, surtout dans ce pays, d'arriver à

des données un peu certaines sur le chiffre de la circulation métallique—

	Or.	Argent.
	Francs.	Francs.
Dans les banques -	47,000,000	18,000,000
En circulation	53,000,000	22,000,000
Total	100,000,000	40,000,000

plus 20 millions en monnaie d'appoint (argent). Les chiffres de Mr. Soetbeer se rapportent au 30 Juin 1885.

Malgré les divergences qui existent entre les deux premières statistiques et celle de Mr. Soetbeer, cette dernière a bien son importance, vu la compétence et la grande autorité de son auteur, et le soin qu'il apporte au contrôle de tous les chiffres qu'il avance.

2^e Question.—Quelles sont les dénominations des différentes pièces en or et en argent qui ont cours en Suisse ?

La Suisse fait partie de l'Union Latine et les pièces d'or et d'argent qui y ont cours légal sont par conséquent les mêmes qu'en France, en Italie, en Belgique et en Grèce. Elles sont fixées par la Convention monétaire du 6 Novembre 1885 de la manière suivante—

Pièces d'or.—De f. 100, f. 50, f. 40, f. 20, f. 10, f. 5, frappées par l'un quelconque des États de l'Union.

Pièces d'argent.—De f. 5

Pièces d'argent (monnaie d'appoint).—De f. 2, f. 1, f. 0.50, f. 0.20, frappées par l'un quelconque des États de l'Union — également.

Toutes ces pièces ont cours en Suisse, bien que la Confédération n'ait frappé que les pièces suivantes—

Or.—Pièces de f. 20 (pour un montant très-restreint).

Argent.—Pièces de f. 5.

Argent (monnaie d'appoint).—Pièces de f. 2, f. 1, et f. 0.50.

3^e Question.—Combien les gens ont-ils l'habitude de porter sur eux ; en prenant une moyenne de dix personnes appartenant à des classes différentes ?

Si l'on tient compte des différences dérivant du sexe, de l'âge (doit-on comprendre les enfants ?), de la fortune, de l'occupation (et des besoins d'argent journaliers qu'elle peut entraîner), on comprendra qu'il ne soit possible de répondre à cette question d'une manière pratique. On arriverait tout au plus à une moyenne purement théorique, qui n'aurait aucune ombre d'exactitude et serait donc sans valeur.

Ce calcul rencontrerait en outre en Suisse des éléments spéciaux d'inexactitude—

1. Dans la diversité des races dont se compose la population, et partant, de leurs habitudes.

2. Dans le grand nombre d'étrangers qui parcourent le pays pendant une partie de l'année et transportent dans leurs poches des sommes plus considérables comme touristes que s'ils étaient habitants réguliers du pays. Cet élément important, qui échappe au contrôle, ne pourrait être laissé de côté dans l'établissement d'une statistique de cette nature.

Nous croyons cependant que dans ce domaine, le rôle du numéraire tend chaque jour à diminuer, les personnes qui ont l'habitude de porter sur elles une certaine somme préférant de plus en plus l'emploi des billets de banque

dont les petites coupures (de f. 50 et f. 100) sont très-pratiques pour les petits paiements.

Genève le 3 Novembre 1886.

F.—BELGIUM.

Bruxelles, le 5 Novembre 1886.

VEUILLEZ m'excuser si je réponds seulement aujourd'hui aux questions que vous m'avez adressées dans votre lettre du 27 Octobre proximo, mais elles étaient d'une nature telle que j'ai dû consulter diverses personnes pour arriver à vous fournir, non pas la solution complète des différents points qui vous intéressent, mais quelques renseignements ayant du moins une certaine valeur.

J'ai été ainsi amené à me mettre en rapport avec le Directeur de notre Monnaie, avec l'Administration de notre Banque Nationale, le grand réservoir de notre circulation monétaire et avec des économistes de mérite très compétents dans les questions de l'espèce dont vous m'entretenez.

A la 1^{re} de vos questions :

A combien estime-t-on le montant d'or et d'argent, en espèces, en circulation en Belgique, on me répond.

Des estimations diverses ont été faites à ce sujet. D'après l'étude faite en 1878 par M. E. Pirmez, Ministre d'Etat, il circulerait en Belgique pour 125 millions de francs en pièces de f. 5. et pour 30 millions en monnaies divisionnaires d'argent.

Toutefois il faut remarquer que cette évaluation repose sur la supposition d'une circulation proportionnelle au nombre d'habitants en France et en Belgique appliquée à la quantité de pièces de cinq francs existantes dans l'Union. Cette quantité n'est pas absolument certaine et dans cette étude, elle a été fixée trop bas : la somme de 125 millions pour les pièces circulant en Belgique semble inférieure de beaucoup à la réalité.

On pourrait admettre plutôt qu'elle est de 150 à 200 millions.

De plus, en prenant pour base d'appréciation les paiements faits à la Banque Nationale on est conduit à croire que la quantité des monnaies d'or est égale à la quantité de monnaies d'argent.

Voici les indications que demande votre 2^e question disant :

Quelles sont les dénominations des différentes pièces en or et en argent qui ont cours en Belgique ?

Pièces d'argent :

$\frac{1}{2}$ franc.
1 franc.
2 francs.
5 francs.

En monnaies d'or il n'y a en circulation que des pièces de f. 20, à l'effigie des souverains Belges.

Vous avez que les monnaies d'or et d'argent des autres pays faisant partie de l'union latine ont aussi cours en Belgique.

Quant à la 3^e question :

Combien pensez-vous que les gens ont l'habitude de porter sur eux en or et en argent, en prenant une moyenne de 10 personnes appartenant à des classes différentes ?

Il m'a été absolument impossible d'obtenir, nulle part, une réponse même par approximation. Aucune statistique ne fournit les éléments nécessaires pour donner des chiffres à cet égard et les évaluations que l'on risquerait seraient du domaine de la pure fantaisie.

En regrettant de ne pouvoir vous donner des renseignements aussi complets que je l'aurais désiré, je vous présente, Messieurs, l'assurance de mes sentiments les plus distingués et bien dévoués.

APPENDIX VIII.

PAPERS PUT IN BY MR. HENRY WATERFIELD.

A.—NOTE and TABLES with reference to Paragraph 4 (1, India) of the Treasury Minute of September 6, 1886.

The Royal Commission on Gold and Silver is instructed to inquire what has been the bearing of the changes in the value of the precious metals upon the remittances of the Government of India:—

- (1.) For payments on old or fixed contracts;
- (2.) For payments on new or current contracts.

An endeavour has accordingly been made to divide the net disbursements in England, for which remittances are made by the Government of India, in the manner indicated; and, in so doing, there have been placed in Class I. payments of which the sterling amount does not fluctuate with the rate of exchange, and which are made under old contracts; and in Class II., payments which fluctuate in amount according to the rate of exchange, or are made in consequence of recent arrangements, or are susceptible of modification.

The year 1874–75 has been selected as the starting point, that being the last in which the rate of exchange per rupee was above 1s. 10d.

The following are the heads under which the disbursements may be classed on the principles described above:—

1. *Interest on Debt.*—Up to the year 1884 it was the practice to raise debt in India rather than in England, whenever the latter course could be possibly avoided. The only material addition to the sterling debt between 1874 and 1884 was caused by the famines of 1874 and 1877, and it in no way differed from the debt raised through the necessities of the administration in previous years, as at the time of the Mutiny; therefore, the charge for interest on debt raised up to 1884 is put into the first class. In 1885–86, owing in a great measure to the Report of the Select Committee of the House of Commons on Railways in India, it was determined to raise in London the annual loan for public works; and, as this was the result of the policy of borrowing for that purpose in sterling rather than in rupees, the interest on this loan is placed in the second class.

2. *Stores.*—The stores being annually purchased, the quantity to be obtained is a matter of current administration, and, moreover, it would be possible, if it were thought desirable, to stipulate that payment should be made in rupees. They are, therefore, placed in the second class.

3. *Home Charges for service of British Forces in India.*—These consist mainly of the payments to the Treasury on account of the recruiting, dépôt, and superannuation charges defrayed by the War Office in connexion with the British forces in India, and are in repayment of charges incurred in sterling. They, therefore, fall into the first class.

4. *Passage of Troops to and from India.*—Nearly the whole of this service is undertaken by the Transport Department of the Admiralty, and can only be effected by sterling payments. It thus belongs to the first class.

5. *Furlough Allowances of Indian Officers.* 6. *Pensions and Annuities of Retired Indian Officers.* 7. *Miscellaneous Pensions.* 8. *Indian Provident Funds.*—Most of these payments are in sterling, in accordance with the conditions under which the officers entered the service many years ago, and therefore fall into the first class. Those which have been granted in rupees, and the privilege of receiving which in England is conceded only on the condition that payment is accepted at the rate of exchange annually fixed, are placed in the second class.

9. *Remittance Transactions.*—The Secretary of State in Council makes various remittances to and from India, on behalf of the British Government and of the persons employed in the public service. A rate for the purpose is annually fixed according to the exchange of the day, so that this head belongs to the second class.

10. *Home Administration.*—The salaries and incidental expenses of the India Office are to a great extent fixed by agreement made before 1874; and, even in the case of persons appointed subsequently, forming as they do part of the English Civil Service, the salaries must be paid in sterling. They therefore fall under the first class.

11. *Miscellaneous.*—These are various payments not falling under any of the foregoing heads, such as payments to the British Government on account of postal and diplomatic services, which are necessarily made in sterling, and these come into the first class.

12. *Railway Companies' Transactions.*—Payments of the interest guaranteed to the old companies, and of the annuities, or interest on stock granted in lieu of annuity, to the shareholders of undertakings purchased by the Government, and also the receipts and withdrawals of capital by the old companies, belong to the first class. Payments of interest, and receipts, and withdrawal of capital, in connexion with companies formed since 1880–81, are placed in the second class. Stores for the East Indian and Rajputana-Malwa Railways, purchased under the agreements made recently with the companies working those systems, are also placed in the second class.

13. *Grants-in-aid by the British Government.*—On account of the Afghan and Egyptian expeditions. Credit is given in the first class for these sums, which were voted by Parliament in sterling.

There have thus been obtained, in respect of each of the two classes, the total net sterling payments made in each year from 1874–75 to 1885–86, and, by deducting from the total of each year, subsequent to 1874–75, the total of that year, the excess of net payments in sterling in each year over those of 1874–75 is obtained. The payments in each year being converted into rupees at the average rate obtained for bills and telegraphic transfers in those years respectively, and the number of rupees required in 1874–75 being deducted from the number in each subsequent year, the excess remittance in rupees, requisite to provide for gold payments, over that in 1874–75 is obtained. This excess is then divided into two portions; by deducting from the requisite rupee remittance in each year the number of rupees that would have been needed for that year if the rate of exchange in 1874–75 had remained unaltered, the portion of the excess which has been caused by the fall in exchange is obtained; and by deducting from the number of rupees needed in each year if the rate for 1874–75 had remained unaltered the rupee remittance needed in 1874–75, the portion of the excess which has been caused by an increase in the sterling payments is obtained.

This method has been applied in Table I. to the payments made on old or fixed contracts, and in Table II. to those made on new or current contracts.

In Table III. a comparison is drawn between the years 1874–75 and 1885–86, in respect of the several descriptions of payments placed under the two classes respectively. By deducting the rupee remittance required in 1874–75 for the payments in gold in that year under the several heads (column 3), from the number of rupees needed for the remittance in 1885–86 of an equivalent gold payment (column 4), the excess is shown which is caused by the fall in exchange if the sterling payments had not been increased (column 5). By converting the excess of sterling payments in 1885–86 over 1874–75 (column 7) into rupees at the rate of exchange of 1874–75 (column 8) and of 1885–86 (column 9) respectively, and deducting the former from the latter, there is obtained the further excess caused by the fall in exchange operating on the increase in the sterling payments (column 10). The addition of these two results gives the total excess due to the fall in exchange (column 11), and if to this last result be added the equivalent in rupees, at the rate of 1874–75, of the excess of sterling payments in 1885–86 (column 8), there is obtained the total number of rupees needed in 1885–86 (column 12)

to defray the sterling payments of that year under the several heads, in excess of the number needed to defray the sterling payments of 1874-75 under the same heads.

The following figures comprise, in respect of the years 1874-75 and 1885-86, the chief points shown in the accompanying tables :—

	Payments under			Payments under	
	Old or fixed Contracts.	New or current Contracts.		Old or fixed Contracts.	New or current Contracts.
Net gold payments in 1874-75 - - £	11,704,953	3,339,968	Equivalent in rupees at rate of 1874-75 - Rs.	- 41,43,307	- 8,95,53,286
Rupees needed for the remittance in 1874-75 - - Rs.	12,67,88,727	3,61,78,726	" " 1885-86 - Rs.	- 60,35,233	- 4,80,14,977
Rupees needed for the equivalent sum in 1885-86 - - Rs.	15,38,93,374	4,39,12,943	Excess caused by fall in exchange on increase in net gold payments in 1885-86 over 1874-75 - - Rs.	- 8,86,886	- 84,56,691
Excess caused by fall in exchange on the net amount of gold payments in 1874-75 Rs.	2,71,04,647	77,34,217	Total excess caused by fall in exchange - Rs.	2,62,17,811	- 7,22,474
Net gold payments in 1885-86 - - £	11,321,979	- 311,996	Total excess whether from increase of gold payments or from fall in exchange - Rs.	2,20,69,414	- 4,02,80,760
Excess of net gold payments in 1885-86 over 1874-75 - - £	- 382,974	- 3,651,964			

The last line shows a net reduction of Rs. 1,82,11,346 in the rupee remittance needed to defray the net sterling payments in 1885-86 as compared with those of 1874-75. This is due to the net receipt on capital account of no less than 4,643,070*l.* in 1885-86 from railway companies with which recent contracts had been made, and of 508,467*l.*

from the old companies, whereas in 1874-75 the old companies withdrew 781,648*l.* from the Treasury of the Secretary of State. This reduction by 5,933,185*l.* in the net gold payments, as compared with those of 1874-75, was equivalent to a saving of Rs. 7,80,07,819 in the remittance in 1885-86.

(Signed) HENRY WATERFIELD.

November 22, 1886.

O.—COMPARISON of the FINANCIAL POSITION of the GOVERNMENT of INDIA in 1880-81 with that in 1885-86 and 1886-87.

(See Question 2765.)

Sir John Strachey's book on the "Finances and Public Works of India" dealt with the financial position of the Government of India in 1880-81, for which he gave (at page 433) the following figures from the Revised Estimates :—

	Tens of Rupees.
Net Revenue	49,431,000
Net Expenditure, apart from War, Frontier Railways, and Famine Relief	44,335,000
Surplus, excluding these exceptional charges	5,096,000
The excluded charges were (in round figures) :	
War, including Frontier Railways	11,296,000
Famine Relief	47,000
	11,343,000
And from the Receipts was deducted a capital credit on account of the assets of Military Funds	27,000
	11,316,000
So that the final result was a deficit of	6,220,000

The actual accounts differed from the Revised Estimates, and the form of stating them has been altered since 1881. For a true comparison with the recent Estimates, the figures should be arranged in the following manner :—

	Accounts, 1880-81.	Revised Estimates, 1885-86.	Budget, 1886-87.
Net Revenue	44,644,000	42,126,000	44,250,000
Net Expenditure, apart from charges shown below	38,233,000	40,359,000	42,268,000
Surplus, apart from charges shown below	6,416,000	1,767,000	1,982,000

	Accounts, 1880-81.	Revised Estimates, 1885-86.	Budget, 1886-87.
EXCLUDED CHARGES.			
War or special military preparations	7,539,000	2,658,000*	300,000†
Construction of Railways, not provided from Provincial Revenues, or from borrowed money, or from the grant for Famine Insurance	2,473,000	500,000	—
Famine Relief and Insurance	35,000	1,500,000	1,500,000‡
	10,047,000	4,658,000	1,800,000
Final Result—Surplus	—	—	182,000
Deficit	3,631,000	2,891,000	—

* See paragraph 42 of the Financial Statement for 1886-87, where the cost of the War preparations in 1885-86 is stated at 2,057,100 in India, and 466,700 for Stores in England, to which must be added 143,900 for Exchange.

† See paragraph 26 of the Financial Statement, giving 300,000 as the Expenditure for the Army in Upper Burma.

‡ The sum of 1,500,000. includes 1,361,300 shown under Famine Relief and Insurance, and 138,700 paid as interest to the Indian Midland Railway Company and included in the Railway Revenue Accounts.

When the Government of India at the end of 1877 made arrangements to meet the recurring expenditure on account of famine, the intention was to provide a surplus of 2,000,000 over the ordinary charges, of which 1,500,000 was to be devoted to the relief of or insurance against famine, and 500,000 was to meet contingencies. In the accounts of 1880-81 there was, over the ordinary charges, a surplus of 6,416,000, of which 35,000 was required for the relief of famine, and the remainder was applied in diminution of the debt that had to be raised to meet the exceptional charges for War and Frontier Railways. In the Revised Estimates for 1885-86 there was, over the ordinary charges, a surplus of 1,767,000, instead of 2,000,000, to meet the charge for Famine Relief and Insurance and an allotment of 500,000 which in the Budget had been made from revenue for the construction of railways. In the Budget for 1886-87 an ordinary surplus of 1,982,000 was provided, of which 1,500,000 was allotted to Famine Relief and Insurance (including 138,700 charged in the Railway Revenue Account for interest payable to the Indian Midland Railway Company), and 300,000 was provided for the military operations in Burmah.

The following Table shows the heads under which has arisen the change in the financial position since 1880-81 :—

Net Revenue and Expenditure, excluding War, Construction of Railways, and Famine.	1885-86. Better +, or Worse —, than 1880-81.				1886-87. Better +, or Worse —, than 1880-81.

GRAND TOTAL - - - -	- 2,879,100	- 225,300	- 1,544,200	- 4,648,600	- 1,221,300	- 1,125,000	- 2,087,700	- 4,434,000

* Excluding Indian Midland Railway Interest, 104,000, and Exchange thereon, 34,700.

These details may be summarised thus in groups :—

Better +, or worse —, than 1880-81.

	1885-86.	1886-87.
(1.) Reduction of the duties on salt and customs (in 1882) - - -	- 2,248,100	- 2,157,500
(2.) Improvement of revenue over expenditure, excluding salt, customs, opium, income tax, army, famine, construction of railways, and fall in exchange - - - - -	+ 1,544,500	+ 1,339,600
(3.) Ordinary army charges, and imposition of income tax in 1886 - - -	+ 433,300	+ 380,800
(4.) Diminution of opium revenue - - -	- 2,646,800	- 1,874,200
(5.) Increased charge for exchange, due to the change in the relative value of gold and silver - - -	- 1,781,500	- 2,122,700
	- 4,648,600	- 4,434,000

The following remarks will explain these changes more fully :—

(1.) As explained in Sir John Strachey's work, the Government of India had, by the adoption of a series of measures, carried on for many years, of which the most important were the construction of the Rajputana Railway, the acquisition of the Sambhur Salt Lake, the negotiation of treaties with numerous Native States, and the temporary increase of the salt duty in Southern India, been enabled to abolish the inland customs line and greatly reduce the duty on salt throughout Bengal and Northern India, and in 1882 they were able to complete the reforms by a further reduction in Bengal, so as to equalise the rate

throughout India, and then reduce it everywhere from $2\frac{1}{2}$ to 2 rupees a maund.

For some years also measures had been taken to reduce the duty on imports of the coarser cotton manufactures, so as to remove all semblance of protection for the nascent industry in India, which was seen to be rapidly developing, and which it was most important to place on an sound footing, dependent on its natural advantages and not fostered by any artificial stimulus. In 1882 it became practicable to sweep away the last remains of the import duty on cotton manufactures, and with it the duties on all goods imported into India except liquors, arms, salt, and opium.

Besides these two great measures, the burden on the land was reduced in the North-West Provinces by the remission of the cess for the payment of the village officers, and in Oudh by the transfer of the cost of such officers from the landholders to the Government.

The following was the financial effect as estimated in the budget for 1882-83 :—

Surplus (after providing 1,500,000L. for famine relief and insurance)	£	3,171,000
Remission of duty on salt - - -	1,423,000	
„ import duties (net) - - -	1,147,000	
„ Patwari cess in North-West Provinces - - -	241,000	
Total remission of taxation - - -	2,811,000	
Increase of expenditure by payment of village officers in Oudh - - -	75,000	
		2,886,000
Surplus retained - - - - -		285,000

(2.) The increase since 1880-81 of the revenue from land, stamps, excise, provincial rates, assessed taxes (omitting the additional taxation in 1886), and minor heads, was :—

	In 1885-86.	And in 1886-87.
	2,372,300	2,735,000
The increase of expenditure, excluding Army, construction of railways, and famine, was	2,559,300	3,518,300
Showing a result worse by	187,000	783,100
But of the increased expenditure the fall in exchange accounted for	1,731,500	2,122,700
So that, apart from the fall in exchange, there would have been an improvement of	1,544,500	1,339,600

(The comparison is not quite accurate, as, on the one hand, the land revenue was exceptionally low in 1880-81, and, on the other hand, the net civil expenditure in Upper Burma is included in 1886-87.)

(3.) The permanent increase of the Army charges in India is shown at paragraph 37 of the Financial Statement as	1,126,900
Besides a sum deferred to future years, estimated (paragraph 36) at	656,900
	1,783,800

And, after adding the increased payments in England, with exchange, the total may be taken at about 2,000,000. This, however, is to a great extent met by the temporary saving effected through the alteration made in the system of payments to the Treasury for Non-Effective charges, by which, since the 1st of April 1884, India only pays the charge due to her during the year, instead of the capitalised value of such payments. The consequence is that, as compared with 1880-81, the ordinary Army charges were better by 433,300 in 1885-86, and worse by 516,300 in 1886-87, in which latter year the income tax was imposed to meet

this charge, the improvement of revenue thereby being estimated at 897,100, giving a net result better by 380,800.

(4.) The following are the figures connected with the opium revenue :

	Number of Chests sold in Bengal.	Revenue.	Charges.	Net Result.
1880-81	56,400	10,480,100	2,023,800	8,451,300
1885-86	50,994	8,914,700	3,110,200	5,804,500
1886-87	54,750	9,227,600	2,650,500	6,577,100

The reduction in the receipts is due partly to the necessity of diminishing the quantity offered for sale at Calcutta, owing to the amount in store having been seriously lessened in consequence of bad crops, and partly to much lower prices being realised at the sales. The increase of the expenditure arises from the fact that the two last crops were remarkably good.

(5.) Exchange on expenditure in England is worse than in 1880-81 :—

	In 1885-86.	In 1886-87.
By	1,544,200	2,087,700
But of this there is attributable to increase of sterling expenditure	45,700	249,000
Leaving due in England to fall in exchange	1,498,500	1,838,700
To which must be added the addition made to the British soldier's pay in India	233,000	284,000
Making a total of	1,731,500	2,122,700

India Office,
24th February 1887.

H. WATERFIELD.

The foregoing memorandum has been shown to Sir John Strachey, who has returned it with the letter annexed :—

My dear Waterfield,

I understand your question to be as follows. At pp. 356 and 374 of the book on the Finances of India, written in 1881 by my brother and myself, some statements were made regarding the possibility of largely increasing the public income in the event of any serious financial emergency. You were asked by the Commission whether you agreed with those statements, and your reply was to the effect that the whole position had changed since they were made, and that they were not applicable to the existing condition of things. You ask me if you are not right in believing that this is my own opinion also. The answer is easy. Yes, I think that your Memorandum shows clearly that the conclusion stated by you is perfectly correct.

Some of the expressions used in the first of the passages in question, at p. 356, are not very well chosen, but the general opinions of the authors of the book were given clearly enough at p. 374. Reading them with what goes before, they were to the effect that the then existing financial position was very prosperous, that the main sources of revenue were improving in productiveness, and that, although no necessity of the kind was probable, there would be little difficulty in still further increasing the revenue by 2,000,000 a year. It was suggested that the greater part of such an additional sum might be raised by an income tax. Further, it was said that if, "in consequence of some great financial catastrophe," a much larger further increase to the revenue should become necessary, it could be provided without injury to the country, but only by what had before been called "heroic remedies."

Obviously in making any such forecast of the future, the first essential fact to be considered was the existing financial position. It would clearly make all the difference in the world, when the anticipated emergency arrived, whether there was a large surplus revenue to start with, or a deficit to be made good before dealing with the emergency itself.

When this book was written, early in 1881, it was stated by the authors that there was an assured normal annual surplus of revenue over ordinary expenditure amounting to more than 4,000,000. I see from your memorandum that the actual surplus over ordinary charges in 1880-81 was 6,400,000. In considering what could be done to meet some serious emergency, it was assumed, first, that we had this surplus of at least 4,000,000 to draw upon; and, second, that an additional 2,000,000 might in case of necessity, be raised. Thus, it was supposed that some 6,000,000 a year would be forthcoming before any question of resorting to "heroic remedies," would arise.

The position is now totally different. Your memorandum shows how the changes have come about. Not only has the whole of the surplus of 4,000,000 disappeared, but the greater part of the additional taxation, which in 1881 was thought immediately practicable, has already been imposed in the shape of an income tax, and although this yields much less than had been anticipated by the authors of the book, it would now be in the highest degree unwise to alter it. Thus, whereas in 1881 we had the means of meeting a very serious emergency without having recourse to any extraordinary measures, we have at the present time, as far as I can see, no such means left. There only remain the "heroic remedies," and I certainly should not now contemplate the adoption of such remedies so calmly as was possible under the very different political conditions of 1881.

But I need say nothing on such questions, which the Commission will doubtless consider fall altogether outside the sphere of this present inquiry. I should be sorry myself to give any opinions regarding them, until I knew the views of the Government of India. They alone have the means of arriving at a sound judgment, if it should unfortunately happen that extraordinary measures become necessary, and on them primarily the responsibility must rest for deciding what those measures should be.

Your sincerely,

JOHN STRACHEY.

28th February 1887.

No. 6.

MEMORANDUM drawn up by E. A. HAGUE, Esq.,
Manchester.

The following Oldham Mills have either been closed altogether by the Indian competition of the last few years or (where buildings and capital allowed) have been adapted for and changed to spin other counts.

MULE TWIST YARN 16/24*.

Number of Spindles.	Mill.	REMARKS.
12,000	No. 1	Sold out machinery.
10,000	" 2	Ditto.
6,000	" 3	Ditto.
40,000	" 4	Ditto.
13,000	" 5	Ditto.
40,000	" 6	One portion stopped. Other portion not reeling yarn.
80,000	" 7	Now making 30* and 40*.
50,000	" 8	Now making up to 40* for home use.
30,000	" 9	Spinning 6* and 24* for doubling.
11,000	" 10	Stopped for twelve months past.
15,000	" 11	Spinning 6/26* for doubling.
10,000	" 12	Ditto.
8,000	" 13	Ditto.
20,000	" 14	Spinning 20/34* for home use.
345,000	Total Spindles in 14 mills of which 7 are entirely stopped.	

No doubt more exhaustive inquiry would add to this list, which, moreover, does not include other towns such as Heywood and Rochdale, where also these counts were partially spun.

I have a further list of 15 other mills hitherto spinning 4* and 14* now closed, some undoubtedly by the competition of such mills as Nos. 9, 11, 12, and 13, which have been forced into adapting their machinery to spin lower Nos. than 16* though these counts were already adversely affected by hostile continental tariffs.

There is no doubt also that spinners of 16/24* water twist have been almost equally disastrously affected, but these spinners are so scattered about the country, from Rochdale to Wigan, that it is difficult, if not impossible to obtain reliable statistics.

The largest exporters of yarn to China and Japan, from tables which they keep, estimate the falling off of the exports to these markets during last years (1886) at—

300 bales (of 400 lbs. each) *weekly* of 16/24* Water and 200 " " " " Mule, from what they were four to five years ago, and there can be no doubt that practically this trade is being simply annihilated.

Be it remembered that up to four to five years ago this was a growing trade despite the competition of the Bombay mills, and it would have continued to grow but for the exchange difficulty.

Meantime, fostered by the quasi-protection of cheap silver these Indian mills enjoy a trade so profitable that in Bombay alone the mills have been doubled within 12 years and from eight to ten mills are now in process of construction in India besides works for bleaching, dyeing, printing, &c. Good spinning mills in Bombay have earned a steady 10 per cent. and upwards since 1878.

This same Indian competition has completely crippled Rossendale and the Todmorden Valley where coarse T. cloths, drills, sheetings, &c. &c. were largely manufactured for India and China. First they were mostly driven from the Bombay market, afterwards from Calcutta and Madras and now they have to meet the Indian goods in China and the East Coast of Africa, until it is probably true that half the manufacturers in these districts (of these goods, i.e.) have been ruined and their mills are empty where they could not be turned on to the manufacture of shirtings, &c. in competition with the Blackburn trade. True the distress in these districts was first caused by hostile continental tariffs, but they would have survived that but for the competition of the Indian mills.

This double cause makes it impossible to estimate the effect of the fall in exchange with any approach to the clearness with which it can be traced in the spinning interest, but there is another branch of trade which has been simply *extinguished* by the same cause, viz., that of *Chudders and Coarse Dhooties* made from about 20* yarns. This trade was the offspring of that "opening up of India" by the construction of new roads and railways.

It first sprang into existence some twelve to fourteen years ago, the demand being to replace the product of native hand-looms mostly from home-spun yarns. The

vastly superior quality of our own goods made from American cotton quickly brought them into favour and enabled us for long to withstand even the competition of Bombay mills. But latterly the trade has gradually died out and last year we did not make a single piece.

APPENDIX X.

PAPERS PUT IN BY MR. H. H. GIBBS.

(1.) *Exchange v. Freights as a local influence on Exports.*
(See question 3049.)

When a country's exports possess an intrinsic value considerably higher than the charge for freight on them, their price in the currency of that country will be affected far more by fluctuations of exchange than by fluctuations of freights.

The reason is that exchange, when applied to first cost, influences the principal factor of the total cost, while an alteration in freights only affects a secondary factor in the total cost.

Picking them out at random, one might say that coffee, wool, cotton, sugar, wheat, indigo, nitrate of soda, and copper, would all serve to prove the truth of the above statement, but it will suffice to give examples from the last two articles named, nitrate and copper.

The currency price of nitrate in Valparaiso at the beginning of January 1886 was \$3 15c. per quintal of 100 lbs. Spanish, current freight was 26s. 3d. per English ton of 22 quintals Spanish, and the exchange ruling was 26½d. per dollar.

The average rate of exchange during that year was 23·76d. per Chilian dollar, and the average rate of freight was 24½ shillings per English ton respectively, 9·91 per cent. and 5·15 per cent. lower than the above-mentioned January quotations.

Supposing other conditions of the nitrate market to have remained the same during 1886, how would the said average declines of exchange and freights have respectively affected the currency price of \$3 15c. with which the year started.

As regards exchange, it is plain that an exporter could afford to increase his offer to buy by adding to the currency price the exact per-centage of the fall in exchange; therefore he could in the present instance add 9·91 per cent., or say 31c. to the original price of \$3 15c. But in considering how the fall in freights will affect the question, we must bear in mind that the decline of 5·15 per cent. cannot be applied direct to the currency price at all, but that it must, in the first instance, be applied to the proportion of freight corresponding to the weight of nitrate represented by said currency price.

This price is quoted per Spanish quintal, of which 22 go to the ton.

Therefore, we must first divide 26s. 3d. (the original freight by 22, which gives 1½ shillings per quintal) or, at 26½d. exchange, 59c. freight per Spanish quintal, on which a decline of 5·15 per cent. is equal to a reduction of 3c. per quintal for freight, which 3c. may now be added on to the price which the exporter can bid for the nitrate.

The calculation, therefore, stands as follows:—

Original price	-	-	-	\$	c.
Add, for decline in exchange, 9·91				3	15
per cent. on \$3·15	-	-	-	0	31
Add, for decline in freight, 5·15					
per cent. on \$·59	-	-	-	0	3
				3	49

The above figures show that while the decline in exchange would affect the currency price to the full extent of the per-centage of fall almost 10 per cent., the decline in freights, though 5·15 per cent. (more than half that of exchange) would only affect the price to the extent of 1 per cent.

The same result will appear in a still more marked degree if we take an illustration from copper.

The currency price of Chilian bar copper at the beginning of January 1886 was \$15·30 per Spanish quintal, and working on the same formula as the above for nitrate, we get the following figures:—

Original price	-	-	-	\$	15·30
Add, for decline in exchange, 9·91					
per cent. on \$15·30	-	-	-	1·51	
Add, for decline in freights, 5·15					
per cent. on \$·59	-	-	-	·03	
				16·84	

Here again, exchange affects the price to the full 9·91 per cent., while the decline in freights, 5·15 per cent., as before, only affects the price to the extent of a fifth of 1 per cent.

Copper therefore, owing to its greater value, was much more affected by exchange than nitrate. This, however, is only a side issue, and the principal point made plain by the foregoing calculations is that the fall in 1886 of 9·91 per cent. in exchange and 5·15 per cent. in freights was equivalent to the following advances on the January currency prices of nitrate and copper, viz.:—

			c.
Nitrate, equivalent extra price for			
lower exchange	-	-	·31
Nitrate, equivalent extra price for			
lower freight	-	-	·03
Total per quintal	-	-	·34
			\$
Copper, equivalent extra price for			
lower exchange	-	-	1·51
Copper, equivalent extra price for			
lower freight	-	-	·03
Total per quintal	-	-	1·54

which figures are an emphatic confirmation of the opinion expressed at starting, that exchange exercises a far greater influence than freights on the currency prices of relatively valuable produce.

JOHN MANLEY LOWE.

London, February 23, 1887.

(2.) *Memorandum on the influence of the depreciated Currency in Chile on its Export Trade with the United Kingdom.* (See question 3192).

The principal exports of Chile,—wheat, copper, silver, and nitrate, have all been benefited by the depreciation of the currency in that country. The best example is wheat, as it has benefited more than the other three, and we will endeavour to show how it has been specially favoured by the declining gold value of the national currency.

To do this it will be necessary to study briefly the conditions under which it is cultivated.

Roughly speaking, Chilian wheat is produced by unskilled, and, therefore, ill-remunerated labour. The land for the most part is owned by Chilians, the farms

are very large, the soil usually good, and the tillage superficial and inexpensive. The agricultural labourers are of mixed Spanish and Indian blood, and, though very strong and hardworking, are notoriously as ignorant and backward as any Roman Catholic peasantry in the world; hence they are slow in understanding that a depreciated currency works against them in the matter of wages.

But even if they were quicker in perceiving the effect of exchange on their wages, it would not make much difference, because they only receive the smaller part of their remuneration in actual money.

A resident labourer on the estate will be allowed—

A cottage, rent free.

A piece of land, perhaps half an acre, rent free, and free use of his master's bullocks to plough it with.

A daily ration of bread and beans, and from 7*d.* to 10*d.* per day in cash.

Between his rations and the produce he gets off his patch of land he has sufficient food for his family; he can grow his own tobacco, and he drinks wine or spirits made from farm produce, grapes, or maize.

The only point where exchange touches him is in buying clothes, but, owing to the generally mild climate, his wants in this respect are very moderate, and he spends next to nothing on imported goods.

From the foregoing it will be seen that however much the currency may fall in its gold value, the Chilean agricultural labourer's subsistence is always secured to him, and that he is only harmed, and that to a small extent, by the shrinking of the money part of his remuneration. Computing the money value of his services at 2*s.* 6*d.* per day, of which only 10*d.* is paid in cash, and supposing the currency to have depreciated 50 per cent., it is clear that he is only affected to the extent of 5*d.* per day, or less than 17 per cent. of his total earnings.

Therefore, even supposing him to find this out immediately, and to have the means to enforce his claim (both of which suppositions are contrary to experience) his employer will only have to increase his total wages 17 per cent. to redress his grievance.

Now let us look at the farmer's side of the question, bearing in mind that he employs no skilled labour, uses no artificial manures, and that his labourers till the land with the cattle bred on the estate.

We will assume his wheat, at 46*d.* exchange to have been worth for export \$4 per hectolitre of 166 lbs. Spanish, and that the gold value of the currency has gradually receded to 23*d.* per dollar.

We will also assume that at 46*d.* exchange his wheat was costing him \$3 per hectolitre, of which the half for labour, and the rest for general farm expenses, freight by rail to the nearest port, and shipping expenses.

In the first instance, with exchange at 46*d.*, he can sell his wheat at \$4, equal to 15*s.* 4*d.*, but in the second exchange has receded to 23*d.*, while the price of wheat in Europe and other conditions have remained the same. The Valparaiso merchants can still afford to pay the equivalent of 15*s.* 4*d.* for the wheat, and competition will oblige them to do so. But 15*s.* 4*d.* at 23*d.* is equal to \$8, or double the price which the farmer formerly got, so that his gross currency profit on an hectolitre of wheat will be \$5, instead of \$1, as in the first example considered.

We have now only to examine what effect the lower exchange will have on his cost of production, which we have assumed to be \$3 when exchange was 46*d.*

	\$	c.
Proportion of wages to total cost of producing wheat, one-half of \$3	1	50
Deduct, paid by free rations, &c.	1	0
Payment of wages in actual money -	0	50
	\$	c.
50 per cent. depreciation in exchange, made good -	0	25
Extra cost of bagging -	0	10
Sundries, say -	0	5
Total extra expenditure, per hectolitre -	0	40

which will leave the farmer with a nett profit of \$4 60 c. at 23*d.*, while he only made \$1, when exchange was at 46*d.*

It is thus easy to understand how Chile has maintained its position as a wheat exporting country in spite of the collapse in the European price of wheat. When exchange stood at 46*d.* the European price of wheat was in the neighbourhood of 55*s.* per qr., while within the last two years it has touched 30*s.*, and exchange has been below 23*d.* Thus, although wheat in Europe has fallen 45 per cent., the currency price in Chile has, as a rule maintained, and sometimes exceeded, its level in former years, in some measure owing to the steady decline in freights, but more particularly to the rapid depreciation of the currency of the country.

The Chilean farmers have been doubly benefited by the fall in exchange, as it has not only tended to increase their incomes, but has at the same time reduced their debts.

As a class they were heavily under advance to the various banking establishments in the country, but of late years they have been receiving extra profits arising from the lower exchange, and have been using these profits to pay off in dollars worth, perhaps 23*d.* currency debts incurred when the dollar was very likely worth 40*d.* or more. It is easy to see what a stimulating effect this would have on their business, and how it would encourage them to increase their wheat acreage.

Altogether, it may reasonably be inferred that if the price of wheat in Europe had been maintained, and Chilean currency had fallen to its present level (23*d.* to 24*d.*), exports would probably have been doubled long ere this, or conversely.

If the price of wheat had receded to 30*s.*, and Chilean exchange had remained steady at 46*d.*, the export of wheat would have been seriously curtailed, if not rendered, altogether impossible.

As it is, the fall in the European price of wheat has been more than counterbalanced by the depreciation in the Chilean Exchange; no extreme effects have been felt either way, but the falling Exchange, assisted by the decline of freights, has enabled the Chilean farmer in many instances to do considerably better than he did formerly with a high price of wheat in Europe and a high exchange on the coast, and has therefore directly tended to protect and stimulate exports.

What is true of wheat is also true, to a less extent, of copper and silver, and to a still less extent, of nitrate. In the production of copper and silver, skilled labour and imported coal, coke, &c. are used, and to a large extent increase the currency cost in direct ratio with the fall of exchange. In the production of nitrate, the currency wages paid to unskilled labour form a still less important item in the total cost, the bulk of which is on a sterling basis, and therefore not affected by fluctuations in exchange. Wheat therefore seems the best article to single out for the purpose of tracing the influence of a depreciated currency on Chilean exports.

JOHN M. LOWE.

London, February 14, 1887.

APPENDIX XI.

Papers put in by Mr. A. D. PROVAND, M.P.

(1.) TABLE showing PRICES at SHANGHAI in each month, from March to August 1886, of six imported articles of Standard quality and also the RATE of EXCHANGE for demand BANK BILLS on LONDON. (See Question 3312.)

	March	April	May	June	July	August
Rate of exchange, per tael -	4/7	4/6½	4/6½	4/6½	4/4½	4/2½
Lead, L.B. brand, per picul -	4'45	4'22½	4'27½	4'15	4'12½	4'25
Tin plate, 10×14, per box -	4'12½	4'12½	4'12½	4'12½	4'12½	3'90
Nail Rods (Dawes), per picul -	2'00	2'00	2'00	2'00	2'00	2'00
Spanish stripes, H.H., per yard -	0'48½	0'46½	0'46½	0'47½	0'47	0'50
Long ells (scarlet) H.H., per piece -	5'12½	5'12½	4'82½	4'74	4'94	5'10
8½ lb. gray shirtings -	1'73	1'73	1'72	1'71	1'72	1'75

Note.—From March to August exchange fell eight per cent. To meet this there was no corresponding advance in the prices of goods. Nearly all the six articles were actually

lower in August than they had been in March, notwithstanding that the largest business during the year is done during the months from March to August.

(2.) TABLE showing RESULTS of 56 TRANSACTIONS completed with SHANGHAI between January 1886 and May 1887. (See question 3289.)

The above table of 56 completed transactions with Shanghai during the past 13 months shows how the export trade from the United Kingdom to China is affected by the fluctuations in the rate of exchange.

Columns 1, 2, and 3 show the position when each draft was sold; the average value of the tael in column 1 is 4s. 4½d., and as the average difference between the rates in columns 1 and 2 is 1½d. (column 3), this on 4s. 4½d. for 105 days, the currency of the drafts (see heading, column 5), is at the rate of 11½ per cent. per annum, which the merchant would have paid for the use of the money, assuming the rate did not alter during the 105 days.

Column 4 shows that the rates at the different dates varied from 6½ per cent. to 23½ per cent. (the average of the 56 transactions being 11½ per cent., as stated above) according to the view the bank took of the future of the rate of exchange.

Column 5 shows the due dates of payment in Shanghai of the various drafts.

Column 6 shows the rates for telegraphic transfers in Shanghai on London on the dates as near as they can be ascertained when the bank was paid the drafts.

Column 7 shows the differences between the telegraphic transfer rates when the drafts were sold to the bank (column 2) and when they were paid to the bank (column 7) and the variations of exchange were meantime so great that—

Column 8 shows that the merchants who sold at the rates in column 1 paid varying rates of interest (as com-

pared with those who did not sell) up to 52½ per cent. per annum; and

Column 9 shows that those who sold at the rates in column 1 had the use of the money for the 105 days (for nothing where marked *) and made a profit besides varying from ½ per cent. to 5½ per cent. on the transactions noted in this column, the fall in exchange had been so great meantime.

It follows from the above that the merchants who sold their drafts forward usually lost on the transactions, when exchange meanwhile advanced, and on the other hand the merchants who did not sell forward, but took the rate ruling in Shanghai when the goods were sold, usually lost when exchange fell, and the conflicting interests of the two classes of merchants kept the rates for imports in Shanghai fairly steady. Cotton goods is the largest item of our exports to China, and while exchange fell 11 per cent. between January and August 1886, and rose as much between August 1886 and January 1887, the Manchester prices of cotton goods varied only about 3 per cent. during these 13 months. The merchant's ventures were therefore chiefly in exchange and not in Manchester goods. The trade is keenly competed for. If a merchant was fortunate in selling drafts forward, or in not doing so, he would likely gain, but if not fortunate, loss was certain, and as loss might come by either a rise or a fall in exchange, instead of the merchant being described as an exporter of cotton goods to China, it would be a more accurate description to say he was a speculator in exchange with China by means of cotton goods.

APPENDIX XII.

CORRESPONDENCE between the TREASURY, the INDIA OFFICE, and the GOVERNMENT OF INDIA.

The SECRETARY of the TREASURY to the CHAIRMAN of the GOLD and SILVER COMMISSION.

Treasury Chambers,
25th November 1886.

SIR,

I AM directed by the Lords Commissioners of Her Majesty's Treasury to request you to lay before the Royal Commission on Gold and Silver the enclosed copy of a letter upon the silver question which has been addressed to them by the Secretary of State in Council of India.

My Lords note the earnestness with which the Government of India urge upon the Secretary of State the difficulties of the situation. It is not necessary for them here to enter upon the discussions which have taken place between the Treasury and the Secretary of State on the silver question. The Treasury, however, while differing widely from the Secretary of State upon many points, has never questioned the inconvenience to which the fall and the fluctuations in the gold price of silver subject the Government of India, and my Lords would be ready to promote by legitimate means, not involving a charge on the taxpayer of the United Kingdom, an extended use of silver in this country. They can only assure the Royal Commission that any suggestion which may be made by a body so well qualified to express an opinion on the subject, will receive their most respectful attention.

I am, &c.

(Signed) W. L. JACKSON.

The Right Hon. A. J. Balfour, M.P.,
Chairman of the Gold and Silver Commission.

Enclosure.

India Office, Whitehall, S.W.,
4th November.

SIR,

IN January last, under the direction of the Secretary of State for India (then Lord Randolph Churchill) in Council, I had the honour to address you, for the information of the Lords Commissioners of Her Majesty's Treasury, on the subject of the serious difficulties which had been caused in the financial administration of India, by the continued fall in the price of silver in relation to gold, and the uncertainty that existed as to the future exchange value of the rupee.

Subsequently a letter was forwarded to the Treasury, which had been received from the Government of India, stating at some length the grounds on which they considered that it was desirable to endeavour to settle the silver question by international agreement.

At the end of May Mr. Fowler, the Secretary of the Treasury, replied, on behalf of the Lords Commissioners, to the letter in which the Secretary of State in Council had called the attention of their Lordships to this subject. For reasons which were stated in my letter of the 7th July, the Secretary of State in Council while taking specific exception to certain statements contained in the Treasury letter, abstained from entering into a discussion on the subject, which, it was understood, was under the notice of the Royal Commission on the Depression of Trade, and expressed the hope that another opportunity might be afforded at an early date for the consideration of the question in which the Government of India had so great an interest.

A copy of the correspondence between this Office and the Treasury having been sent to the Governor General of India in Council, the Government of India has addressed to the Secretary of State for India a letter replying to Mr. Fowler's letter of the 31st of May last, and I am now directed to forward a copy of this letter for the information of the Lords Commissioners of the Treasury, with the following remarks.

Her Majesty's Government having resolved that it was expedient to refer the whole of the questions arising in connexion with the recent changes in the relative values of the precious metals to a Royal Commission, and such a Commission having now been appointed, the Secretary of State for India in Council considers that it will be desirable

that copies of the correspondence that has been above referred to should be laid before the Commission, and he will further be prepared to furnish it with any other information on the subject of their inquiry which may be at his disposal.

It would obviously be out of place at the present moment to attempt any discussion of the more technical points raised by the Government of India relative to the desired establishment of a fixed ratio between gold and silver for currency purposes, as these are among the chief subjects on which the opinion and advice of the Royal Commission have been asked, and that body will have to judge of the relative weight of the arguments addressed by the Governor General of India in Council and of those to which they are designed to reply.

Neither does it seem desirable to offer any comments on the question whether India has, in respect to its trade or otherwise economically, gained or lost by the effect of the recent fall in the value of silver in relation to gold. The facts bearing on this part of the subject are, however, of great interest; they have received special attention in the Financial Department of the Government of India, and a copy of a note prepared by the Assistant Secretary in that department is annexed.

Viscount Cross entirely concurs with the Government of India in the observations contained in paragraphs 15 and 16 of their letter so far as they relate to certain proposals affecting the Indian coinage made in 1878, which had not been renewed or even referred to on the present occasion. In addition to the general explanations afforded in paragraphs 17 to 22 relative to the growth of Indian expenditure, it may further be stated that much of the apparent growth of expenditure referred to in the Treasury letter is due to changes in the form of the Indian accounts and to the exhibition of charges on account of public works, affecting alike both the receipts and expenditure which in former years had been excluded from the published statements.

The Secretary of State for India in Council likewise desires especially to repudiate the idea apparently entertained in some quarters that the Government of India has been unduly influenced in its representations on this subject by the personal interests of the English officials in India, otherwise than so far as every Government not only may, but is in duty bound to consider the welfare of its servants.

In conclusion, Viscount Cross will only repeat the opinions expressed by Lord Randolph Churchill in January last, and reiterated by the Government of India time after time, as to the difficulties and dangers to which India is exposed by the present state of the silver question. "Further taxation appears at present inevitable" says the Viceroy in his last letter "and when we have again established equilibrium there is no prospect that the settlement will be final or even reasonably permanent," and he concludes by saying, "we do not, therefore, hesitate" emphatically to repeat that from the point of view of "Indian finance the position has become intolerable."

I have, &c.

(Signed) J. A. GODLEY.

The Secretary to the Treasury.

No. 277 of 1886.

GOVERNMENT OF INDIA.

DEPARTMENT OF FINANCE AND COMMERCE.

ACCOUNTS AND FINANCE.

To the Right Hon. VISCOUNT CROSS, G.C.B., Her Majesty's Secretary of State for India.

MY LORD, Simla, 4th September 1886.

We have the honour to acknowledge receipt of Lord Kimberley's Financial Despatch No. 194, dated 8th July 1886, forwarding a copy of correspondence with the Treasury on the subject of the settlement of the exchange question by international agreement.

2. In our Despatch No. 45, dated 2nd February 1886, we pressed upon Lord Randolph Churchill the extreme importance in the interests of our Government of settling the silver question by international agreement, and we observe with much satisfaction that in Mr. Godley's letter of 26th January 1886, addressed to the Lords Commissioners of Her Majesty's Treasury, the Secretary of State for India in Council stated that he could not avoid "the conclusion that it is imperatively necessary to make every effort to find some remedial measure which will relieve the Government of India from the position in which it is now placed," and that "the comparative stability of the relative value of gold and silver" was "essential for the regular course of trade" and "of vital importance to India." The Lords Commissioners of Her Majesty's Treasury replied, in Mr. Fowler's letter of 31st May 1886, to our proposals and to the communications made by the Secretary of State for India in Council, that they could take no measures for summoning, or co-operating in, a new Monetary Conference until they had previously determined what policy they should initiate, or could assent to; that the whole question was understood to be under the consideration of the Royal Commission on the Depression of Trade; and that there was nothing in the correspondence and information before the Lords Commissioners which should induce them to depart from the instructions given to the Representative of England at the Monetary Conference of 1881. The instructions given to the English delegate at that Conference were to the effect that "he would assist at the meetings of the Conference solely in order to be a medium of communication, and to afford information which the Conference may require, but with no power of voting."

3. We observe that your Lordship's predecessor did not propose to continue at present the discussion of this important matter with the Treasury. We have no wish to question the expediency of this decision; but, in view of the probability of the subject being again taken into consideration in compliance with the recommendations of the Royal Commission now inquiring into the causes of the depression in trade, we think it of importance to acquaint your Lordship with our views on the main points raised in the letter from the Lords Commissioners of Her Majesty's Treasury, dated 31st May 1886. We cannot, meanwhile, in view of the experience gained since 1881, and of the grave importance of the question, avoid expressing disappointment at learning that Her Majesty's Government proposes to adhere to a purely passive attitude, and that the Government of India is to meet its pressing financial difficulties unaided, or with such assistance as it may derive from the action of foreign nations. We trust that this decision is not irrevocable, and that the result of the deliberations of the Royal Commission, which we hope will be appointed for the special purpose of examining the silver question, may be to disclose some method of relief for our finances which will, at the same time, be acceptable to Her Majesty's Government.

4. We understand the grounds on which the Lords Commissioners of Her Majesty's Treasury decline to take any steps at present towards a settlement of the silver question by international agreement to be as follows:—

Firstly, that it is doubtful whether it is possible to secure stability of value between gold and silver.

Secondly, that it is not proved that any measures which would raise the gold value of silver would on the whole be a gain to India.

Thirdly, that the arguments employed against the proposals made by the Government of India in 1878 have never been answered, and retain their full force.

Fourthly, that the difficulty can be met in great measure by reduction of expenditure.

Fifthly, that the Government of India has not distinctly stated the nature of the remedy which it proposes.

We propose to deal with these arguments in the order in which we have stated them.

Possibility of maintaining stability of relative value of Gold and Silver.

5. The Lords Commissioners remark that the question of the possibility of maintaining a fixed ratio between gold and silver is "one of the most disputable and disputed points in economic science," and they quote the declaration recorded by the representatives of Her Majesty's Government at the International Monetary Conference of 1878 that "the establishment of a fixed ratio between gold and silver is utterly impracticable."

We desire to observe that the establishment of a fixed ratio between gold and silver may be held, as in the words above used, to be utterly impracticable, either because it is theoretically impossible to devise measures which would

have the desired effect, or because it is practically impossible to secure the adoption of these measures as the result of international agreement. If it is meant that it is theoretically impossible to secure stability of value between gold and silver, we cannot do more, within the limits of a despatch, than refer to the facts that the first 70 years of the present century, and to the numerous treatises in which the theoretical possibility of maintaining a fixed ratio has been demonstrated. But if, on the other hand, the Lords Commissioners refer to the practical difficulty of securing an international agreement on a sufficiently wide basis, we beg that reference be made to the proceedings of the Monetary Conference of 1881. The Conference of 1881 was held at the instance of France and the United States of America, and the following are the words of the note forwarded by the United States Minister in London to Her Majesty's Secretary of State for Foreign affairs:

"The Government of the Republic of France and the Government of the United States having exchanged views upon the subject of a conference between the Powers principally interested in the question of establishing internationally the use of gold and silver as bi-metallic money, and securing fixity of relative value between these metals, and finding themselves in accord as to the usefulness and importance of such a conference, and as to the time and place at which the same should be held, have the honour now to invite the Government of Great Britain to take part in a conference, by such delegates as each Government may appoint, to be held at Paris on Tuesday, the 19th day of April next, to consider and adopt for presentation to the Governments so represented, for their acceptance, a plan and system for the establishment by international convention of the use of silver and gold as bi-metallic money at a fixed relative value between these two metals."

France and the United States are the two nations whose influence, with the exception of that of England and India would be the most powerful in maintaining the stability of the relative value of gold and silver; and the words of the note above quoted show in unmistakeable terms that, whatever views may be elsewhere entertained, the Governments of those countries considered the establishment of a fixed ratio both practicable and expedient.

6. At the Conference the attitude of the delegates, excluding those of France and the United States, was generally one of reserve, each country desiring to retain for itself complete liberty of action; but the delegates of Holland and of Italy distinctly avowed their desire to see the free coinage of both gold and silver at a fixed ratio. M. Pierson, delegate of Holland, observed: "The adoption of the bi-metallic system is the only means of escaping from the annoying situation in which we are placed. That, at least, is the conclusion we have arrived at in Holland." M. Seismit-Doda, delegate of Italy, observed: "The Italian delegates associated themselves fully with the declarations presented by Messrs. Denormandie and Cernuschi, as well as Sir Louis Mallet, on the subject of the necessity of raising the value of silver, and of establishing a fixed ratio between the two metals." The delegate of Austro-Hungary, in view of the fact that the currency of that country consisted of inconvertible paper, was unwilling to adopt an attitude other than that of reserve; but nevertheless Count Kufstein declared: "Still they felt no hesitation in saying that as in the Conference of 1878, so for the future, their sympathy was with any measure which might be adopted with the aim of improving or re-establishing as much as possible the position of silver. They therefore hoped that the Conference would not separate without having adopted some remedy to obviate the inconveniences of the present monetary situation, which they believed in many ways to be a grave one."

7. As the attitude of Germany at the Conference is of special importance, we quote at some length the words of Baron Thielmann, the delegate of that country:—"We acknowledge, without reserve, that the rehabilitation of silver is desirable, and that it could be attained by the re-establishment of the full coinage of silver in a certain number of the most populous States represented at this Conference, which for this purpose would take as a basis a fixed proportion between the value of gold and that of silver. Nevertheless, Germany, whose monetary reform is already so far advanced, and whose general monetary situation does not seem to invite a change of system of such vast importance, does not find itself able to concede, as far as it is itself concerned, the full coinage of silver. Its delegates cannot therefore agree to such a proposal. The German Government is, on the other hand, entirely disposed to help as far as possible the efforts of the other Powers which might be willing to unite, with a view to the rehabilitation of silver by means of a full coinage of this metal. To attain this end, and to guarantee these Powers against the influx of German silver which they

"seem to dread, the German Government will impose "some restrictions on itself." When Baron Thielmann was asked if the attitude of England had been the cause of the reserve shown by Germany, he replied "that the "attitude of England had had some effect on the resolution of the German Government," as it was "necessary "for the German Government to pursue a monetary system "similar to that of England." There is, therefore, reason to believe that if Her Majesty's Government had shown a stronger desire to further the objects of the Conference, Germany would have been prepared to take steps in the same direction.

8. In view of the opinions expressed by France, the United States of America, Austro-Hungary, Italy, and Holland in favour of the establishment of a fixed ratio between gold and silver, and of the undoubtedly favourable attitude of Germany, and the evident inclination of that Power to follow the lead of England, it appears to us reasonable to conclude that it was within the power of Her Majesty's Government at the Conference of 1881 to have secured the adoption of a fixed ratio; and as the evils due to the non-existence of a fixed ratio have manifested themselves in an aggravated degree since 1881, we may reasonably conclude that it is still within the power of Her Majesty's Government to secure this result, if willing to exert its influence for that purpose. Looking to the facts we have just stated, we are unable to admit the contention that the establishment of a fixed ratio is impossible because international agreement cannot be secured. It appears to us that if Her Majesty's Government abandoned the attitude of absolute reserve which they have so long maintained to the injury, as we believe, alike of England and India, there would remain no obstacle to the establishment of international agreement which could not be surmounted. Even allowing, for the sake of argument, that it should prove impossible to secure the establishment of a fixed ratio on a sufficiently wide basis to permanently maintain that ratio, we see no reason to doubt that that the active and sympathetic intervention of Her Majesty's Government would secure the adoption of measures which would tend in that direction, and which would at any rate have the effect of mitigating existing evils, and of removing grave grounds of apprehension as regards the future.

9. In connexion with the question of the possibility of maintaining a fixed ratio between the two metals, we further desire to observe that, in quoting the opinion of Mr. Goschen, Mr. Gibbs, and Sir Thomas Secombe as recorded in 1878, the Lords Commissioners of Her Majesty's Treasury appear to have attached little weight to the extremely important fact that since the expression of opinion by the representatives of England in 1878, the evils of the unsettled state of the silver question have become greatly aggravated, that the question has been far more thoroughly discussed, and that both the origin of the disease and the nature of the remedy are better understood. It seems to us to be at least possible that if an opinion were obtained in 1886, it might differ from that given in 1878; and we know that in the case of one of the gentlemen cited, the opinion expressed in 1878 has been entirely repudiated.

10. We have no opportunity of ascertaining the views on this question which Sir Thomas Secombe may now hold, nor are we aware whether Mr. Goschen considers the impracticability of establishing a fixed ratio as great as it appeared to be in 1878; but we observe that in 1878 Mr. Goschen concurred with the other representatives of England in holding "that a campaign undertaken against "silver would be exceedingly dangerous, even for the "countries which have given a position as legal tender only "to gold." Again, in a speech "on the condition and prospects of trade" delivered by Mr. Goschen at Manchester on 23rd June 1885, we find him reported to have expressed himself as follows:—

"Now let me take the silver question. It is impossible to embark upon that or upon the appreciation of gold in a satisfactory manner in a few sentences, because it would take a whole speech to itself. But there is one point connected with the silver question which I will touch, and it is the insecurity which it imparts to trade with the silver-using countries. That must affect your dealings with India and with others, and I am sorry to think that with regard to that insecurity there is no hope till you know what the United States will do with respect to the Bland Bill. It seems to me that we must almost conclude that the uncertainty in the trade of the silver-using countries will increase, and that the position in that respect must get worse; and I do not hold with those who think that this country has little interest in the question because we are a creditor country. This is an argument which is often put forward that we are a creditor country, and that as amounts are due to us in gold, therefore the more gold will command for commodities the better for

this country. But we are not all creditors; and though we may in the balance be a creditor country, there is an enormous interest in our trade with the silver-using countries; and so I trust that this silver-question will fairly be kept in view by those who are responsible for our Indian Empire. It is a question of the deepest interest. As I have said, it is impossible for me at this moment to expatiate upon the subject; but I must submit that is a factor in the case, and a very important factor too."

Finally, we find from Hansard (3rd series, vol. ccciii, page 1491) that during the late session of Parliament, Mr. Goschen addressed the following question to the Chancellor of the Exchequer:—

"Whether in view of the deep and increasing interest shown in various parts of the country on the silver question, he will consider the expediency of separating this urgent subject from the other matters referred to the Royal Commission on the Depression of Trade, and of appointing a separate Commission to inquire into the position of silver, the condition of the currency, and the various plans of utilising silver to a greater extent for currency purposes."

We believe, in view of the above extracts, that we are justified in coming to the conclusion that, whether or no Mr. Goschen believes in the practicability of establishing a fixed ratio between gold and silver, he at any rate considers the silver question to be one of great importance, and is anxious that measures should be taken to utilise silver to a greater extent for purposes of currency.

Mr. Gibbs has entirely altered his opinion since 1878: is now of opinion that the establishment of a fixed ratio is not merely practicable, but in itself highly desirable; and for some considerable period has himself been President of the Bi-metallic League. We are at a loss to understand how the change in Mr. Gibbs' views since 1878, which his writings on the subject have rendered matter of much notoriety, should, as would seem to be the case, have escaped the knowledge of the Lords Commissioners of Her Majesty's Treasury.

Question of gain or loss to India from the fall in the rate of exchange.

11. With regard to the question whether India has obtained any such advantages from the fall in exchange as wholly or in any part to compensate her for the undoubted injury which the fall inflicts, and specially for the loss on the gold remittances of the Government of India, we would observe that this is a matter on which opinion is by no means unanimous. The fall in the rate of exchange has coincided in point of time with a large development of Indian trade and a steady increase of Indian revenue; but many authorities hold that this growth of trade and revenue is due to a succession of several good harvests, to the increased energy shown of late years in the construction of railways in India, to the cheapening of the cost of sea transport, and to the opening of the Suez Canal rather than to the fall in exchange. The question has been recently examined in a paper entitled "Indian Trade and Exchange," prepared by the Assistant Secretary in our Financial Department, copies of which have been forwarded for your Lordship's information; and the considerations therein set forth materially assist in enabling a judgment to be formed upon this important matter. It is beyond question that the instability in the relative value of gold and silver discourages the investment of capital in India; and the higher rate of interest which we should have to pay for silver loans forces us to borrow in gold, and to accept the risk of a still further appreciation of that metal. The variations in exchange introduce great uncertainty in that large class of commercial transactions in which the element of time is involved. The fall in silver, by throwing unexpectedly a heavy burden on our finances, has more than once compelled us to defer the construction of public works intended for the protection of the country against famine, and has led to regrettable and wasteful fluctuations in our public works policy. These are evils of great magnitude; and if we take into consideration also the direct accumulating increase to the public expenditure due to the fall in exchange, it is, to say the least, difficult to contend that India as a whole may have gained as much as she has lost. It has no doubt been argued that the fall in exchange by encouraging Indian exports has given a stimulus to industries in which India competes with countries that have a gold standard; but, apart from the results of recent inquiry into this part of the subject which we have above alluded to, we have been unable to discover that the silver prices of Indian exports, or Indian commodities generally, have risen since the fall in the rate of exchange, and there are good grounds for believing that the effect of the change that of late years

has taken place in the relative value of silver and gold has been to lower gold prices and not to raise silver prices. Apart from this aspect of the question, it further appears to us that the Lords Commissioners of Her Majesty's Treasury have failed to notice that those persons who are of opinion that India has gained by the fall in exchange hold, as an essential part of the same opinion that England and all other countries with a gold standard have lost in an exactly equal degree. They argue that the rupture of the old ratio of 1 to 15½ between the two metals has led to a reduced supply of metallic money to countries with a gold standard, and an increased supply, of an exactly equivalent amount, to countries with a silver standard; and if the increased supply has been a gain to the silver countries, it follows that the reduced supply must have proved injurious to countries with a gold standard by causing a general fall in the prices of commodities.

12. The Lords Commissioners quote, with seeming approval, the opinion of Mr. Barbour, our Financial Secretary, on the question of the gain or loss to India; but we observe that they have omitted to refer to the passages in which Mr. Barbour states that the gain of the silver countries is balanced by a corresponding degree of loss on the part of the gold countries. The following extracts from the preface to the book quoted from show what Mr. Barbour's opinion is on this point:—

"This fall in prices has been aggravated in countries using the gold standard, and checked, or altogether obviated, in countries using the silver standard, by the partial demonetisation of silver. In so far as this has been the case, the silver countries have unquestionably gained, while the gold countries have lost." * * * * *

"Every fall in the gold price of silver will be followed by a corresponding decline in the gold prices of commodities, by increased disinclination of capitalists in London to invest money in India, by a reduction of profits and a general increase of the burden of obligation already contracted in England."

These passages make it clear that the theory of gain to India by the fall in exchange is based on the belief that countries with a gold standard have lost in an equal degree; and that, in short, the gain of the silver countries arises from a species of protection against countries with a gold standard. It is not possible to accept one-half of the theory and to reject the other. If the silver countries have gained by an increase of the supply of metallic money, the gold countries must have lost by an exactly equivalent reduction in the supply. We desire to lay special stress on this aspect of the case, because we find it stated that "England would not herself take the initiative in making changes which would have the effect of disturbing a monetary system under which she has enjoyed much prosperity," and no notice is taken of the fact that any special gain to India from the low exchange must have been attended with corresponding loss to England. In connection with the question of the prosperity which England may have enjoyed in former years under the gold standard, it should not be overlooked that up to 1873 England enjoyed the benefits of a comparatively stable ratio between her gold standard and the silver standard of other countries, and that since the wide departure from the old ratio occurred, the progress and prosperity of England have suffered a decided check. Without attempting to define the specific causes which have been in operation, we may observe that the prices of commodities have fallen very largely in England in recent years.

13. Even if, for the sake of argument, it be admitted that India, as a whole, has gained as much as she has lost by the fall in exchange, we are still of opinion that a change is imperatively required in the interests of the British Government in India. If the gain has just balanced the loss owing to the fall in exchange, we may reasonably conclude that in case of a rise in exchange, the loss would not on the whole exceed the gain, while the financial relief, and consequent political advantage, to our Government would be incalculable. This view of the matter was referred to by Sir Louis Mallet at the Conference of 1881 in the following words:—

"Although we may, no doubt, look forward in the future to some rearrangement of taxation when the depreciation of the coinage has produced its effect in a general rise of prices, and particularly in that of labour, we must wait a long time for that result; and, meanwhile, it would be impossible without serious political danger to propose new taxes based on considerations which the mass of the people would not be able to understand.

"But it is not only the actual loss which we have to think about; it is the absolute uncertainty which hangs about the future, and which prevents any serious or accurate calculation of the revenue and resources of Government."

These words have a special bearing on our present financial position. The recent renewal of instability, followed by a heavy fall in exchange, and maintained up to the present time, has rendered the most careful calculations we can make valueless. We have already imposed unpopular taxation, and we see before us the possibility of being compelled to have recourse to the imposition of further taxes, alike unpopular and injurious to the well-being of the community. The future is, if possible, even less assured than it was when Sir Louis Mallet spoke. Moreover, the rise in prices, owing to the depreciation of the silver currency, to which Sir Louis Mallet looked forward, has not taken place; the alteration in relative gold and silver prices, which must necessarily follow the alteration of the exchange, has taken the form of a fall in gold, and not of a rise in silver prices. We cannot, therefore, count, within any reasonable time, on such a growth of revenue as will enable us to meet the burden thrown on our finances in recent years by the fall in exchange.

14. Putting aside, however, all matters of minor importance, we desire to observe that, in our judgment, the question of the establishment of a stable ratio between gold and silver must be decided on broader grounds than the gain or loss of a single country, and that it is a question of world-wide importance, the interest of England in securing a permanent settlement being no less than that in India. So far as regards the momentary standard, no country is, or can be, independent of the action of other countries. Apart from the dislocation of trade and industry caused by variations in the rate of exchange between two standards not linked by a legal ratio, each country is at the mercy of others, which, by adopting or discarding the gold or silver standard, can seriously prejudice the interests of that country which makes no change in the standard. England has made no change in the standard since 1816; but the result of the more extended use of gold by foreign countries is certainly not less serious in its effect on the industries of England and the interests of the English people than in its effect on French and American industries and interests. The Government of India, like that of England, has made no change in the standard; yet the action of foreign nations has placed our finances in those perpetually recurring difficulties which are set forth in our Despatch of 2nd February last, and threatens them with even greater disasters in the immediate future. The question of the monetary standard appears, therefore, to us to be pre-eminently one for settlement by international agreement; in no other way can a satisfactory or permanent settlement be effected; and we trust that Her Majesty's Government will abandon their attitude of absolute isolation—an attitude which, we venture to think, is both indefensible in theory, and in practice fraught with danger both to England and to India.

Omission to answer the arguments employed against the proposals of 1878.

15. In 1878 the Government of Lord Lytton proposed that the coinage of rupees should be restricted, by means of a seigniorage, in such manner as to raise the value of the rupee from 1s. 7d., the market rate of the day, to 2s.; and these proposals contemplated ultimately the introduction into India of a gold standard. The Lord Commissioners of Her Majesty's Treasury refer to this proposal, and express regret that in the Despatch of 2nd February last the Government of India has not replied to the arguments which led to its rejection, nor shown that it has now some scheme in view which is not open to similar objections. Great importance is evidently attached to this point, as in Mr. Fowler's letter of 31st of May the arguments used against the proposals of 1878 are repeated, and it is added that "the Lords Commissioners find no reason stated in the Despatch of the Government of India in the present year which induces them to dissent from the conclusions thus set forth on the authority of Sir Stafford Northcote as to the results of any attempt to artificially enhance the gold price of silver." We confess to having read these remarks with surprise, as, for the reasons which follow, we can perceive no analogy whatever between the proposals of 1878 and those which we recently put forward.

16. The proposals made by the Government of India in 1878 involved the restriction of the coinage of rupees, a measure which, in our recent proposals, we have not advocated. The proposals of 1878 aimed at establishing a fixed ratio between gold and the coined rupee, which is a totally different matter from the establishment of a fixed ratio between gold and silver. The Government of 1878 proposed to establish between gold and the rupee the ratio of ten rupees equal to one pound sterling, while the proposal contained in our Despatch of 2nd February last merely

involved the establishment of a stable ratio between gold and silver, and left the question of what that ratio should be for future discussion. The proposals of 1878 could have been carried out by legislation in India, and were entirely independent of international agreement; the essential feature of our present proposals is their dependence on international agreement. The proposals of 1878 would not, as seems to be supposed, have raised the gold value of silver, but would, on the contrary, have tended very materially to reduce it. The arguments used against the measures advocated in 1878 have, therefore, no bearing on our recent proposals; and, as those measures lay outside the scope of the recommendations contained in our Despatch of February 2nd, we admit our inability to perceive why, in that Despatch, we should have been at the pain of answering them. The proposals contained in our Despatch of 2nd February did not necessarily involve the raising of the gold value of silver to the old ratio of 15½ to 1. It was our intention that the question of the precise ratio to be adopted should be left for future discussion, and for settlement after full consideration of all the interests involved, and after ascertainment of the view of the principal nations interested in the matter. Even if a Conference should have decided on the adoption of the old ratio of 15½ to 1, we cannot admit that the change could more accurately be described as one for raising the value of silver rather than as one for lowering the value of gold. The essential end to which our recent proposals were directed was the establishment of a stable ratio between silver and gold; and even if a higher ratio than the market ratio of the day had been adopted, the procedure which we advocate would have had as much effect in lowering gold as in raising silver. The scheme of 1878, on the other hand, would have materially lowered the value of silver, and must ultimately have had the effect of raising the value of gold by increasing the demand for it. We fail, as we have said, to perceive anything in common between the two proposals; and we conceive it unnecessary to remark further on this portion of the question.

Possibility of relieving the finances by reduction of expenditure.

17. In paragraph 15 of Mr. Fowler's letter our attention is directed to the importance of the reduction of expenditure, and it is added that the principal element which has determined the unfavourable condition of Indian finance, and which has conduced to our difficulties more obviously and certainly than the fall in the price of silver, is the alarming growth of expenditure. The general question of the growth of expenditure on the civil administration of India was dealt with very fully in the Despatch from Lord Ripon's Government, No. 233, dated 24th August 1883, and in the Minute by Sir Evelyn Baring, which accompanied, as well as in other correspondence which took place about the same time, and which was published as a Parliamentary blue book in August 1885. We can add nothing to what is contained in the correspondence in question beyond remarking that our financial difficulties since that date have forced us to scrutinise very narrowly all proposals for incurring additional expenditure, and that we have been compelled to put aside many valuable reforms simply because we could not find the means to carry them out. We do not know to what facts the Lords Commissioners of Her Majesty's Treasury more particularly desire to draw attention when they speak of the alarming growth of expenditure. The fall in silver has no doubt added largely to expenditure on account of exchange, and we have been obliged to incur expenditure in the construction of famine railways, which do not, for the present at any rate, return a profit sufficient to cover interest on capital. The same remarks hold good in regard to the expenditure on frontier railways and coast defences, while the events that have occurred in recent years beyond the north-west frontier have compelled us to increase the army, both European and native. Her Majesty's Government, we believe, concur with the Government of India in the necessity of measures calculated to minimise the risk of such loss of life as occurred in the Madras famine, and to guard against external attack on the north-west frontier of India. So long as the adequate protection of India against the consequences of war, and famine is an essential portion of the policy of Her Majesty's Government, it is premature to object to the expenditure which the attainment of these ends necessarily for a limited time involves.

18. With the exception of the expenditure referred to in the preceding paragraph, which was incurred deliberately and with a full knowledge of the burden it would impose on the country, and which we should gladly have avoided

if we could safely have done so, we are not aware of any great growth of expenditure in recent years. The measures taken in 1881 to provide an insurance against the financial effects of famine have, no doubt, added nominally 1,500,000*l.* (conventional sterling) to the expenditure; but this was, as those conversant with Indian finance are aware, a measure of economy, and this item of 1,500,000*l.* is of the nature of a reserve or insurance fund. Possibly the fact may have been overlooked that the Government of India is now a very large railway proprietor, and that the opening of new railways necessarily involves an addition to the yearly expenditure of the total amount of the working expenses of the railways. This expenditure cannot, however, be avoided; it brings in corresponding revenue, and can in no sense be treated as an addition to the cost of Government properly so-called. The danger of misunderstanding arising from this cause was alluded to in our Despatch No. 331, dated 1st December 1885, in the following terms: "The rapid increase and great complexity of the railway transactions make it very inconvenient to embody them in finance accounts, and the apparent increase of revenue at the disposal of Government as new lines are opened and corresponding apparent increase of cost of governing the country give rise to mistaken idea of the increasing income and extravagance of the Government." But whatever the origin of the remarks regarding the growth of expenditure may be, we must be allowed, with all deference, to maintain that we have by no means been forgetful of the relief to the finances which can be obtained by reduction of expenditure; the fall in the gold value of silver has more than once led to reductions of expenditure, which have caused serious administrative inconvenience; and we are at the present time engaged in making every reduction which is reasonably or safely practicable, though there is no hope that any economies we may be able to effect will do more than cover a fraction of the additional burden imposed on India by the recent fall in exchange.

19. In order that there may be no room for misunderstanding as to the serious effect which the fall in exchange has had on the course of Indian administration, and of the repeated efforts which have been made to meet the additional expenditure therein involved by reduction of expenditure, we will briefly review the facts of the last 10 years. In the financial statement for 1876-77 Sir William Muir remarked as follows:—

"The sudden depreciation of silver, and the consequent enhancement of charge to the Government of India in laying down yearly the sum required in England of about fifteen millions sterling, without doubt cast a grave shadow on the future. In truth, it may be said that the danger, from whatever point of view considered, is the gravest which has yet threatened the finances of India. War, famine, and drought have often inflicted losses on the exchequer far greater than the charge which threatens us in the present year. But such calamities pass away: the loss is known and limited; and when it has been provided for, the finances again stand on sure and stable ground. This is not the case with the present cause of anxiety. Its immediate effects are serious enough, as has already been shown. But that which adds significance to it is, that the end cannot be seen; the future is involved in uncertainty." As a consequence of the position in which the Government found itself owing to the fall in exchange, measures were taken in July 1876 for the effective curtailment of expenditure on extraordinary public works, and at the same time all outlay of public money on the ordinary civil administration was stopped "which is not absolutely necessary, or to which the Government is not committed, or the discontinuance of which will not cost disproportionate loss and waste."

20. In November 1878 measures were again taken "for the reduction of the ordinary expenditure of the country within the narrowest limits"; but these measures were based on the probability of heavy war expenditure, as well as on the fall in exchange. The orders given in November 1878 were followed up in May 1879 with equally stringent orders for still further reduction of expenditure in all branches of the administration. The contracts with provincial Governments were temporarily set aside, and contributions obtained from them to help to tide the Government of India over its immediate difficulties. The result of the measures taken involved a reduction of 758,000*l.* in ordinary expenditure, as well as the reduction of productive public works expenditure by 1,000,000*l.* yearly, although the estimated expenditure of 1879-80 was already 1,000,000*l.* below the average expenditure of the two preceding years.

In June of the same year the following language was used:—"Rigid economy in every branch of the public service is in present circumstances the policy which must

"be followed." To quote again the words of the resolution of the 1st May:—

"Unless positive necessity exists, no improvements in administration, however desirable, must be undertaken if they involve increased charges; no fresh establishments must be entertained; no new offices must be created; no new works, which it is possible to postpone, must be commenced.

"It is through this policy of retrenchment and economy that the necessity for fresh taxation has for the present been avoided; and if the fall in the value of silver in relation to gold should further increase, strict adherence to that policy will be more than ever essential."

The language used by Lord Lytton's Government in their Despatch No. 138, dated 22nd May 1879, shows how great must have been the pressure which compelled them to have recourse to such reductions:—

"We do not propose in this Despatch to discuss the circumstances which have rendered it necessary to undertake these reductions in the expenditure on public works in India. The result will undoubtedly be that the material progress of the country will be seriously retarded; and we in no way disguise from ourselves the injury which India will sustain, or the discredit which will be entailed on the Government, by even the temporary abandonment of a policy which we are satisfied is essentially wise, and which in spite of many errors has been on the whole attended with eminent success. The measures which we now take with so much regret have been forced upon us by circumstances over which we have no control, and for which our Government is in no degree responsible."

21. From 1879-80 the rate of exchange remained nearly constant for some years, the average rate obtained for home remittances having been as follows:—

			d.
1879-80	-	-	19-96
1870-81	-	-	19-96
1881-82	-	-	19-89

The surplus revenue, which was found to exist in the beginning of 1882-83, was used, not for the increase of expenditure, but for the reduction of taxation, including the removal of the general import duties.

After 1881-82 the course of exchange was steadily downwards, and in 1883 the question of reduction of expenditure having been brought before, and impressed upon, the Government of India by the Secretary of State for India in Council, the matter was exhaustively considered, as will be seen from the correspondence referred to in paragraph 17 of this Despatch.

In 1885 stringent measures were taken for the reduction of expenditure in consequence of the probability of a war with Russia; and, in order to meet the cost of military preparations, reductions were effected in the sanctioned expenditure of 1885-86 to the extent of over 1,500,000*l.* (conventional sterling). As regards the current year, we may observe that at the time of framing the estimates our financial difficulties were seen to be so great that every effort was made to keep down expenditure, and the extreme measure was adopted of withdrawing the sum of 400,000*l.* from Local Governments, and consequently of reducing the possible provincial expenditure by that amount. In February 1886 a Committee was appointed with the special object of effecting reductions of expenditure, and is at present earnestly prosecuting inquiries directed to this end. The language used in the orders appointing the Committee indicate the anxiety with which we have sought economy in the hope of avoiding taxation.

"The circumstances in which the Government now finds itself placed compel it to examine with renewed and anxious attention the possibilities of such an effective decrease in its expenditure as shall in a sensible degree contribute to relieve it of the financial embarrassments with which it is threatened. The uncertainty which prevails regarding the future relative value of gold and silver compels the Government to contract, so far as is possible, expenditure which in other circumstances may have been desirable or necessary, but which at present it can no longer maintain."

22. The sketch which has been given of the financial history of the last ten years is sufficient to show that the Government of India has been very far from unmindful of the relief to the finances which may be obtained by economy and reduction of expenditure; it demonstrates, on the contrary, that such relief has frequently been secured at the cost of great detriment to the administration. We are at present again seeking to effect all possible economies in the cost of civil administration, and we hope in this way to secure an improvement to the extent of at least 500,000*l.*

yearly. How insufficient this relief may prove in comparison with the burden thrown on the finances by the fall in exchange will be seen from the fact that, though the rate of exchange for the estimates of 1886-87 was taken at only 1*s.* 6*d.* per rupee, we have at present to contemplate the possibility of taking a rate as low as 1*s.* 4*d.* per rupee in the estimates of 1887-88—a fall which would impose an additional yearly burden on our revenues of more than 2,000,000*l.* (conventional sterling).

Looking to the facts which we have stated, we are compelled to arrive at the conclusion which admits, in truth, of little dispute, that further reduction of expenditure is unlikely to give us financial relief in any degree commensurate with the magnitude of our difficulties; and that the contention that the alarming growth of expenditure in late years is the principal element in the unfavourable condition of Indian finances will not stand the test of examination.

Nature of the remedy proposed.

23. With regard to the complaint that we have not definitely indicated the nature of the international agreement which should supply the solution of the silver question, we desire to observe that it appeared to us that we stated with sufficient plainness that the end to be aimed at was a stable ratio between gold and silver, and that the means for the attainment of this end was an international agreement between the countries interested in the question. We did not specify the exact ratio which we wished to see established, nor the precise nature of the agreement, because we felt that on both these points it would be necessary to ascertain and take into account the views of foreign Powers, and that any attempt on our part to lay down the exact terms of the settlement at the outset might have a prejudicial effect on the negotiations. If Her Majesty's Government had been willing, under any circumstances, to recommend the opening of negotiations, there would have been no difficulty in obtaining a more definite expression of our views by telegram. Your Lordship will, moreover, not have forgotten that on May 29th of the present year, while we were still awaiting the reply of the Lords of the Treasury, we submitted specific proposals, which were only not laid before the Lords of the Treasury because their letter was received by your Lordship's predecessor very shortly after the recommendations we refer to reached him. What we consider essential in the interests of the finances of British India is the establishment of stability in the relative value of gold and silver, and the removal of the danger which hangs over the silver market from the existence of large quantities of overvalued silver money in the currencies of France, the United States, and other countries. For the attainment of these ends, we propose generally the utilisation of silver as currency to a greater extent than is the case at present, as well as an international agreement for the free coinage of silver, and the making of both gold and silver coin a legal tender at a fixed ratio by a group of nations possessed of a metallic currency of sufficient extent to maintain that ratio permanently. The question of the ratio to be established is one which must be decided by the nations which undertake to coin both gold and silver freely, and it should be a ratio not lower than the average market ratio of recent years, and not higher than the former French ratio of 1 to 15½. So great is the importance which we attach to stability of relative value, that we do not consider that there would be sufficient grounds for objecting in the interests of India to any ratio, within the limits above indicated, which might be approved by the other nations concerned; and, on behalf of India, we would be willing to undertake either to maintain the present silver standard, or to coin both silver and gold for all comers at the fixed ratio. It does not appear that any plainer expression of our views, or any proposals of a more specific nature, could be expected, or should be required, at the present stage.

24. In conclusion, we desire again to express our conviction of the importance, in the interests of British rule in India, of securing a speedy and final settlement of the silver question. In our Despatch of 2nd February last we stated in the clearest terms, but not, as we consider, more strongly than the occasion required, the nature and extent of the difficulties and dangers to which India is exposed in the present state of the silver question, and we need not repeat our observations. The immediate cause of future disturbance which we specially took into consideration at that time was the possibility of the repeal of the Bland Act by America. Since the date of our Despatch, although there is every prospect that America will, for the present at least, continue the coinage of silver, the rate of exchange has

fallen $1\frac{3}{4}$ d. per rupee. The additional burden thrown on our finances by this fall of $1\frac{3}{4}$ d. in the gold value of the rupee, after all allowance made for any possible set-off, amounts to at least 1,750,000*l.* (conventional sterling) yearly, and it is quite possible that the repeal of the Bland Act by America might increase the burden by an equal amount. We cannot hope to cover more than a fraction of the amount already added to our expenditure through the recent fall in silver by any economies in the cost of the administration which we may be able to effect. Even though the measures which we are now carrying out for the defence of the country against war and famine should, in view of our pressing financial difficulties, be curtailed, further taxation appears at present to be inevitable; and when we have again established equilibrium, there is no prospect that the settlement will be final, or even reasonably permanent. A rise in the rate of exchange may prove that unpopular measures of taxation have been undertaken unnecessarily; a fall may force us to impose further taxation. Meanwhile the pressure of our present difficulties is

compelling us to use resources which we relied upon as a reserve to meet the cost of possible war or famine. Above all, our finances will still remain subject to the special uncertainty due to the unsettled condition of the American currency. Your Lordship is aware that a powerful party in the United States of America presses for the stoppage of the coinage of silver. If that course should be adopted in the immediate future our financial difficulties threaten to be greater than any which the Government of India has hitherto experienced. We do not therefore hesitate emphatically to repeat that, from the point of view of Indian finance, the position has become intolerable.

We have, &c.

(Signed)

DUFFERIN.

ANALYSIS OF EVIDENCE.

(Names of Witnesses arranged in Alphabetical Order.)

PROFESSOR ROBERTS AUSTEN, F.R.S. :

Is chemist to the Royal Mint, 1198.

Puts in a paper on the subject of the cost of producing silver, 1200, 1201.

Different methods of obtaining silver, 1202-1204; by the refining of native gold, 1205-1211; by the desilverisation of lead, 1212-1233; by the desilverisation of copper, 1234-1247; from silver ore, 1248-1274.

General conclusion as to mean cost of production by the above methods, 1275-80, 1326.

Explains what is included in cost of production, 1281-1300.

Notifies large difference between cost of production and the market price of the commodity, 1301-1316.

Observations on amount of production of silver, 1323-1325, 1332, 1333.

Possibility of new discoveries in the future, 1318-1320.

Will undertake a similar inquiry into the cost of producing gold, 1327-1331.

MR. D. M. BARBOUR, C.S.I. :

Information as to hoarding in India, 1097-1101, 1154-1160, 1163-1176, 1183-1197.

The precious metals are hoarded in the form of both bullion, coin, and ornaments, 1099-1101.

Net imports of gold into India since 1835, 1102-1112.

Amount of silver hoarded probably exceeds amount of gold, 1113-1116, 1196.

Total amount hoarded, 1102, 1117-1121.

Causes which are likely to bring out hoards, 1124-1129, 1135, 1149-1153, 1155.

Consumption of gold in India for various purposes, 1108, 1109, 1130-1134.

Illustrations of capacity of the people for absorbing money, 1136-1141, 1145-1148, 1190-1194.

Opinion as to probability of a diminution in tendency to hoard, 1142-1163.

Probable effect on value of precious metals of a cessation in hoarding, 1143, 1144.

Alteration in purchasing power of silver in India, 1179-1182.

Little alteration in price of labour in India in recent years, 1161, 1162.

Diagram showing oscillations in prices of silver and of commodities since 1860, 1177.

MR. ROBERT BARCLAY :

Is engaged in the export trade from England to India and other silver-using countries, 2230-2235.

Trade has suffered from fluctuations in exchange, 2236, 2369.

Merchants generally able to protect themselves against loss if all parties to contracts fulfil their obligations, 2237-2245, 2279; but business is necessarily checked by the introduction of a speculative element, 2240, 2245, 2275-2278, 2369, 2373-2379.

Losses arising through failure of manufacturer to keep his contract, coupled with concurrent alteration in exchange, 2261-2270, 2284-2285; though intrinsically insignificant, become important, owing to small margin of profit with which business is conducted, 2271-2274.

Silver prices in the East have a tendency to rule the gold prices here, 2245-2260, 2349, 2362; and have been little affected by the disturbance in values in Europe, 2245, 2354, 2419-2421, 2458, 2459.

Advantage of falling exchange to the Indian merchant and manufacturer, 2287-2299, 2305; growth of Indian cotton manufacture and falling off of certain branches in England, 2301-2304, 2319-2334.

Advantages to India of trading with silver-using countries, 2306-2319, 2357-2368.

Stimulus to Indian exports of wheat, 2335-2344, 2371, 2372.

Extent to which the English and Indian export trades are respectively affected by fall in exchange, 2369-2370, 2395-2401.

Manner in which exchange operates on international trade, 2402-2418, 2460-2465, 2486-2496.

Advantage and disadvantage to the two countries generally of exchange fluctuations, 2419-2457, 2466-2494.

Causes of appreciation of gold or fall of gold prices, 2349-2353.

Is in favour of adopting a fixed ratio between the two metals, 2355-2356, 2477.

Objections to introduction of a gold standard in India, 2380-2386.

Effects of a further fall in silver, 2387-2394.

MR. J. W. BIRCH :

Extension of banking expedients during the last 20 years, 1336-1340. Possibilities of further increase, 1341, 1344-1346.

Effect of telegraphic transfers, 1342, 1343.

Estimates of circulation and of stock of gold in the United Kingdom, 1348, 1362-1365.

Light gold and *li*. notes, 1395-1399.

Sources from which Italian demand for gold was met, 1349-1353. Similar information with regard to Germany, 1354-1361. South America, Portugal, &c., 1368-1370. Hoarding in France, 1354-1360.

Sources from which gold is drawn through a rise in the rate of interest, 1366-1368.

Amount of gold coin melted down for industrial purposes, 1371.

Stock of gold held by Bank of France, 1379-1382.

Currency in Spain, 1386-1394, 1400, 1401.

Puts in certain statistics as to circulation in France, Germany, Belgium, Italy, and Switzerland, 1378.

MR. J. K. BYTHELL :

Is a Manchester merchant, engaged chiefly in the import trade from India, 1897-1899.

Mode in which the export and import trade with the East is financed, 1900-1912.

General effect on trade of the uncertainty in exchange and extent of the risk imposed upon the several parties concerned, 1907-1931.

Alleged stimulus to export trade of India owing to fall in exchange, 1932-2008, 2072-2165, 2185-2190.

Advantages to the Indian producer, 1933-1944, 1947, 2082-2165, 2184.

Causes of fall in gold prices, 1933, 1944, 1945, 1950, 2170. Difficulties of the Government of India have been exaggerated, 2009-2012, 2026-2046, 2066-2071.

Real extent of the loss sustained by the Government, 2013-2025, 2040-2042, 2047-2059.

Borrowing power of the Government as affected by exchange, 2019-2025.

Effects of a fixed ratio between gold and silver, 2062-2065, 2166-2169.

MR. H. H. GIBBS :

Is a Director of the Bank of England, and engaged in trade with silver-using countries, 3020-3023. His opinions are not those of the majority of the Court of Directors, 5880.

Present divergence in relative value of gold and silver due to both appreciation of gold and depreciation of silver, 3024, 3025, 3221.

Causes which have led to appreciation of gold and depreciation of silver, 3026, 3027.

Other causes have prevented silver being depreciated in relation to commodities, but those causes have not operated in the case of gold, 3028-3041.

Probable result of a further fall in silver, 3109-3113.

Injurious effect on trade of fluctuations in the values of the precious metals, 3042, 3043, 3098.

The risk arising from uncertainty must be an impediment to trade, and cannot be transferred to other persons without paying for the accommodation, 3045-3049, 3106-3108, 3215, 3216, 3299-3233, 3241-3244, 5791-5803.

Extent to which trade is obstructed by this means, 3049-3058.

Stimulus given to production in countries with depreciated currency, 3069, 3070, 3138-3145, 3179-3212, 3779-3784, 3811, 3812, 4517-4553, 5385, 5386, 5804-5807, 5872-5879; caused by diminution in the initial cost of manufacture, 3070-3073; corresponding disadvantage to producers in countries with an appreciated currency, 3073-3084, 3234-3237; facilities offered for trade between two silver countries as against trade between a silver and a gold country, 3715, 5808-5815.

Discouragement to invest in silver-using countries, 3101-3103, 3164-3178, 5847-5861.

In countries with inconvertible paper currency the depreciated paper is the basis of transactions, not the appreciated coin, 3645-3650.

Effects of exchange upon trade and prices, 3114-3137, 3224-3227, 3677-3679, 3687-3714, and on investments in silver countries, 3146-3164, 3218-3220; evils arising from the want of a fixed par of exchange, 3677-3679, 3709-3714, especially in the case of India, 4483-4516.

Disadvantages under which the agricultural interest suffers owing to the existing state of things, 3778-3781.

An appreciating currency is generally unfavourable to trade, 3092-3099.

Evils of low and especially falling prices, 3104-3105, 3238, 3617-3626, 3851, 5816-5818.

Necessity of an elastic currency to meet the increasing requirements of trade, &c., 3617-3626, 3846-3854.

Effect of contraction of the currency in this and other countries, 3746.

Meaning of the term "appreciation of gold," 5180-5188, 5201-5205.

Effects of a fall of prices vary according to the causes which have brought it about, 5189, 5190.

Fall of prices proceeding from increased abundance of commodities, 5190-5200.

Nature of the evidence which proves a fall in prices, 5205-5219; and a scarcity of gold, 5354-5362.

The evil alleged is a scarcity of gold, which in itself constitutes a fall of prices, 5201-5205, 5220-5222.

Course of prices during the last 25 years, 5256-5262.

And the available supply of gold, 5322-5327, 5355-5368, 5374-5378, 5396-5400, 5831-5841.

As to economy of currency in recent years, 3747-3758.

Connexion between prices and currency, 4554-4572, 4634-4641, 4675-4693, 5223-5255, 5262-5321, 5388-5395, 5820-5830.

Effect of the rate of interest on the supply of gold, 5328-5352, 5368-5373.

Wages and necessities of life are affected very slowly by changes in the value of the currency, 3076-3079, 3082-3084, 3138, 3139, 3213, 3214, 3743-3745, 4529-4553; except, perhaps, in countries themselves producing the material of the currency, 3085-3089.

A large portion of the existing uncertainty in exchange would be removed if bimetalism were adopted, 3459-3460; explains proposed bimetallic law, 3461, 3462.

The two metals were always effectively linked at a fixed ratio previous to 1873, 3716-3729.

The bimetallic proposal is merely to revert to a state of things which existed before that date, 3786-3794.

Number of countries necessary for a bimetallic union, 3663-3666.

Possibilities of an agreement with foreign countries for the establishment and maintenance of a fixed ratio, 3669, 3673, 3674, 5785-5788. Improbability of the agreement, if made, being infringed by any nation, 3670-3674, 5787.

As to the precise ratio to be adopted, 3627-3642, 4649-4659. Extent of re-coinage which would be required, 3629-3640, 4613a.

Effects of bimetalism, as it existed in France, and the Latin Union, 3463-3471, 3732, 3733, 3739; stability in exchange which resulted, 3467-3469, 3477; tendency of the cheaper metal, *i.e.*, the metal that will purchase more elsewhere, to go to the more favourable market, 3478-3484, 4588-4602; the ratio is, nevertheless, permanent, because either metal remains legal tender, 3485, 3486.

Agio in gold in France, 3529, 3608, 3732-3, 3832-9.

Mode in which the bimetallic law maintains the stability of the ratio, 3487-3493, 3542-3546, 4576-4586.

Reasons why a ratio between two metals can be preserved, and not between a metal and paper, 3494-3510, 3547-3550, 4588, 5819.

Maintenance of the ratio, 3529-3532, 3577-3579, 3597, 3606-3608.

Effect of the ratio on the course of trade and exchange between a bimetallic and a mono-metallic country, 3511-3541, 3567-3570, 3574-3609, 4589.

Effect of the ratio in the bimetallic area on the values in mono-metallic countries, 3551-3556, 3571-3609, 3667, 3668, 3827-3845, 4614-4620.

Effect of a large discovery of one of the two metals, 3610-3616, 3661, 3662, 3675, 3676.

o 24358.

Effect of bimetalism on the production of the two metals, 3855-3858, 3871-3876, 4582-4586, 4603-4611.

Operation of the Gresham law as bearing upon bimetalism, 4588-4602.

As to possibility of contracts to pay in one metal, under bimetalism, and consequent effect upon the system, 4642-4648.

Probable effect of the free coinage of silver in England, especially as regards the existing stock in other countries, 3734-3738.

Effect upon prices and wages of remonetizing silver, 3739-3745, 3759-3777.

And upon the owners of gold or gold bearing securities, 3776-3777, 5383-5385.

Opinion as to the equity of making a change which would prejudice those who now profit by the existing disturbance in the ratio, *e.g.*, the producers in India, or persons interested in existing contracts, 3651-3658, 3794-3808, 3811-3824, 5383-5385.

Desirability of preventing gain or loss to either partly from disturbance of exchange, 3659, 3660.

As to silver being held by the Issue Department of the Bank of England, 3680-3686.

As to a scheme for the issue of international notes, 5842-5846.

MR. R. GIFFEN:

General review of statistics of production of precious metals and progress made since 1876, 464-466, 648-652. Remarks on statistics relating to Russia, Australia, and the United States, 467-471; Mexico and South America, 475; China, 476-481.

General accuracy of Dr. Soetbeer's figures, 472-474, 482, 483.

Relative proportion of gold and silver produced, 485-488.

Details of increased demand for gold in recent years, 489-528; in Germany, 489-503; the United States, 504-516, 656-658; Holland, 517-521; Italy, 522, 523; Spain, 527.

Extent to which the demand for gold has been in substitution for silver, 524-538.

Demand for gold since 1871 compared with demand previous to that date, 529-543. Demand in France between 1850 and 1865, 529-531.

Difficulty of distinguishing between the normal demand and that required for temporary emergency, 544-546, 567-571. Normal demand in the United Kingdom, 546-553. Factors which contribute to the normal demand of a country, 554-562.

Extension of banking expedients, 556, 558, 559.

Net amount of coinage in the United Kingdom, 563-566, 635, 636, 642-644.

Indian demand for gold, 572-581.

Alterations in demand for silver in recent years, 582-602, 645-647, 659-662; France and the Latin Union, 582-587; United States, 588-593, 629-634; India, 594-596, 601, 602; China, 597-600.

Summary of conclusions as to alterations in demand for gold and silver, 603-606.

Consumption of precious metals for industrial purposes, 607-619, 659-662.

Possibility of estimating total stock of gold and silver, 621-624.

Sources from which gold is attracted to the money market by a rise in the rate of interest, 624-628.

Cost of production of precious metals, 620, 637, 638.

Imports of gold and silver ore to be considered in estimating consumption, 653-655.

Information with regard to the various methods of recording prices during the last 50 years, 663. Extent to which such records may be accepted, 832. Investigations of Mr. Jevons, 666-669, 686-696; the "Economist," the Board of Trade, Mr. Sauerbeck, Mr. Palgrave, Dr. Soetbeer, 670, 671, 697, 871-875.

Explains system of index numbers, 672-676.

Facts on which these records are based, 677-679, 681-685, 693-696, 719-730, 827-830.

Objections to the system of index numbers, 680, 687-692.

Board of Trade Reports on variations of prices, 670, 709-717.

Records of Indian prices, 681-685, 761-793, 859-863.

Comparison of conclusions arrived at from the several methods described, 697, 701-705, 718, 731-748, 763, 831, 869, 870.

Investigations into prices of previous times by Sir G. Evelyn and others, 749-760, 847, 850.

Price of labour or services, 795-814, 822-825. Railway fares, freights, &c., 815-817.

Records of retail prices, 794, 818-826.

Nature of conclusions which may be drawn from records of prices generally, 832-846, 858, 864-868.

Causes which affect prices, 833-858.

MR. H. R. GRENFELL:

Is a director, and has been Governor of the Bank of England, 4171-4173.

Lord Liverpool's views as to the standard of value in England at the time when he wrote, 4174, 4185-4189, 4197, 4198. Meaning of standard of value, 4178.

The double standard existed up to 1797, 4174-4178.

Mr. Giffen's statement as to existence of the double standard in France, 4178-4184, 4190-4196.

Criticises the view stated to have been put forward by Mr. Fremantle and the Treasury that the fixing of a ratio between gold and silver is an interference with natural law or with the principles of free trade, 4199, 4200, 4213-4230, 4261-4303.

Observations on the contention that the position of London as the centre of the commercial world is due to a single gold standard, 4304-4306.

Agrees generally with Mr. Gibbs's evidence as to the possibility and expediency of introducing the bimetallic system, 4307.

Serious consequences of a further fall in silver, 4308-4315, 4336-4337.

Ascribes recent fall in prices to alterations in the standard of value and the contraction of the currency, 4316-4329, 4346-4380, 4476-4482. These alterations due to foreign legislation, 4326-4329, 4444-4446.

Effect upon wages and employment, of the appreciation of gold, 4409-4424.

Effect of currency legislation on contracts, 4425-4434.

Question whether under a bimetallic system contracts could be expressed in one of the two metals only, 4231-4261.

Extent to which the recent disturbance of the ratio has been caused by the depreciation of silver and the appreciation of gold, 4439-4441.

Effect of bimetalism on prices, 4200-4202, 4446-75.

Effect of the bimetallic system in preserving the ratio 4390-4394, 4400-4408.

The ratio of 15½ to 1 was fixed and maintained by law and had no relation to the cost of production of the two metals, 4330-4332, 4338-4345, 4381-4397.

Comparative insignificance of the mining interest in America, 4203-4212.

Effect of peace and war upon prices, 4442-4443.

SIR HECTOR HAY:

Statistics of production of precious metals, 237-297.

Sources of information, 298-331, 431.

Statistics of coinage, 332-368; difficulty of obtaining accurate information as to re-coinage, 356-368.

Estimated consumption of gold for industrial purposes, 371-416, 432-437, 450, 451; and of silver, 418-422.

Consumption of gold in the United States, 388-405.

Consumption in England and India compared, 409-414, 444-448, 452-457.

Opinion as to future production, 425.

Cost of production, 426-430.

Estimated stock of gold in the United Kingdom, 438-443.

As to accuracy of import and export statistics, 313, 458-463.

MR. DAVID McLEAN:

Is manager of the Hong Kong and Shanghai Banking Corporation, carrying on business with India, China, and Japan, 4986-4989.

Mode in which the export trade to the East is financed, 4990-5014.

Similar information with regard to the import trade, 5015-5035.

Differences between the India and the China trade in respect of banking accommodation, 5002, 5003, 5034, 5035, 5086-5095.

Extent to which fluctuations in exchange interfere with trade, 5036-5044, 5051-5063.

The fall in exchange has stimulated exports from the East, 5064-5076, 5100-5103, 5146-5166.

Effect on the exchange of a cessation of Council Bills, 5130-5140, 5167-5174.

MR. SAMUEL MONTAGU, M.P.:

Banking accommodation in London superior to that in other parts of the world, 1407, 1421, 1433.

But as regards small remittances, and transfer of funds from one part of the country to another, foreign countries offer greater advantages, 1407-1409, 1413-1415, 1422-1425, 1469-1473, 1486-1490, 1515-1520, 1539-1547.

This defect to some extent neutralized by the more common habit of keeping banking accounts here, 1418-1421, 1426-1429, 1539-1543.

Economy of gold currency on the continent as compared with the United Kingdom, 1411-1413, 1422, 1432, 1435-1439.

Possibility of further economy owing to extension of banking accommodation abroad, 1441-1445, 1486-1507, and issue of paper, 1436, 1474, 1478, 1492-1494, 1512-1514, 1557-1559. Issue of 1l. notes, 1436, 1478, 1558, 1559.

General disuse of small notes, and consequent increase in demand for specie, 1447-1457, 1467, 1468, 1495, 1535-1538.

Transmission of specie from London to Scotland and Ireland, 1409-1411, 1434, 1508-1514, 1521-1530, 1548-1556.

Light gold in circulation, 1484, 1485.

PROFESSOR J. SHIELD NICHOLSON:

Is professor of political economy in the University of Edinburgh, 3877.

Fall in the gold price of silver due rather to alterations in demand than in supply, 3879-3881, 3885, 3894, 5511-5516, 5593-5599, 5609-5612, 5670-5678.

Statistics of production of the precious metals, 3882-3893, 4052-4061.

Nature of the alterations in the demand in recent years, 3896-3919, 3933-3941.

Great increase in recent years in the use of gold for purposes other than currency, 5487-5503; consequent danger in the disuse of silver as money, 5504-5510.

Possibilities of an increased production of gold or silver, 5523-5526.

Effect upon prices and the course of trade of the depreciation of silver, 3920-3932, 4076-4089, 4111-4118, 4145-4153, 4156-4170, 5413-5418, 5422-5430, 5618-5631, 5652-5669, 5711-5728.

Present depreciation likely to continue, with frequent fluctuations, 3942-3949.

Nature of the evidence as to recent appreciation of gold, 3951-3978; causes of the fall of prices, 3957-3978.

Nature of the evils arising from appreciation, 4028-4050, 5553-5577, 5602-5633.

Reasons why the annual additions to the stock of the precious metals are not sufficient to prevent appreciation, 4052-4061, 5455-5464.

Mode in which prices are affected by the volume of the currency, 3979-4026, 5465-5486, 5772-5784.

Dislocation of trade between silver and gold countries is a more serious evil than appreciation, 4121, 4122.

Explains the operation of bimetalism as a remedy for the existing evils, 4062-4072, 5679-5701; advantages that would be derived from the adoption of bi-metalism, 4073, 5431-5434, 5517-5522, 5533-5535, 5578-5592, 5636-5650, 5652-5669, 5729-5739; reasons for adopting ratio of 15½ to 1, 4092-4096.

Effects of large discoveries of the precious metals under a bimetallic system, 4076-4079, 4119, 4120.

Bimetalism not likely to materially alter level of prices, but would produce greater stability, 4099, 4100, 4145-4147.

Effect of bimetalism on prices in silver countries, 5740-5765.

The monetary standard is necessarily a question for international arrangement, 5527-5532.

Effect of the existence of legal ratios between the two metals in producing stability, 5401.

Importance of a stable standard of value, 5403-5412, 5419-5421, 5702-5710.

Ethical aspect of the alteration in values which would be produced by bimetalism, 4123-4144, 4154, 5580-5591, 5600, 5601, 5608-5610.

Explains a method for measuring variations in the purchasing power of the standard of value, 5435-5438; result of the application of this method during the present century, 5449-5454.

MR. R. H. INGLIS PALGRAVE:

Explains circumstances under which his memorandum for the Commission on the Depression of Trade was prepared, sources from which the information was procured, and the lines of inquiry suggested by it, 1-5.

Equilibrium of prices maintained from middle of 17th to middle of 18th century, as shown by price of wheat, notwithstanding increased production of the precious metals, 6-18.

Doubts as to the inference which may be drawn from this fact, owing to difference between the circumstances of that period and of the present day, 15-18, 20.

Various estimates of production of the precious metals, and of amounts available for coinage, 21-29, 108-121, 135.

Statistics of coinage, 37, 70-72, 125-130.

General conclusion that production of gold has been less in recent years and of silver more, 30.

Production, consumption, and price of silver, 31-36.

Mode in which silver is valued in the statistics, 58-69.

Extent of available information with regard to re-coinage, 37-47; 90-94, 125-130, 135.

Estimates of stocks of the precious metals existing from time to time, 48-51, 101-107, 122-124, 133-135.

Information as to amount of gold in the United Kingdom, 52-54, 94-100.

Amount of light gold, 99, 100.

Amount used for industrial purposes, 55-57, 117-119.

Effect on production of the precious metals of alterations in their value, 73-89.

Indian demand for gold, 78-89, 131, 132.

MR. STEWART PIXLEY:

Statistics showing monthly price of silver in London since 1833, 139-141.

London prices govern prices elsewhere, 142-146, 268-279.

Statistics of production of gold and silver since 1852, 147-172.

Source from which information is derived, and comparison with other similar estimates, 148-172.

Statistics of consumption of precious metals for various purposes, 173-197; for use in arts and manufactures, 175-178, 182-188, 219; for export to India, 175-181; for coinage, 196, 197, 280, 281.

Amount of gold and silver coin in the world, 263-265.

Amount of gold in the United Kingdom, 198-206, 256; and amount of light gold, 260-262, 282-285.

Amount of old coin re-melted, 207-218.

Possibilities of future production of the precious metals, 225-231.

Cost of producing silver, 232-245.

Ofigin of the gold required for new demands of various countries in recent years, 250-255.

MR. A. D. PROVAND, M.P.:

Is a merchant trading, with China, Japan, &c., 3245-3250.

Changes in mode of transacting business with the East in consequence of the fall in silver, 1873, 3251, 3260-3265; mode in which the Eastern trade is financed, 3252-3265; extent to which the merchant can protect himself from uncertainty of exchange, 3375-3377; evils which result from uncertainty, 3317-3319.

Fluctuations in exchange are more unfavourable to trade with China, &c. than to India, 3266-3288, 3306-3316; illustration showing the extent of the consequent burden on trade, 3289, 3385-3404.

Operations of the exchange banks, 3290-3304, 3336-3342, 3346-3353, 3369-3374, 3405-3408.

Comparison of exchange rates between England and China, and India and China, 3320.

Transfer of trade with China, &c. from England to India, owing to more favourable position of Indian producer, 3320-3335, 3343-3345, 3354-3361, 3413-3422, 3429-3456.

As to whether it would be equitable to take away this advantage by legislation, 3362-3368, 3378-3384.

Trade with Java as compared with that with China, 3409-3413.

MR. A. SAUERBECK:

Accepts Dr. Soetbeer's statement of production of the precious metals, 879-884.

Consumption of gold for industrial purposes, 885-887, 955, 956.

Methods of economising the precious metals for purposes of currency, 891-901, 963-966, 971, 1069-1075.

Effect of telegraphic transfers not economical, 892-895, 967-970.

Use of bills of exchange not so economical as formerly, 896, 897, 970.

Amount of reserves held by banks, 892-894, 896-898.

Probability of extension of banking expedients, compensating increased demand for precious metals, 900-903, 1069-1075.

Demand for the precious metals for currency purposes, 932-934, 976-979, 1057-1068.

Relation between commercial transactions or production of commodities and demand for currency, 935-954, 1052-1056, 1067, 1068.

As to increase of production in silver-using countries, 944-954, 958-962.

Inaccuracy of statistics of imports and exports of precious metals in France, 957.

Amount of reliance to be placed on index numbers as showing fluctuations of prices, 905-910, 972-975, 991-1052, 1076-1084.

Comparison of fall in wholesale and retail prices respectively, 911-916, 1037-1039, 1085-1093.

Dr. Soetbeer's conclusions as to fall of prices compared with others, 1006-1015.

Investigations into the fluctuations in wages, or price of labour and services, 913, 918-931, 1040, 1051, 1052.

Causes of the fall of prices, 983-990, 1057-1068.

Variations of price of silver with prices of commodities, 986-988.

MR. SAMUEL SMITH, M.P.:

The fall of prices since 1873 is due to an appreciation of the standard rather than an increase of commodities, 4696-4715.

It has also been caused partly by the increased competition of silver using countries, 4721-4726.

Evidence derived from index numbers and other sources, 4700-4706, 5881-5913, 5917-5931.

Evidence of a contraction of the currency, 5914-5916.

Mode in which a contraction of the currency affects prices, 4716-4741.

Causes of the rise of prices before 1873, 4745, 4746, 4843-4847.

New demands for gold in recent years, 4741-4753, 4757-4760; have not been compensated for by increased economy, 4754-4761, 4851.

The connexion of trade depression with the appreciation of the standard and the fall of prices, 4765-4795, 4807-4823, 4854-4908, 4959-4980.

Effect of appreciation of the standard on fixed contracts payable in gold, 4796-4823, 4909-4956.

Protective tariffs and socialistic movements are encouraged by depression of trade, 4824, 5932-5940.

Effect of the depreciation of silver on the export of Indian wheat, 4810-4814, 4837-4840, 4969-74.

Explains the operation of bi-metallism as a remedy for the evils alleged above, 4895-4836, 4981-4285; number of countries to be included in the bi-metallic union, 4827-4831, 4982, 4983, 5943; is in favour of the old ratio of 15½ to 1, 4832, 4833.

MR. PAUL F. TIDMAN:

Is a merchant engaged in the trade with the far East, 2813, 2814.

Explains manner in which the English exporter suffers owing to uncertainty of exchange, 2815-2818.

Reasons why he cannot entirely cover this loss by banking and other expedients, 2819-2829, 2870-2877, 2915-2927.

Gives instances of trade being checked in the course of last year owing to uncertainty, and panic in the silver market, 2824-2826, 2833-2852, 2981-2986.

Import trade not affected by fluctuations in the same way as export trade, 2830-2832.

Illustrates loss incurred by tracing an actual transaction of export of goods to the East, 2853-2862; and a similar transaction of export of produce from the East, 2863-2869.

Loss accruing to English capitalists investing in the East, 2878-2885, 3004-3017.

Consequent difficulty of obtaining capital for the proper development of those countries, 2881-2885, 2958-2962.

Stimulus to manufacture and production in silver-using countries, 2885-2899, 2936-2970, 2979-2986.

Points out stability of exchange between Java and Europe, and consequent commercial advantages of Java as compared with Straits Settlement, 2900-2914, 2971-2978.

Causes of variation in relative values of gold and silver, 2928-2935, 2948, 3002, 3003.

Effect on the price of silver of the suspension of coinage in France, the Bland Act in America, and the German sales, 2987-3001, 3018.

Comparative slowness with which prices in silver countries adjust themselves to alterations, 2944, 2955-2958, 3019.

MR. HENRY WATERFIELD, C.B. :

Is Financial Secretary to the Secretary of State for India in Council, 1563.

Nature of the difficulties felt by the Government of India owing to fall in value of silver, 1565, 1646, 1647, 1710-1752, 1853, 2786-2802.

Details of the financial position of the Government of India, 1566, 2767-2774, 2803-2806.

Items of revenue, 1575-1601, 2656-2716.

Possibilities of increased taxation, 1598-1601, 1648-1652, 1745-1748, 1753-1767, 2764-2766.

Items of expenditure, 1602-1638, 1831, 1832, 2655, 2717-2721, 2755-2763.

Explanation of charge for exchange, 1603-1608, 2650.

Basis on which military pay is converted from sterling into rupees, 1616-1625.

Financial effect of the fall in exchange, 1639-1647, 1735-1744, 1838-1881, 2645-2654.

Effect of fall in exchange on the borrowing powers of India and on investments in India, 1653-1660, 1722-1729, 1768-1780, 1833, 1834, 1888-1893, 2722-2744, 2775.

Expenditure on public works, 1713-1721, 1734, 1867-1876, 2746-2754.

Effect on employés of the Government, 1661-1665, 1843-1852, 1882, 1883.

Question whether prices have undergone any alteration in India, 1666-1680, 2606, 2607.

Liabilities of Government of India under old and new contracts respectively, 1681, 1854-1866, 2644-2655.

Effect of fall in exchange on the export and import trade of India, 1682-1707, 1781-1821, 2499-2569.

Possibility of a gold standard or currency in India, 1896, 2776-2785.

As to effect of alterations in exchange on trade generally, 2570-2604.

Observations on Mr. Bagehot's evidence before Select Committee of 1876, 1800-1803, 2594-2604.

Real nature of the burden imposed on India, 2613.

MR. J. TALBOYS WHEELER :

Represents the uncovenanted Indian civilians, 2191-2196.

They sustain a loss of 25 per cent. on pensions and furlough pay paid in Europe, 2197, 2198, 2227-2229.

Complain that the Indian Government have kept them to a bargain made when the rupee was worth about 2s., 2198, 2209, 2217.

Nature of the uncovenanted service, 2222.

Payment of rupee pensions in England a concession made by the Government of India, 2225.

GOLD AND SILVER COMMISSION.

FIRST REPORT

OF THE

ROYAL COMMISSION

APPOINTED TO INQUIRE INTO THE

**RECENT CHANGES IN THE RELATIVE VALUES
OF THE PRECIOUS METALS;**

WITH MINUTES OF EVIDENCE AND APPENDICES.

Presented to both Houses of Parliament by Command of Her Majesty.

LONDON:

**PRINTED FOR HER MAJESTY'S STATIONERY OFFICE,
BY EYRE AND SPOTTISWOODE,
PRINTERS TO THE QUEEN'S MOST EXCELLENT MAJESTY.**

And to be purchased, either directly or through any Bookseller, from
EYRE AND SPOTTISWOODE, EAST HARDING STREET, FLEET STREET, E.C., and
32, ABINGDON STREET, WESTMINSTER, S.W.; or
ADAM AND CHARLES BLACK, 6, NORTH BRIDGE, EDINBURGH; or
HODGES, FIGGIS, & Co., 104, GRAFTON STREET, DUBLIN.

1887.

GOLD AND SILVER COMMISSION.

S E C O N D R E P O R T

OF THE

ROYAL COMMISSION

APPOINTED TO INQUIRE INTO THE

**RECENT CHANGES IN THE RELATIVE VALUES
OF THE PRECIOUS METALS;**

WITH MINUTES OF EVIDENCE AND APPENDICES.

Presented to both Houses of Parliament by Command of Her Majesty.

L O N D O N :

**PRINTED FOR HER MAJESTY'S STATIONERY OFFICE,
BY EYRE AND SPOTTISWOODE,

ROYAL COMMISSIONS.

I.

VICTORIA R.

Victoria, by the Grace of God of the United Kingdom of Great Britain and Ireland Queen, Defender of the Faith.

To Our right trusty and well-beloved Councillor Arthur James Balfour, Our Secretary for Scotland; Our right trusty and well-beloved Councillor Joseph Chamberlain; Our trusty and well-beloved Charles William Fremantle, Esquire, Companion of Our Most Honourable Order of the Bath (commonly called the Honourable Charles William Fremantle); Our trusty and well-beloved Sir John Lubbock, Baronet; Our trusty and well-beloved Sir Thomas Henry Farrer, Baronet; Our trusty and well-beloved James Richard Bullen Smith, Esquire, Companion of Our Most Exalted Order of the Star of India; Our trusty and well-beloved David Miller Barbour, Esquire; Our trusty and well-beloved John William Birch, Esquire; Our trusty and well-beloved Lionel Louis Cohen, Esquire; Our trusty and well-beloved Leonard Henry Courtney, Esquire; and Our trusty and well-beloved William Henry Houldsworth, Esquire, greeting.

Whereas it has been represented unto Us that it is expedient that a Commission should forthwith issue to inquire into the recent changes in the relative values of the precious metals shown by the decrease in the gold price of silver.

Now know ye, that We, reposing great trust and confidence in your knowledge and ability, do by these Presents authorise and appoint you the said Arthur James Balfour; Joseph Chamberlain; Charles William Fremantle (commonly called the Honourable Charles William Fremantle); Sir John Lubbock; Sir Thomas Henry Farrer; James Richard Bullen Smith; David Miller Barbour; John William Birch; Lionel Louis Cohen; Leonard Henry Courtney; and William Henry Houldsworth to be Our Commissioners for the purposes of the said inquiry.

And We do hereby enjoin you, or any five or more of you, to investigate the causes of the said recent changes in the relative values of the precious metals, and especially to inquire whether the said changes are due—

- (1.) To the depreciation of silver; or
- (2.) To the appreciation of gold; or
- (3.) To both these causes.

If you should find the said changes to be due to the depreciation of silver, you will then inquire whether such depreciation arises from increase of supply or diminution of demand, or from both, and you will endeavour to ascertain the proportions in which these different causes have operated.

If you should find the changes to be due to the appreciation of gold, you will inquire whether the appreciation arises from the diminution of supply or from increase of demand, or from both, and you will endeavour to ascertain the proportions in which these different causes have operated.

Having regard to these different causes and their respective effects, you will next inquire what has been the bearing of the changes in the value of the precious metals on the following matters of practical business:—

I. India :

(a.) Upon the remittances of the Government of India :

(1.) For payments on old or fixed contracts.

(2.) For payments on new or current contracts.

(b.) Upon the persons in India who have to make remittances home in gold.

(c.) Upon the producers, merchants, and taxpayers of India.

(d.) Upon merchants and manufacturers at home who trade with India.

II. *The United Kingdom :*

- (a.) Upon the trade of the United Kingdom with other silver-using countries.
- (b.) Upon the foreign trade of the United Kingdom generally.
- (c.) Upon the internal trade and industry of the United Kingdom.

If you should come to the conclusion that the aforesaid changes in the values of the precious metals are causing permanent or important evils or inconveniences to any of the interests above referred to, it will be your duty then to inquire whether it is possible to suggest any remedies within the power of the Legislature or the Government, by itself or in concert with other Powers, which would be effectual in removing or palliating the evils or inconveniences thus caused without injustice to other interests, and without causing other evils or inconveniences equally great.

Lastly, if you are of opinion that this is possible, you will state the precise form which such remedies should take, and the manner in which they should be applied.

And for the better effecting the purposes of this Our Commission, We do by these Presents give and grant unto you, or any five or more of you, full power to call before you such persons as you shall judge likely to afford you any information upon the subject of this Our Commission ; and also to call for, have access to, and examine all such books, documents, registers, and records as may afford you the fullest information on the subject ; and to inquire of and concerning the premises by all other lawful ways and means whatsoever.

And We do further by these Presents authorise and empower you, or any five or more of you, to visit and personally inspect such places in Our United Kingdom as you may deem expedient for the more effectual carrying out of the purposes aforesaid.

And We do by these Presents will and ordain that this Our Commission shall continue in full force and virtue, and that you, Our said Commissioners, or any five or more of you, may from time to time proceed in the execution thereof, and of every matter and thing therein contained, although the same be not continued from time to time by adjournment.

And We do further ordain that you, or any five or more of you, have liberty to report your proceedings under this Our Commission from time to time, if you shall judge it expedient so to do.

And Our further will and pleasure is that you do, with as little delay as possible, report to Us, under your hands and seals, or under the hands and seals of any five or more of you, your opinion upon the several matters herein submitted for your consideration.

And for the purpose of aiding you in such matters, We hereby appoint Our trusty and well-beloved George Herbert Murray, Esquire, to be Secretary to this Our Commission.

Given at Our Court at St. James's, the Twentieth day of September one thousand eight hundred and eighty-six, in the Fiftieth year of Our Reign.

By Her Majesty's Command.

HENRY MATTHEWS.

II.

VICTORIA R.

Victoria, by the Grace of God of the United Kingdom of Great Britain and Ireland Queen, Defender of the Faith.

To Our right trusty and well-beloved Councillor Farrer, Baron Herschell; Our right trusty and well-beloved Councillor Joseph Chamberlain; Our right trusty and well-beloved Councillor Sir Louis Mallet, Knight, Companion of Our Most Honourable Order of the Bath; Our right trusty and well-beloved Councillor Arthur James Balfour; Our right trusty and well-beloved Councillor Henry Chaplin; Our trusty and well-beloved Charles William Fremantle, Esquire (commonly called the Honourable Charles William Fremantle), Companion of Our Most Honourable Order of the Bath; Our trusty and well-beloved Sir John Lubbock, Baronet; Our trusty and well-beloved Sir Thomas Henry Farrer, Baronet; Our trusty and well-beloved David Miller Barbour, Esquire, Companion of Our Most Exalted Order of the Star of India; Our trusty and well-beloved John William Birch, Esquire; Our trusty and well-beloved Lionel Louis Cohen, Esquire; Our trusty and well-beloved Leonard Henry Courtney, Esquire; and Our trusty and well-beloved William Henry Houldsworth, Esquire, greeting.

Whereas We did, by Warrant under Our Royal Sign Manual, bearing date the twentieth day of September one thousand eight hundred and eighty-six, authorise and appoint Our right trusty and well-beloved Councillor Arthur James Balfour, Our then Secretary for Scotland, together with the several gentlemen therein mentioned, or any five or more of them, to be Our Commissioners to inquire into the recent changes in the relative values of the precious metals shown by the decrease in the gold price of silver.

Now know ye, that We have revoked and determined, and do by these presents revoke and determine, the said Warrant, and every matter and thing therein contained.

And whereas We have deemed it expedient that a new Commission should issue for the purposes specified in such Warrant of the twentieth day of September one thousand eight hundred and eighty-six.

Further know ye, that We, reposing great trust and confidence in your ability and discretion, have appointed, and do by these Presents nominate, constitute, and appoint, you the said Farrer, Baron Herschell; Joseph Chamberlain; Sir Louis Mallet; Arthur James Balfour; Henry Chaplin; Charles William Fremantle (commonly called the Honourable Charles William Fremantle); Sir John Lubbock; Sir Thomas Henry Farrer; David Miller Barbour; John William Birch; Lionel Louis Cohen; Leonard Henry Courtney; and William Henry Houldsworth to be Our Commissioners for the purposes of the said inquiry.

And We do hereby enjoin you, or any five or more of you, to investigate the causes of the said recent changes in the relative values of the precious metals, and especially to inquire whether the said changes are due—

- (1.) To the depreciation of silver; or
- (2.) To the appreciation of gold; or
- (3.) To both these causes.

If you should find the said changes to be due to the depreciation of silver, you will then inquire whether such depreciation arises from increase of supply or diminution of demand, or from both, and you will endeavour to ascertain the proportions in which these different causes have operated.

If you should find the changes to be due to the appreciation of gold, you will inquire whether the appreciation arises from the diminution of supply or from increase of demand, or from both, and you will endeavour to ascertain the proportions in which these different causes have operated.

Having regard to these different causes and their respective effects, you will next inquire what has been the bearing of the changes in the value of the precious metals on the following matters of practical business :—

I. *India :*

(a.) Upon the remittances of the Government of India :

(1.) For payments on old or fixed contracts.

(2.) For payments on new or current contracts.

(b.) Upon the persons in India who have to make remittances home in gold.

(c.) Upon the producers, merchants, and taxpayers of India.

(d.) Upon merchants and manufacturers at home who trade with India.

II. *The United Kingdom :*

(a.) Upon the trade of the United Kingdom with other silver-using countries.

(b.) Upon the foreign trade of the United Kingdom generally.

(c.) Upon the internal trade and industry of the United Kingdom.

If you should come to the conclusion that the aforesaid changes in the values of the precious metals are causing permanent or important evils or inconveniences to any of the interests above referred to, it will be your duty then to inquire whether it is possible to suggest any remedies within the power of the Legislature or the Government, by itself or in concert with other Powers, which would be effectual in removing or palliating the evils or inconveniences thus caused without injustice to other interests, and without causing other evils or inconveniences equally great.

Lastly, if you are of opinion that this is possible, you will state the precise form which such remedies should take, and the manner in which they should be applied.

And for the better effecting the purposes of this Our Commission, We do by these Presents give and grant unto you, or any five or more of you, full power to call before you such persons as you shall judge likely to afford you any information upon the subject of this Our Commission ; and also to call for, have access to, and examine all such books, documents, registers, and records as may afford you the fullest information on the subject ; and to inquire of and concerning the premises by all other lawful ways and means whatsoever.

And We do further by these Presents authorise and empower you, or any five or more of you, to visit and personally inspect such places in Our United Kingdom as you may deem expedient for the more effectual carrying out of the purposes aforesaid.

And We do by these Presents will and ordain that this Our Commission shall continue in full force and virtue, and that you, Our said Commissioners, or any five or more of you, may from time to time proceed in the execution thereof, and of every matter and thing therein contained, although the same be not continued from time to time by adjournment.

And We do further ordain that you, or any five or more of you, have liberty to report your proceedings under this Our Commission from time to time, if you shall judge it expedient so to do.

And Our further will and pleasure is that you do, with as little delay as possible, report to Us, under your hands and seals, or under the hands and seals of any five or more of you, your opinion upon the several matters herein submitted for your consideration.

And for the purpose of aiding you in such matters, We hereby appoint Our trusty and well-beloved George Herbert Murray, Esquire, to be Secretary to this Our Commission.

Given at Our Court at St. James's, the Sixth day of May one thousand eight hundred and eighty-seven, in the Fiftieth year of Our Reign.

By Her Majesty's Command.

HENRY MATTHEWS.

III.

VICTORIA R,

Victoria, by the Grace of God of the United Kingdom of Great Britain and Ireland Queen, Defender of the Faith.

To Our trusty and well-beloved Samuel Montagu, Esquire, greeting :

Whereas We did, by Warrant under Our Royal Sign Manual, bearing date the sixth day of May one thousand eight hundred and eighty-seven, appoint Our right trusty and well-beloved Councillor, Farrer, Baron Herschell, together with the several gentlemen therein mentioned, or any five or more of them, to be Our Commissioners to inquire into the recent changes in the relative values of the precious metals shown by the decrease in the gold price of silver.

And whereas one of Our Commissioners, so appointed, namely, Lionel Louis Cohen, Esquire, has since deceased.

Now know ye, that We, reposing great confidence in you, do by these Presents appoint you, the said Samuel Montagu, to be one of Our Commissioners for the purpose aforesaid, in the room of the said Lionel Louis Cohen, deceased, in addition to and together with the other Commissioners whom We have already appointed.

Given at Our Court at St. James's, the Twenty-sixth day of July one thousand eight hundred and eighty-seven, in the Fifty-first year of Our Reign.

By Her Majesty's Command.

HENRY MATTHEWS.

NOTE.—The Right Hon. Joseph Chamberlain resigned in September 1887.

GOLD AND SILVER COMMISSION.

SECOND REPORT.

TO THE QUEEN'S MOST EXCELLENT MAJESTY.

MAY IT PLEASE YOUR MAJESTY,

WE, the undersigned Commissioners, appointed to inquire into the recent changes in the relative values of the precious metals, desire humbly to submit to Your Majesty a further report of our proceedings.

We append notes of the evidence which we have taken since the date of our last Report, together with other information bearing upon the subject of our inquiry.

This section of the evidence relates chiefly to the effect upon the trade, industry, and general interests of the United Kingdom of the changes in the relative value of gold and silver.

We shall very shortly proceed to consider our Final Report on the several matters referred to us, and we hope to submit our conclusions at no distant date.

All which we humbly submit for Your Majesty's gracious consideration.

30th January 1888.

HERSCHELL.

MINUTES OF EVIDENCE

TAKEN BEFORE THE

ROYAL COMMISSION ON GOLD AND SILVER.

Twenty-fourth Day.

8, Richmond Terrace, Whitehall, S.W.

Friday, 10th June 1887.

PRESENT :

THE RIGHT HON. LORD HERSCHELL, the CHAIRMAN, presiding.

MR. D. M. BARBOUR, C.S.I.

MR. J. W. BIRCH.

MR. L. COURTNEY, M.P.

MR. C. W. FREMANTLE, C.B.

MR. W. H. HOULDSWORTH, M.P.

SIR LOUIS MALLET, C.B.

MR. GEO. H. MURRAY, *The Secretary.*

Mr. S. WILLIAMSON, M.P., called and examined.

5945. (*The Chairman.*) You have carried on business for many years in Liverpool?—Yes.

5946. Amongst other branches of your business you have large dealings with Chili, I believe?—Yes.

5947. In the importation of wheat from Chili to this country?—In the importation of Chilean produce generally, wheat amongst others, copper, nitrate of soda, and in the shipment of British manufactured goods and others to Chili.

5948. Has your principal business been with Chili?—It was for many years. Latterly, perhaps, our largest business has been with California, where we also have a house.

5949. Chili, as we have heard, is a silver-using country, but with a depreciated paper currency?—Yes, it was really bimetallic in a certain sense, that is to say silver being a product of the country was at their hands, while gold had to be imported, but during the recent war with Peru their metallic money was all drained away and they were left practically with an enforced paper currency. But previous to that, Chili was a silver-using country although they had gold coins with a fixed ratio to silver.

5950. You have considered the question of the effect of the more general adoption of the gold standard, which has taken place in recent years, in lieu of the silver standard?—Yes, I have.

5951. In your opinion has that caused an obstacle to business with silver-using countries?—Yes, I think it has been most hurtful and damaging, injurious to commerce, generally speaking bringing down values, and presenting hindrances to the interchange of commodities.

5952. Will you explain to the Commission how, in your view, that has operated?—Since Germany discarded silver as her money Europe has practically become gold monometallic, but silver has not been

driven out of the world. Foreign nations, South America and the East, still use silver largely, and the difficulties that we foresee, and the injurious consequences that we fear, are to a large extent apprehensions founded on the partial experience of that divorce since 1874 up till now. What we are afraid of is that this tendency to divorce silver from the money of the world will go on unless a remedy is now put to it, and that leads us to believe that very injurious effects will fall upon our manufacturing industries and our trade.

5953. Silver is not divorced from the money of the world; it still is the standard in countries using very large quantities?—Quite so. Up to this point it is a partial divorce only.

5954. You are referring specially to the evils which have arisen in relation to the trade between gold-using and silver-using countries, I understand?—Yes; and while there has been a struggling up till now to interchange commodities, the expansion that we would naturally have expected during recent years has not, according to my view, taken place, and there are those hindrances now existing that any man can easily apprehend. For instance, you would not, under existing monetary laws, think of investing money in a silver-using country, getting your interest paid in rupees or dollars, you would not think of investing in the debentures of a railway company, paying you interest in its silver money; and you would not think of investing in shares in any of these industrial enterprises such as railways, waterworks and so on in silver-using countries, so that we are putting a check upon their development, and the expansion of commerce.

5955. One of the evils, then, to which you refer is the obstacle which it creates to the investment in a silver-using country of capital existing in a gold-using country?—Quite so. That is the principal point

Mr. S.
Williamson,
M.P.

10 June 1887.

Mr. S.
Williamson,
M.P.

10 June 1887.

that I would like to lay stress upon. Of course, besides that, to a merchant transacting business with a silver using country, the fluctuations in exchange are most tantalising. Some may by haphazard make money out of the fluctuations, but as a rule to a prudent merchant they are excessively annoying and injurious.

5956. You think that that inconvenience is to some extent met by the operations of exchange banks, yet they cannot completely obviate the hazardous character of transactions between gold-using and silver-using countries?—In the small silver-using States you cannot arrange ahead for remittances with banks, or at least to a very moderate extent only. The Indian banks have certainly been trying to meet the difficulty, but we know that some of the Indian banks have got into trouble because of it, and are not paying dividends, and I look upon it as an extremely risky business. You make these banks that are now trying to accommodate their customers, exchange speculators, and what English capitalist is to put money into these banks, I should like to know? I think it is a most serious position that you put these Indian banks into. They can buy, of course, ahead to a certain extent, but the tendency is to sell exchange ahead to a larger extent to meet the demands of exporters from this country, and that is rash speculation. We know perfectly well that two or three of the Indian banks have presented very bad accounts recently.

5957. Are you able to arrange ahead in transactions between this country and Chili?—Only to a small extent, and we are obliged to give up giving credit almost entirely now, in Chili. The credit in Chili used to be 6, 7, and 8 months. I grant it was a long credit to give to dealers there, yet that was the course of business. We had interest. We ought to have got and did get interest for the use of our capital, besides the commercial profit on the goods we sold, and *pro tanto* it was an outlet for the employment of British capital. Now we are obliged to curtail those credits, and sell for cash. Three-fourths of our sales are cash sales; that is to say, payable in a month, and for these we can possibly arrange ahead, but we still occasionally make sales at six months' credit, and for those we cannot arrange ahead.

5958. Does that result from the depreciation of silver or from the depreciated paper currency?—It arises from the extreme fluctuations in exchange. We have no basis on which to found exchange.

5959. Yes, but those fluctuations might exist, I suppose, even if silver were steady elsewhere, in a country with an inconvertible paper currency?—I am speaking of the country rather as a silver country. Let us take the dollars as silver dollars. Even suppose Chili were now on a silver basis, we could not sell at six months' credit and know what we were to get back, at the end of that time, if we could not arrange exchange ahead. The fluctuations in the sterling value of silver dollars are now very great.

5960. But supposing a change were made which fixed the value of silver in relation to gold, would that get rid of your exchange difficulty between this country and Chili so long as the latter had an inconvertible paper currency?—No; but it would present an inducement to Chili to resume specie payments. She has got State railways to borrow money on sufficient to enable her to resume specie payments if there was any inducement for her to do it, but there is none. She is just about as well with a paper currency as with a silver currency just now.

5961. Then you think that one effect of a change which produced a fixed relation between silver and gold would be to induce Chili to resume specie payments?—To a large number of countries, Chili as well as other countries, the existing monetary position of silver is an absolute barrier to the resumption of specie payments. I think this is a very serious question well worthy of the consideration of the Commission.

5962. With regard to the counterbalancing advantages which it is suggested arise from the present condition of things, in the exchange between this country and India, what have you to say?—I think

the advantages have been exaggerated. The maximum export of wheat from India has been 6,000,000 of quarters in a year. Of these we have received 3,000,000 of quarters, and I would put the advantage at 15s. a quarter, that is 2,250,000*l.* The Continent and the Mediterranean have taken an equal quantity, making another 2,250,000*l.*; together 4,500,000*l.* But then the whole of that has not been gained by the fall in exchange. For instance, freights have fallen during recent years. Steamer freights have fallen from 55s. a ton down to 20s., which is now pretty much the standard rate from Bombay and Calcutta for wheat. That is exactly 8s. a quarter of saving in freights now as compared with what it was about the year 1880 or 1881. That is 2,400,000*l.*, and practically we have just a net gain through fall in exchange of about 2,000,000*l.* sterling on wheat, to the Indian people, and we know that the cultivation is not increasing much. If they produced about 20,000,000 of quarters we would not get any of it. It is the surplus of a large crop, of which India only exports about one-fifth or one-sixth, and we know that notwithstanding this great gain that we hear so much about, the Indian producers are in a state of penury. When they have to buy clothes to clothe themselves, or other European commodities, they have to pay so much more for them. Then the Indian Government have to provide about 50,000,000 of rupees or thereabouts annually more than they did when the exchange was about 2s. or 2s. 1*d.*, and this implies additional burdens on the people of India.

5963. And you do not think this suggested stimulus or advantage to India has been great?—I think it has been an advantage to a certain extent, because of the land rents being in silver; no doubt the Indian cultivator has gained, that is to say the Indian cultivator has been able to meet the fall in the price of wheat more easily than cultivators in other countries. That may be, but they are a set of poor people, notwithstanding, and the advantage to India as a whole has been very much exaggerated, and the advantage to ourselves has been exaggerated too.

5964. You mean the advantage to ourselves by getting the food cheaper?—Yes, it has been exaggerated, I think. Certainly the shipowners, who have contributed perhaps most largely to the bringing of this cheap wheat, have done it at their own cost; few of their boats are paying expenses.

5965. Then what do you say with regard to the suggested advantage to India, by certain manufacturing industries being stimulated in India?—Yes, that again is a very serious question. By divorcing their silver money from gold and having the Indian mints, the only mints in the world now open for the coinage of silver, if you force large quantities of silver on the London market (supposing that this question is not settled, and that the United States cannot go on, as I am sure the United States cannot go on, hoarding their silver as they are still doing). India is almost the only outlet for it. It will go either by direct shipments from America to India, or by way of the London market. The usual route for it is by the London market. It comes across here and is forced off. If they stop the hoarding of it in America it must come here for sale, it must compete with Indian bills, and it must force down exchange. I do not know how low, it would be ridiculous to predict, but I think it is very likely that it might be forced much lower than any of us dream of. Well, then, the effect of prices payable in greatly depreciated rupees and annas for British manufactured goods, must undoubtedly be to stimulate the planting of native industries in India. We see what has taken place in Calcutta in the planting of jute factories there. Some Dundee people thought that they would still keep the hold of that trade, and get cheap labour out in India and cheap jute. Freights were then very high, and they planted some jute mills. These have got extended; they are not now all in the hands of Dundee people, they are in the hands of London and Liverpool and Glasgow people largely, and they are making jute goods in

Calcutta, I know, at prices that Dundee cannot compete with. We ourselves struggled on shipping bags from Dundee to the West Coast and to California, but we found ourselves losing heavily one or two years. We found that our neighbours were getting cheaper goods in Calcutta, so, contrary to our own inclination, we had to abandon buying in Dundee and had to make our purchases in Calcutta. Now freights are so low all over the world that we get goods sent from Calcutta to San Francisco cheaper than to London. We paid four dollars and a half a ton last year, and the demand for these Calcutta goods is of course just taking away the trade from Dundee altogether, except in those other staples made of jute that from time to time come into play in this country; but practically the trade in bags and sacking is taken away from Dundee to Calcutta almost entirely. The same thing may happen in cotton goods, and our persistent adherence to a gold monometallic standard will inevitably give a greater stimulus to the planting of native manufactures in India.

5966. Do you think that if the Indian Government were to cease borrowing in the English market and to borrow in India on a silver basis instead, that would be likely to have any prejudicial effect upon the trade between this country and India?—I think it would reduce the exports of commodities from this country, but it would be beneficial to the Indian Government and a necessary step for them to take, I think.

5967. You think that borrowing in India on a silver basis, instead of in this country on a gold basis, would be a prudent course for the Indian Government to take as far as they were concerned?—Yes.

5968. My question was rather directed to the point whether it would be likely to have a prejudicial effect upon the trade between this country and India?—The way it would act would be simply this. Silver is pressed upon the London market; the borrowing in this country would enable you to send it out, and it would not curtail the export of goods from this country to any appreciable extent; but if you borrow in India you do not require to send the money out, you have then the silver competing with council bills exclusively. The silver comes and is forced off on the London market, and that necessarily must bring down the exchange and reduce the volume of our exports of goods to India.

5969. Have you any opinion on the question which has been raised whether our national wealth has grown in recent years or not?—Yes, I have read statements from time to time in *The Economist* upon that question. I think that *The Economist* has left out a good many facts in its calculations. I think that they have left out of account the very large diminution in the value of shipping property which I estimate at about 50,000,000*l.* sterling; and it is well known that we hold a much lesser amount of foreign securities of certain classes, such as Russian stocks and United States bonds, than we did years ago.

5970. When you estimate the depreciation of shipping property since 1880 at 50,000,000*l.* sterling, do you arrive at that estimate upon the basis of the increased quantity of shipping between now and 1880?—I will take the medium quantity, I will take 7,500,000 tons at 7*l.* a ton; it will come to 50,000,000*l.* in round numbers.

5971. Yes, but there has been a large increase in the tonnage between 1880 and 1885?—Yes, but I take the average quantity of tons. A steamer, for instance, was sold in Liverpool the other day. She was built in 1883. She was sold for 13,500*l.*, and she cost 30,000*l.* She was a steamer carrying 3,000 tons. She was forced off at auction, and she only brought 13,500*l.* What of vessels that were built about 1880 or before 1880? The diminution in the value on the quantity existing in 1880 or the quantity existing a few years ago is at least 50,000,000*l.* sterling.

5972. There has been a very great addition between 1880 and 1885 in tonnage?—Yes, there has been to the extent of perhaps 1,500,000 of tons.

5973. That would naturally tend to a diminution of

value unless there had been an increase in the demand for carrying purposes, corresponding with the increase in the tonnage?—I am only stating a fact that I think *The Economist* lost sight of. While they give a glowing account of the increase of our national wealth, they forget a diminution of value in other quarters.

5974. You are not speaking of the causes which led to that diminution?—No, not at all; merely I apprehend that the calculations of the *The Economist* are erroneous. I do not know what it is in London, but I know that in Liverpool there are whole streets of houses standing empty, working men's houses. In the course of a few years a street of working men's houses becomes so dilapidated that decent people go out of it, and then there are new streets built of working men's houses in the suburbs, and the working people go into these and leave the streets they had occupied empty. *The Economist* says we have had a great increase in the value of our house property. Yes, but I think they lose sight of depreciation, of natural deterioration besides actual depreciation, and so in many other particulars. In landed property, we all know there has been a great depreciation, and I think *The Economist* entirely lost sight of that. I do not think our national wealth is increasing. That is my belief.

5975. I gather that you think that the condition of things arising from the suspension of the use of silver as a standard in Germany and other countries is sufficiently serious to demand some remedy?—Most assuredly. Not a new remedy, but a reversion to what existed in this country with great advantage, the bimetallic system that we had. It is not a new remedy.

5976. When did that exist in this country?—All through last century. We are accused of introducing a novel idea. It is not novel; it exists in France now with advantage, although free mintage, which is the real thing that we want, does not exist, but you can pay your debts to day in silver to any extent in France.

5977. You mean reverting to the condition of things which existed in France prior to 1874?—Exactly so. But on a much wider basis.

5978. And adopting that state of things in this country as well?—Yes, I do not think that France by herself can do it. France and the United States together could, but I do not think that the United States will venture without the concurrence of England and Germany, one or other of them at any rate; and seeing that we are so largely beholden to our manufacturing industries for our existence, I think it behoves us to give serious consideration to this question.

5979. Has the import of wheat from Chili increased of late years?—No; it is not a large quantity, it never has been a large quantity, it has never exceeded half a million of quarters in a year.

5980. Then the depreciation of currency in Chili has not in fact stimulated the export of wheat from that country to this?—No, but the low exchanges and low freights during recent years may have enabled Chili to ship part of her surplus to Europe during a time of very low prices.

5981. (*Mr. Barbour.*) Can you say when the export of wheat from Chili began?—It began 40 years ago.

5982. You hold that in the present day, the export trade from this country to silver countries depends very much upon the exchange; that you have to watch the turn of the market to get a favourable exchange?—Naturally yes.

5983. Have you had any experience in trading with countries which had the same standard as England, or with countries which had a silver standard at the time that silver and gold bore a fixed ratio to each other?—Well we have, as I told you, a house in San Francisco where practically, because payments there are on a gold basis, we find no difficulty.

5984. You have not to pay the same attention to the

*Mr. S.
Williamson,
M.P.*

10 June 1887.

Mr. S.
Williamson,
M.P.
10 June 1887.

probability of fluctuations in exchange?—There are slight fluctuations in exchange that do occur and will always occur when there is a greater or less demand for money. But you can either send the coin out to, or bring it in from, a gold using country, subject to the mere charges of transmission, and you have to allow for that in your calculation, as a prudent merchant in any case will, if he has to give long credit.

5985. But if there is no common basis between the two standards, the balance of indebtedness has to be adjusted by the exchange acting directly on the trade. It cannot be adjusted through money?—With a silver using country it cannot so be adjusted under present conditions.

5986. You cannot make an adjustment through money, and that is an inconvenience, because the exchange acts directly on the trade, checking the trade for the time being, or stimulating it, as the case may be?—You can, of course, make an adjustment through money, running the risk of losing very heavily by your remittance of it.

5987. Have you heard that a fall of a penny in the rupee makes a difference to the Government of India now of ten millions of rupees in a single year?—I believe so. Yes.

5988. For 1882-3 the Indian estimates were based upon an exchange of 1s. 8d. and for the current year, 1887-8, they are based upon an exchange of 1s. 5½d. That makes a difference of 2½d. in the rupee?—Yes, and now I understand the Indian exchange is really about 1s. 4½d.

5989. That is 2½d. in five years, or ½d. for each year?—Yes.

5990. And that is on the average an additional half million of money every year since the year 1882?—Yes, it would be so.

5991. There had been also a considerable fall before 1882?—Oh, very large.

5992. And are you aware that since March of this year, since the estimates were made on the basis of 1s. 5½d., the exchange has gone down to 1s. 4¼d. as nearly as may be?—I believe so, rather lower in fact.

5993. That makes a difference of ¾d.?—Yes.

5994. And that at the present rate of exchange would be about eight millions of rupees?—It would be.

5995. Do you consider that such a state of affairs is a serious matter?—Most decidedly for the Indian Government, and so must react on our own trade.

5996. I think you hold the opinion that when exchange with India falls, and the Manchester manufacturer finds that he cannot get a higher rupee price than before, he tries in some cases to meet the difficulty by lowering the quality of the goods?—Well, I have had no experience of the Indian trade, but I know that we have had to do that in our Chilean trade; not that we would do it willingly, but the traders have a decimal currency. They have got certain small coins 10 cent, 15 cent, and 20 cent. pieces, you may say a token currency like our own, and the course of the trade compels them to bring articles to sell to the poor work people who must make their wages go as far as they can. They try to get it to fit in with the small silver coins, and the consequence is that with the great fall in exchange they are obliged to ask us to bring cheap goods. We do not choose it. There is often a great deal of nonsense talked about English merchants and manufacturers lowering the quality of the goods they make. They make as good qualities as they ever did and they make goods as poor as they ever did. It is no new thing. We simply send out what they ask us to send, whether it be cheap domestics or cheap prints. Of course there is a larger portion now of low class goods sold in those countries that are being affected by heavy declines in the exchanges. There is a larger proportion, although there was always a certain proportion, but as the exchange goes down you must get a larger proportion of low classed goods in order to fit in with the wants of the dealers.

5997. For goods manufactured in a gold standard country and sold in a silver using country the trader adjusts the matter as far as he can by lowering the

value of the article as the value of silver falls relatively to gold?—That is one of the necessities of the situation with silver using countries or with countries with a very fluctuating paper currency based ultimately on silver.

5998. (Mr. Birch.) I think you stated just now that formerly there was a ratio between gold and silver in Chili. Can you tell me when that was or what the ratio was?—The ratio was the French ratio of 15½ to 1 or within a fraction of it.

5999. And now what is the ratio between the paper and the silver?—None whatever. It is based on the possibilities of resumption, which of course would become much stronger and might become effective at once if silver was put in its old position.

6000. Yes; but is there no discount on the paper at present?—Oh, yes, the exchange just now is about 26s with Chili; and the silver dollar, the old Chili silver dollar, if remitted, would give about 32s.

6001. And that difference, I suppose, you have to take into consideration in such operations?—It is not a fixed discount. Even if we got paid in silver we could not remit the silver dollars as we used to do when sellers of bills to us did not give us the exchange that we thought reasonable. We merely remitted the dollars in those circumstances, but we cannot remit paper money.

6002. Then those silver dollars would give you varying exchanges in accordance with the variation of the premium upon the silver dollar?—Yes; that is quite true. The silver coin does not appear just now in our calculations as it does in the River Plate, where there is a premium on gold or a discount, but they have simply a paper dollar in Chili now.

6003. But surely the paper dollar, being at a discount, and a varying discount from one day to another, must be a great hindrance to the introduction of commodities which you were speaking of just now?—It accentuates the difficulty very greatly. We would have difficulty enough with silver, but the difficulty with inconvertible paper is much greater.

6004. The difficulty is greater, but the difficulty would exist even supposing silver should return to the ratio that previously existed in Europe?—Certainly it would remain if the paper money remained. But I have tried to point out that there would then be a stimulus to resumption.

6005. That would depend rather, would it not, upon the powers of the country itself?—Yes, Chili has plenty of power to resume specie-payments if they set their minds to it.

6006. Then I understood you to say that the difficulty is not so much what is now felt, as what may happen in the future?—Evils have happened, but I think much greater evils may happen in the future unless we try to put this matter right.

6007. I have before me a book published in 1859, in which exactly the same difficulties were foreseen and prophesied with regard to gold as you are now prophesying with regard to silver. This is a book that was written by Monsieur Chevalier, a man very well known in France; and the same things were stated then with regard to gold as are now stated with regard to silver. He foresaw that gold would then be produced to a large extent and English Consols would decline in value, very much what is pointed out now with regard to silver. The difficulties that presented themselves to Chevalier's mind evidently arose from a fear of a superabundance of the metal?—The difficulties now are of a totally different character, they arise from the inadequacy of the metal gold for the use of the world. You are forcing gold, the great monetary nations of the world are forcing the use of gold, and the quantity of gold is notoriously inadequate, consequently the difficulties that Chevalier faced, or apprehended rather (for it was a mere apprehension), are totally different from the actual difficulties that we are practically experiencing.

6008. (The Chairman.) But is it not the converse case?—Yes, exactly the converse of it.

6009. (*Mr. Fremantle.*) In one case there has been too much gold, and in the present case there is too much silver?—Yes, or too little gold; that is to say, if gold is to be used universally, there is too little of it.

6010. (*The Chairman.*) What I meant by the converse case was that what M. Chevalier apprehended from a certain condition of things was exactly the opposite of that which you apprehend from the opposite state of things?—Exactly so.

6011. But then what is suggested to you is that as his apprehensions proved ill-founded, so yours may prove to be equally ill-founded?—No, because his were mere apprehensions and never were embodied in actual facts at all. They vanished, they were found perfectly illusory, but we have experienced the difficulties.

6012. (*Mr. Birch.*) Surely they were not illusory, inasmuch as prices, you remember, rose very materially?—Yes, and wages rose also and people were able to pay better prices; there was more general prosperity.

6013. (*Sir L. Mallet.*) But are you not confusing the two things?—In the first place you have a question of the effect on prices, as to which, no doubt as you say, M. Chevalier's apprehensions were the converse of those which are now current; but in Chevalier's time at all events there was what there is not now, a fixed ratio between the two metals; at all events there was no variation, whether it was caused by the French law or not is matter of controversy; but at all events as matter of fact, the price of gold and silver remained practically at a fixed ratio during the whole of the period of the gold discoveries; and the difficulties that you, as I understand it, apprehend from the present prospect before us arise from the fact that the two metals, which for 70 years had been practically at a fixed ratio are no longer at any ratio?—Quite so, are divorced from each other.

6014. And are flying about wildly without any kind of thing to keep them together—a state of things quite different, as it seems to me, in that respect from the case which Chevalier contemplated?—The apprehensions of Chevalier have no bearing whatever on this question.

6015. (*Mr. Birch.*) You were referring specially to the business of Chili and how much it was interfered with. We had one leading witness the other day before us who stated (question 3069) that "if the exchange should rise from its present point of 25d per dollar to somewhere between 36d and 40d, not another quarter of wheat would be grown in Chili for export; many copper mines which subsist on the low exchange would be closed, and many nitrate establishments would be in the same case." Now as you are a merchant trading with Chili it would hardly appear that it would be greatly to your advantage that that state of things should be brought about?—Well, I believe this, that being on an enforced paper currency, and wages not having yet risen as might have been expected the smelters of copper are able to carry on a struggling industry nominally with some advantage, but their whole property is correspondingly depreciated in value and the thing will come to an end. Workmen will stand out for higher wages, and they will be no better off in the end. If Chili cannot produce copper in competition with countries that produce copper more cheaply then it is evident they will not be able to maintain the manufacture there. In Australia it has gone down, because they cannot compete with Montana, and I grant that Chili has a struggle in regard to her copper industry; there is no doubt about that, and the use of paper currency *pro tempore* alleviates the evil, that is all. If Chili cannot produce copper to compete with other nations that produce it more cheaply, then she must improve her methods, and her methods of mining. With respect to nitrate of soda, it only comes from the coast of Chili, and whatever the importers of nitrate of soda demand has to be paid. They have no competition. If the price is put up very high naturally the consumption of it will fall off. In regard to wheat I do not believe that

its production would be very materially affected. The quantity exported to Europe is very small.

6016. But you would allow that the merchant trading with a country like Chili and exporting goods, as you have told us just now that your house does, would not be benefited by that country failing to be able to export its produce. Surely the condition of the country being a flourishing condition must be advantageous to you who ship your English goods there. You get a better chance of being paid than if they had nothing to ship?—Yes; but I do not think that any prudent merchant ought to base his transactions on prices that are inflated by the use of a paper currency. They ought to get on some prudent basis, and I repeat that if Chili cannot produce copper in competition with other countries, then her copper industry must decline, and it is declining in competition with Spain and Montana.

6017. (*Mr. Houldsworth.*) Do you approve of the doctrine that the fall in silver has stimulated the export of wheat from India?—It may have done so to a certain extent, but the fall in freights has given an equal stimulus.

6018. I understood you to say that you did not think it had done so in the case of Chili. Now we have had very strong evidence, in fact I think the evidence has been universal, that it does stimulate it in the case of India or that it has stimulated it?—Yes, in regard to export naturally, but taking it in view of the entire growth of wheat in India, the margin for export has not increased enormously in proportion to the total quantity of the crop grown in India. That is to say we only get a surplus, and that is a small quantity of the entire crop of wheat in India.

6019. What I wanted to ascertain was whether in your mind there is any difference in the position of Chili from that of India, with regard to the stimulation of the export of wheat?—Yes, there is a difference, because Chili has a small population. It has only a population of barely 2,000,000 of people, and they have not got hands for the growth of it. The production of nitrate of soda has increased, and wages in the north part, in the desert part of Chili, have been higher than in the agricultural part, and hands have been drawn away. Then they lost a good many men in the war with Peru, and other circumstances have come into play in Chili, with regard to the production of wheat, which do not apply in India.

6020. Then would you anticipate that in India the export of wheat would be largely stimulated if the present fall of silver was continued or was increased? It has been stimulated, no doubt. If the rupee fell to 1s. there might be a further stimulus, but what then of the Indian debt, and of our export trade?

6021. And it would continue to be stimulated to a large extent?—It may be; it depends, however, very largely on the cost of internal carriage, and on the maintenance of those very low freights that are so totally unremunerative to shipowners. I do not think that during the last two or three years the Indian crop of wheat has increased.

6022. Do you think it has been the increased export from India which has reduced the price of wheat in this country to any extent?—Well, prices fall so soon as you get over the exact quantity that this country requires to import for consumption. So soon as you get a surplus of a million of quarters floating about wanting buyers, prices go down.

6023. Then you do think that it has?—Yes, but look at the question in this light. Our wants are about 15 to 17 millions of quarters a year. We have never in any year had more than three millions of quarters from India, about one-fifth of it. No doubt that one-fifth has had its influence in lowering the prices, along with other imports from the United States, California and elsewhere.

6024. Do you not think that the present state of things will increase that export from India, and that instead of one-fifth it will become a larger proportion?—It may be; but if the Indian people have to pay more for their goods, and if the price of wheat, which

Mr. S.
Williamson,
M.P.

10 June 1887

*Mr. S
Wilkinson,
M.P.*
10 June 1887.

is one of our own commodities that we grow in this country, is unduly depressed by means of very unjust and erroneous monetary laws, then I do not think it is an advantage. I would be very glad to see India competing on fair terms, with Indian money on the same metallic basis as our own. I do not see why we

should make laws to stimulate the growth of Indian wheat adverse to the whole of our other commercial interests and to our own agricultural interests too; that is to say, I do not think the present is a fair basis. Looking at it all round I think there is disadvantage instead of advantage.

The witness withdrew.

Adjourned.

Twenty-fifth Day.

Friday, 24th June 1887.

PRESENT:

THE RIGHT HON. LORD HERSCHELL.

MR. D. M. BARBOUR, C.S.I.
MR. J. W. BIRCH.
MR. HENRY CHAPLIN, M.P.
MR. L. COURTNEY, M.P.
SIR THOMAS H. FARRER, BART.

MR. C. W. FREMANTLE, C.B.
SIR W. H. HOULDSWORTH, BART., M.P.
SIR JOHN LUBBOCK, BART., M.P.
SIR LOUIS MALLET, C.B.

MR. GEO. H. MURRAY, *The Secretary.*

*Mr. J. Barr
Robertson.*

24 June 1887.

Mr. J. BARR ROBERTSON called and examined.

6025. (*The Chairman.*) You have resided, I believe, some time in the United States?—Yes, 10 years.

6026. And have paid considerable attention to questions of currency and variations in the value of the precious metals?—Yes, I have.

6027. It is a subject which has excited much interest on the other side of the Atlantic as well as on this side?—Yes.

6028. I believe you have drawn up a table showing the changes that have taken place during the last 25 years in England, and in India, as a gold and silver using country?—Yes, I have.

6029. Will you explain to us the sources from which you have obtained the materials, and the result?—It commences with gold. The eight years, 1858 to 1865, and the 10 years, 1866 to 1875, are taken from the Report on the Depreciation of Silver of 1876. The 10 years, 1876 to 1885 and 1886, are taken from the Board of Trade Returns. 1886, I may say, is taken from "The Economist's" monthly issue of the Board of Trade Returns. Silver is from the same sources.

6030. And is that the case with regard to India, as well as the United Kingdom?—India I have taken from the Report on the Depreciation of Silver down to, I think, 1873–74. I took these from the India Office returns. I had them specially sent to me for the purpose, so that these figures are all really official figures.

6031. Now as regards the result you find the net imports in the eight years 1858 to 1865, of gold, into the United Kingdom to be 29,658,000*l.*?—Yes, that is correct.

6032. By net imports, I suppose, you mean the gross import of gold during that period less the amount exported?—Yes, that is the meaning of it.

6033. Then in the following 10 years it was 50,108,000*l.*?—Yes.

6034. Making an average annual addition to the gold in this country during the first eight years of 3,707,000*l.*; and during the following 10 years of 5,011,000*l.*?—Yes, that is correct.

6035. Then in the next 10 years, from 1876 to 1885, I understand you to say that the exports of gold from this country exceeded the imports of gold into it?—Yes, they did.

6036. Showing a net export of 865,000*l.*?—That is correct.

6037. Was that process going on generally during those 10 years, or did it result from any specially large export during any particular year?—There were five years in which the net exports amounted to 17,988,000*l.* and five years in which the net imports were 17,123,000*l.* Of course, I have the whole of the tables showing exactly what that is, though I have not brought them with me, and have not put them in my memorandum.

6038. Then in 1886 the net export was 342,000*l.*?—Yes. The reason why I have these tables in that form is that I drew them up just about 16 months ago, as I was going to America, and I have only recently returned. I had them complete up to 1885. I put in a year later. The figures also show, of course, an increase on the average for that one year. That is how I make the 11 years.

6039. That 11th year showed a larger export than the average of the previous 10?—Yes, it did.

6040. Before we leave the gold, have you endeavoured to ascertain in what form that net increase, during the first 18 years of the period which you have taken, remained in this country?—I have not done that, except that there are tables showing the estimated consumption in the arts, and, of course, the balance naturally would pass into currency.

6041. You say that the balance would pass into currency, but it can only pass into currency by being added to the reserve or by being actually coined?—It must be coined, of course. Then there is far more coin than what this net amount is. It may be coined, and exported as coin. I daresay it will be found that most of it is so; but the coinage is a very unreliable test, in my opinion, as to the movement of the metals. The fact that it is coined is no proof at all that it remains in the country.

6042. Yes, but have you at all carried your investigations out to ascertain whether there was an increase of the reserve of bullion in this country, or of coinage, representing this net import?—No, I cannot say that I have; I am dealing with the official figures simply.

6043. And supposing that there was no addition to the reserve of bullion, then it would all have taken

the form of an increase of the coinage, I suppose?—Of course the natural form would be to be coined in much larger quantities than what we absorb, than what passes into the currency, and the currency might be increased without anything to show in the Bank of England reserve, as that is in a general way comparatively stationary.

6044. Yes, but if the Bank of England reserve was stationary, then the whole of it must in some way or another pass into circulation?—So it must, yes. Prices regulate whether it will pass into circulation or whether it will go abroad.

6045. But according to your investigation this did not go abroad, this is the excess of imports over exports, which remained in this country?—Yes; precisely. Consequently, allowing for what was consumed in the arts, which, in another part of my paper I show, upon Dr. Soetbeer's calculation, probably amounted to 2,400,000*l.* a year, though it would of course be less in the period from 1866 to 1875; then the balance must have gone into the currency, it must have gone into circulation, it did not go abroad.

6046. Supposing it went into circulation in that way, must not that have shown itself, somehow or other, in the amount of coin held by the banks?—No; it would only show itself to a small extent in the banks, because they are simply private institutions, holding enough to protect a certain amount of capital and liability.

6047. That is, people must have had more in their pockets?—Precisely, that is inevitable. There must have been more in their pockets, more in their tills, more in their counting-houses.

6048. That would be a change of habit, would it not, if people kept any more in their pockets? People generally take such coin as they have to the bank, except the small amount they need for their daily transactions?—Still, of course, you will readily see, whereas we were importing 5,000,000*l.* sterling a year, it was impossible for the bank to hold 1,000,000*l.* or 2,000,000*l.* more than a certain fixed quantity without lowering the rate of discount and driving it abroad or into general circulation. Suppose now that a large amount of gold was produced in the world, say 100,000,000*l.* sterling, that gold must pass into every country on the gold standard. I am speaking about normal conditions. That 100,000,000*l.* must pass and must distribute itself according to the proportion that each country holds of the gold standard. It must pass into the countries having the gold standard, and most of it must pass into general circulation, because all the financial institutions are simply private institutions holding a certain amount to protect liabilities, and are in no sense mere repositories of the precious metals.

6049. Yes, but what puzzles me is this, how the habits of the people should have become changed, so that instead of paying in all the money that they receive into the banks they should have kept it in their pockets or in their houses?—The habits of the people did not change in the 10 years 1866 to 1875, they still paid into their banks, but any surplus beyond the necessary reserves of the banks must have passed out of the banks into the hands of the people and influenced prices.

6050. But I want first to see where it is?—Well, I will take an illustration. I will suppose that any one purchased a certain amount of articles 12 years ago, and is purchasing the same articles to-day; it is very evident that prices having fallen, for whatever reason is not material for the moment, a smaller amount of money will enable him to make all these cash purchases than would have been required 12 or 15 years ago. He has not changed his habits, though he will require less money for current wants than formerly. Now, it seems to me that the money in the country during periods of excessive imports of gold not being in the banks it must be held in the pockets of the people, or in tills and counting-houses; it must be, where can it go? The banks may hold only a small

portion of it. Money has, therefore, its effect upon prices by being to a larger extent in circulation.

6051. (*Sir T. Farrer.*) Wholesale or retail prices?—Upon both, though wholesale prices are real prices. Of course retail prices are largely conventional. They differ for the same articles in different shops and in different localities.

6052. (*The Chairman.*) I am coming to the relation of the volume of currency to prices presently. I was for the moment only trying to trace where this addition to the amount of the precious metal, if it existed, was to be found?—It must be in the hands of the people.

6053. (*Mr. Courtney.*) Is it not the usage of the people who are dealing with large sums of money to deposit their money with their bankers and to draw as wanted?—Yes, it is, although people dealing with large sums, and having large command of money, rarely have much money, as their transactions will generally be in documents—cheques or bills—which they will deposit with their bankers, and the amount will be placed to their credit.

6054. Well, if there was a large accretion of gold in any one year in the United Kingdom, would not the greater part of that be deposited with the banker until wanted?—Well, if deposits were increased any banker would hold a larger amount of gold against these increased deposits, that is perfectly true; but he would only hold, say, one quarter or one fifth or less of the gold deposited, and the surplus, I maintain, must pass into general circulation among the people.

6055. (*The Chairman.*) That is what is rather puzzling me. I do not quite understand how there should be more in the hands of the people; because, if the habit, which certainly was acquired prior to 1858, of people paying all the money that they did not want for their immediate use into their bankers still continues, why should not any extra gold that came into the country have found its way into the hands of the bankers?—Well, I might put the question the other way. Where else is it to go? It must remain somewhere in this country because we are on the gold standard, we are assuming that every country has got a large amount of gold, and the bankers only hold a reserve against their liabilities, they hold only a fraction of the amount of their deposits.

6056. It may be that the true explanation is that more was used in the arts, or that there is some error in the calculation or in the returns?—You see we are assuming an addition of the quantity of gold that is not required in the arts.

6057. Then it may point to this that there is some error in the returns, in the figures?—That can scarcely be the case, as considering the production of gold there is no inherent improbability in the fact of our getting so much.

6058. I mean if you have to account for it either by saying that there is some error in the figures, or by saying that people have changed their habits, and keep large sums of money in their pockets or in their places of business, it may be that the former is rather the direction in which one would look for the explanation?—Well, I maintain that the habits of the people may be assumed to be the same, only when prices are high people must pay more money than when prices are low, and thus both those who have bank accounts and the very great number who have no bank accounts must use more money in the transactions where they pay actual money and not cheques. I do not say that there is no economy of money, more banks opening up and that sort of thing, still, as matter of fact, people carry about money in their pockets in proportion to the amounts they have to pay in money.

6059. (*Mr. Birch.*) All the evidence and all the experience I have had in connexion with banking is exactly the contrary, that there is less money carried about in the pockets of the people, and that most payments are now made by cheques. We pay cheques generally for everything, and we do not carry about money in our pockets, save for petty payments, as railway and cab fares, and such small calls upon one's

*Mr. J. Barr
Robertson.*

24 June 1887.

Mr. J. Barr
Robertson.

24 June 1887.

purse?—Still there are 37,000,000 of people to-day, all using more or less money. There is an increasing population, and what I maintain is this, that the banks simply take what gold they reasonably require; they do not want to hold large quantities of gold which bring no profit, that is beyond reasonable reserves against their liabilities. When the banks have a much larger amount of gold than is necessary to protect their liabilities it seems to me that their natural course must be to invest this surplus in first-class securities. I take the Bank of England. Notwithstanding the diminution in the stock of gold in the United Kingdom, the Bank of England continues to hold practically the same amount as before:—

£

Average amount of coin and bullion	
in Bank of England in 1874	- 22,294,000
" " " 1884	22,955,000
" " " June 1st, 1887	23,562,000

Notwithstanding the larger business being done in the world, the Bank of England has usually no more gold or silver; its capital is nearly at the same figure. Its deposits are not any greater, probably less sometimes, so there is the fact, the Bank of England itself has not any larger amount of gold in the vaults than it had 10 years ago.

6060. It is constantly varying, you know; we have had 36,000,000*l.* and 19,000,000*l.*?—Still, I am taking the average over long periods, showing there is no great variation in the normal supply, and particularly when the rate of discount is neither high nor low compared with the permanent rate of interest.

6061. (*The Chairman.*) Have you made any investigation of the deposits held by the banks from their customers during this time which covers the diminution of the gold in this country?—I have not.

6062. I suppose you would expect, would you not, during that time that the deposits would diminish?—Yes, they might diminish per head of the population; yes, on the whole I would expect them to diminish to some extent, though as the holders of securities and the investing classes generally have gained immensely in purchasing power it might be that deposits had not diminished per head of the population.

6063. (*Mr. Courtney.*) Supposing you divided the people roughly into two classes, private persons and merchants; in the course of business if merchants receive money, you would not say they put it in deposit in the bank, but they put it in the bank to draw against?—Yes, that is true.

6064. And no greater affluence of money would cause the result of more money being held by the merchants?—No, except in so far as higher prices would require a larger amount of money on hand for small payments.

6065. Well, then, do you think that the greater affluence of money has caused the result that the average amount kept in the purses of the private inhabitants of the kingdom has increased, or did increase, during those years 1866 to 1875?—It must be evident that in all cash transactions the money paid out of the pocket or the till must be greater when prices are high than when they are low. During the last 10 years the amount of money outside of the banks has undoubtedly diminished; that is, where the diminution falls.

6066. Whereas a man was content with carrying about on an average 4*l.* or 5*l.* in cash and drawing on his banker for anything extra, he would increase that 4*l.* or 5*l.* to 6*l.* or 7*l.*?—Yes, I think he would, during the period of increase in money.

6067. But what force or motive would induce him to do that; it is inconvenient to him to increase his money in his pocket?—If he has to pay higher prices for what he is purchasing, he must have more money in his pocket to pay higher prices for the same articles.

6068. You are not conscious yourself of having carried about more money with you?—No individual can judge on a point of that kind; it is hardly an individual question.

6069. (*The Chairman.*) Almost all wholesale trans-

actions are settled simply by cheque upon the banker?—That is perfectly true.

6070. No money passing, the whole of the transactions being settled by a system of set-off?—Now that was in existence, except probably in Liverpool and one or two towns of that nature, 20 years ago. No merchant who had a bank account held any more money practically than he does to-day. The mercantile business does not weigh in this question very much, the actual money in the counting houses of merchants being so very small in comparison to their business.

6071. That is what puzzles me as to this great increase in the gold held in this country during those years. I do not quite understand why it should have been held by people who usually did not hold money but paid it into the bank?—Well, where is the gold to go to; a certain amount is there; it is an automatic thing; it comes into the country; it will be paid into the bank; the bank will have to use it, or pile it up; and as no bank does keep it piled up beyond a limited amount, consequently it must pass out of the banks and be in the hands of the people. There is at any one time a certain amount of money in the banks, and a certain amount in circulation outside of the banks. In periods of what is called inflation of the currency, the percentage of money outside of the banks as compared with the amount in the banks will be greater than it was before inflation took place. On the other hand, when the currency is diminishing and contraction is taking place, the percentage of money outside of the banks as compared with the amount in the banks will be smaller than before contraction set in, and thus the diminution must come almost entirely out of the pockets of the people and out of the tills of merchants.

6072. When bankers receive money they lend it out to somebody else. Well, that somebody else pays it into his bank. It may remain out for a very short time, but it will come back into the bank?—There is an average business that a bank does, depending on its reserve. Of course, a large bank can do a large business, and a small bank can do only a small business.

6073. But if a bank lends a man 1,000*l.* for a mercantile purpose, the man who receives it pays it into his bank, and he will only draw it out as he wants it. If he pays it to some person doing work for him, that person will pay it again into his bank, therefore I do not quite understand how the money should be an addition to the circulation, that it should not show itself in any way in the reserves of the bank or the coin held by the bank.

6074. (*Mr. Courtney.*) I might, perhaps, add to the statement of the Chairman, that these loans and repayments are not accompanied by any movement of real money?—The loan of 1,000*l.* may or may not be accompanied by any movement of real money. It may be dealt with entirely by cheques, and these cheques may be paid into other banks. But the 1,000*l.* may be wanted entirely for wages, and if so every sovereign of the 1,000*l.* will be drawn out of the bank, and before it filters back to banks another 1,000*l.* may have been borrowed for the same purpose.

6075. (*Sir W. H. Houldsworth.*) Would not the increase of population account for it?—Well, of course, that has a considerable influence.

6076. That would be the same thing as individuals carrying more money, more individuals wanting money?—The increase of population would really account for a certain amount of contraction of money; more population requires more money.

6077. And that would really account for where this gold has gone to *pro tanto*?—It would certainly in proportion to the increase of population.

6078. Would it account for all?—I do not think the increased population from 1858 to 1875 would; while the increased population for the last 10 years would not account for more than 1,500,000*l.*, I think.

6079. (*The Chairman.*) You mean each year?—

Each year; it means so much more money than the previous period for the population alone.

6080. (*Sir W. H. Houldsworth.*) The increase of population would account for the gold between 1858 and 1875; now the population has increased by 4,000,000, from 28,000,000 to 32,000,000, I think. Would that take up the extra gain of gold in this country, do you think?—No, I do not think it would; but then the increased amount of gold set in motion a vast amount of new industries or extensions of then existing industries.

6081. Of course, in addition to the point you put just now, which is worth consideration, in addition to the 4,000,000 of increased population, those 4,000,000 are engaged in industrial work, therefore they would carry no more in their pockets, but would use more money in various forms of industry?—Yes, certainly.

6082. (*The Chairman.*) There would be a great deal of what is carried in the pocket and paid in wages, in silver, would there not?—Yes, no doubt.

6083. (*Mr. Courtney.*) The increase of gold in the period from 1858 to 1875 is 80,000,000*l.* in round numbers, is it not?—Yes, it is.

6084. That bears a proportion to the estimated stock beforehand of about 40 per cent.?—More than that; probably it is 100 per cent.

6085. Is altogether out of relation to the increase of the population?—Entirely.

6086. (*Mr. Barbour.*) Have you deducted from that 80,000,000*l.* whatever amount would probably be used in the arts?—No, I have not; I am giving a comparative statement of the quantity absorbed in this country.

6087. But if you deduct from that the amount supposed to be used in the arts and for ornaments, you would get a less addition to what you may call the money of the country?—Yes; certainly you would.

6088. (*The Chairman.*) Now to pass to the silver, during the 10 years 1866 to 1875 the net imports of silver you put at 12,714,000*l.*?—Yes, that is correct.

6089. And the succeeding 11 years the net imports you put at 2,000,000*l.* only?—Yes. Of course I may explain that I do not place any importance on silver for this reason. Silver, of course, is a limited article, coined in a limited quantity. It has comparatively little effect in this question of money, very little indeed. The gold, the full valued currency of the country, is what of course can be increased or decreased by imports or exports; the silver cannot be changed except by the wants of the people, either using less or using more, consequently you provide an automatic system at the Bank of England, by which the Bank is bound to give silver money for gold or gold for silver, so that silver cannot become either redundant or deficient.

6090. What rather strikes me about those silver statistics is this, that I should have expected an increase of the population, so far as it affected the currency, to have shown itself in an increase of the silver used, wages being paid to a large extent in silver, and the silver production having certainly increased rather than diminished during the last 10 years?—Yes; well, of course, you see the Master of the Mint coins what is demanded for money. This is a totally different question from the gold, which must be coined to any extent, as it may be offered. I only put the silver in to show you the figures. To me they are quite unimportant.

6091. (*Mr. Barbour.*) Do these figures of the imports of silver given by the Board of Trade include the lead ore which contains silver which may have been imported into this country?—Well, I am not sure on that point.

6092. Because if there has been a considerable import of ore containing silver, which is not shown as an import of silver, that may account for the apparent falling off in the imports of silver?—That may account for the deficiency, because the use of silver in this country must have amounted to a great deal more than 2,000,000*l.*, and it must have been imported;

but the figures I have taken were from the Statistical Abstract and the Board of Trade Returns.

6093. (*Mr. Birch.*) We produce a great deal of silver in lead mines here?—I have no statistics relating to that. Silver does not enter into the currency in any sense the same as gold. Although there were 20,000,000*l.* of silver imported we should still only add the insignificant amount which the Bank of England would demand at the Mint, so that although I have put these figures in they are the same as the gold figures in India; they do not figure in the currency at all, because the production of silver might be enormously increased without our coining a single additional shilling on that account. I do not look upon the statistics of silver in this country as having anything to do with the currency, because we only can add a limited quantity when it is wanted, whereas we are bound to take all the gold offered, and give up all the gold demanded.

6094. (*The Chairman.*) Passing to India, you deal with silver there, of course, as the principal metal?—Yes.

6095. In the 10 years from 1863-4 to 1872-3 you find the net imports of silver to be 78,182,000 tens of rupees?—Yes, that is the amount.

6096. That is an average of 7,818,000 tens of rupees a year?—Yes.

6097. And in the succeeding 10 years the net imports of silver are 59,116,000 tens of rupees, or an average gain per annum of 5,912,000 tens of rupees?—Yes, that is the case.

6098. Then after that date you give them year by year. In 1883-4, 6,406,000; 1884-5, 7,246,000; 1885-6, 11,607,000; and 1886-7, 7,156,000?—These are correct.

6099. Excepting 1885-86, which seems to have been unusually large, that gives something like 6,000,000 to 7,000,000 tens of rupees per annum?—Yes, that is correct. I print that to show the comparison between 7,818,000 tens of rupees per annum in these 10 years, and 6,538,000 tens of rupees per annum in the last 14 years, during which the production of silver has very largely increased, and where authorities have predicted that consequently India would be deluged with silver, and to show that silver has not gone there even in a quantity as large as it did in the 10 years 1863-4 to 1872-3. However it would certainly, in my opinion, have gone in as large quantity, and probably in larger quantity, but for the Bland Bill in 1878 in the United States.

6100. (*Mr. Birch.*) The exports from this country to India you have taken from the India Office returns?—From the India Office excepting the first 10 years, which are taken from the Report on the Depreciation of Silver of 1876.

6101. (*The Chairman.*) That seems to show that of the considerable increase in the production of silver during the last 10 years, compared with the earlier 10 years that you have taken, none of it has gone to India?—No, none of it has gone to India. It has not increased the money in silver countries, that is my point; because India is a country depending on imports and exports for the movements of silver the same as we are for gold. It does not produce anything of any importance in the way of silver. I take the last 14 years and show that the average is less than the 10 years from 1863-4 to 1872-3.

6102. Then you have also taken the gold imports into India in the 10 years 1863-4 to 1872-3 the net imports of gold into India were 52,057,000*l.*, giving a net average gain per annum of 5,206,000*l.*, and in the next 10 years the net imports were 19,761,000*l.*, giving a net average gain per annum of 1,976,000*l.*?—Yes.

6103. Then you have given each of the succeeding years 1883-4, 5,462,000*l.*; 1884-5, 4,672,000*l.*; 1885-6, 2,763,000*l.*; 1886-7, 2,172,000*l.*; showing a net average gain per annum for the 14 years, 1873-4 to 1886-7, of 2,488,000*l.*?—Yes, these figures are official, only I have changed them from rupees.

Mr. J. Barr
Robertson.

24 June 1887.

Mr. J. Barr
Robertson.

24 June 1887.

6104. (*Mr. Barbour.*) Are those pounds 10 rupees to the £?—Yes.

6105. (*The Chairman.*) The result that you bring out as regards the United Kingdom is that there was a gain in gold between 1866 and 1875 of 50,108,000*l.*?—Yes, that is correct.

6106. And that in the following 11 years, 1876 to 1886, there was a loss of 1,207,000*l.*?—Yes.

6107. Then you say the deficiency of gold in the 11 years, 1876–1886, as compared with the average per annum in the 10 years, 1866–1875, was 56,326,000*l.* By that, I suppose, you mean that if the same gain had gone on during those 11 years as had gone on during the previous 10 years, there would have been 56,326,000*l.* more gold in the country?—In this country, yes; that is the point.

6108. Then as regards India you make the silver gain in the 10 years, 1863–4 to 1872–3, 78,782,000 tens of rupees; and in the 14 years, 1873–4 to 1886–7, 91,551,000 tens of rupees?—Yes, these are correct.

6109. And that the addition in the last 14 years was 17,921,000 less than if it had progressed at the rate of the previous 10 years?—Yes, that is a correct statement.

6110. Then you have made an estimate of the amount of money in circulation in the United Kingdom and India?—Yes.

6111. Taking first the United Kingdom, you take the estimated amount of gold in England in 1876 at 122,368,000*l.*?—Yes, that is correct.

6112. That figure you get from the Report of the Committee on the Depreciation of Silver?—Yes, I do. On the first page of the Appendix.

6113. The Committee do not give it on authority?—It is supplied from the Bank of England; the names of the gentlemen who have drawn up the figures are given.

6114. (*Mr. Barbour.*) It is an estimate?—An estimate of course?—Still we can only go upon what we have. Of course I am not relying upon the accuracy of that. It is a fact to begin upon; the question then is what was added to that or subtracted.

6115. (*The Chairman.*) Does that estimated amount of gold in England include both bullion and coin?—I think it does. The coin and the stock in the Bank of England, consequently that is really coin and bullion as far the currency is concerned. It gives there the quantity of net imports in the year 1875, and that causes me to think that the net imports includes bullion. After all bullion in the Bank of England is potentially, and for all purposes of reserve, coin.

6116. I see it is headed "Estimate of Gold Coinage in Circulation in the United Kingdom." This apparently estimates the addition to the coinage between 1858 and 1872 at about 17,000,000*l.*, and from 1872 to the middle of 1876 at a further sum of 15,000,000*l.*?—Yes, I have not the document before me.

6117. The silver money in circulation you put at 20,000,000*l.* Where do you get that from?—That is also from the Report of the Committee on the Depreciation of Silver in 1876, 19,000,000*l.*, I have not changed that figure.

6118. Then notes in excess of gold in circulation 10,000,000*l.*; where do you get that?—I take that from the statement of the Bank of England—23,000,000*l.* of gold, 24,000,000*l.* of notes. The Bank of England practically has only a very small amount of notes issued without gold against them. The Scotch Banks have got about 3,000,000*l.*, the Irish Banks about 4,000,000*l.*, and Provincial Banks 1,000,000*l.* or 2,000,000*l.* There are not more than 10,000,000*l.* now, but they vary a great deal. The Bank of England can by law issue 15,000,000*l.* without any gold being held against this amount. I am taking this as the statement now, there is not much more than 10,000,000*l.* of notes in circulation for which no gold is held.

6119. Then you deduct 26,400,000*l.* for 11 years' consumption in the arts, &c., and loss by net exports

1,200,000*l.* You assume that during the last 11 years there has been something like 2,500,000*l.* consumed annually in the arts?—That statement is taken from the Appendix to the Third Report of the Commission on the Depression of Trade.

6120. That 2,500,000*l.* of coin that was in circulation has been converted into articles of ornament and jewellery?—That is so. It is 2,400,000*l.* that is put in the Report of the Commission on the Depression of Trade, from Dr. Soetbeer's calculation.

6121. (*Mr. Barbour.*) Do you take it all to be coin or bullion?—I am dealing with the quantity merely of gold, and I do not place any importance on the distinction between coin and bullion, because for currency purposes they are interchangeable.

6122. (*The Chairman.*) If your figures are correct it must have been from actual coin, because we were actually exporting gold from this country, and therefore, it must, according to you, have come out of the coinage?—No, not necessarily, because we were importing gold bullion all the time, in fact we are always doing so, but we were exporting more gold coin or bullion than we were importing of gold. Thus we are consuming our stock of gold money.

6123. Then you arrive at the conclusion that the total money in circulation is now 124,768,000*l.*, so that there is actually less gold in circulation now than there was in 1876?—Of course there must be less because we have consumed 24,000,000*l.* at least in 10 years in the arts, and we have received none. In 11 years we have consumed 26,400,000*l.* on that estimate. Of course, you understand these figures are not estimates of mine, but I am showing the movement on some general basis. I took this figure of 122,368,000*l.* from the report because I thought it was coin and bullion. I see I am mistaken on that point. Still that does not alter the fact that there is some very wide ratio. There are 26,400,000*l.* that we did not get in 11 years; whether the stock of gold in 1876 was 122,000,000*l.*, or 135,000,000*l.*, which would be a fair estimate including bullion, and we have taken out 26,000,000*l.* sterling in the last 11 years.

6124. (*Sir T. Farrer.*) The quantity consumed in the arts is little more than a guess, I think, is it not?—I suppose the Master of the Mint could form a very close opinion on that point.

6125. (*Mr. Fremantle.*) Have you ever seen any estimate made by the Mint or any other public Department in this country?—I have not seen any estimate from the Mint; I have been away for the last 13 months, and only came back the other day, and have not had all the time I should have wished to prepare materials for this examination. I took this from the Report on the Depression of Trade, in Mr. Palgrave's statistics; and the United States Government make an estimate also which, of course, would not be altogether reliable for our purpose, but that estimate is 2,300,000*l.* per annum as the amount consumed in the arts in the United Kingdom.

6126. But in Mr. Palgrave's memorandum, I think he said that it was very difficult to form any opinion as to the consumption of the precious metals in the arts?—Well, he gives Dr. Soetbeer's figures in a table for this country.

6127. In this country he said it was next to impossible?—Well, of course I have simply given that figure as being one that can be criticised by those who put it forward. That does not get rid of the fact that there are 26,000,000*l.*, or some very large amount, to be accounted for in 11 years.

6128. (*The Chairman.*) But would you not expect, if there was this scarcity of gold, that the amount which was used for the purposes of the arts, would be rather diminished?—No; the only way in which it might be diminished would be the fact that people could not afford so much, and it is evident that the investing classes and those having fixed incomes have been both absolutely and relatively enriched by the contraction of the currency. On the other hand, we have an increasing population and a greater tendency

probably for poorer people to use gold instead of silver in ornament. I think, perhaps, the additional tendency to use gold would be counterbalanced by any diminution in the resources of the people to purchase gold ornaments.

6129. Well, then, you estimate that if the gold during the last 11 years had increased in this country to the same extent as it did in the previous period, that there ought to have been in circulation 181,000,000*l.* of money, or would have been, instead of 124,000,000*l.*?—Yes, these are the figures. I may remark, of course, that if that return I started from, 122,368,000*l.*, is wrong, then, of course, it does not vitiate any other figure. This is a question now of additions or diminutions in the stock. I take 122,368,000*l.* as a starting-point. Now, supposing you had 13,000,000*l.* more, making it 135,000,000*l.*, which is perhaps an approximate estimate of the stock of gold coin and bullion in 1876, you still would want much more than 56,000,000*l.* to keep the same relative amount of increase as in the previous 10 years. It does not affect that part of it.

6130. It does not affect it except so far as the increased or diminished per-centage, as compared with the pre-existing stock, may be important?—Exactly.

6131. (*Mr. Birch.*) But how do you imagine that that gold would have come? Gold does not pour down upon us, how would it have come?—It would have come in through the Bank of England.

6132. How would it have come at any period? People would not have sent us gold for nothing; you say we ought to have had it, but surely we ought not to have had it, unless we sent goods or something, commodities to represent it?—That is perfectly true, but commodities will go to represent it. The foreign exchanges will cause the gold to be sent, otherwise gold would fall to a discount in gold money. Supposing now anyone has imported 1,000,000*l.* sterling in gold bullion from some country. He goes to the Bank of England with it and receives for it British legal tender money or its value at 3*l.* 17*s.* 9*d.* per standard ounce. He does not ask if anybody is sending goods or not, he goes and gets the notes or the gold. The Bank of England is bound to take all the gold offered, and give up all the gold demanded, without any choice. I am talking generally; my argument is this, that if our supplies of gold were in any sense normal in the previous 10 years, then we are 56,000,000*l.* short in the last 11 years, and if we were keeping up prices to any just level during the period 1866 to 1875, then we are at a very unjust level now. It is a comparative statement; I am not relying on the figures I start from at all, it is a comparison of changes in the quantity of the stock of gold based on the Board of Trade returns.

6133. (*The Chairman.*) Then you say: "As, however, instead of having 181,000,000*l.* of money in circulation in 1887, we have only about 125,000,000*l.*, we need not be surprised that average prices have fallen from 30 to 35 per cent., seeing that the supply of money that would have been necessary to keep up prices is deficient to the extent of 56,000,000*l.*, which is equivalent to a diminution "in the volume of money of 31 per cent." Now is it your view that there is a direct relation between the volume of money and the price of commodities generally?—It is, certainly.

6134. And that as you contract or expand the volume of the currency prices would rise or fall?—Certainly.

6135. I should like you to explain how in your view that operation comes about?—I will give you an illustration. I do not happen to have the document here, but I know the facts. In 1861 the United States suspended specie payments and adopted the Legal Tender Act and began to issue greenbacks. Now in the debates in Congress at that time there were not more than three or four men out of 300 who believed but what the United States could issue any quantity of greenbacks, and that they still would remain at par

in gold, because the United States signature was attached to them. Well, then, they found at the end of a very brief period that the greenbacks began to fall to a discount in gold.

6136. That is to say, because people had not that perfect confidence in the United States?—The greenbacks were legal tender, the same as gold.

6137. In the United States, but nowhere out of them?—Yes, but if they had issued a limited amount of legal tender paper, gold could not have gone to a premium in greenbacks. That is to say, the greenback went on falling in purchasing power as compared with gold, until for 100 dollars in gold you could get 280 dollars in greenbacks. Now, then, that was due to the issue of more than one and half times the amount of money in the United States that could be kept at par in gold. Instead of having, we will say, a basis of 100 they had a basis of 280. That is an illustration of the exact relation between a much larger amount of money than can be kept at par on the gold standard, and a volume of money of say gold, silver, and paper such as we have, kept at the gold standard.

6138. Yes, that is an illustration of what happens from an excessive issue of inconvertible notes and consequent depreciation of currency; but I should like you to explain, where you have no such feature, where you are dealing simply with a particular standard, such as gold, how the diminution in the volume of gold that there is in this country affects the prices?—Well, in my opinion, the withdrawal of gold comes practically from the money in the hands of the people, that is to say, by far the greater portion of it, and thus prices are correspondingly lowered.

6139. No; but let me put this illustration to you. Supposing that to-day the deposits in the banks or the money which the public have lent to their bankers, for that is the legal relation between them, is greater than it was 10 years ago, so that the amount of cheques which can be drawn upon the bankers is larger than the amount of cheques which could have been drawn 10 years ago. People pay for what they buy by means of a cheque upon their banker, and what they are willing to give is regulated by the balance which they have at their bankers or can put there. Now supposing that that is greater even though there be less gold in the country, why should prices go down?—Well, of course, the quantity of deposits naturally depends on the number of people who have money to deposit. There is an element in this thing, I think, that is not perfectly clear. The money is not the property of the country; it is merely a standard. I will take an illustration. You can carry on all the business of this country with 125,000*l.* if you will divide it small enough; if you will divide it into millionths of a sovereign, each millionth will represent in that system of money about the same ratio to the whole that a farthing now does to the whole. You are going, in my opinion, on an impression that if a man has 40,000*l.* that somehow it is in the bank. He may not have 1,000*l.* in the bank, though he has 40,000*l.* worth of property. This is a mere standard; you may as well speak of the goods in the country, and the yardsticks in the country. Money as a measure is not altogether analogous to a yardstick as a measure, but there is some analogy between the two. A yardstick will measure any quantity of goods, but the goods must be in existence. Money is simply a something in which the property is valued. At the present moment in England there is probably not one-fiftieth part of the money in existence that there is of wealth, probably not one-hundredth part; yet this fractional amount distributes all the wealth, and all values are rated in terms of it.

6140. Quite so; but what I want you to explain is if this is the only function of money, how comes it that 10 per cent. contraction in the amount of that meta will produce 10 per cent. contraction in prices of all the commodities that are measured by it?—Let me take an illustration. I will suppose you have a dozen commodities represented by 100*l.* each, that is 1,200*l.*

*Mr. J. Barr
Robertson.*

24 June 1887.

Mr. J. Barr
Robertson.

24 June 1887.

Well, I will suppose now that a number of gentlemen really have a certain amount of money with which to purchase these exact commodities, let us suppose 1,200*l*. We will say that by some process the money is reduced by 10 per cent. That reduces the 1,200*l*. to 1,080*l*., and how are you to get prices up to 1,200*l*. if you have only 1,080*l*. to pay with; how are you to do it?

6141. There can be no doubt if the transactions of the world were carried on by the exchange of the precious metal for the commodities, the diminution of the precious metal must in the same proportion affect the prices of the commodities. But when you suggest that the same operation now goes on, you allow no effect to all the banking expedients, because you say the state of things is now precisely the same as if there were no banking expedients, and the prices are in the same way affected by the contraction or expansion of the precious metals?—In the way of banking expedients from 1866 to 1875 they were probably nearly as extended for all mercantile purposes as they are to-day. Still that is an important subject for consideration, and perfectly reliable information ought to be obtainable regarding it from bankers and others.

6142. I do not think you catch my point. Supposing the banking expedients did exist during that time as much as they do now; they existed then to a large extent, but when you say that prices will vary precisely as the expansion or contraction of the precious metals, you allow nothing at any time for the effect of banking expedients, because you say that the process now is precisely the same as it was if there were no banking expedients, but every transaction were a direct exchange of the precious metal for the commodity?—No, I am not going on that ground, as I am confining myself to the enormous contraction in the volume of money, and to the enormous concurrent fall in prices as accounted for to the extent of about 30 per cent. by the diminished currency, while I regard banking expedients, the varying numbers of employed and unemployed, the increase of population as disturbing elements of secondary importance, while in the present case they offset each other to a great extent. I am going on the ground that we have, assuming a large measure, we will say 10,000,000,000*l*. worth of property in the country. Well, what I maintain is that we do all the exchanges on that with, let us suppose, 125,000,000*l*. of money, we can do it with 12,000,000*l*., one-tenth part of that, if we will only contract the currency down to that amount and make the divisions of money small enough.

6143. But how does the amount of currency, which happens to be in circulation on any particular day or in any year, affect the value of all the commodities which exist and which are measured by money, though people may not be exchanging them, or dealing with them, at the time?—There is a certain number of transactions in the country performed by actual money. Now all this banking in London to my mind has nothing to do with the currency at all, simply because it is done without any money. How can the little money in the bank here—comparatively speaking nearly all locked up permanently—take the Bank of England balance; it does not vary a million or two in ten years. Take the balance of other banks, they are not changing at all. Now what I maintain is this, that there is a certain amount of transactions all over the country done by actual money, retail transactions done by what people carry in their pockets or have in their tills and offices, and payments of wages, and that sort of thing. If you have a certain quantity of money at a given time, then you can distribute that money all over these transactions and pay a certain price, you must pay a certain price. Now then, if we suppose that at that given time there was 10 per cent. less money available while the same transactions in actual money were to be carried out, it is perfectly certain that these transactions can only be carried out if the prices are 10 per cent. lower than in the former case. The whole principle of money goes on the ground that whatever money is in the country will be

distributed over the whole transactions of the country in actual money.

6144. But are not those transactions in which money is actually used, namely, retail transactions and the payment of wages, just those in which prices have been least affected?—That is perfectly true, they are those in which prices have been most slowly affected.

6145. Then on your hypothesis ought not they to be those which ought to have been most and earliest affected, and the wholesale prices to have been later and less affected?—The wholesale prices of most commodities are changing every day. Supply and demand are surprisingly active in producing daily and hourly changes of price, and speculation is also an important element in making wholesale prices. Retail prices follow these changes very slowly, and only when some, not merely temporary, rise or fall takes place in prices per pound, per hundredweight, or per ton, sufficient to enable changes of retail prices per ounce, 4 ounces, 8 ounces, or per pound, or in cheaper articles per hundredweight or per ton. If retail prices continue high while the volume of money is contracting the demand of the public, and thus of the retail dealers, will fall off, and wholesale prices will fall. If a high wholesale price is due to speculation and there is not a corresponding volume of money to sustain that price, the price will, as soon as the abnormal demand of the speculators ceases, fall to a lower level, because the quantity of money will not admit of such a high range of prices. Now I have said before that there are conventional prices, high in wealthy neighbourhoods, low in poor neighbourhoods; consequently there are certain wholesale prices that are determined by the prices that the people have the money to pay in their retail purchases, and consequently everything tends to be affected by the quantity of money that there is to cover these retail transactions and the current money transactions wherever money is used. In fact, how can it be otherwise?

6146. Well, it might be otherwise in this way, that some people think that the chief function of money is as a measure of the relative value of commodities one against another?—It serves as a standard of measure in that sense, but it only serves thus by the total available money being spread over the actual transactions performed by money. It is not an independent and unvarying measure, the measure consists in the changing ratio between the available money and the transactions actually carried out by that money. So that in transactions with actual money or without it, money is a measure of value, but it becomes a measure of value only by being a medium of exchange in transactions in which actual money is used.

6147. (*Sir T. Farrer.*) Do retail prices as a matter of fact follow wholesale prices, or do wholesale prices follow retail prices?—Well, I do not say that retail prices follow closely, but I will say this. Take the case of a baker in a time of contraction of currency, after a time the 4 lb. loaf falls from 6*d*. to 5½*d*. or 5*d*., but I do not say that it immediately accommodates itself. So far as money is concerned retail prices follow wholesale prices; but it is the inability of the public to find the money to pay high prices, the amount of money not being in existence, that causes a diminution in demand and wholesale prices to fall to a lower level, so that the same amount of goods as formerly may be paid for with the smaller amount of money. So far as supply and demand of commodities on markets are concerned, with which I am not dealing at all, retail prices follow wholesale prices; but so far as the money question is concerned any change must come through a money source.

6148. Then for the effect of money upon prices we must look to retail transactions?—I think so, because though there is only one standard of wholesale prices, while retail prices for the same articles vary according to the locality of shops and other conditions, yet retail transactions are those in which money is actually used, and the demand of those who actually pay money is the final determining element in wholesale

prices, though other causes may lead to temporary changes in prices. Therefore the average wholesale prices of all the principal commodities as modified by their relative quantities, reduced to a single number, at stated intervals, will give the most accurate idea of the rise or fall of average prices produced by changes in the volume of money and by all other disturbing causes.

6149. (*The Chairman.*) You say average prices have fallen so much; if the fall of prices results from the cause that you have suggested, ought there not to have been a certain uniformity in its effect upon all commodities?—Certainly there ought to have been a uniform effect.

6150. But in regard to a considerable number of commodities there has been no fall, and in regard to some others there has been a rise?—I am not dealing with the supply and demand of commodities, changes in quantity or changes of taste, causing people to demand one thing to-day and another thing 12 months hence—I am dealing with this simply as a question of quantity of money and my contention is that you cannot reduce the quantity of money without reducing prices. In the struggle for keeping up a certain average of prices some goods will rise and some will fall from day to day. If some rise out of relation to others it is because there is some additional demand or some diminished supply, and conversely in case of a fall. I am not dealing with that question.

6151. But some witnesses have put this case before us. There has been this fall in prices; therefore they reason *a posteriori* that it has resulted from the diminished supply of gold which was coincident with it. You reason *a priori* that you would expect a diminished supply of gold to produce a fall of prices?—Precisely.

6152. And, therefore, such fall as there has been you attribute on that account to it?—There may be other slight temporary causes, but this is the chief if not the sole permanent cause, and it can be estimated in a rough way. Of course increase of population must be considered and allowed for.

6153. In taking your 181,000,000*l.* you have assumed an increase of gold year by year corresponding with that which took place during the previous period?—Yes.

6154. Well, but supposing there was no increase at all, but the quantity of gold in circulation remained absolutely constant except as regards the demand arising from an increase of population, why should prices be affected at all on your theory?—They would not be affected on my theory; average prices would not.

6155. But, then, according to your view, if the quantity of gold had increased as much during the last 10 years as during the previous period, prices ought considerably to have increased?—Well, perhaps not, because, you see, we had increased populations, and we were reaching out to enterprises in all directions in the world also.

6156. Yes; but from 1876 to 1886 you have not an increase of population that would correspond to the increase of 28,000,000*l.* on 122,000,000*l.*, which is about 15 or 16 per cent. You have said that if we had had that continued supply the total amount which ought to have been in circulation is 181,000,000*l.* Instead of that we have only 125,000,000*l.*, therefore we need not be surprised that average prices have fallen 30 to 35 per cent. because the circulation has diminished by 31 per cent. below what it would have been in that case. But surely in that case there ought to have been a rise in prices on your theory?—No, because we take 26,400,000*l.* for the arts out of the current gold, and, taking 122,000,000*l.* as the stock of gold in 1876, and adding to that 20,000,000*l.* of silver money and 10,000,000*l.* of uncovered notes, we have a total amount of money in circulation in 1876 of about 152,000,000*l.*

6157. You have deducted what is used in the arts?—Yes; if you begin at this fixed figure of 122,000,000*l.* of gold, and add the amount which would have been

over and above the supply for the arts, and add the silver money and the notes in circulation, it brings it up to 181,000,000*l.*

6158. That 181,000,000*l.* is the amount that you would have had in circulation?—Yes.

6159. But if you had that in circulation you would have something like 15 or 16 per cent. more gold, and prices ought to have been higher?—They might have been; the probability is that they would not have been higher, because the probability is that we would have had a vast number more people employed to-day than we have now.

6160. According to your theory, how could prices help being higher—putting the increase of population aside,—if you had 181,000,000*l.* of currency in 1887 as compared with 152,000,000*l.* in 1876, your theory is that prices must have been higher; that the two are bound together so that they could not help being higher?—That does not follow. Excuse me one moment. The increase of population from 1874 to 1887 was 4,500,000, and that is about 13 per cent. We have had 13 per cent. increase of population from 1874 to 1887. It is a little longer period; it is 14 years. Of course, you see another point is this. In all probability more people would be employed, and they would be consuming more commodities; that is to be kept in view.

6161. There, of course, you are bringing a fresh element in?—I am. The difficulty is to keep it out when you ask me to consider the case completely. I have not considered all the elements, as my desire has been to consider only the monetary elements, which are the most important by far, and to leave to others to bring forward facts of other classes entering into a complete and final judgment as to all the causes which have contributed to the fall in prices. The population is, however, a considerable element in this case.

6162. (*Mr. Birch.*) In production also?—Yes.

6163. (*The Chairman.*) What I was calling your attention to is this. It is not wonderful that average prices have fallen from 30 to 35 per cent., seeing that the supply of money that would have been necessary to keep up prices is deficient to the extent of 56,000,000*l.*, which is equivalent to a diminution in the volume of money of 31 per cent. Now I do not understand quite how you say that 56,000,000*l.* was necessary to keep up prices to the extent that they were in 1876, seeing that that is more than the proportionate increase which is required by the increase of population?—Well, of course, I am arguing on the general point, that if we were having a fair supply of gold during that period between 1866 and 1875, then we have had to put up with a very enormous diminution in the last 11 years. The following figures, calculated from the index numbers of the *Economist*, will show that even with a gain of 50,000,000*l.* of gold from 1866 to 1875, average prices were lower than in the eight years 1858 to 1865, showing that 50,000,000*l.* were not enough to keep up prices to the level of the eight years 1858 to 1865:—

	Average Index Number.
8 years, 1858 to 1865 -	3,038
10 years, 1866 to 1875 -	2,877
10 years, 1876 to 1885 -	2,419
1886 - - - -	2,023
1887 - - - -	2,059

6164. Now passing to India. The estimated amount of money in circulation in India in 1875 was about 180,000,000 tens of rupees?—Yes.

6165. The deficiency in net imports of silver was 17,921,000 tens of rupees, which leaves 162,079,000 tens of rupees?—Yes.

6166. Now by the deficiency in net imports in silver you mean that there was so much less imported than would have been imported if the previous rate of import had gone on?—Yes.

6167. You say this is roughly about 9 per cent. of diminution, and Mr. O'Connor's estimate of the fall of

Mr. J. Barr
Robertson.

24 June 1887.

Mr. J. Barr
Robertson.
24 June 1887.

Indian prices is about 10 per cent., though of course this is only approximate. But it is not 9 per cent. of actual diminution, there was actually a large increase of the currency; it is only 9 per cent. less than it would have been if the large increase that had been going on before had continued?—That is what I mean, but still in the face of large amounts of silver being added to the currency, Indian prices did not rise, because there was not enough added to keep up prices. If you will look back to the previous page of my memorandum you will see that during the last three years the import of silver into India has increased beyond the average. It has gone to 8,000,000 tens of rupees. That is higher than the average of the previous ten years, but prices have not risen.

6168. According to your theory they ought to have risen, ought they not?—Population comes in and the general development of railways, and so on, demanding more money. I want to show, nevertheless, taking even this mode of comparison, that it comes nearly exactly to Mr. O'Connor's estimate of the actual fall in prices.

6169. I think the evidence before us shows that prices were stationary and had not fallen?—Well, if you look at the note issued by the Indian Government you will see that it shows distinctly that there has been 10 per cent. of fall of prices in India, and a further fall of 20 per cent. in the Exchange.

6170. Is that 10 per cent. of silver prices?—In silver prices, and 20 per cent. more between silver prices and gold prices.

6171. Between what dates?—Between 1873 and 1886. Since the ratio of silver has changed, within the last 12 years.

6172. Then you suggest that if you take 100 as representing the circulation in the United Kingdom and India in the period 1870–4, in 1887 it was reduced to 69 in the United Kingdom, and to 91 in India?—Yes, that is what these figures that I have given would show.

6173. Is it correct to say that in one case 100 and in the other 91 fairly represents the facts when there was actually more in the later period than the former, unless you say that the increase was not proportionate to the increase in the population?—I take 100 as a standard of quantity, and contend that the figures of the net imports of silver into India show that there was not enough to maintain 100, but that there was enough to keep the standard at 91, while the Indian Government declares that prices during the period have fallen from a standard of 100 to a standard of 90.

6174. But India did get the silver, though not so much as she did before?—17,000,000 tens of rupees less, I show; this would account for 9 per cent. of a fall if these figures are correct. I am stating the official figure when I state this 17,000,000 tens of rupees of a deficiency.

6175. (*Sir T. Farrer.*) Surely in making any estimate of this sort you ought to take an estimate not of what has come into a country during a certain period of 10 years, and then another period of 10 years, but what has been the accumulated currency of the country, and what has been the relation to it of the amounts added to it from time to time?—The difficulty, of course, as you will readily see, is to find these statistics. I do not control the British Government nor the Government of India, I only take what they give me, and it is very singular that both Governments should entirely neglect such important questions as the statistics of money and of the precious metals. According to the Report of the Committee on the Depreciation of Silver, it was estimated that 180,000,000 tens of rupees were in the currency of India in 1875 or about that time. The official figures show that in proportion to the period 10 years previously, they did not get the same supply, but they got 17,000,000 tens of rupees less.

6176. (*The Chairman.*) But they were adding it to a pre-existing larger stock?—If I have been adding rapidly to my fortune for several years, and then go

on adding less rapidly, I still am adding to my fortune, and my fortune is larger than it was before?—That is quite true, but if you are adding less rapidly, you are adding a less per-centage. You are diminishing relatively, because, mind you, you are consuming it at the same time. The population is expanding, so that you are really providing additional wants for this money. It might very well be that India did not get enough silver to keep up prices from 1866 to 1875, but comparatively it got less from 1873–4 to 1886–7 than from 1863–4 to 1872–3.

6177. (*Mr. Barbour.*) May I ask if you know how that estimate of 180,000,000 of tens of rupees as the amount of money in circulation in India was obtained, because I may say that, judging from my experience, I think it would be extremely difficult to get even a roughly approximate figure of the circulation in India?—I simply took these official figures as a basis of argument. That is the figure given, I think, by Professor Fawcett.

6178. (*Sir T. Farrer.*) Is it stated on the authority of the Committee on the Depreciation of Silver in 1876? Is it in the report?—I have not looked at it for a long time. These are figures I had previously taken from the Report, where they will be found.

6179. (*The Chairman.*) So that your view is that the quantity of money in England is deficient now as compared with the period of 1870–74 by 31 per cent.?—Yes, that is the point.

6180. (*Sir T. Farrer.*) May I ask you why you took those particular figures of your earlier decade, and why you did not go back, say, to 1820 or the beginning of the century?—Well, of course modern society is on a certain level of consumption, a certain level of wealth, and to go back to 1820 would be to deal with small populations and numerous combinations which do not exist now at all. I am trying rather to get very active periods of life in both cases sufficiently near together, so that the conditions do not vary to any very great extent. And, further, I desire to show immensely varying supplies of gold, which make that metal very unsuited to be a standard of value.

6181. Yes, but you began just at the period when there was a great influx of gold?—Well, that is where the Report on the Depreciation of Silver happens to begin; I just took their figures where they started. I put these eight years to show how the figures in that period stood, but the two tens is what I am comparing, not that eight.

6182. (*The Chairman.*) Your view is that inasmuch as this large sum is annually being taken from the coinage of gold in England for the arts, there must be a further diminution of the currency, and consequently a fall of prices?—Certainly.

6183. Supposing that there was an increase of gold imported into England, and that it was not kept by individuals, but was paid into their bankers, and so there was an increase of gold in the reserve of the Bank of England, what would be the effect of that?—Only this, the increase of gold to be retained by the Bank of England would only bear a certain relation to deposits. They have practically a fixed proportion which the gold must bear to their liabilities. If they increase their deposits of gold to a certain point, they would not themselves keep the whole of the gold on deposit; probably about one third of it, 35 to 40 per cent. they would keep on deposit. They have nothing to do with the balance of gold over and above their normal per-centage of reserve. If there was a large amount of it and they could not lend it, they would lower the rate of discount and drive it abroad.

6184. Then it would go to other countries, and what would come in its place?—Of course goods might come, securities might come.

6185. In that case it leaves the country?—Yes, certainly.

6186. Then when that operation has taken place there would be less currency in the country?—Well, there would not be less currency, because this really

was something that could not pass into the currency, because we are assuming that it could only pass into the currency if every country with a gold currency was getting a similar supply.

6187. Well, but in currency do you include only that which is actually coined, or the bullion which can be coined, as well as that in circulation?—I include that also, of course.

6188. You include that; well, of course it would diminish the currency of the country?—It would not touch the effective currency of the country in my opinion at all.

6189. There would be less gold in this country than there was before?—But then we were going to get too much. I will assume a figure. I will suppose that there was 5,000,000*l.* sterling of gold came into the country. I will suppose that other countries were not receiving a similar amount so as to keep up the gold standard in all countries. 5,000,000*l.* sterling comes into the Bank of England. It becomes a liability. They may say, "We have only to hold 1,750,000*l.* against this 5,000,000*l.* sterling," and they can deal with this 3,250,000*l.* They can deal with it by lowering the rate of discount, because they feel that they want to drive it away. It had not gone into the currency, it had gone into the bank vaults because the bank could not refuse it, and as it could not be absorbed into the currency it had to be exported. If they cannot lend the 3,250,000*l.*, they must get rid of the 5,000,000*l.*, and this they do by lowering the rate of discount and causing it to be exported, so that importation of gold which went into the Bank of England, and could not be used by the Bank but had to be exported under the action of a low rate of discount, did not really touch the effective currency of the country.

6190. According to that, would not you expect a period when you had a superabundance of gold to be marked by a low rate of discount, and a period when you were lacking gold to be marked by a high rate of discount?—I would expect that to occur.

6191. If you look at the rate of discount during the periods you speak of, precisely the opposite is the case?—The average bank rate of discount in 1849, when gold from California was first imported, was 3 per cent., in 1850 it was 2½, in 1851 it was 3, in 1852 it was 2, and in 1853 it was 3½. No such low rates for five years have ever ruled at the Bank. When the currency is being contracted the process is slow, and need not therefore be shown by a conspicuously high rate of discount. Indeed contraction might very well take place without any very perceptible change in the rate of discount. Sudden withdrawals of gold from the banks and from circulation would be inevitably attended by a rise in the rate of discount. It must also be borne in mind that a contracting currency paralyses trade, throws artisans out of employment, and diminishes the demand for discounts. Further, there is a tendency to a lower rate of interest as civilisation progresses, owing to the accumulation of wealth and the greater security of institutions.

6192. Then we have had a great deal too little during the last 10 years, and the rate of interest has been a great deal too low?—It has been below the average of the previous 10 years, not much, except for temporary purposes. But in considering the rate of discount as affected by import or export of gold, it is necessary to take into account the whole of the imports and exports, and not merely the balance between the two. The figures show that the total imports and exports from 1866 to 1875 amounted to 343,200,000*l.*, and from 1876 to 1886, 294,300,000*l.*, so the average rate of discount would not be very materially affected. But the rate of discount has nothing to do with this question of the volume of money distributed over a country. The rate of discount is a temporary question, varying every day, and depends on the quantity of money available at any time for loans, but not in the volume of the circulation over the country.

6193. According to the view you have suggested, it is the one thing which regulated what amount

remained in this country or came into the country at any time?—Prices regulate the quantity that can be absorbed in the country. If there is gold coming into the country and going into other gold countries, that means that you are increasing the quantity of the gold standard in all gold countries. In that case the gold will have a temporary effect on the rate of discount, but the gold once distributed over the circulation and the reserves of the banks, its effect on the rate of discount has entirely ceased, that is when prices have become adjusted to the new gold. If, however, the gold standard is not increasing and we are drawing gold from Paris or New York, as soon as some material importation of gold is made, the Bank of England lowers its rate and out it will flow; if, however, too much flows out, the bank raises its rate and brings the necessary supply back.

6194. (*Sir T. Farrer.*) But do you not say that the quantity of gold regulates prices?—The quantity of money regulates prices; gold being the standard, therefore practically I say gold regulates prices. Gold regulates prices, though paper money and silver also help to make up the gold standard.

6195. (*The Chairman.*) Now with regard to the deficiency of money in the gold countries in 1887, compared to what it was in England during the 10 years 1866–1875, what have you to say?—Well, you see, that in the 11 years 1876 to 1886, the United States have absorbed about 119,000,000*l.* sterling of gold. But what it gained in these last 11 years was 37,000,000*l.* by net import and 82,000,000*l.* by production. Now, but for the fact that America resumed specie payments, we would have had in England here a large amount of this gold.

6196. Have you any estimate of what it was before this addition was made of 119,000,000*l.*?—At the moment I cannot say. There could not have been more than 20,000,000*l.* or 30,000,000*l.* sterling at the outside.

6197. (*Mr. Birch.*) You said just now that if it had not been for what happened in America a very large amount of that gold would have come to the Bank of England?—Yes.

6198. Then you said directly the Bank of England got a certain amount of gold it took means to get rid of it?—These statements are perfectly reconcilable. I maintain this that, if you have a large amount of gold being produced in the world from new mines like California and Australia, every gold country must come to the gold level. England, France, the United States, and other gold standard countries must take the gold, otherwise you would have in England, France, and other countries gold at a large premium, say 10, 15, or 20 per cent. as compared with gold in the country of the new mines, or more properly it would in the latter be at a large discount. That is an impossibility, except very temporarily and in places remote from mints and refiners of gold, consequently I say that when gold comes in large enough quantity to enter into the currencies of the different gold countries, then the Bank of England does not drive it abroad, indeed it cannot, and for this reason, all prices rise from the effect of the gold, and the gold must remain for this purpose of keeping up these higher prices. But when 1,000,000*l.* or 2,000,000*l.* comes over to the Bank of England or 3,000,000*l.* or 4,000,000*l.*, and there is no demand for it to pass into circulation, prices being stationary or declining, then the gold standard is not being increased over the world, the gold cannot be employed, and it becomes necessary to drive it out by lowering the rate of discount.

6199. (*The Chairman.*) Then there was silver absorbed during those 11 years in the United States to the amount of 74,800,000*l.*?—They are the actual figures of the United States, the net imports and the production. I am not dealing now with any mere estimate, I am dealing with the actual figures as given in the official returns. There is 119,000,000*l.* of gold which is what they have absorbed. I will suppose that they would have probably con-

*Mr. J. Barr
Robertson.*

24 June 1887.

Mr. J. Barr
Robertson.

24 June 1887.

sumed 25,000,000*l.*, probably 30,000,000*l.* sterling in the arts in the time, but there would have been 89,000,000*l.* sterling of gold, which had they not resumed specie payments they would not have required or only a small amount of it. They would have had no use for that, and it naturally would have come to England and the other gold standard countries. The previous 10 years they had no use for the gold, except in California and for paying the interest on their debt, and we got it, France got it, and the other gold countries got it. Now America not only absorbed all its own production in the 11 years, 80,000,000*l.* sterling, but it imported 37,000,000*l.* sterling from ourselves, France, Italy, and other countries, wherever the gold was to be found; whereas 10 years ago the United States made no such demand; and Germany made no such demand. I take these two figures of Germany and the United States. Taking the German addition, there is alone a demand of 80,000,000*l.* sterling, and adding that to the demand of the United States of 119,000,000*l.*, you find that Germany and the United States have absorbed 200,000,000*l.* sterling that otherwise would have been largely available for, and must have gone into, the gold coinages of the gold countries.

6200. But taking the United States from 1875 to 1885 there has been a very large increase in the volume of the currency?—A very large increase.

6201. And there has been a large fall in prices between 1875 and 1885. How do you account for that on your theory?—The fact is this, they have a very largely increasing population. In England and the Continent of Europe we are dealing with a population with a fair amount of natural increase and with a diminution by emigration, they are dealing with a population with a very large amount of natural increase, which is greatly increased by immigration. Then they have immense developments going on in the country, immense development of railways, immense settlements in the West, even in the last 10 years these have been something enormous, consequently they want money to keep them on this gold basis. On the other hand a large accumulation of gold has taken place in the Treasury, which practically is withdrawn from the circulation.

6202. (*Mr. Barbour.*) Has there been a reduction of the paper simultaneously with this increase of gold; has there been any reduction in the greenback and other paper circulation?—There has been some reduction in bank notes, not in greenbacks. The United States Treasury holds of this gold coin and bullion about 46,000,000*l.* I am not dealing with money in circulation in America. They have absorbed this gold that otherwise would have gone to the gold countries, and in the previous ten years did go to the gold countries, and we got 5,000,000*l.* sterling a year, as our share of the gold production of the world.

6203. I understand that the gold in America is largely used to cover the paper circulation which was previously uncovered?—Yes, it was inconvertible up to 1879—346,000,000 of dollars were inconvertible, but since 1879 greenbacks are convertible into gold, and the Treasury holds 46,000,000*l.* of gold to pay interest on its debt, and to provide for the convertibility of the greenbacks.

6204. (*The Chairman.*) Your estimate of coin circulating in the United States on the 1st July 1886 is 109,664,000*l.* of gold, and 61,757,000*l.* of silver?—Excuse me, I say in the Treasury the gold is only 46,000,000*l.* The total gold in the country was 99,000,000*l.*, but in the Treasury it was only 46,000,000*l.* What I want to point out is that the United States in these 11 years absorbed 119,000,000*l.* sterling of gold, and Germany absorbed 80,000,000*l.* or 90,000,000*l.* of gold. That makes 200,000,000*l.* sterling of gold, that, but for the resumption of specie payments in the United States, and Germany passing on to the single gold standard, would have gone to swell the currency in the gold countries. Of course there is Norway and Sweden, the Netherlands, Denmark, and Italy; they have taken gold, but I find

these two figures alone amount to 200,000,000*l.*, so that the demand has been greater than this.

6205. How do you account for the fact that if the United States absorbed in these 11 years 119,000,000*l.* and had already some stock to start with, all that they possess at the end, taking the higher estimate, is 109,000,000*l.*?—Of course the supply for the arts has got to come out of that 119,000,000*l.*

6206. You include there the total addition for all purposes?—Yes. I should have deducted the amount used in the arts from that, still that is the gold absorbed.

6207. That would show, according to your estimate, that there would only appear to be 1,000,000*l.* a year in the United States applied for the purposes of the arts?—About 2,000,000*l.* a year is the estimate.

6208. You are supposing them to have started with 20,000,000*l.*?—That is about their estimate. On June 30, 1875, 110,000,000 dollars, according to their statistical abstract.

6209. Now we will pass to the observations that you have to make about the practicability of bimetallism? Taking from the Report of the Committee on the Depreciation of Silver the official figures of the French coinage, it appears that in every year from 1795 to 1875, except 1860, silver was tendered at the French Mint for coinage into five franc pieces; that in every year from 1803 to 1875 gold was tendered at the Mint for coinage on the basis of 1 to 15½, with the exception of 1872 and 1873, when specie payments were suspended, so that this proves conclusively, in my opinion, that gold and silver every year were tendered at the French Mint at this price of 1 to 15½; consequently there was in France no variation whatever in the ratio of 1 to 15½ in so far as money was concerned.

6210. (*Mr. Birch.*) Several statements have been made in regard to this, and this book is M. Chevalier's "Treatise on Gold," published in 1859, and translated by Cobden. It is almost as good evidence as to the real state of affairs as any can be, and in Chapter 2 he says:—

"Whilst in France the coinage of gold takes this unexampled development, the like process with regard to silver is diminishing, and bids fair to cease altogether. . . . During the eight years terminating the 31st December 1857, the coinage has only amounted to 323,660,000 francs, or a yearly average of 40,457,000 francs (1,618,280*l.*). It should, moreover, be observed that the coinage of silver during the latter years has only taken place in consequence of the great influence exerted in that respect by the Government upon the directors of the mints. Left to themselves, they would not, perhaps, have struck a single 5 franc piece since 1853.

"Not only is much less silver money coined, but even that which the country possessed has been rapidly disappearing. The Custom House returns afford upon this subject only proximate indications, as the declarations are not always exact, though they nevertheless must be taken for authority. Formerly, France imported much more of silver commodities than she exported. It appears from a report made in 1839 to a commission on the currency, over which M. Thénard presided, that during the period from the 1st January 1816 to the 1st January 1839, the excess of the importation of silver over the exportation amounted to 1,822,824,818 francs (72,912,992*l.*). Nearly the same proportions were preserved until 1851 inclusively; but then commenced an inverse movement which gathered strength every year.

"In 1852 the exportation surpassed the importation by 2,700,000 francs (108,000*l.*). . . . From the 1st January 1852 to the 1st January 1858, the total excess of exportations over importations amounted to 1,127 millions (45,080,000*l.*), which would be about two fifths of the silver money possessed by France a few years since. . . . There are not two ways; there is only one way of explaining these facts; gold is imported into France in masses, and takes the place in the circulation formerly filled

by silver, which disappears, because it is profitable to come from abroad to barter gold for silver on the footing of one kilogramme of the former for $15\frac{1}{2}$ of the latter, the proportion established in the French currency.

"The merchant possessing ingots of gold has only to carry them to the Mint to obtain the same amount in pieces of 10 francs or 20 francs, weight for weight, and fineness for fineness, save only the small charge to cover the expense of coining. In this way every kilogramme of gold introduced into France enters into the circulation on the footing just described of an equality with $15\frac{1}{2}$ kilogrammes of silver. The creditor is obliged to take it in discharge of his claim on that basis.

"From the very fact of the parallel circulation of gold and silver, on the footing of one of the former to $15\frac{1}{2}$ of the latter, it is easy to withdraw the silver coins from circulation, and export them, giving gold in exchange. From the moment that numbers of persons devote their time and capital to the carrying out of this substitution, we must conclude that it is a profitable trade, for, if the relation of 1 to $15\frac{1}{2}$ were not advantageous for the holders of gold, they would take good care not to carry on the operation upon the large scale on which they have proceeded.

"Chapter 4. . . . We know that what is now to be seen taking place in silver occurred a few years previously in gold. Gold was at a premium in the French market; at the same time that the coinage of this metal had fallen to an insignificant sum, and the amount which had been in circulation in France was escaping abroad. The returns of the Custom House show that from the 1st January 1816 to the 1st January 1839 the exportation of gold exceeded the importation by 541,000,000 francs (21,640,000*l.*) without counting that which travellers carried with them. During this period the relative value of gold remained nearly fixed at $15\frac{3}{4}$ times that of silver, instead of the proportion of $15\frac{1}{2}$, indicated by the law of the 7 Germinal, year 11. Now $15\frac{3}{4}$ in relation to $15\frac{1}{2}$ represents only a deviation of $1\frac{1}{2}$ per cent. Such a slight divergence from the legal proportion sufficed, however, to cause the disappearance of gold from the circulation, and to lead to the exportation of the larger portion of it." This proves how small a difference suffices to effect the displacement of the precious metals?—These passages only show this, that when under bimetallism you have a very large amount of gold passing into a currency naturally there is not likely to be much silver offered at the Mint, as there is the highest probability that the excessive importation of gold will be accompanied by an export of silver. I showed that in two years 1859–60 the French Mint coined 45,000,000*l.* sterling of gold. Well, of course, France could not take up 45,000,000*l.* sterling on its bimetallic standard; it probably exported 22,000,000*l.* of silver; and thus, while it absorbed 45,000,000*l.* of gold, it only added perhaps 23,000,000*l.* to its bimetallic standard of money. Then I showed that in 1860 no silver was tendered for coinage into five-franc pieces, and I accounted for that by stating that the large additions of gold to the French currency could only be made by exporting silver, and this was why in 1860 no silver was tendered at the Mint. I wish to say in regard to the passages read from the volume by M. Chevalier "On the probable Fall in the Purchasing Power of Gold," that in the "Revue des Deux Mondes" of April 1st and August 1st 1876, M. Chevalier turned round and proposed to demonetise silver for the same reasons as he proposed in the volume from which Mr. Birch has read to demonetise gold. This book is written with the view to show the extraordinary dangers of enormous quantities of gold being produced and passing into the currencies of the gold countries. He was an eminent economist; but as a matter of fact, within 18 years after vehemently insisting on the demonetisation of gold he turned round and as vehemently urged the demonetisation of silver.

6211. (*The Chairman.*) Why should they have

been coining at that time so much gold and so little silver?—This is the whole theory of bimetallism, that France had to take all the gold offered from California and Australia, in whatever quantity, and had to give out silver, which is what Chevalier describes. Silver was bound to disappear when France alone in Europe, you may say, was holding this ratio 1 to $15\frac{1}{2}$. It is very natural to suppose that there was a tremendous pressure, as was proved by the enormous import of gold during those years 1859 and 1860. France took 45,000,000*l.* in two years, while from 1858 to 1865 we only got 29,000,000*l.* altogether. I quote from the official figures to show that in two years alone France took 45,000,000*l.* of sterling into its currency, simply because if the export of silver was probably 20,000,000*l.* sterling, then that helped to diminish the standard of money, because instead of adding 45,000,000*l.* they only added 25,000,000*l.*; 20,000,000*l.* having been drained away to India and the East. If 45,000,000*l.* could be taken into French currency, it could only be so by an immense addition to French prices; the consequence was that as gold and silver were at 1 to $15\frac{1}{2}$ in France, then this bimetallic standard would naturally have increased in quantity so much above the Indian silver standard that silver would begin in India to have a much larger value than in France, and so silver flowed to the East to raise prices there, so that silver prices might correspond to the increased bimetallic prices in France. Thus gold took the place of silver in the French currency, and the amount of gold thus substituted had no influence whatever on the currencies of the gold standard countries, because it was a substitution, and not an addition to the currency. But for the existence of French bimetallism all the gold must have gone into the currencies of the gold countries, and must have raised prices in these countries to a much higher level than they did actually reach.

6212. Then you say that in 1876 the cash reserves of the Bank of France amounted to 53,960,000*l.* in gold and 22,000,000*l.* in silver?—Yes. As at the time that France suspended the coinage of silver the Bank of France had only 22,000,000*l.* sterling of silver and had 53,000,000*l.* sterling of gold, it was consequently not the pressure of an enormous amount of silver in the Bank of France that caused it to suspend the coinage of silver, it was simply the financial and political consideration that it did not want Germany to draw away its gold.

6213. 1876 was not the date, was it, of the suspension of free mintage; I thought it was earlier than that?—It was 1874. These figures are taken from the Report of the Committee on the Depreciation of Silver.

6214. Yes, but do you know what the amounts were in 1874?—They are given there.

6215. (*Sir T. Farrer.*) Can you say why they did not wish Germany to take away their gold?—Because they naturally said: "We do not want to encourage any country to pass on to the single gold standard by drawing away this 53,000,000*l.*, or any other large quantity of gold, and giving us silver. We are willing to hold the double standard so long as other countries behave decently to us." They did not want to co-operate in any such scheme. I think that is a very valid reason, particularly as with Germany they had a very strong patriotic motive.

6216. They submitted very quietly to receive gold instead of silver, why was it that they would not receive silver instead of gold?—Because they felt that while they were anxious that other countries like England and Germany and the United States should become double standard countries like themselves, they did not want to allow themselves to be unjustly taken advantage of. When Germany decided that it should have a gold standard the French Government did not want Germany to come to France and take away gold, and when somebody else decided to have a silver standard that they should come to France and take away silver. They did not want other countries to change their currencies when they pleased, throwing

*Mr. J. Barr
Robertson.*

24 June 1887.

Mr. J. Barr
Robertson.

24 June 1887.

upon France the derangement of the French currency and the expense of frequent recoinage at the option of other countries. France was being treated as the mere reservoir of precious metals for the convenience of other nations, and it resented this abuse by suspending the free coinage of silver, and thus depriving Germany of the opportunity of taking away French gold in exchange for the silver of Germany.

6217. (*The Chairman.*) Why would it have been at their expense?—Suppose Germany had drawn away from the Bank of France 30,000,000*l.* of gold, France would have had to coin more silver, and they said, "What is the use of permitting our currency to be raided upon in this fashion?" They would require to have given up 30,000,000*l.* of gold and to have recoined 30,000,000*l.* of silver, which would have come to them in the form of bullion or German silver money. It compelled them to recoin it. Well, then, they said, "We do not want our currency to be raided upon in this way."

6218. Why was it that they accepted the change when the change was from gold to silver, and would not accept it when it was from silver to gold?—It was hardly from monetary considerations; it was a question of politics, though I think it will be conceded that France might very well refuse to continue to be the victim of the currency changes of all other countries, when it was completely in its power to do so.

6219. (*Mr. Chaplin.*) Were they offered the silver in the same quantities that they were offered the gold?—Germany began to sell its silver for gold, and France began to have its gold drained away and the silver from Germany substituted.

6220. I want to ask if you can tell us at all whether, in those years, 1859 and 1860, there was an extraordinary quantity of gold offered for coinage, and was coined in France?—Yes, a very extraordinary quantity.

6221. Was there anything like the same amount of silver at that time; had they the opportunity of coining the same amount of silver if they had wished it?—There was no abnormal amount of silver being produced, but the French Mint was bound to coin whatever gold or silver might be offered.

6222. (*Sir T. Farrer.*) They were saturated with silver; gold became cheaper, gold came in and drove out the silver, and silver went to India. So that they submitted, but when the converse operation came about and silver offered itself as the cheaper metal, and gold was to be taken away, they would not submit to that.

6223. (*Mr. Chaplin.*) I understood that in 1859 and 1860 they coined 45,000,000*l.* of gold, an abnormally unusual quantity, and that to that process they submitted very quietly. What I understood was that they submitted to lose their silver, perhaps they had no choice?—They had no choice under their bimetallic law, but M. Chevalier wrote his book in 1858 for the purpose of showing that gold was so certain to be produced in the future in enormous quantities, and that those gigantic supplies would so raise prices as to bring ruin and disaster on France, that he urged upon the French Government the imperative necessity of demonetising gold.

6224. They might have put an end to their bimetallic system?—They might, but they did not.

6225. (*Mr. Barbour.*) You have been asked how it happened that the French allowed all their silver to pass away and gold to take its place, but would not allow gold to pass away and silver to take its place. Was there not this difference in the two cases, that in the first instance the influx of gold came from a natural cause, and in the case of the influx of silver it was an artificial cause, mainly the act of Germany, which had recently been at war with France?—There was no political motive in the first instance; there was a very strong political motive in the second instance.

6226. Are you aware that in the beginning of the century France allowed her gold to pass away and

silver to take its place, or have you no information on that point?—I have no information on that point, except the statistics on the subject in the Report on the Depreciation of Silver.

6227. I will read you an extract from a report of the Minister of Finance of France in 1803, showing what the state of affairs was at that date: "Gold coins compose about a third of our specie. They are the principal instrument of our interior commerce. It is admitted that breadstuffs, cattle, and almost all the bulky objects of consumption disseminated throughout all parts of the Republic, and which are gathered together for the provisioning of our cities, of the army, and of the seaports, are in the first instance purchased with gold." Does not that show that there was a large amount of gold in actual circulation in France in 1803?—Yes, it probably does.

6228. I will read you an extract from the evidence taken before the Committee for Coin at the Board of Trade on April the 26th, 1828. Alexander Baring, Esq., M.P., afterwards Lord Ashburton:—"The variation in France is seldom above a tenth per cent.; it sometimes runs up to a quarter per cent. It has been, I am told, something higher on particular occasions; when the Bank of England was running all over the Continent for gold. This was the case, I believe also, at another time for the service of the Peninsula; now and then, from casual circumstances, one metal gets preferred. If Russia goes to war in a distant part, she does it always with gold. At the present time gold has been bought up to a large extent for this purpose." This evidence was given in 1828, and shows that gold had become scarcer at that time than in 1803?—Well, I would not draw that inference.

6229. It was not so common in circulation?—No.

6230. Then I will read you an extract from the evidence given by N. M. Rothschild, Esq., before the Committee on Bank of England Charter on 24th July 1832:—"Q. 4833. Has there been a great export of gold from France at different times for the purposes of foreign war?—A. Certainly; in general the gold is bought up in France before it goes from this country, and if there is a scarcity in France then it is fetched from here. Q. 4834. Does the demand for gold from France produce a scarcity of money in France?—A. No. Q. 4835. Why is that?—A. Because the gold is, in general, in private hands; it is merchandise there." Does not this extract show that in 1832 gold had disappeared from the ordinary circulation in France?—Well, I cannot say. The statement there made is that when Russia goes to war she demands gold. It is perfectly true, but nevertheless, although in 1832 France lost by export about 1,600,000*l.* of gold, it gained by import in 1830, 1831, and 1833 about 1,800,000*l.*, and it coined in the five years 1830 to 1834 about 5,000,000*l.* of gold. The total imports, however, from 1815 to 1836 were about 15,800,000*l.*, and the total exports about 16,400,000, so that France really lost in that time by excess of exports about 600,000*l.* of gold.

6231. What I wish to ask you is this, do not these extracts beginning with the report of the French Minister in 1803 to the effect that one third of the specie was gold coin, and that all the breadstuffs were purchased with gold and ending with the evidence of Mr. Rothschild show that there had been a drain of gold from France, and that she had submitted to that drain without altering the laws regulating her currency?—Yes.

6232. In other words, she had allowed gold to go and silver to take its place between 1803 and 1832?—Yes, that appears to be perfectly correct according to these extracts, but the total amount of net export of gold from 1815 to 1836 was, according to French official figures, quite insignificant.

6233. (*The Chairman.*) From 1803 down to the present time has the banking and commercial business of France been carried on in gold and silver money indiscriminately in your view?—Yes, certainly it has.

6234. Both gold and silver, each of them being at times at a premium?—For export, not in money. If either had been at a premium in money, there must have been two prices in France, a silver and a gold price for all articles. Now, in the first place, the French law makes it criminal to act on the basis of premium or discount. It always did so, and consequently any one depositing money in a bank in France, say, 100,000 francs, he might get silver, gold, or paper when he wanted the money, but he got 100,000 francs, neither more nor less. There may, however, have been a premium on silver, either bullion or coin, for export to India, and the premium might for a time be considerable if there was an excessive demand for export, as silver could not always be easily got in France, all banks and other payers having the option of paying in gold or in silver. There was doubtless also under bimetallism a premium on gold. But this premium was a question for the bullion dealer; it in no way affected the money affairs of the French people. I might instance business in China. I have seen in Shanghai, when silver was scarce, and everybody wanted it, the price of silver as expressed in the sterling exchange on London of the Shanghai tael rise 10 per cent. in a month. When there had been changes, before telegraphs and before steamers, in the available silver in India and China silver would immediately bear a premium for export from Europe; but the question is this, where is the example of any bank in France that received money, gold or silver on deposit, having proposed to pay out either more or less than the exact amount in figures deposited? Where is the transaction where any merchant has paid more or less than legal tender money, and more or less than the exact amount due. Of course, silver must be driven out of the currency when gold flows in in large quantity; silver must be driven out of the currency by some process, and it is done by a premium on export, that is, by a rise in the foreign exchanges with silver countries. A similar process goes on with gold in England. A sovereign is always a sovereign in London, but the exchange value of a sovereign in London payable in New York in gold dollars changes in London in dollars from day to day, and similarly a 20-dollar gold piece in New York as valued in sovereigns in London changes from time to time. This is the only way in which the exchanges can be regulated; by a rise or fall in the foreign exchanges gold will flow from or flow to a country, so that we have with our gold exactly the same conditions operating as the French had with their silver, only that then the changes in our gold that cause it to flow out or flow in are shown in the foreign discount or the foreign premium on the exchanges. Similarly in foreign countries changes in their gold are shown by changes in the rate of exchange on London.

6235. I believe you have some observations to make with regard to Professor Jevons's views?—Jevons has been regarded in England here as the leading authority on this question, and Bagehot accepted and argued upon his views in regard to bimetallism. Now my contention is that Jevons did not understand this question, and his diagrams do not show anything in regard to bimetallism whatever.

6236. (*Sir. T. Farrer.*) Which book of Jevons is this?—"Money and the Mechanism of Exchange."

6237. (*The Chairman.*) Will you quote the passage?—The passage is that "the standard of value always follows the metal which falls in value" (p. 138), and "At any moment the standard of value is doubtless one metal or the other, and not both; yet the fact that there is an alternative tends to make each vary much less than it would otherwise" (p. 139). What I contend is that this is a mere theory, and is not in any way borne out by the official figures which I have presented in regard to the French currency and the Bank of France. During the period from 1795 till to-day the French standard never was a purely gold or silver standard, as Jevons's theory would imply, but it was a standard of the two metals in some proportion, in varying proportions, depending upon whether gold or

silver might be flowing into the French Mint, or was being drained away by foreign countries. But he treats here upon a theory, and builds upon that theory a set of diagrams, so that his diagrams and his argument have been very widely accepted as settling the question. Now I say it does not settle it at all, his diagrams and his arguments do not apply to bimetallism, as I have shown by authentic facts and figures in the case of France. I have not got the book, but I can draw the diagrams if any one cares to see them.

6238. What do you say the diagrams are inserted by Professor Jevons to show?—To show the action of bimetallism; but he assumes that under bimetallism gold and silver vary in regard to each other, which would require that there should have been in France a gold price and a silver price for every article, whereas I have shown that in France they have not varied as money from 1795 to the present day, and that there have not been two prices for articles.

6239. With reference to the argument that gold cannot have appreciated because money is so cheap, what have you to say?—Well, I maintain that the rate of discount is no permanent indication as to the quantity of money in a country, and therefore it is no indication as to the range of prices. Prices may be high or low with a high rate of discount or a low rate of discount. There is no relation between the two except during the period when the change in the quantity of gold is taking place. If we are exporting gold, or if we are importing gold, during that change it would to some extent affect the rate of discount, but it could not affect it permanently.

6240. Of course you would not suggest that all the gold that comes into this country, that is not used for the arts, would be turned into coin; some of it would remain in bullion?—It does so at the bank.

6241. What regulates in your view the amount of gold that is turned into coin?—I suppose the amount that is demanded for the purpose of being paid over the counter of the bank. Of course they do not pay bullion over the counter, that is in payment of cheques. I suppose as long as they find that they have plenty of gold coin in the issue department for probable demands, it is not material for them to send bullion to the Mint. I presume so. Of course I have no experience on the subject. I see no object in coining gold when it may, owing to the demands of foreign countries, have afterwards to be sent abroad as if it were bullion.

6242. That rather leads me to ask, during those years in which you say there was this large excess of imports over exports, which in your view must have been turned into coinage, whether it must not have resulted in people seeking more coinage for some reason or other?—No, they do not seek it; it passes automatically into the currency.

6243. But how could it pass automatically into the currency? The amount that will pass into the currency will depend upon the amount that people's requirements demand?—No, I cannot agree in that view. The monetary organization of a country like ours provides the method by which all gold available for currency is automatically distributed over the whole country. In a general way the demand for money is equal to the whole of the available money in the country.

6244. I am talking of the amount that is coined as distinguished from what is kept in bullion. I am supposing the stock of gold to remain the same, what would determine how much will remain as bullion, and how much will be turned into coin?—Well, I suppose the individual views of the Directors of the Bank of England, as to whether they were likely to be called upon for more coin than they possessed.

6245. If their judgment was good and sound that would depend upon what people did require and seek for?—Yes, in a certain sense; however, they must keep this gold to suit their liabilities. Their own gold reserves and their own liabilities are the only guide that they attend to; they take no cognizance

Mr. J. Barr
Robertson.

whatever of the amount of gold in circulation outside of the bank.

6246. Yes, but what I mean is, what in your suggestion would have brought about the effect that in a period of 10 years or so people would have required 50,000,000*l.* more of gold coins, as distinguished from bullion?—Of course if it has to be paid across the bank counter for currency purposes it has to be paid in coin. The point is this, the amount in the Bank of England in reality remains almost stationary, there may be a few millions up or down, and the legislation by which the bank directors lower or raise the rate of discount drives out of the bank all surplus gold beyond the reserves to protect their liabilities, either into the circulation in the country or to foreign countries; or on the other hand, draws gold into the country from abroad. This process is really automatic.

6247. (*Mr. Birch.*) It has varied in the 10 years from 20,000,000*l.* to 36,000,000*l.*, you know?—That 36,000,000*l.* is very rare, and could only remain in the bank until the action of the directors themselves reduced it to the normal amount necessary for their reserves.

6248. (*Mr. Fremantle.*) You can hardly say that the coinage remains stationary?—No, the coinage will vary in proportion to the supply of gold and the demand for coin. Will you allow me to make one illustration that will show this; the illustration of the suspension of specie payments in America up to 1879. Why did gold rise to a premium in greenbacks of 180 per cent., that is to say, 100 dollars in gold was the equivalent of 280 dollars in paper money? Prices advanced on the basis of the 280 and not on the basis of the 100. You ask me how it is? I say the banks did not hold this money when it was issued by the United States Government, because they were only holding enough for their liabilities. The country was bound to take this surplus when it was issued, there was no means of refusing, whether it raised prices or whatever it did. That is an illustration of it. They thought in America because the United States Government signed these greenbacks they would remain at par, still they found this premium on gold as expressed in greenbacks went on increasing and increasing until it reached 180. I give that illustration to show how an increase in money did go on raising the paper money standard to 180 per cent. above the gold standard.

6249. (*The Chairman.*) People are only bound to take it there. It is a different measure of value altogether compared with what it is in relation to commodities that people desire from other countries that will not take the greenback?—The thing is exactly the same.

6250. Why surely a man who had a greenback could not induce all the rest of the world, if a large number of greenbacks were issued, to give him goods for the greenback to the same extent as they would give him for gold?—He could go into a bank in New York and get credit for any amount of money, if he would only deposit the equivalent greenbacks. Gold could always be got for greenbacks at the rate of the day.

6251. Yes; but not at the same rate as if he deposited so many pounds sterling?—It is exactly the same, not the same value, but if you deposit 280 dollars in paper you would get 100 dollars in gold. What I want to point out is this, this standard of value in America having changed from the gold standard on the basis of 100 to the paper standard of 280 prices rose to a very large extent. Now, then, I say when they began to contract the paper currency they reduced this 280, and gradually population increased, and thus they brought the currency down to par in gold in 1879. There was an operation produced directly in consequence of increase and diminution in the quantity of money inserted in the currency and withdrawn from it, and what I maintain is this, that prices rose correspondingly, and yet if you look at the banks, the banks had not this money, they only had enough for their liabilities; but when a man went to pay something for which

he had formerly paid five dollars he found he had to pay 14 dollars for it, and therefore he required to have in his pocket for this transaction 14 dollars, though under the gold standard he would only have required five dollars. Why was that? Simply because this standard was one of 280 in paper money against 100 in gold coin, and paper money was the money of the country.

6252. But in that case would you have found the man with so many more dollars in his banking account?—He might or he might not have had.

6253. If all prices had gone up he would probably have 280 dollars where he had 100 before?—No, I beg your pardon, if you had deposited 1,000 dollars in 1861 you would, when the greenback was at 280, have had 1,000 dollars, not 2,800, as you ought to have had if you had been entitled to an equal amount of purchasing power.

6254. That is perfectly true, but when you had all your prices going up there would be some approximation in all respects to an increase in the same proportion?—In prices.

6255. In prices, and therefore in the deposits which people had at their bankers?—Certainly there would be. The bankers went on changing from a gold to a paper basis, but they did not give any man credit for the increase; so that the increased deposits would have been made by those who were making additional profits by the advancing prices, and not by those who had made the deposits before prices began to advance, as the latter deposits would have remained unchanged in figures, though their purchasing power would have diminished by every advance in prices.

6256. But if the same process was going on here in the reverse direction, ought you not to have found that the money that people had at their bankers diminished just in the same way as you find it increased in America?—Well, I dare say there is a diminution. I have not examined it, but I feel almost certain that there must have been a diminution. On the other hand, I ought to explain that while a process of contraction is going on the amount of money people keep at their bankers undergoes no change in figures while it is there, that is 1,000*l.* remains 1,000*l.* with, however, increasing purchasing power. If there is during contraction a diminution of people's money at their bankers, it is caused solely by the withdrawal of deposits, and not by any automatic shrinking in assets or liabilities at the banks, as there is an automatic shrinking in the prices and money values of commodities.

6257. (*Sir T. Farrer.*) One question about the greenbacks. Do you say it was due entirely to the excess of quantity; do you think that the credit of the Northern Government at that time had nothing to do with it?—The excessive quantity of greenbacks in circulation produced a corresponding rise in prices as soon as the greenbacks were distributed over the country. With that, in my opinion, the credit of the Government had nothing to do. The fact is prices are produced automatically, money being forced into the circulation.

6258. (*Mr. Birch.*) What effect had it upon the wage-earning class?—All prices went up enormously.

6259. The wages of the day labourer, did they increase immediately?—Yes, because he had to pay dearer for everything that he used.

6260. Where was the advantage?—No advantage at all.

6261. (*Sir T. Farrer.*) All American securities went down?—That is perfectly true. That was a question, not of quantity of money, but of the credit of the Government.

6262. Paper was a security?—It was money.

6263. Was there any magic about calling it money?—Yes, because it was legal tender. Every man was compelled to take it for the money marked upon it, but he was not compelled to take American Government Bonds in payment of debts. Securities like Consols depend as to their price upon the estimation placed upon the credit of the British Government

the chief consideration being whether we are likely to be involved in wars or in serious political troubles.

6264. (*Sir J. Lubbock.*) Do you not think the apprehension that there might be a further increase had something to do with the fall in value?—Are you speaking of the values of securities or of commodities.

6265. I understood you to lay down the principle that the fall in paper values was entirely due to the increased amount. Sir Thomas Farrer asked you whether you thought the fall of the credit of the American Government had anything to do with it, and you said no. Now I ask you whether you think that the apprehension that the amount might be still further increased had some influence upon the value?—Undoubtedly it had upon the value of securities which is a mental apprehension, as the increased quantity of greenbacks was clearly an indication that would lower the credit of the American Government in the eyes of investors. But prices of commodities in the long run are not mental apprehensions of value, they are the automatic results of the quantity of money as distributed over the business of the country in transactions where money is actually used. Prices of commodities, therefore, would not be in any permanent manner affected by any apprehension that increased amounts of greenbacks might be issued, they would be affected only by the amounts already issued. Taking the illustration of France during the war of 1870–71 and afterwards, it had to pay a much larger rate of interest on its loans during that period when it issued enormous amounts of securities, and thus weakened its credit.

6266. (*The Chairman.*) I will revert to the question of dear gold and low rate of discount. You say that the rate of discount, whether it is low or high, has no relation to the amount of currency in circulation?—It has not.

6267. Now with reference to the appreciation of gold, which you consider has taken place, would you point out what effect it has produced in the relative position of different classes in the country?—Yes. I think that all producers have had to sustain a very great loss; that all parties possessing securities, like Consols, that demand the payment of a certain amount in money and bear a fixed rate of interest, and all annuities and all fixed salaries have immensely benefited.

6268. That is by reason of prices being lower, and therefore the income purchasing more commodities?—Yes, by reason of the wealth of the producing classes having gradually undergone a diminution in its value in figures relative to the wealth of people holding theirs in Consols and other forms of securities.

6269. You have made some calculations, I think, to show your view?—The involuntary transfer of wealth from one class of persons to another class by means of a contracting or expanding currency I call by the name of “mediatization.” Let me illustrate this process by a few examples, and as I have already shown that the contraction of our gold currency in the last 11 or 12 years amounts to more than 30 per cent., I will use 30 per cent. as the fall in prices due solely to currency causes. Taking the National Debt at 740,000,000*l.*, it represents to-day an amount of average commodities that would have taken 1,057,143,000*l.* to purchase before the contraction of the currency began. In the same way, if we take the assets in “figures” to be paid, of the Joint Stock Banks of the United Kingdom at 1,000,000,000*l.*, the present purchasing power of this sum will amount to about 1,428,571,000*l.* of the former purchasing power of money. Take again the railways of the country at 800,000,000*l.*, and $4\frac{1}{4}$ per cent. on an average was paid on this amount in 1884 (I have no later figures at hand). To-day that sum will purchase an amount of average commodities that formerly would have required 1,142,857,000*l.* If these three large items are taken, amounting in all to 2,540,000,000*l.*, in obligations in figures, we find that they now represent a purchasing power which before the contraction of the currency would have required 3,628,000,000*l.*

Thus we have an amount of wealth which has been mediatized into the possession of the owners of these three classes of obligations, and out of the possession of the owners of all kinds of property, and of manufactories and mines, and of the agricultural and productive classes generally, to the amount of 1,088,000,000*l.* If, on the other hand, those obligations had been paid up in India or in a silver currency, the amount mediatized would only have been about 282,000,000*l.*, so that India has suffered but very little in comparison with England, because silver was a juster standard of value than gold.

To take another illustration. The civil services in 1884–85 cost about 18,000,000*l.* This amount will now purchase commodities that before the contraction of the gold currency would have cost 25,714,000*l.*, that is an excess of 7,714,000*l.* This sum of 7,714,000*l.* represents an addition to the burden of the National Debt of 257,133,000*l.*

Let me suppose now that two gentlemen each invested 100,000*l.* in the period 1870–74, but that the one invested in consols and the other bought an estate with a rental from crops corresponding to the purchase money. To-day the owner of the consols has his 100,000*l.* intact, with a purchasing power over commodities as compared with the time he made the investment of 143,000*l.*, and he has his 3,000*l.* a year with an increased purchasing power of 1,290*l.* On the other hand, the owner of the estate could not sell it for 70,000*l.*, and yet if the volume of money had been kept up from 1876 till the present time, as it was from 1866 to 1875, there can be no doubt that his property would, under average circumstances, have been worth 100,000*l.* to-day, and would have been yielding a corresponding rental. This amount of depreciation is due solely to the mediatization produced by a contracting currency, which has given to the owner of the consols part of the value of the other gentleman's estate.

The farmer and the manufacturer have had to accept continually over the last 10 years lower and lower prices for the benefit of the owner of obligations in figures, to whom the farmer, the manufacturer, and the producer generally had to gradually give up their wealth and become themselves impoverished.

A careful investigation of this question would probably show that the mediatization of wealth from the producing classes and those allied with them to the holders of securities and the possessors of mortgages, annuities, fixed incomes, &c. has taken place in the United Kingdom in the last 12 years to at least 2,000,000,000*l.*

6270. (*Sir T. Farrer.*) All due to scarcity of gold?—Yes, all that I have stated is due to the scarcity of gold.

6271. (*The Chairman.*) That 30 per cent. fall arises from taking a number of articles and averaging the fall, but how far that will benefit me, with a fixed income, will depend on the fall in relation to these given articles which I myself use, would it not?—Certainly it would.

6272. Well, now, rent, which is a large item of expenditure, has house rent fallen anything like that amount?—I think relatively materials for building have fallen very greatly. Of course, I do not say that in every case; no one article can be taken as giving any exact average. There will be articles above and below the average prices of commodities.

6273. But is not one very likely to be misled as to the benefit arising to a person with a fixed income by taking an average of that sort, because if the fall has been small in the articles that are much used, and large in the articles that are not so much used, it would give a very false idea of his position, would it not?—Well, still the figures in the “Economist” are of staple commodities. The point is this, that if prices have fallen 30 per cent., then anyone with 1,000*l.* can purchase 43 per cent. more produce with the 1,000*l.* than he could have done before this change between gold and silver. That is my contention. Of course, one man may not be able to do it in his own

Mr. J. Barr
Robertson.

24 June 1887.

Mr. J. Barr
Robertson.

24 June 1887.

case, but if you take the wholesale commodities he has the command over these commodities to that extent.

6274. (*Sir John Lubbock.*) I think I understood you to say that all producers have suffered a loss of something like 30 per cent.?—Yes, I think so.

6275. I should like to follow that out for a moment. Supposing I am a manufacturer of any kind, and I buy raw material to the extent of 1,000*l.*, I turn that into a manufactured article which I sell for 2,000*l.* The difference of the 1,000*l.*, less my expenses, is the profit I should make upon the operation?—Yes.

6276. Supposing everything has fallen, if the raw material falls to the same extent as the manufactured article falls, the difference remains the same; where is my loss?—Now you are engaged in a business for 11 years; to-day you purchase cotton at a certain price, and you are buying a certain quantity of cotton all the time, and selling a certain quantity of goods all the time.

6277. Now you are supposing a continuous fall; I understood your position was that articles had fallen 30 per cent., and that the consequence of that was that the producers continue to suffer heavy loss?—No, I draw a distinction. When the fall stops and its effects are adjusted they no longer lose, but they may have lost all their capital in the 11 years.

6278. You do not mean to say that the loss is permanent, but it is during the process?—My point is that whatever anyone has lost he has lost permanently. When the fall in prices has adjusted itself, a manufacturer who had originally 100,000*l.* may find that he has only 50,000*l.*, the loss being due entirely to currency changes, not to any other. But if there is no further contraction of the currency, producers will not make any further losses from currency causes, though demand and supply of commodities will continue to act upon prices.

6279. (*The Chairman.*) I believe you have something you desire to say with reference to the India Council Bills?—I take the ground that whereas the India Council Bills are sold here, in reality if the same transaction were being done by a merchant in Calcutta instead of having bills drawn on India, he would remit sterling bills, for which he would in India pay rupees. My contention, therefore, is that the natural order of this operation is to remit sterling, which would not interfere with silver in any way. The only reason why Council Bills show an interference with silver here is this, that where the quantity of bills offered is abnormally large it is exactly the same rule as applies to the Bank of England if the quantity of surplus money is large; the India Council, like the Bank of England, must then take a lower rate. When the India Council wishes to press more bills than the normal quantity that have been offered, and to which the trade between the two countries tends to correspond, when they issue more than usual, then, of course, they must take a lower rate; as the market is not prepared for that additional amount at the same price as before.

6280. And in that case do you say that the silver market is affected?—Temporarily. Instead of sending silver, which they would do, with the normal amount of bills, these additional bills must be sold off; consequently, to a certain extent, bankers and merchants do not send out silver because they remit Council Bills as the India Council takes a lower price.

6281. (*Mr. Birch.*) If the Indian Government bought bills in India and the bills were sent over here people would buy silver and send it over, it is exactly the same thing?—No, I beg your pardon, the difference is this; in the one case there would be a remittance from India of gold bills on London, and these gold bills arriving here would not compete with silver as the Council Bills now do temporarily when they are sold for abnormally large amounts. Silver would not be pressed down by sterling bills arriving from New York or Paris; these would be sterling transactions only; and why, therefore, should Indian gold bills on London have a different effect in London

from the gold bills from the United States and France?

6282. (*Sir L. Mallet.*) It would have the same effect on the trade?—All the effect it has on those prices is temporary. My argument is this, that it has no permanent effect on the trade, although many merchants and bankers in the city believe with Bagehot that if the India Council did not draw so many bills, silver would flow to India in large quantities. I deny that altogether.

6283. (*Mr. Barbour.*) Would it go at a different rate of exchange; assuming that it did not go in large quantities, would the rate of exchange be different?—Not permanently different, the rate of exchange, in my opinion, would be different until this exceptional pressure of bills had ceased or had adjusted itself, but having done so the Indian currency requires a certain amount of silver to keep up prices, and that would flow to India when this abnormal condition had been removed.

6284. (*Sir T. Farrer.*) I understand you to mean that if the India Government ceases to draw bills on this side, and the Government were to remit bills from India, in that case you say there would be no flow of silver to India, there would be no change, it would not affect the trade. But if the Indian Government were to stop drawing bills altogether, because they did not want the money, you do not mean to say that there would be no silver going to India then?—Yes, there would be silver going to India. Silver would go in preference to anything else, because prices must be maintained in India. I am not quite sure that the point I am trying to make is clear. The assertion in London is that when the India Council go on drawing perhaps 2,000,000*l.* sterling more than their former annual drawings, that that fact changes the rate of exchange, and that this is shown they say by the fact that when they advertise a larger amount than usual to be sold, the price goes down. I maintain that the price goes down temporarily only; but it does not interfere permanently with silver flowing to India.

6285. You mean to say that if silver is more valuable in India than it is here, it will go to India, Council bills or no Council bills?—That is my view. If they stop the Council bills or draw an unusual amount of Council bills, that will be adjusted, and silver will still keep flowing in its normal channel.

6286. (*Mr. Birch.*) If we owe a balance to India we have to pay our indebtedness. If we cannot get Council bills we have to send silver or gold?—Or commodities.

6287. (*The Chairman.*) Do you think that bimetallism would be a complete remedy for the evils to which you have called attention?—I think it would not be a complete remedy.

6288. On what grounds?—I have a table here which gives in a general way—of course you understand all those figures are general—certain figures showing how bimetallism would work out at 1 to 15½ and 1 to 21.

Estimated Amount of Money in Circulation.

	1887.	Standard of quantity of money in circulation about 1876, say, 100: fall in 1887 to
Gold Countries - -	£ 900,000,000	69
Silver Countries - -	450,000,000	91
	1,350,000,000	

Bimetallism at 1 to 15½ would give the following figures:—

	1887.	The above figure 69 would rise to	The above figure 91 would fall to
Gold Countries -	£ 987,250,000	75½	—
Silver Countries -	362,750,000	—	75½
	1,350,000,000		

Bimetallism at 1 to 21 would give the following figures :—

—	1887.	The above money figure 69 would fall to	The above money figure 91 would fall to
Gold Countries -	£ 856,000,000	65½	—
Silver Countries -	428,000,000	—	86½
	1,284,000,000		

I assume that the gold countries have an estimated amount of money in circulation, gold and silver and paper of 900,000,000*l.* sterling; and the silver countries, 450,000,000*l.* sterling. I take that as a basis at least. Now at 1 to 15½, the French ratio, the following would be the figures: in the gold countries there would be an increase of 87,250,000*l.* sterling of money which would have to come from the silver countries in silver. There would be 119,250,000*l.* of excess of money in the silver countries as compared with the gold standard that would have to be distributed over the world; 87,250,000*l.* sterling of silver then would come to the gold countries, and the balance of 30,000,000*l.* would remain in the silver countries. The effect of the 1 to 15½ ratio would be that there would be 987,000,000*l.* in the gold countries, and 362,750,000*l.* in the silver countries. That would be on my calculation that the purchasing power of gold, which I represent by the figure 69 in 1887 as compared with 100 about 1875, would rise to 75½; and the purchasing power of silver, represented by 91, would fall to 75½, so far as England is concerned, therefore the rise would be a rise in price from 69 to 75½ as against 100 about 1875.

6289. Well, then, do you mean that it would not last, because that is not a sufficient rise?—I think so; that is not a sufficient rise, and it is very doubtful if enough gold and silver are being produced in the world to keep it there, particularly in the face of increasing populations. I take the next ratio of 1 to 21, the present ratio, with silver at 44½*d.* per standard ounce, and the Indian exchange at 1*s.* 4¾*d.* The gold countries would then have 856,000,000*l.* and the silver countries 428,000,000*l.* Now I call your attention to the fact that the total amount of money would be 1,284,000,000*l.* In the other case it is 1,350,000,000*l.* Now the reason of that is this, that in the gold countries there is 250,000,000*l.* sterling—it may be a little less—of silver which at the present moment is passing exactly the same as if it were gold. It fulfils exactly the same functions as gold now, the same as if in France and the Continent of Europe the ratio was 1 to 15½, and in the United States 1 to 16. In order to establish the ratio of 1 to 21 they would require to recoin every 21 five-franc pieces into 15 five-franc pieces, and thus on those 250,000,000*l.* there would be a loss to those countries by recoinage of 66,000,000*l.* sterling. That would be a diminution in the present quantity of money in circulation of 66,000,000*l.* sterling, or from 69 in gold countries to 65½, and from 91 in the silver countries to 86½.

6290. Then your view is, looking at what is required for the arts, that the supply would not be enough to keep up that addition to the currency which alone could keep prices steady and prevent that dislocation which you have spoken of between the fixed income and the prices?—Precisely. If in England we have not had enough gold, and in India they have not had enough silver, to keep up prices, where are you to get gold and silver enough to keep up prices either at 1 to 15½ or at 1 to 21? Of course it remains to be seen whether the present ratio of 1 to 21 can be maintained, that is, silver at 44½*d.* per ounce and the Indian exchange at 1*s.* 4¾*d.* That might prove a point of adjustment for a year or two, it could hardly be longer, unless the production of gold was increased.

6291. Your view is that bimetallism would only make a temporary barrier?—It is a palliative, and it would have the advantage of rendering the exchanges

between the gold countries and the silver countries in the world, you might say, uniform. Undoubtedly it would be a great advantage to have uniformity of exchange.

6292. It would not affect your view of the appreciation of the standard in consequence of the depreciation of prices?—Not at all. In England the ratio of 1 to 15½ would not restore anything more than from the level of 69 to the level of 75½, and in all probability 75½ could not be maintained.

6293. (Sir T. Farrer.) What would your remedy be?—I will state it as briefly as I can. As there is not enough gold and silver in the world for the increasing business of the world, as already England is suffering for want of coinage, and India is suffering for want of coinage, a normal gold country and a normal silver country so far as money is concerned, then if you had bimetallism to-morrow, if you have not enough gold and silver you must have falling prices, with bimetallism or with any metallic money system you choose to adopt. Now the question is this; are we going to try to find a money system that will preserve a tolerably uniform purchasing power? If we are, then metallic money cannot possibly give us a uniform purchasing power.

6294. (Mr. Chaplin.) You mean metallic money limited to gold and silver?—Oh, yes; I am not supposing that they would take any other metals, so the question is just this; you can raise the standard of money from 69 in the gold countries to 100 or to 90, and to the same figure in the silver countries if you decree by law to do so. It is clear that we have not got enough gold and silver to keep up prices; then on bimetallism, if you adopt it to-morrow, you might have it at 75½ or 65½ in England; but when you got it there it would immediately begin to contract, at least in the case of 75½. The proof is that we have not got enough gold to supply the arts, we are consuming our stock of gold. If we wish to adopt a system of money where we can maintain a positive standard, the real way is to issue inconvertible paper money along with gold and silver on a tabular standard of value, that is, upon an index number like those worked out in *The Economist* tables. If we could have adopted some means by which, during the last 12 years, we could have added to the quantity of money in circulation enough to have kept our standard average prices up to 100, then it is unnecessary to say that this standard of average prices would not have fallen to 69, both present and future payments would have been justly dealt with on the basis of 100, and no mediatization of wealth could have gone on, at least not to any material extent. This would have been a tabular standard perpetually rectified in the interests of justice by the rectification of the actual standard itself, namely, of the amount of money in circulation.

As we cannot depend on the production of gold and silver to give us the amount of these metals necessary to keep the purchasing power of money up to a fixed standard, and as thus with gold and silver alone we must still have falling prices, it becomes necessary to find some means of adding to the currency, and this can only be done by the use of inconvertible paper money. Money would then approximate to a yardstick or a gallon measure, though it would not be such an accurate standard as either of these.

6295. (Sir T. Farrer.) You first get your tabular standard of value, and then you make any quantity of paper that is necessary to keep up your currency to a certain point, or you take away any quantity that may be necessary to reduce it to a certain point?—That is the proposal. Without this you have no means of making any real or approximate standard of value; and so in the meantime contracting prices must go on ruining more and more the producers of the country, the class that in reality are needing protection, that is to say, protection against an unjust and ruinous system of legal tender money.

6296. Have you thought how your tabular standard ought to be constructed?—The “*Economist*” index

number is an illustration of how it might be done. Suppose a Government department were to thoroughly consider the entire question, it can be worked out.

6297. A Government department is, in the first place, by collecting prices of everything to make a standard of value, and then the prices are to be kept uniform by creating such paper money as is necessary?—Quite so, enough to do justice. There is just this one point, and I must say it is a very important point in this case, there is no trouble about establishing the $65\frac{1}{2}$ and there is no trouble about establishing the $75\frac{2}{3}$, in 1 to 21, or 1 to $15\frac{1}{2}$; but the law would require to decide whether you are to start with a standard of $65\frac{1}{2}$, or $75\frac{2}{3}$, or 91, the Indian standard, or go back to the 100 of 12 years ago. It is for the law to establish that. The rectification of the injustice that has been done the last 12 years depends upon the extent to which the law would fix one figure or another. If it fixed 91, Indian prices would be in a general way stationary, that is if India received the amount of silver it is now receiving, and ours would rise from 69 to 91.

6298. Then would it not be necessary that a standard of value should be fixed not only in this country but in all countries?—It would be necessary.

6299. That would probably need an arrangement between all countries to make one uniform standard?—Yes.

6300. One uniform standard for all countries, and then the quantity of paper that each must issue must also be arranged?—Regulated entirely between the different countries.

6301. (*Mr. Chaplin.*) Then, do I understand you that the paper money is to be international money?—No, national money; but each nation would issue enough to keep the fixed standard.

6302. The metal money, the gold and the silver, would, of course, be international legal tender?—Yes.

6303. But the paper would be simply national?—Yes.

6304. Do you think that arrangement would work?—I think so.

The witness withdrew.

Adjourned till Friday.

Twenty-sixth Day.

Friday, 1st July 1887.

PRESENT :

THE RIGHT HON. LORD HERSCHELL, the CHAIRMAN, presiding.

MR. D. M. BARBOUR, C.S.I.
MR. J. W. BIRCH.
MR. HENRY CHAPLIN, M.P.
MR. L. COURTNEY, M.P.
SIR T. H. FARRER, Bart.

MR. C. W. FREMANTLE, C.B.
SIR W. H. HOULDSWORTH, Bart., M.P.
SIR JOHN LUBBOCK, Bart., M.P.
SIR LOUIS MALLET, C.B.

MR. GEO. H. MURRAY, *Secretary*.

Mr. T. COMBER called and examined.

6305. (*The Chairman.*) I believe you are a member of the firm of Messrs. Lyon, Lord, and Company, of Manchester?—We have three firms, Lyon, Lord, and Company, Manchester; Lyon, Comber, and Company, Liverpool, and Lyon and Company, Bombay.

6306. And you have a house of business at each of those places?—At each of those places.

6307. I believe you have devoted some consideration to the question of the gold standard of this country, and the proposal to substitute for a single gold standard a bimetallic standard?—For the conduct of my business I have had to give consideration to what is termed the silver question generally, that phase of it as regards this country and as regards other countries.

6308. Having a house in this country and also in India, and your trade lying between the two, you, of course, have necessarily had your attention called to the effect of changes in the value of silver in relation to gold?—Certainly.

6309. And you have, as you say, studied the silver question generally?—Yes.

6310. Amongst other branches of that question,

have you devoted attention to the proposals of those who are known as bimetallicists?—I have, as I understand them.

6311. Perhaps you will be good enough to commence by stating what are their proposals as understood by you, in order to enable us to judge of your criticisms upon them?—So far as I can make out, under a good deal of conflicting statement, the main points of their contention, taken from the more intelligent exponents, and I may say that the authorities that I have principally gone by are the statement of the bimetallic theory appended to the Report of the Indian Delegates to the Paris Conference in 1881, and the book "The Theory of Bimetallism," published by Mr. Barbour, are as follows:—that gold and silver, apart from their value as mere commodities, acquire, when coined, a special status, which confers upon them a special value, as money, which is conferred on them by the fact that governments give them currency as legal tender; that if, in thus making them legal tender, governments attach the condition that they shall exchange at a fixed ratio they must ex-

Mr.
T. Comber.

1 July 1887.

change only in that ratio, and their value, as coins, must be regulated thereby. For purposes other than coinage the precious metals are used to so limited an extent that there is practically but the one market for them. Their value, as commodities, must therefore be governed by their value as coins within the limits of the charge for coinage. Consequently, if the principal nations that coin money combine to establish a fixed ratio of value, which I term "legal value," this will become the relative value of gold and silver throughout the world, which I term "market value." Although there may be, at first, a tendency to offer for coinage only the metal which can be obtained at the least cost, say, under present circumstances, silver, and to melt down that which costs most, say, under present circumstances, gold, the increased coinage demand for the former and the increased supply in the market of the latter, must eventually bring about an adjustment of the market value and make it correspond with the legal value. Lastly, that it is not the cost of production that determines the relative value of gold and silver, but the relative value which leads to the abandonment of the worst paying mines of one metal, and to the opening of fresh mines of the other metal, until the relative cost of production exactly corresponds with the fixed ratio.

6312. You understand their proposals to include a free and unlimited mintage of whichever metal is offered?—Whichever metal the public brings to the Mint.

6313. Now, what criticisms have you to make, assuming their views to be such as you have stated, upon those propositions?—Well, it appears to me that the inquiry falls naturally into two parts, first, whether it is possible to permanently establish a fixed ratio between gold and silver, and, secondly, whether it is desirable for this country to enter into such an international agreement in view of her own interests and the interests of India.

6314. Taking first the possibility of establishing a fixed ratio of value between gold and silver, what have you to say?—Well, as regards the first question the possibility of establishing permanently a fixed ratio between gold and silver, I think our opinion should be guided by the experience of other nations that have established a double standard, that we should inquire whether they have succeeded in permanently maintaining a fixed ratio; and I would premise that for a double standard to be really maintained I consider two conditions are necessary, first, that the Mints should be open to receive both metals whenever brought to them by the public, at the fixed ratio. The coins of whichever metal the mints will not receive are in reality current only as tokens. That both metals should be in actual circulation without either of them commanding a premium. There are three nations which during the present century have established a fixed ratio. France in 1803 established the ratio of 1 to 15½, the United States in 1834 established the ratio of 1 to 15.98, and India in 1841 established a ratio of 1 to 15. In the United States silver was undervalued, so that it commanded a premium, and was exported, and as it did not circulate the double standard was not operative; the standard though nominally double was actually single gold.

6315. Just pausing there for one moment, was that in your view because France had a different relation of silver to gold?—Because the market value was different, and the demand in France was a factor in that market value, but not the sole factor.

6316. (*Mr. Chaplin.*) At what date?—Between 1834 and 1853, I think.

6317. There was one standard, did I understand you?—There was nominally a double standard, but practically there was only gold current. In India gold was undervalued, and although some was coined, the coins commanded a premium and did not circulate. The double standard, therefore, in my opinion, was not operative, and when from the discoveries of gold in California and Australia there was a prospect

of its becoming operative, the Indian Government promptly abolished it.

6318. (*Mr. Barbour.*) May I ask at what date they abolished it?—1852.

6319. Was gold a legal tender before 1852?—From 1841 to 1852.

6320. Can you give your authority for that, because according to my information gold has never been legal tender since 1835?—I will read you my authority; you may take it for what it is worth. An Order in Council was promulgated January 1841, authorising officers in charge of public treasuries to freely receive gold coins struck in conformity with the provisions of Act XVII. of 1835 establishing the 15 rupee pieces. This continued till December 1852, when the proclamation of 1841 was rescinded.

6321. That was an executive order of the Government, as I understand it, directing its officers to receive gold at a certain ratio, but I do not think there was any law or order of the Government declaring that gold was a legal tender among the public?—I may be wrong.

6322. Can you find anything more?—Nothing beyond that. I go on the Government order of 1841.

6323. (*The Chairman.*) For the purposes of all payments which had to be made to the Government, as I understand, it was made a legal tender?—It was made a legal tender.

6324. (*Mr. Chaplin.*) Were all creditors obliged to take it in discharge of their debt?—I was not in India then, I only give you what I know.

6325. (*Mr. Fremantle.*) A ratio was established between gold and silver for certain purposes?—The Government agreed to accept them at that ratio.

6326. (*Mr. Chaplin.*) But other people were not bound by it?—I do not know about that.

6327. (*Mr. Barbour.*) Have you any evidence that other people were bound by it?—I have no evidence, I was not in India at that time.

6328. (*Mr. Chaplin.*) Then in other words you have no evidence that gold was legal tender?—Not beyond the amount that was legal tender at Government treasuries. It may have been legal tender otherwise, but that I cannot say; I have given you all my authority.

6329. (*Sir T. Farrer.*) Do you know whether it was paid and received as a matter of fact?—Never.

6330. (*Mr. Barbour.*) Was there never any gold paid to the treasury under the operation of the Act?—I should think not.

6331. (*The Chairman.*) Would you be good enough to continue?—In France I consider that the standard varied from time to time according to changing circumstances. For a number of years gold was rather undervalued. Little was brought to the Mint, 18,000,000*l.*, as against 127,000,000*l.*, during the 30 years ending 1850. It generally commanded a premium, and did not circulate. The difference between France and India was, at that time, in my opinion, one not of kind but only of degree. The Napoleon did not go to so high a premium as the gold mohur, but the French standard, though nominally double, may almost be considered to have been then actually single silver. When there was a large increase in the production of gold the market value of that metal changed, and it became overvalued at the French ratio. From 1851 to 1866 the quantity tendered for coinage was consequently largely in excess of silver, 224,000,000*l.* as against 13,000,000*l.* For a portion of this period the action of the Mint controlled the markets, and the double standard was really operative, but eventually silver went to a premium, and did not circulate freely, and then, though the standard was still nominally double, it is a question whether it should not be considered to have been actually single gold.

6332. Can you give us the date when you say that silver went to a premium?—It was during the civil war in America, when the demand for silver for India set in. Afterwards there was a large increase in the production of silver. Market values changed and gold became again undervalued at the French ratio.

*Mr.
T. Comber.*
1. July 1887.

Mr.
T. Comber.
1 July 1887.

For a time the action of the French Mint again controlled the markets, but during the years 1872 and 1873 nothing but silver was tendered for coinage and the Government eventually refused to coin it. Since then the standard of France has undoubtedly been actually single gold; and her silver coins are as much tokens, in my opinion, as our own shillings.

6333. Do you attribute the refusal to coin it to the condition of things which you have just stated, or to the apprehension arising from the demonetisation of silver by Germany?—It was the apprehension that silver would be much depreciated. The demonetisation in Germany was, of course, one main factor in that depreciation.

6334. Then you attribute it to the joint operation of the state of the silver market, owing to the increased production and to the apprehension excited by the proposed demonetisation by Germany?—Yes, like other articles, excessive supply and apprehended diminished demand produced a fall in prices.

6335. (*Mr. Barbour.*) Do you know if the French Legislature has formally abolished the bimetallic system or has merely given authority to the Government to suspend the coinage of silver?—To suspend the coinage of silver, I believe; my contention is that it is equivalent to the suspension of a double standard. The experience of all three countries then appears to me to coincide and to show that a double standard cannot be permanently maintained under conditions that have heretofore existed. So far as it goes this is evidence against the maintaining of a double standard, even if the area over which the fixed ratio is established be extended.

6336. (*The Chairman.*) What have you to say on the fact to which the advocates of bimetalism point, that down to the time that France, as you say, ceased to be bimetallic in 1873, the price of silver, notwithstanding variations in the production of gold and silver, continued to be about the same?—I say that it was largely due to the action of the French mints and to the accident that the fluctuations in the supply of the two metals found her with a large stock of the metal which was being under produced. When gold was being largely produced during the discoveries in California and Australia, the currency of France had been almost altogether silver, and she had a very large stock of silver with which to feed the demand for that metal and a large vacuum in her currency which could be filled by gold. On the other hand, when silver became largely produced her currency was principally composed of gold, she had a large stock of gold to supply to other nations, and a large vacuum which would have been filled by silver if she had continued the coinage.

6337. (*Mr. Barbour.*) I believe France did absorb a good deal of the German silver?—I fancy so.

6338. Before she stopped the free coinage of silver?—I think so. During those two years, 1872 and 1873, she coined nothing but silver. My contention is, that if the increase had been just the other way, if, when gold was largely produced it had been the production of silver that had largely increased, she would not have been able to have maintained the fixed ratio or to control the markets.

6339. Do you think that the operation of the French system prevented a fall in gold in 1848?—To a very considerable extent, undoubtedly.

6340. (*Mr. Birch.*) As you stated just now, by the silver disappearing and the vacuum being filled by gold?—Yes.

6341. (*The Chairman.*) Then I understand your position to be that, in point of fact, the bimetallic system which existed in France did have an effect in steadying the price of both gold and silver at two different times, but that that arose in a measure from the accident of the position of France with reference to the possession of the precious metals respectively at those two epochs?—I think so. I think the action of France has been compared to a parachute, and it is a very good comparison, it prevents the balloon reach-

ing the ground quite so soon, but it does not stop its coming there eventually.

6342. And do you think that the result would have been the same supposing not France only, but all the great commercial nations had been bimetallic?—I have not given consideration to that question; of course the larger the area the greater the action of the parachute.

6343. Do you then arrive at the conclusion, from the facts to which you have called attention, that the permanent creation of a fixed ratio between the two metals as standards is possible?—I believe that it will be found impossible to permanently maintain a double standard, even when established over an extended area, by international agreement, and for the following reasons:—The figures as to the annual supply of gold and silver from the mines show that the production of gold is becoming less profitable even with the increased buying power which it has of late possessed; while on the other hand the production of silver is evidently becoming more profitable, even at the lower value to which it has recently fallen in the markets. I should like to put in a paper here which, if the Commission have not had the figures before, will prove interesting to them. It is a statement of the total dividends paid by certain joint stock mines in America as prepared by the "Engineering and Mining Journal," for the three years 1884, 1885, and 1886, and it divides them into mines producing gold only, mines producing gold and silver, mines producing gold, silver, and lead, and mines producing gold, silver, lead, and copper, and the result of the comparison, is this—that in 1884 the mines producing gold only distributed in dividends 2,222,000 dollars; the mines producing gold and other metals distributed 356,000 dollars. Two years later the mines producing gold only distributed in dividends 1,567,000 dollars, being a decrease of 655,000 dollars, the mines producing gold, silver, and other metals, distributed 1,925,000 dollars, being an increase of 1,569,000 dollars, so that while the profits on the one very largely fell off the profits on the other were quintupled. The effect of a fixed ratio, inasmuch as it will materially reduce the buying power of gold, will be to further largely curtail the production of that metal. I believe that the production will fall much below the world's consumption for other purposes than coinage, and that the stock at present existing as currency will be year by year diminished, and that eventually gold will command a premium and disappear from circulation. The production of silver will, on the other hand, be stimulated, for its buying power will be increased and an unlimited market will be secured for it by the opening of the mints under the international agreement. Silver alone will be tendered for coinage, and in course of time the metallic currency of the world will become wholly silver.

6344. (*Mr. Chaplin.*) Where would the gold go to if it disappears from circulation?—The gold will be used up in the arts and manufactures, and in hoarding in India and elsewhere.

6345. The whole of it?—The whole of it in course of time, a reasonable length of time.

6346. (*Mr. Barbour.*) May not that happen under the present circumstances, may not the supply of gold become less than the demand for arts and manufactures?—I do not think so, because the buying power of gold under the present system will increase, and stimulate its production.

6347. That is to say, gold will be saved from disappearing by a continual appreciation of the standard?—Possibly so.

6348. (*Mr. Chaplin.*) Can you tell us what is the relative proportion of gold now in circulation, and gold that is hoarded, or that is used in manufactures?—I will give you some figures, but they are very conjectural. I do not profess to have any special knowledge on that subject; I only take it from other authorities.

6349. What I mean is this, your statement would lead to the conclusion that the amount of gold to be

hoarded in the future, and to be used in manufactures would be enormously increased?—No, I could not give you a definite estimate of my own, but I could refer you to a definite estimate. I think there are two. There is one by Mr. Kimball, the director of the United States Mint; in his report for the year 1886.

6350. (*Mr. Courtney.*) But your suggestion of the possibility of the gold now in currency being exhausted in the use in arts does not depend upon a considerable increase of the use of gold in arts?—No, I do not think so. I am going to give you what I believe to be a fair estimate of the present consumption; regarding the future I do not anticipate any increase whatever.

6351. (*Mr. Chaplin.*) No, but I understood you to say that the whole of the gold in circulation under certain circumstances would ultimately disappear?—Yes.

6352. And that it would be used either for the purpose of hoarding or in manufactures. Well, there is a certain amount of gold in circulation now, and there is a certain amount, I suppose, used for those purposes at the present moment also, but the amount of gold in circulation, I imagine, enormously exceeds the amount used for those other purposes, is it not so?—Well, I will give you what I consider to be fair figures, but as I stated they are very conjectural, therefore it is very difficult to follow them. Assuming that the stock of gold now is 1,200,000,000*l.*

6353. Is that in circulation?—No. Of which 700,000,000*l.* consists of coin or of bullion held by the banks which may be considered as good as coin, leaving 500,000,000*l.* supposed to exist in the shape of manufactured articles and hoards. Then as to the consumption in the arts, you asked me a question, and I was going to give you the estimate of Mr. Kimball. It is the estimated annual consumption by the principal nations of the world. In the United States, 13,000,000 of dollars; in England, 11,500,000; in France, 8,600,000; in Germany, 8,200,000; in Switzerland, 6,600,000; in other countries, 9,500,000; total, 57,400,000 dollars. But that does not include any consumption by India and eastern countries generally, nor by Mexico and South America.

6354. (*Sir T. Farrer.*) All these figures are necessarily very loose estimates, are they not?—I believe so. I believe there is also Mr. Palgrave's estimate before the Commission on the Depression of Trade, and I believe that he estimates the consumption in arts and manufactures at 12,500,000*l.*, and the outflow to India at 4,000,000*l.*, making a total of 16,500,000*l.*

6355. (*Mr. Courtney.*) Pounds sterling, of course?—Pounds sterling.

6356. (*Sir L. Mallet.*) How long, do you think, with the annual consumption of, say, 16,000,000*l.* of gold, the stock of gold at present employed in coinage of 700,000,000*l.* would last?—I will give you those figures, if you like. I take Mr. Palgrave's estimate of 12,500,000*l.* for industrial purposes, 4,000,000*l.* for hoarding in India, and I add 1,500,000*l.* for hoarding elsewhere, which I believe goes on, making a total of 18,000,000*l.*

6357. Well, that is nearly the whole annual production?—Well, I consider that the annual production will be very largely curtailed, and will probably sink. It is quite conjectural what it will sink to, but I take 6,000,000*l.* That would give 12,000,000*l.* annually to be taken out of the estimated stock of gold, which I take as 700,000,000*l.* In the course of 30 years the 700,000,000*l.* would be reduced by one half, and I think that long before then gold would go to a premium and would disappear from circulation. I think it even possible that, from the very first, capitalists, who hold reserves of bullion, would prefer to hold them in gold, and I would instance the Bank of France, which, at the end of last year, to protect her reserves of gold, charged a premium of 4½ to 6 per mille.

6358. (*The Chairman.*) A premium for what?—

For gold, when it was required for export or other purposes.

6359. (*Mr. Barbour.*) Although gold was the standard of the country?—Yes.

6360. Really the standard?—Yes.

6361. (*Mr. Courtney.*) But nobody is bound to pay in gold, not even the Bank of France; it is not the standard in France?—The debtor always has the option.

6362. (*Mr. Barbour.*) But France has got, at present, a gold standard?—Yes.

6363. (*The Chairman.*) A gold standard, but with the option to pay in silver at a fixed ratio?—Quite so.

6364. (*Mr. Barbour.*) But may not, under any circumstances, the consumption of gold in the arts and manufactures largely increase. For example, the production of gold in the beginning of this century did not average 4,000,000*l.* a year at the outside, and therefore, apparently, 16,000,000*l.* a year or more for the arts and manufactures and hoarding is four or five times the production of that time; so there must have been a very great increase in the consumption of gold in the way stated since the beginning of this century?—There must have been an increase, but as to the probability of that increase continuing I have not sufficient special knowledge to venture an opinion.

6365. But if a great increase has taken place in the past, and the world has not less wealth, but more wealth, is the increase not likely to continue in the future?—It appears to me probable, but I have no special knowledge.

6366. (*The Chairman.*) That would appear to be the result you would anticipate from the extension of the general system of bimetallism to the commercial nations of the world?—That is the result which, more or less, I should venture to anticipate, not tying myself in any way to the figures or the number of years which would be requisite to attain the end which I venture to foreshadow.

6367. (*Mr. Birch.*) But that is on the ratio of 15½ to 1?—That is on the ratio of 15½ to 1.

6368. (*Sir L. Mallet.*) Should you think that that would be an undesirable result?—Very much so. I think it is much better for gold and silver to perform what bimetallists call the function of money than for any one metal to perform it. It will be a natural appreciation.

6369. (*Mr. Barbour.*) Do you call the exclusion of silver from the coinage of Europe and the free coinage of gold a natural appreciation of gold?—So far as this country is concerned, because its gold standard was established many years ago.

6370. When was the silver standard finally abolished in this country?—1816.

6371. (*The Chairman.*) You have alluded to the fact that the purchasing power of gold is greater than it was before?—Yes.

6372. Do you regard that as necessarily an evil?—For this country?

6373. Yes?—No; on the contrary, I think it is an advantage to this country.

6374. Will you tell us why you think it is advantageous to this country?—This country is a creditor nation. It has made large loans to foreign countries on a gold basis, and the annual interest it receives in the shape of commodities. When the purchasing power of gold increases the quantity of the commodities which it receives in payment likewise increases, and that is a benefit to the country.

6375. Is there any other respect in which you think it beneficial?—I think it is beneficial to a certain extent in India, because India is entirely differently situated.

6376. (*Mr. Barbour.*) Do you mean that the appreciation of gold is beneficial to India, or the depreciation of silver?—The depreciation of silver. It is the same thing. India is a producing country. She produces and exports sufficient to pay for her imports, for what has been termed the Government tribute, by which I mean the liabilities of the Indian Government

Mr.
T. Comber.

in London, and to receive a balance in treasure, largely composed of silver, from her debtors, viz., the recipients of her exported produce. The lower silver falls, the more silver she exacts from her debtors, just as the higher gold rises the more commodities England exacts from her debtors. I think both countries are benefited by the recent change in the value of the precious metals.

6377. Do you think that India receives more from England, and England pays less for what she gets from India?—I do not take it as between India and England; I take it as between England and the rest of the world, and India and the rest of the world.

6378. Let us confine the question to India and England for the purpose of discussion?—That I have not investigated.

6379. But you hold that England gains on the whole more than she otherwise would do, and India also gains more than she otherwise would do?—On the balance of trade, yes. I enter into that explanation because I see, in a despatch of the Viceroy of India, that he points out that those persons who are of opinion that India has gained by the fall in exchange hold, as an essential part of the same opinion, that England and all other countries with a gold standard have lost in an exactly equal degree. That is what I want to controvert.

6380. (*The Chairman.*) You do not agree with that?—I do not agree with that.

6381. You hold that India has gained; you do not hold that India has lost?—I think not.

6382. (*Sir L. Mallet.*) I think you have said that one very great advantage to England is the fact of her being a creditor nation, that she lends money on a gold basis. The interest on that is paid in commodities, consequently she gets a larger amount of commodities, which is a benefit. Well, India is one of the countries to which these gold loans have been made. She has to pay a large quantity of commodities as interest on those loans. How should that be an advantage to India? If it is an advantage to England to get more, it is a disadvantage to India to pay more?—The item to which you have alluded is only one item in India's balance of trade, and it is more than counterbalanced by the other items.

6383. (*The Chairman.*) So that in the result, including that item, India is a creditor nation?—Yes, India is a creditor nation, and has to receive payment for the balance due to her. She exacts part of it in largely increased imports, and beyond that she also exacts payment of the balance in treasure.

6384. So that I understand your view to be this: that if you were to regard only that one item in the account between India and other countries which consists of a payment of interest on gold debt, she would be a loser by the depreciation of silver in relation to gold, yet allowing for that disadvantage, when you look at the total position of India as a whole, that disadvantage is more than counterbalanced by the advantages?—Exactly so.

6385. (*Sir John Lubbock.*) The silver debt of India is much larger than the gold debt?—I think they are pretty nearly equal, but I have not got figures, it is only a general impression. You will get that from other people much better than from me.

6386. (*The Chairman.*) Now with regard to the alleged depression of trade and agriculture in this country, owing to the suggested appreciation of gold, what have you to say?—I think that it is, as regards trade, much more largely due to other circumstances.

6387. What are the other circumstances to which you would call attention?—A great deal of loss undoubtedly has been sustained by the commercial community in consequence of the fall of gold prices, but I attribute that fall of gold prices largely to other causes than the absence of a fixed ratio.

6388. (*Mr. Barbour.*) Do you attribute it partly to the absence of a fixed ratio?—Partly to that. I think it is much more largely attributable to the cheaper production and over supply of various commodities; to the cheapening of the cost of transit,

both by land and by sea; to the elimination of middle men so that produce reaches the market without passing through so many hands; and to the cutting down of trade profits resulting from the increase of competition. As to the second of those items, the cheapening of the cost of transit both by land and sea; I should like to place before you some figures which have been prepared for me by one of my neighbours in the Bombay trade who is much more largely engaged in the wheat business than I am. The decrease in the value of wheat from 1875 to the present time may be taken at 10s. a quarter. He has calculated the cost of carriage from Cawnpore to Liverpool, and he finds that the cheapening of it during that time has been, from Cawnpore to Bombay 2s. per quarter; from Bombay to the United Kingdom 7s. 3d. a quarter, making a total of 9s. 3d. reduced cost of transit, or very nearly as much as the reduced price for wheat. He has also calculated the cost of transit from Chicago to Liverpool. He finds the reduction in the land carriage from Chicago to New York was 3s. 4d. and the decline in the cost of sea freight was 4s. 10d. a quarter, making a total of 8s. 2d.

6389. (*Mr. Chaplin.*) That is from America?—From America.

6390. (*Mr. Barbour.*) May I ask what rate of freight is taken from Bombay?—He has taken 50s. in 1875 and 20s. now, I think. He is more largely engaged in the charter of steamers than anybody in the trade.

6391. (*Mr. Chaplin.*) What is the price at which he estimates the wheat in 1875?—He takes it at 45s. a quarter in 1875 and 35s. a quarter now.

6392. (*Sir John Lubbock.*) And to those figures of 9s. 3d. and 8s. 2d. would probably have to be added something further for the facility you have in getting to Chicago or Cawnpore?—Chicago and Cawnpore are taken as being more or less the centres of the producing districts, for some wheat which came from a further distance it may be more, but some may be produced much nearer the shipping ports, and he has taken those places as an average.

6393. At the same time those are not the actual spots at which the wheat is grown, and to those figures there would certainly have to be made some addition?—If they all came through those spots it would be so, but some comes without passing through Chicago to New York; some might be grown quite close to New York.

6394. Clearly on whatever wheat comes from places farther off than Chicago, of course there would be an additional saving?—No doubt.

6395. I am not speaking of the wheat which came necessarily further, but of the wheat which came through those centres. There would not only be that reduction, but there would be some further reduction from the place at which it was grown?—This would be so.

6396. (*Mr. Chaplin.*) It would depend upon whether between 1875 and 1885 there had been any variation in the cost of bringing them to those centres?—I have no special knowledge of the rates of carriage in America myself, but I take it for granted that if the railway carriage from Chicago to New York is reduced, the chances are that the rate of carriage from the point of growth to Chicago, on such portion as comes through Chicago, would also be reduced.

6397. But would not your faith in that calculation be somewhat shaken by the fact that I find that in the year 1877 the average price of wheat was 56s. a quarter?—I did not prepare those figures myself, they were prepared by Mr. Nixon, who is largely engaged in the trade, more largely than I am, and I presume he selected that year as being a fair average.

6398. In that particular year, 1875, it is true it is put at 45s. 2d., but two years later than that it is 56s. 9d., or nearly 60s. a quarter, and it is now a good deal less than 35s.; therefore the increased rate of transit would not sufficiently account for the fall?—The 35s. was not the average price, it was the price at the date he made up his calculation. My object in putting

forward the figures is merely to show how largely the cost of transit has decreased since 1875, when the fall of silver first began.

6399. (*Mr. Barbour.*) Do you think that the lowering of the cost of production of commodities, and the cheapening the cost of carriage, would affect the relative value of gold and silver?—I do not think so at all.

6400. That is a separate question?—Quite.

6401-3. (*The Chairman.*) I suppose if half the crop failed in India the price would go up, and if there was double the average crop the price would go down, but that would not affect the fact that in either case they would be able to charge 8s. 4d. less than they would have done if they had not had that reduction in the cost of transit?—Yes.

6404. (*Mr. Barbour.*) Would you not ordinarily expect that the opening out of a new market for Indian wheat by a reduction in the cost of carriage to Europe would tend to increase the price of wheat?—I should expect that it would have that effect.

6405. (*Sir T. Farrer.*) Then you account for nearly the whole of the fall in the price of wheat by diminution in the cost of production and transport?—I do not wish to go so far as that, I merely wish to show how greatly the cost of transport has decreased.

6406. But you do not add the diminution in the cost of transport to the exchange, and say that is the diminution in the cost of wheat?—Exchange has helped to put down the price of wheat, and a thousand and one other things have affected the price of wheat. I am merely mentioning how much the cost of transport has been reduced, which will be one of the forces that will produce that effect.

6407. But the figures that you have given account for pretty nearly the whole of the fall in the price of wheat?—Very nearly, but they vary from year to year, as has been pointed out.

6408. (*The Chairman.*) What you mean is, that supposing the present year and the year 1875 were what we may call normal years, as regards production and demand in India, the difference in the cost of transit would account for the difference in the price between these two years?—Largely account, not altogether.

6409. Now with reference to a general fall of prices as affecting trade; do you consider that an unmixed evil?—While it is in process it produces loss, but when it has taken place I think it produces safety.

6410. Can you give your grounds for saying so?—When prices fall merchants, who always hold more or less stock, merchants and dealers throughout the country, lose on their holding.

6411. Yes, that is the loss while it is going on, but what is your reason for saying that it leads to a condition of greater safety afterwards?—There is less room for a further fall.

6412. (*Mr. Barbour.*) But are you not looking too exclusively to the interests of the merchants? We must also consider the producers. A fall in prices is a fall for the producer too. It is unpleasant, no doubt, for both parties while the fall is going on, but it takes a longer time for things to adjust themselves to that lower price for the producer than for the merchant?—By the producer do you mean the farmer?

6413. The farmer in his capacity of producer would lose?—Yes, the farmer would lose, until he could get his rents adjusted, but when he gets his rents adjusted he makes a living profit, whether he makes it at 1l. an acre or 3l. an acre.

6414. He passes the loss on to the landowner?—He passes it on to the landowner, and the landowner undoubtedly suffers.

6415. And the process of having the rent adjusted to correspond with the prices may be a very troublesome one, as we see in Ireland?—It may be, but I think in the long run it will be effected.

6416. (*The Chairman.*) Should you dispute the proposition that a variation in the purchasing power of the standard, depending on the greater scarcity

of the metal which formed the standard, was a disadvantageous thing?—I think the steadier the standard could be kept the better.

6417. As regards fixed payments that have to be made at a future date, it does alter the obligations of the debtor to the creditor substantially if the standard varies between the date when that obligation was contracted and the date when it has to be performed?—I think that is self-apparent.

6418. And of course, if it could be avoided, you would not deny that it would be desirable to avoid it?—Just so.

6419. What have you to say with regard to the suggestion that, trade being largely carried on with money borrowed from capitalists, there has been a disturbance in the relation of the trader to the lender, owing to a change in the value of gold?—I think that it has been very largely exaggerated by some of the people who have written on the subject. I do not think that the trade of the country is so largely carried on by borrowed capital as some of the writers on the bimetallic side have contended.

6420. (*Sir T. Farrer.*) And would the loans be permanent loans, or would they be loans from day to day, the terms of which would be altered according to the state of circumstances?—The greater part of the loans would be temporary loans, but of course the joint stock companies borrow very often in debentures. These may be permanent loans, but the greater part would be fluctuating and temporary loans.

6421. (*The Chairman.*) Your view is that even if you adopted the double standard with a fixed ratio such as that suggested, it would not really make your standard less variable than it is at present?—I think so.

6422. (*Mr. Barbour.*) Would not the average of the two metals have the effect of producing a more stable standard than if you allowed them to vary independently?—My opinion is that within an appreciable time you would only have one and you could not take the average of two.

6423. But that would be on the whole the cheaper metal of the two, would it not?—The cheaper metal of the two.

6424. I mean there would be less appreciation of that metal?—It is cheaper in one sense; at present it is worth only one twentieth part of the other, but it might appreciate or depreciate.

6425. It might appreciate or depreciate, but what I say is this: you have two metals at a fixed ratio and one of them appreciates as you may say out of existence as money; clearly the other or the less appreciating standard is the one that would remain?—The less appreciating certainly, it may very largely depreciate.

6426. (*The Chairman.*) Then whilst those who have fixed payments to make have suffered from the greater purchasing power of gold, and those who have fixed payments to receive have benefited, what have you to say with reference to the wage earning classes?—Wages are very slow to feel the influence of any change in the standard of value, and they have not decreased as much as the prices of produce have decreased; consequently the condition of the wage earning class is now very much better than it was 14 or 15 years ago.

6427. (*Mr. Barbour.*) You think their wages have fallen something?—In particular instances they may have fallen.

6428. Take an average if it is possible to do so?—I should like you to refer to some tables which were prepared by my partner, Mr. Lord, for the Commission on the Depression of Trade, in which he showed that although the rate of wage given to cotton operatives in Lancashire had declined, the weekly earnings of the operatives in consequence of the larger amount of work which by better machinery they were able to turn out had very considerably increased, but that is not as between 1873 and now, but as between the time at which he spoke and 30 or 40 years ago.

6429. But as between 14 or 15 years ago and the

*Mr.
T. Comber.*
1 July 1887.

Mr.
T. Comber.
1 July 1887.

present day?—I should think that, speaking generally, wages had decreased very little.

6430. Very little, but something?—Something.

6431. (*Mr. Courtney.*) Money wages?—Money wages.

6432. Real wages?—Real wages, that is to say the buying power that the wages represent, have risen I think decidedly.

6433. (*Mr. Barbour.*) That is owing to the cheapening of the cost of production of commodities?—A man can buy for his reduced money wage a great deal more than he could 14 or 15 years ago.

6434. That cheapening of the cost of production of commodities would not be lessened by the adoption of bimetallism?—In so far as relates to the reduced cost of transport and so forth it would not.

6435. (*The Chairman.*) Therefore your view being that the larger proportion of the diminished cost of commodities has arisen from causes other than the standard, there would be nothing in the adoption of bimetallism to prevent all those other causes acting still?—I think not.

6436. (*Sir T. Farrer.*) But so far as alteration of the standard goes and a diminution of the purchasing power of gold, it would have the effect that you speak of on wages?—There is no doubt.

6437. So far as bimetallism had the effect of depreciating the standard?—It would largely increase the price of various commodities to the wage earning classes.

6438. (*The Chairman.*) I am not quite sure that I follow that. Why should it largely increase the price of commodities if the diminished price of commodities has chiefly resulted from causes other than those which have relation to the standard?—It would largely diminish the purchasing power of, I was going to say gold, but gold and silver combined, the standard.

6439. But why should it do that?—Because silver is produced to such excess that the large quantity of it that would be tendered for coinage would very largely increase the currency, and that always has the effect of raising prices.

6440. (*Mr. Chaplin.*) You mean that one effect, at all events, of the adoption of the bimetallic theory would be to increase prices generally?—Yes.

6441. Largely, you say?—I think largely in time, as the production of the mines comes into the currency.

6442. (*Mr. Barbour.*) And supposing that the adoption of bimetallism at 1 to 21 was chosen, what would be the effect on prices as compared with present prices?—I should think very little for a time.

6443. And ultimately?—Ultimately, if the production of the mines was very largely increased, it would tend to send them up.

6444. (*Sir W. H. Houldsworth.*) Would not the same effect that you say would be produced on the commodities be produced on wages?—I think so. I think that the wage earning classes are quite able to take care of themselves.

6445. And therefore their relative position between the wages and commodities, although both had risen, would be the same?—I think the wages would be slower to rise than other things.

6446. (*Sir L. Mallet.*) You say that you think on the whole that the effect of the increased purchasing power of gold has been favourable to the wage earning class?—I think so, yes.

6447. Are you aware that that opinion is entirely opposed to that of a great many very eminent economical authorities, more particularly I might refer to Professor Cairnes, who is very well known to most of us, and who wrote a series of very valuable essays on the gold question, in which, after arguing very elaborately and with his usual great power of exposition and skill, he comes to the conclusion that although the result of those gold discoveries has been an advantage in many respects, on the whole it has been unfavourable. Still in spite of that he distinctly came to the conclusion, as regards the wage earning classes, that it was a decided advantage; and that opinion, I

think, would be held by a great many authorities. It is curious to find a diametrically opposite opinion on that very vital question held by both sides of this argument?—I have given you the best opinion I can form quite independently.

6448. (*Mr. Barbour.*) I believe between 1848 and 1873 the condition of the wage earning class improved immensely?—I fancy so; I believe so.

6449. Everbody says it did?—Yes.

6450. The standard of value was pretty steady between 1848 and 1873?—The standard of value; that was while France still maintained the double standard.

6451. Notwithstanding the great production of gold, (I believe the production increased to 10 times what it was before,) the operation of the bimetallic system almost kept the standard steady during that time?—I have already given my views that it did at times. And during that time, while the standard of value was pretty steady, there is no doubt that trade and manufactures largely increased in this country and that the operatives increased their wages.

6452. (*The Chairman.*) The extent to which the adoption of bimetallism at any ratio of gold to silver would affect prices, would depend upon what the real relation is between prices and an increase or diminution of the volume of the currency?—I think so. I do not quite follow your question.

6453. Well, you have assumed, I rather gather, what some people question, that an addition to the volume of the currency must directly and extensively affect prices?—Yes.

6454. And when you say that prices would largely rise if you adopted bimetallism at a particular ratio, it is upon the assumption of the direct relation, which some people doubt, between a change in the volume of currency and the prices?—It is quite so.

6455. (*Sir T. Farrer.*) Supposing that price did not depend upon a direct relation between the volume of currency and the transactions of commerce, but upon a value of the standard unit of metal, the value of that standard unit of metal will still be affected by the demands which are made upon that metal for the purposes of currency? It is proposed, is it not, by bimetallism that silver shall be made equally with gold the currency of the world?—I understand so.

6456. And the effect of that would be to increase the value of silver, and to diminish the value of gold, considered as metals?—Yes.

6457. Therefore, what are now gold prices would be altered and would rise, even though there were no direct relation between the volume of currency and the individual transactions, because there would be a less demand upon gold and a greater demand upon silver?—Gold prices would then cease. What are now gold prices would rise when they came to be currency prices, and what are now silver prices would fall when they came to be currency prices.

6458. (*The Chairman.*) Supposing that you did not alter in the slightest degree the volume of the currency, but substituted so much silver for so much gold; and had the same volume as before, taking the two at a fixed ratio, why should there be any alteration of prices at all?—After the change, caused at first by the adjustment of exchange, I do not think, under these circumstances, that there would be.

6459. (*Sir T. Farrer.*) But what ratio would you take. Taking it at 1 to 21 there would be no difference?—No difference.

6460. Supposing that you adopted bimetallism for the whole of the civilized world, including India, and that you adopted it at a ratio of 15 to 1 instead of the present ratio of 20 or 21 to 1, what would be the effect on prices in India, and what would be the effect on prices in England?—Prices in India would undoubtedly fall considerably, and prices in England would rise.

6461. (*Mr. Barbour.*) And supposing there was an increased production of silver owing to the adoption of this new ratio, what would be the effect of that

on India?—As the volume of the currency increased I should think prices would tend to rise again.

6462. Do you think that if the value of gold and silver altered to-morrow on the London market from 44*d.* an ounce to 60*d.* an ounce, that instantaneously all values all over India would fall in proportion?—I do not say instantaneously, but in the course of a comparatively short time.

6463. Do you think it would be a short time or a very long time?—I should say it would be a short time. I know that at ports for shipment the prices would change immediately.

6464. Do you think an immediate change would take place in the silver prices of articles produced in the interior of India and wholly consumed by the people of India?—As the production of them would be affected by the production of the other articles. If you would allow me to explain, wheat and seeds and cotton and indigo and a very large proportion of what India produces is exported to other countries. If the price of those articles fall, as I think you admit they will fall, the cultivator would tend to produce much more largely those articles the price of which has not fallen, and by that larger production he would eventually reduce the prices of those articles to which you have alluded, and which are not exported from India.

6465. The question is what length of time would that process take to affect prices generally in India, not of articles exported, but of the articles consumed in the country?—I should think a year or two.

6466. (*The Chairman.*) I am not sure yet that I quite understand your view. Supposing that you fixed for the great commercial nations a ratio of 15½ to 1 to-morrow, why should prices in this country thereupon rise?—I have attributed the fall of prices partly to what is generally termed the appreciation of gold.

6467. But you attribute it very little to that?—Well, to that extent, I think, prices would at once rise.

6468. That I understand, but I thought that your view was that although the fall of prices very little depended upon that, if you fixed the bimetallic ratio there would be a very large rise of prices?—It would depend a good deal upon the ratio that was fixed.

6469. I am supposing 15½ to 1?—I think then that there would be a rise in prices.

6470. (*Mr. Courtney.*) But is there any difficulty in reconciling the two propositions. Supposing silver did not exist at all, and that our currency was simply gold, might there not have been during the last 10 years a great diminution in prices, owing to the diminution of the cost of production, of carriage, and other circumstances to which you have referred?—I think that a considerable amount of the fall that has taken place has been caused by the decreased cost of transport and other things which I have enumerated.

6471. Quite so, and if we could blot out of our experience the fact that there is such a metal as silver the same sequence of cause might have been in operation, bringing down gold prices which would then be gold prices?—Bringing them down, but not quite to the extent to which they have fallen.

6472. But still largely operative to bring down prices as they have been brought down?—I think so.

6473. Well now, if upon that supposition you add this other that henceforth any person, who is bound to pay an ounce of gold, should be equally at liberty to pay 15½ ounces of silver; if the 15½ ounces of silver are much cheaper in the market than the ounce of gold, would not the effect of that alteration in the condition of payment at once cause a very considerable change in prices to ensue?—It would depend a great deal upon the cheapness of the silver which was brought into the currency.

6474. I take it that 15½ ounces of silver are to be an equivalent, for the purpose of payment, to one ounce of gold. If, as we know by experience at this moment, 15½ ounces of silver can be produced at a much less rate than one ounce of gold, the effect I have referred to would follow?—That would be the effect.

Undoubtedly there would be a rise, but until the amount of silver in currency largely increased I do not think the rise would be very material.

6475. The difficulty to which the Chairman has referred appears to be this, that you cannot have a rise of prices, according to the theory of money, without a commensurate increase in the volume of the currency. Would not the effect of introducing such a capacity of payment as I have referred to, of 15½ ounces of silver being worth one ounce of gold, at once produce a movement, going on *pari passu*, an increase of the currency and a rise of prices, not one as the cause of the other, but two conditions flowing from the same cause, namely, the fact that the 15½ ounces of silver are worth for the purposes of payment one ounce of gold, and that they may be obtained with much less cost than one ounce of gold. The tendency undoubtedly would be to cause a rise of prices if the cheaper silver were brought in, and the currency at the same time were to be augmented?—Yes, certainly.

6476. They would go on together?—They would go on together.

6477. They are conditions of one another, rather than causes of one another?—As the currency increased higher and higher would go the prices.

6478. (*The Chairman.*) I thought that, according to your view, as the silver went in the gold would go out, therefore the volume would not be greater?—I am assuming that there is a very large increase in the production of silver. You put it to me as part of the question, that the volume of the currency should largely increase, and I answered it on that hypothesis.

6479. What I wish to put to you is this: the extent to which this affected prices, even in the view suggested in the question put to you, must depend on this, must it not? We are supposing that that fixed ratio extends to all commercial nations, so that everybody in England, France, Germany, Italy, and the United States would have an equal right to discharge the obligation of one ounce of gold by 15½ ounces of silver. Then the extent to which that would affect prices would depend upon the amount of silver that would be available for all those creditors to get hold of to discharge their obligations with?—Yes.

6480. (*Mr. Courtney.*) That could be poured in from month to month, you might say?—The effect on prices even in a silver country where they already have an option of paying in silver would be to eventually cause a rise in prices.

6481. (*The Chairman.*) I was talking of the gold using countries adopting a bimetallic standard, where, I understand you to suggest, because your suggestion would not apply to England alone, that if all the gold using nations became bimetallic, prices would rise everywhere else as much as in England?—They would rise in all gold countries.

6482. Well, the extent to which they would rise must depend, must it not, upon the amount of silver which you suppose it would be advantageous to the debtors to pay?—There would be an immediate effect, because silver is cheaper than gold, and when silver is brought into the currency, that reduces, as it were, the average of the currency in my view, and would of course cause a rise in prices.

6483. I am looking at it apart from the consideration of currency at all?—I cannot consider prices apart from currency.

6484. Apart from the volume of currency. What I was going to ask you next was this, whether, if it were so advantageous to all the debtors in all the great commercial countries of the world, whose debts would be very largely in gold, to pay silver instead of gold, there would not be immediately such an increase in the demand for silver as to be likely to raise the price of silver, and therefore make it less and less advantageous to take that course?—The present price of silver would change at once, immediately, instantaneously.

6485. And rise?—And rise, yes.

6486. (*Sir T. Farrer.*) What would be the effect upon the different countries? France holds a quantity

Mr.
T. Comber.
1 July 1887.

Mr.
T. Comber.
1 July 1887.

of silver, the United States holds a quantity of silver, India holds a quantity of silver. Would all that silver rise in value?—Certainly, when the fixed ratio was established. Its value with relation to gold would at once change, its gold price would at once change.

6487. Then silver in all those countries, the value of the property which those nations hold in silver, would rise?—Yes.

6488. And the gold of those nations which hold gold would fall in proportion?—I think so.

6489. Therefore the adoption of bimetallism at the ratio of $15\frac{1}{2}$ to 1 would be a gain to the silver possessing countries and a loss to the gold possessing countries?—It would be a gain to a country which held a large stock of silver, so far as that stock of silver was concerned.

6490. (*Mr. Barbour.*) And if a country happened to hold both gold and silver, as India does, and I believe France, the loss and gain might balance?—It might if the quantities were about equal.

6491. And in any case the loss or gain would be exactly equivalent to the gain or loss from the abandonment of the old ratio?—So far as the effect of the currency is concerned, but value has had many influences brought to bear upon it since that time.

6492. (*Mr. Birch.*) I understood you to say that prices have fallen where the competition from the silver using countries, from India, for instance, had come in, while India had benefited by the exchange?—I have given my reasons for thinking India should benefit.

6493. Then she would lose that benefit supposing the ratio were raised to $15\frac{1}{2}$ to 1?—Yes; I think India, as a whole, would very decidedly and very greatly suffer if the ratio of $15\frac{1}{2}$ to one were adopted.

6494. (*Mr. Barbour.*) Who do you think would get the benefit of that loss to India?—Those nations which hold a large stock of silver, and more especially the owners of silver mines.

6495. (*Mr. Birch.*) We were told the other day by one of our witnesses that should a ratio of $15\frac{1}{2}$ of silver to one of gold be established, not another quarter of wheat would be shipped from Chili, and not an ounce of copper, that it would stop the shipping, therefore it would raise the price here by keeping that competition out of our markets?—I do not know anything about Chili. I do not think it would stop the import of Indian wheat, for instance.

6496. The export from India?—The export from India, and the import into this country of Indian wheat. To a certain extent it would check it, it would not be in favour of it, but I do not think it would stop it by any means.

6497. Can you tell us the proportion of grain that India ships to this country, compared with what she consumes herself?—No, I do not know what she consumes.

6498. (*The Chairman.*) One disadvantage of the present system, in which the change in the relative value of silver and gold arises, has been said to be that it checks the investment of British capital in silver using countries; what have you to say with regard to that?—I think as regards loans it has that effect. Capitalists will not lend money to incur the risk of interest and principal being repaid in silver, which may be still further depreciated, without having a *quid pro quo* in the shape of larger interest; but as regards investments in industrial undertakings, I do not think it would have the effect of checking outlay of capital in silver countries.

6499. What is your reason for that statement?—The reason is that if the value of silver were to decline, the value of every industrial undertaking, other things being equal, would advance in exact proportion, so that the gold value would be the same.

6500. (*Mr. Barbour.*) That is on the assumption of which we spoke a little time ago that the value of everything alters with the alteration of the gold value of silver; that silver prices alter very quickly after the gold price of silver is altered?—As regards India, certainly.

6501. (*Sir L. Mallet.*) Is it not a fact that in consequence, I suppose, of the present price of silver the Government of India has found it impossible to get railways constructed in India except by giving a guarantee?—I have no special knowledge on that point.

6502. That is the fact. She has been compelled to give a guarantee and interest in gold at an increased rate, in consequence of the impossibility of finding British capitalists willing to embark in railway enterprises. One railway was started, you know, without any guarantee at all, and that movement was entirely checked?—I have never had anything to do with the raising of capital for Indian railways.

6503. (*Mr. Barbour.*) If you will allow me, I will read to you what a Bombay merchant wrote to me last September on the subject of the investment of capital in silver countries. I may mention that the enterprise in which he is engaged is a very prosperous one:—"There can be no doubt that the uncertainty of exchange has checked foreign capital. No sane man would bring out money here with the uncertainty as to what it would be worth later on. Our . . . capital we brought out at $1s. 11d.$ I could send it home to-day at $1s. 4\frac{3}{4}d.$. . . I have no doubt that English capital would come here for every promising scheme if it were not for the uncertainty regarding exchange." You do not agree with that?—I do not agree with it.

6504. Do you agree with that partly?—I do not as regards industrial undertakings.

6505. (*The Chairman.*) You agree that while formerly he could send it home at $1s. 11d.$, he can do so now only at $1s. 4\frac{3}{4}d.$, only you say that he could get as much for his $1s. 4\frac{3}{4}d.$ as he could for his $1s. 11d.$ I understand?—I do not know the circumstances of the case. That he could formerly send it home at one rate, and now at a very much lower rate is patent.

6506. What I understand you to suggest is, that although there has been a fall in exchange there would not necessarily be a fall in the real value, even in gold of the money invested in industrial undertakings in India?—That is it.

6507. It is true that if you had to send the money home you would have to send it home at the exchange of $1s. 4\frac{3}{4}d.$ instead of $1s. 11d.$, but you would get so many more rupees for your industrial undertakings than you did before, and you would be able to send the same amount of gold home?—Other things being equal.

6508. (*Sir T. Farrer.*) There is another alternative that the gold which you receive may be worth so much more, supposing that the change has taken place rather in the relation of gold to commodities than to silver to commodities; is that not so?—Yes, you are quite right in that. It might be a smaller amount of gold, but the purchasing value of that gold would be greater.

6509. The commodities would be the same, whether there were more or less silver would be comparatively immaterial?—That is it.

6510. (*Mr. Courtney.*) And in that view it would not matter in the least, whether you invested 10,000*l.* in commodities in India, or 10,000*l.* in commodities in Great Britain. At the end of ten years the commodities might sell, those special commodities, for a less amount than 10,000*l.*, but the amount would be equally powerful to buy other commodities?—Yes.

6511. (*The Chairman.*) But do you not think that people investing money are so much affected by what one may perhaps term sentiment rather than reason, that if they invested their 10,000*l.* in gold and they could only count on getting say 9,000*l.* back in gold, they might be unwilling to invest, though you could show them that the 9,000*l.* would buy as much as 10,000*l.* could before?—There might be a sentimental objection.

6512. People still insist on payment of interest out of capital, though it has been demonstrated to them

that they only get so much of their own money back?—Yes.

6513. But the same thing would happen, would it not, supposing it were an investment in a gold using country if it was the value of gold that increased. A man who invested 10,000*l.* in Australia would only receive 9,000*l.* instead of 10,000*l.*, but the 9,000*l.* would be worth quite as much as the 10,000*l.* was before?—Yes.

6514. (*Mr. Barbour.*) The fall in silver in relation to gold during the last 14 years has been rather more than 25 per cent.?—Yes, it is more than 25 per cent.

6515. And very little short of 2 per cent. per annum for this period of 14 years?—Just about that.

6516. Do you not think it a serious drawback in going into any investment, to feel that possibly you may be losing every year, during a period of 14 years, 2 per cent. every year of your capital, which you have to cover by increased profits?—That is so, but I am assuming that in industrial undertakings, other things being equal, the amount would not remain fixed, but would increase in rupees as the exchange falls.

6517. But would not that increase have to be very considerable and very rapid to cover the loss of 2 per cent. on your capital every year for 14 years?—I do not think it is more rapid than I should expect, other things being equal.

6518. As matter of fact, have industrial enterprises in India been giving that large per-centage of profit to cover the fall in their original gold value?—No; other things have not been equal.

6519. (*The Chairman.*) Now, as regards the unsettlement of trade between gold and silver using countries owing to the change in the relative values of the metals, have you any observations to make?—That is a question on which I can speak with greater confidence than any on which you have yet touched, because I have been engaged in business with India throughout the whole of the time, and undoubtedly when the first fall in exchange took place merchants who were engaged in the Indian trade, who had large outstandings in rupees, lost and lost heavily, but since that time anyone who has been desirous of avoiding the risk of exchange and who has taken the trouble of taking proper precautions has been quite able to do so. Those who wear the boot know whether it pinches or not, and I should just like to read to you the resolution, if you have not had it before, to which the Bombay Chamber of Commerce came when the subject was brought before it. This is from the last report of the Chamber.

6520. (*Mr. Birch.*) What is the date?—The report is for the year 1886, and was issued sometime in 1887, about May, I should think. This is an extract from the report:—“Amongst the committee (of the ‘Bombay Chamber of Commerce’) themselves no ‘difference of opinion had ever existed, and it was ‘satisfactory to find therefore that the members of ‘the Chamber by a large majority declared in favour ‘of identical views, viz., ‘That they deprecate any ‘interference with the currency. While admitting ‘the inconveniences of constant fluctuations in ‘exchange, they are of opinion, after considering ‘the question from all sides, that the fall in exchange ‘leaves a balance of benefit to the commerce and ‘people of India, and are in favour of allowing things ‘to run their natural course.’”

6521. (*Sir T. Farrer.*) At what date?—It was debated in the course of the year 1886, I think towards the end of the year.

6522. (*Mr. Barbour.*) I believe they hold that the fall in exchange has stimulated the export trade?—I do not know whether that is the ground on which they go.

6523. (*Sir L. Mallet.*) They think on the whole that they are benefited?—That the commerce and people of India have benefited.

6524. Is it your opinion also, that as regards the trade of England with India, it has also benefited by this state of things?—I think it has undoubtedly, as regards both imports and exports.

6525. Then these fluctuations of exchange have been an advantage both to India and England?—I say that when the first fall took place merchants lost. You see you are rather mixing up two things. You are mixing up the fall of exchange with loss caused to the trade by fluctuations in exchange. I will speak to one or other; they are distinct.

6526. I do not understand to which those remarks of the Bombay Chamber of Commerce apply?—They apply to both. The first part of the resolution deals with the “constant fluctuations in exchange;” the latter portion refers to the other question of the fall of exchange, and its advantage or otherwise to the commerce and people of India.

6527. Then you think the fall in exchange has been a benefit to the people of England, and to the people of India too?—Yes, I have already tried to explain how.

6528. Then it has been a benefit to both sides?—I think so.

6529. (*Mr. Barbour.*) Do you hold that the fall of exchange has stimulated Indian exports?—I do.

6530. A witness gave evidence to that effect, and when it was pointed out to him that the import trade had increased as rapidly as the export trade, he said that, in his opinion, the fall in exchange had stimulated imports too. Do you agree with that?—Yes, certainly, but I should rather you took the latter information as matter of fact from the Board of Trade returns than as matter of opinion from me.

6531. I merely wish to get your opinion upon that question that the fall of exchange has stimulated exports from India, by giving the Indian cultivator more rupees for his produce?—More purchasing power.

6532. The fall of exchange has stimulated imports also?—Yes.

6533. I understand you to hold that a fall in silver relatively to gold has stimulated the imports and exports of a silver country with a gold country?—Yes, the imports indirectly by improving the condition of the consumers.

6534. And, as a matter of fact, the fall has increased the quantity of exports, and increased the quantity of imports?—Yes.

6535. Do you lay it down as a general principle, that that would be the effect of a fall in exchange?—I cannot; on the contrary, I will give you my reasons why I think that the fall in exchange has stimulated the exports from India alone under the special circumstances which exist in India, and I should not like to extend that as a general principle to other countries.

6536. What are the reasons why the fall has specially stimulated the exports and imports of India, and would not do so in other silver countries?—In my opinion it has given the Indian producer an advantage over his competitors in other countries, in this way, as the exchange falls, the rupee prices, other things being equal, rises. The cost of production, which he incurs, in consequence of the fixed settlement in India, or in other words, the rent he pays, does not advance, and if he employs labour, the wages also are slow to advance, and as matter of fact, they have not yet advanced as much as the produce has. Under those circumstances I think the producer in India is at a decided advantage over his competitors, whether in England or in America, and to that extent I believe that it has stimulated exports.

6537. Would not the producer in any silver country equally, or at any rate in something like the same degree, have the same advantage?—No, I should think that he would have to pay advanced rents.

6538. And will not the Indian producer have to pay advanced wages?—Yes, in time.

6539. And when the Indian producer has to pay advanced rents and wages the benefit disappears?—I think so, yes.

6540. (*The Chairman.*) Did you say, owing to the land settlement the Indian producer never would have to pay advanced rents?—So I believe.

Mr.
T. Comber.
1 July 1887.

Mr.
T. Comber.
1 July 1887.

6541. (*Mr. Barbour.*) Where there is a permanent settlement in India there is a landlord, and under those circumstances the cultivator would not benefit?—But then the man whose landlord is the Government, and whose land tax does not advance, gets the benefit.

6542. Where there is a temporary settlement for 20 or 30 years the cultivator would get the benefit for that period?—Yes.

6543. As matter of fact has the Indian price risen?—Not much, but it is immaterial, I think, in his competition with other countries whether he has obtained a rise in price, or whether he has avoided a fall in price which his competitors have had to suffer. I should like to quote the Viceroy of India's despatch on that point if you would allow me. It is dated the 2nd February 1886, paragraph 13. I think it is addressed to Viscount Cross:—"We would call your 'Lordships' special attention to the fact that the 'Indian cultivator of wheat and cotton appears to have actually gained, while the English and American producer of these commodities has suffered by the fall in the rate of exchange.'"

6544. Do you agree that the Indian producer has gained temporarily?—That they temporarily gain; by gain I mean either by obtaining an advance in price or by avoiding a fall in price.

6545. And the English producer has lost?—The English producer has lost; that also is temporary until he gets his rents reduced.

6546. And his wages?—And his wages.

6547. Then would it not be a good thing to try and avoid these fluctuations in the future whereby one country gains and another loses, and to have the same standard everywhere?—I have stated already that I think a steady standard would be an advantage if it could be obtained.

6548. (*The Chairman.*) I was asking you about the inconveniences of the unsettlement of trade between this country and silver using countries, owing to the alteration in the relative value of the metals?—And I quoted the opinion of the Bombay Chamber of Commerce. Well, then, as regards my own practical experience I am largely engaged in the import trade from India and the export trade to India, and I am able to make arrangements which completely eliminate the risk of exchange from the transactions which I enter into.

6549. It has been suggested that although you are able to make those arrangements that they must cost something, and so far add to the burdens of the trade?—Well, of course the position of each firm varies according to its credit and its capital. All I can say is that I think they do not cost me anything. I do my business simultaneously, at least nine-tenths of it, both in goods and in cotton, and other produce. When I sell my cotton in Europe, or my wheat, I buy it in Bombay; I fix my exchange one way or another, and I secure my freight. Those three items go to make up the cost. I thus secure the cotton or other produce in sterling, and I make my sale contract in sterling, and the risk of exchange is eliminated. In the same way when I make my contract for goods in Bombay I buy them in Manchester, and I fix my exchange, and the risk of exchange does not affect me afterwards.

6550. It has been suggested to us that although that may be the case as between this country and India, yet the difficulty is greater as between this country and China, because the cross currents of business, if I may say so, are not so constant; have you anything to say as to that?—I cannot speak as to China.

6551. Would there be anything in the way of difficulty as regards business between this country and China?—I should think not. I have seen it stated by some that the banks make an extra profit out of it, but my experience is that the banks compete so with each other that they do not make any profit out of it.

6552. (*Sir W. H. Houldsworth.*) It would not cost you 2 per cent. on a transaction to effect this exchange?—Nothing like 2 per cent.

6553. We have it in evidence by an Indian merchant that that is the difference?—I think there must be some mistake; it cannot be.

6554. (*Mr. Barbour.*) It gives you a certain amount of trouble and inconvenience?—A little inconvenience.

6555. And when there is any doubt about fluctuations in exchange the difficulty and inconvenience would be increased?—Slightly, in case it lasts it would increase the inconvenience.

6556. It does not stop business?—It may have the effect sometimes of stopping business in Manchester for a week, but next week there is double the business done. If you will allow me to revert for a moment to the effect of the fall in exchange upon imports of piece goods into India from this country, I should like, if you have not got it before you, to put in a return of the exports of cotton piece goods to British India, from the Board of Trade returns in millions of yards and tenths from 1873 to 1886. I lay it on the table. In the first year 1873 the exports in millions of yards were 1110·1 and in 1886 2237·6, so that they have just a little more than doubled.

6557. The import duties had been taken off in the meantime?—Possibly, indeed as matter of fact they were.

6558. (*The Chairman.*) Now as regards the effect of the fall in the value of silver as compared with gold, upon the financial administration of the Indian Government, what have you to say?—Well, I have less special knowledge about that than I have of the fluctuations of exchange, but it appears to me that the loss to the Indian Government by the fall in the value of the rupee for which the officials abroad are always harping, is very much exaggerated. There are undoubtedly certain set-offs which are lost sight of, or at any rate I do not see them mentioned. It has been pointed out that there are gains from the fall of exchange; that there is a gain for instance in the price which is obtained for the Indian opium, that the price obtained for the Indian opium is much higher than it would be if the rupee had retained its former value.

6559. As matter of fact is it much higher than it was?—I do not know, but I see the revenue has increased of recent years. In 1872–3 the revenue from opium was 8,684,000 tens of rupees and in 1883–4 it was 9,556,000 tens of rupees.

6560. You have not got the figures for 1884–5?—I have not got the more recent returns.

6561. That is the gross revenue?—No, it is the net revenue that is brought into account. I would rather not go into figures, because I have not the special knowledge.

6562. The price of opium is very low at the present time?—I do not know at all; I never deal in it. But even so it stands without argument, I think that if the rupee were at its old value it would be lower still. Then there is an increase in the land revenue, which I presume is partly owing to fresh settlements. Then there is a large increase in the revenue from railways and canals, a very large increase. That of course is very largely owing to the increase of mileage, and the development of railways generally, but I think it is also to a considerable extent due to the increased traffic arising from the stimulus given to trade. There is the increase in stamps and excise, also partly due to the same cause. I think if all these items could be properly calculated out, that they would very nearly or altogether balance the loss of 3,250,000*l.* which the Indian Government suffered in 1883–4, as compared with 1872–3, in its remittances to England.

6563. (*Mr. Barbour.*) I understand you to consider the existence of a fixed ratio for coinage has under certain circumstances a tendency to maintain fixity of relative value between gold and silver?—Undoubtedly.

6564. Do you happen to have seen an extract from a report by Mr. Raymond, United States Commissioner of Mining Statistics, which is printed as an Appendix to the Report of the Select Committee of

1876 on the Depreciation of Silver, and which shows that, according to the information available, the ratio of exchange between gold and silver in Asia Minor remained constant at 1 to 13·3 for a very long period, in fact for many centuries before Christ?—I have not seen that.

6565. I will read you what was said on this subject by Mr. Barclay Head of the British Museum, in a paper read before the Institute of Bankers in November 1879:—"The accepted value of gold as compared with silver was in these early times, and for centuries afterwards in Asia, as 13½ to 1. There is no evidence that there were the same fluctuations between the relative values of the two metals which are now so common. The consequence of this steadiness of exchange was the early introduction of what is now called bimetallism." This corroborates what Mr. Raymond states?—

6566. (*Sir T. Farrer.*) At what date was that?—(*Mr. Barbour.*) I think it came to an end about 400 years before Christ. I will also read you what Mr. Head says on this subject in a work called *Historia Nummorum* published this year:—"Silver was very rarely at this early period weighed by the same talent and mina as gold, but according to a standard derived from the gold weight somewhat as follows:—The accepted value of gold as compared with silver was in these times and for long afterwards as 13·3 to 1. There is no evidence that there were the same fluctuations between the relative values of the two metals which are now so common. The consequence of this steadiness of exchange was the early introduction in Asia of a double currency (bimetallism). The proportion of 13·3 to 1 made it inconvenient to weigh the two metals by one and the same standard, as in that case a given weight of gold would not have been easily exchangeable for a round number of bars or wedges of silver of like weight, but for 13½ of such bars; hence, in order to facilitate the exchange of the two metals, the weight of the silver shekel, mina, and talent, was raised above or lowered beneath that of the gold shekel, mina, and talent, in order that the gold shekel might be the more readily convertible into a round number of silver shekels." The fact that this arrangement was made for weighing gold and silver is fair evidence that the relative value of gold and silver must have been pretty constant?—I am quite unable to say.

6567. If the relative value of gold and silver had fluctuated very frequently, it would not have been worth while to have two units of weight for the purpose of weighing them separately?—I cannot form any opinion upon that.

6568. You have said that "for a very long period the conditions of supply and demand were such as would themselves keep the market value of the two metals at about the same ratio to each other?"—I have not said so to-day, but I have said so in my pamphlet.

6569. Do you refer to the period between 1803 and 1848?—Yes, I said that in my pamphlet, but I have not repeated that to-day.

6570. Were there no special demands between 1803 and 1848 for gold?—There was when England resumed specie payments, and therefore I omitted to say anything to that effect to-day.

6571. So that at that time the French bimetallic ratio was effective in maintaining fixity of value?—Probably it was.

6572. Did not the French law of 1803 continue bimetallism at the ratio of 1 to 15½; that was simply continuing the ratio which had existed from 1785?—I do not know.

6573. And at that time France might have either adopted silver monometallism, or gold monometallism, or bimetallism?—I presume so.

6574. It was open to her to do as she liked?—Yes.

6575. Do you think it has been an advantage to the world that she chose bimetallism at that time?—I

do not think any special advantage, except this, that she undoubtedly prevented the violent fluctuations which would have taken place when the gold discoveries took place in California, and to that extent I think she has benefited trade.

6576. (*Sir T. Farrer.*) Seeing you remember all that historical part, perhaps you recollect that when France adopted the bimetallic ratio, she contemplated an alteration of the ratio from time to time?—If necessary.

6577. (*Mr. Barbour.*) As it turned out it was an advantage?—Yes, I think so, at the time that I mentioned. I think if you could get her and the other countries, without England and India, to adopt a fixed ratio, it would probably be an advantage.

6578. But you do not think it would be such an advantage to England as to make it worth England's while to change her standard?—No.

6579. You do not consider, do you, that the standards and currencies of the different civilised countries are in a satisfactory condition at present?—I think the English currency is in a satisfactory condition. I should think the French was not. I think that the large holding of silver in France is bound to bring a heavy loss upon her.

6580. The American?—The same thing applies there.

6581. The Italian?—It is part of the Latin Union. I do not know what amount of silver she holds, but if she holds a large amount of silver she must suffer also.

6582. What would be the best solution of the present difficulty?—I have not contemplated it from any point of view but our own.

6583. What would be the best solution from our point of view?—From our point of view that we should decline to enter into any such international engagement.

6584. We should leave other nations to do what they like?—Yes.

6585. And what course on the part of other nations do you think would suit us best?—That is not a subject I have considered; I should not like to answer it off hand.

6586. There are only two courses, so far as I can see, bimetallism, or that the different countries should finally separate on this question, one set using gold and the other silver?—I should think, but of course I am giving you an opinion on the spur of the moment; it is quite a new subject to me; but I should think the most advantageous would be for them to adopt a bimetallic standard somewhat approaching the present market value of the two metals.

6587. Something between the present market ratio and the old ratio?—Not at all near the old ratio.

6588. But very near the present market ratio?—Near the present market ratio.

6589. Do you think if they all decided to use gold that it would be an injury to the world, or if France and Germany, and the Latin Union, and the other European nations finally abandoned silver altogether, and said that they would have nothing but gold, that would be a benefit to the world?—I think that is practically the present condition.

6590. They have not got rid of their silver?—No.

6591. If they decided to finally get rid of their silver, and offered their silver for sale, and used nothing but gold, would that be a net loss or a gain to the world?—I think it would have much the same effect that the decline of silver has already had.

6592. There would be a further decline of silver?—I do not think it would be on the whole on the balance disadvantageous to this country and India; of course these other countries would suffer, and suffer very greatly.

6593. Have you fixed any limit to that fall of silver, at which the benefit to England and India would cease?—No, I have not considered the subject.

6594. Do you think if the rupee went to 1s. it would be a gain?—I should not like to answer off hand beyond what I have stated.

*Mr.
T. Comber.*
1 July 1887.

Mr.
T. Comber.
1 July 1887.

6595. You think that there might be a fall below 1s. 4½d., which on the balance might not be injurious?—To this country and to India.

6596. Have you any personal knowledge of the probable production of silver in future years if the present gold price is maintained?—No personal knowledge at all.

6597. Merely from what you read?—From what I read. Second-hand.

6598. I see that you have called attention in your book at page 20, to the great increase in the production of silver in Nevada?—Yes.

6599. According to the figures that I have got there has been a very great falling off in the production of silver in Nevada. The production according to the report of the Select Committee of 1876 was 22,000,000 dollars in one year, and now it appears to be about 3,000,000 dollars?—Instead of Nevada I should have said the American mines generally.

6600. But it is a remarkable fact, is it not, that the production of silver in Nevada should have fallen from 22,000,000 dollars to 6,000,000 dollars now?—Yes, it is.

6601. It shows that it is quite possible that the large production of some of the other States may fall off too?—I think that is a legitimate inference, but I have no personal knowledge.

6602. I believe you hold the opinion that by adopting the ratio of 1 to 15½ the wealth abstracted from this nation would be enormous?—Yes.

6603. Because we possess or are owed more gold than any other nation?—Yes.

6604. You do not mean that there is really more gold in this country than there is in the United States, or France, or even India?—Oh, no, certainly not; I think we hold less.

6605. You mean that we are creditors on the balance of our foreign gold obligations?—Yes.

6606. And I believe England has got obligations payable in silver?—England has.

6607. That is there are people in England who have lent money, the interest of which is paid in silver?—Yes, to a comparatively small amount.

6608. The nation as a whole would only lose on the difference between the amount of her foreign gold obligations and silver obligations; the loss would be on the balance?—Yes.

6609. And these debts that are payable to people in England, I believe are paid by the export of produce and manufactures from the debtor countries, and the produce and manufactures are sold for gold. That is how the debt is paid?—Yes.

6610. The gold price of that produce has fallen on an average about 30 per cent. in recent years?—It is very likely that is the per-centage, but it has fallen considerably.

6611. So that the debtor countries have to give, and the creditor countries now receive, about 30 per cent. more in real value than was formerly the case?—If you accept the percentage it would be so.

6612. And some portion of that increase is due to the abandonment of the old ratio?—Yes.

6613. (*Mr. Courtney.*) But a comparatively small portion I think you said?—A comparatively small portion.

6614. (*Mr. Barbour.*) Whatever portion of the increase is due to the abandonment of the old ratio, the same portion, and neither more nor less, would be lost by the restoration of the old ratio?—I do not think that exactly follows. In answer to questions, which were put to me before, I tried to show that though at first the restoration of the old ratio would only bring back that proportion of which you speak, eventually if the production of silver were very largely increased, the rise in price might be a good deal more than the fall which has taken place.

6615. But still that rise in price would have occurred if the ratio had not been changed. Even if the old ratio had never been abandoned that increase in the production of silver would have taken place?—Oh, yes, and England would have lost.

6616. I believe that when the great gold discoveries took place, gold fell in value?—Yes.

6617. You admit that the existence of the French bimetallic system, at that time, reduced the amount of fall that would otherwise have taken place?—Yes.

6618. Consequently by this reduction of the fall that would otherwise have taken place in the value of gold, gold creditors gained and silver creditors lost?—Yes. The action of the bimetallic system then was in favour of this country.

6619. Well, as gold creditors benefited and silver creditors lost by the bimetallic system after 1848, do you think gold creditors have any right to object to the system in the present day, because it may no longer work to their special advantage?—Looking at it from the British Indian point of view I simply regard the interests of this country.

6620. You are prepared to take the gain and refuse the loss?—Inasmuch as we had nothing whatever to do with the alteration of the system.

6621. You are no doubt aware that the production of gold between 1856 and 1860 increased tenfold as compared with what it was between 1831 and 1840?—If you have got the figures, I have no doubt that is so.

6622. And whatever the depreciation of the standard was, due to this tenfold increase of production, it was equally shared between the gold and silver countries?—Yes, in consequence largely of the French system.

6623. I believe the production of silver is now about three times what it was between 1856 and 1860?—About that, not quite.

6624. And having got the benefit of avoiding one half the depreciation due to a tenfold increase of production of gold, you would refuse to take any share of the loss that might arise from the depreciation due to a threefold increase in the production of silver?—Inasmuch as we had nothing to do either with the one or the other.

6625. Has there, as a matter of fact, been an excessive production of silver in recent years?—There has been a large increase.

6626. Has it been excessive as compared with the increase of production that has taken place in former times?—I do not know about former times, but as compared with what it was 30 or 40 years ago I think it is an excessive production.

6627. But it has not increased in the same ratio as the production of gold has increased?—At that time?

6628. At the present time the production of gold is probably six times what it was 50 years ago?—I have not got anything to show that.

6629. At the present time the production of gold is about 20,000,000*l.*; 50 years ago it was not above 3,000,000*l.*?—I think that there is no authoritative information on that point, but it is estimated I think.

6630. The best estimates that can be made show about six times increase?—Yes.

6631. While the production of silver has not increased to more than three or four times what it was 50 years ago?—In speaking of gold I do not refer to the production of previous years, but to the consumption for the wants of the world.

6632. I will give you some figures which I have taken from Dr. Soetbeer who gives high figures as a rule for production. He gives the annual average production of silver between 1866 and 1870 at very nearly 12,000,000*l.* sterling, and he puts the total production of silver in the 15 years from 1871 to 1885 at 328,000,000*l.* valuing silver at the old ratio of 1 to 15½. Taking the average annual production before 1870 at 12,000,000*l.* sterling, and supposing that the same rate continued for 15 years, that would give you 180,000,000*l.* sterling?—Yes.

6633. So that the excess, since 1870, over the average production of the period immediately preceding 1870 is 148,000,000*l.* sterling?—Assuming those figures to be correct.

6634. I take Dr. Soetbeer's figures. The United States, under special arrangements, have coined up to 1885 about 44,000,000*l.* of silver. This was a special demand for silver, which we may deduct from the

excess production, consequently there have been 104,000,000*l.* sterling of silver, as it were, thrown on the markets of the world in excess of the former scale of production?—Yes.

6635. Now you have no doubt heard that statisticians have estimated the special demands for gold in recent years at about 200,000,000*l.* sterling?—I have not heard it, but I am willing to assume it.

6636. Assuming that figure to be correct, it would appear that the excess available supply of silver since 1870 has been very little more than one half the total amount of gold which was required to meet special demands?—I have no doubt if you have worked it out it is so.

6637. Assuming those figures, for which I am not responsible, to be correct, that would be so?—Yes.

6638. And under those circumstances would it not be more, on the whole, in accordance with the facts to talk of the appreciation of gold rather than of the depreciation of silver, since the special demands for gold are about equal to double the additional supply of silver?—It depends altogether upon what you mean by appreciation and depreciation. I regard the term appreciation of gold as being simply equivalent to a fall in gold prices, and a fall in gold prices has taken place, and the term depreciation of silver to be equivalent to a rise in silver prices, and a rise in silver prices has taken place, and there has been thus an appreciation of gold and a depreciation of silver, yet as to the fall or the rise in price I do not attach any greater importance to the one than to the other.

6639. In what countries has that rise in silver prices taken place compared to what prices would have been, other things being equal?—It has prevented a fall in silver prices.

6640. As matter of fact you do not assert that silver prices have actually risen?—I think they have slightly; in India, I think, they are now higher, but when I speak of the rise in prices I mean the rise in prices compared with what the silver prices would probably have got to if the old system had been in operation.

6641. (*Mr. Birch.*) I should like to ask you a question to clear up a doubt. In answer to the question as to the effect on the currency of this country by the adoption of a free coinage of silver at the ratio of 15½ to 1, I understood you to say that this would lead to an increase of currency, and consequent rise of prices?—I think you misunderstood me. I did not say an increase of currency at first, an eventual increase if the production of the silver mines continued very large.

6642. I do not see how this need be, save in the coinage of the silver held over here at present in bars, now worth, say, in a proportion of 20 to 1?—I think you misunderstood me. I did not quite make the statement which you say. I think there would be at first a rise in price consequent on bringing into the currency a cheaper metal, and that eventually the rise in price would be continued by an increase of the currency if the production of the silver mines continued very large. I think that was what I stated.

The witness withdrew.

Adjourned till Tuesday.

Twenty-seventh Day.

Friday, 8th July 1887.

PRESENT :

THE RIGHT HON. LORD HERSCHELL, the CHAIRMAN, presiding.

MR. D. M. BARBOUR, C.S.I.
MR. J. W. BIRCH.
MR. HENRY CHAPLIN, M.P.
MR. J. CHAMBERLAIN, M.P.

SIR T. H. FARRER, Bart.
MR. C. W. FREMANTLE, C.B.
SIR JOHN LUBBOCK, Bart., M.P.
SIR LOUIS MALLET.

MR. GEO. H. MURRAY, *Secretary*.

Mr. BERTRAM W. CURRIE called and examined.

6643. (*The Chairman.*) You have given attention to the subject of the standard of value in this country and to the proposed changes with regard to it?—I have given them a moderate degree of attention.

6644. And with reference to the effect upon India and this country of the changed relation of silver to gold?—I have done so specially with reference to this country.

6645. And also to the remedy which has been suggested in the shape of establishing a fixed ratio between the two precious metals with the view of preserving greater stability in the currency?—I have seen the remedy that has been proposed.

6646. Will you be good enough to favour us with your view as to whether the existing standard of value in this country is satisfactory?—My view is that in this country it has never met with any objection until within very recent times, and I am unable to see in what respect it fails to perform the function for which it was instituted.

6647. You are aware of the evils which are said to exist owing to a change in its value in relation to commodities and in relation to silver?—I am aware of the evils that are said to exist, but I am very sceptical as to their being evils. I believe it is a totally new economical discovery that a fall in prices is

Mr.
T. Comber.

Mr. Bertram
W. Currie.

8 July 1887.

an evil. It was always considered formerly, I think, that low prices were one of the conditions of well-being and prosperity. That prices have fallen in consequence of any scarcity of gold, I beg leave most humbly to doubt altogether. I think it may be proved that there are many other causes which account for the fall of prices; and I also do not understand, if the scarcity of gold has made prices fall, why prices fell most remarkably in 1857, which was the period when the gold discoveries were at their fullest development. After the panic of 1857, which was the greatest panic of which I have had any experience, there was a general collapse of credit, and prices fell. There certainly was no scarcity of gold, for it was the period of almost the greatest gold production.

6648. And I gather you do not think that there is that intimate and direct connexion between an increase or decrease in the production of the precious metal which is the standard and the prices of commodities, which is suggested by some?—I altogether fail to believe in it. I believe, on the contrary, that it is not gold alone which has an effect upon prices, but all the different media of exchange—book credits, cheques, &c.—and I am prepared to show that they have increased in a marvellous manner. If it would interest the Commission, I have prepared a table to show, first of all, the remarkable increase of postal orders, which are exactly those instruments which would displace gold, because they are issued for small sums; secondly, the increase in the number of suburban banks which evidently apply to a class of customers who would formerly have held gold in their tills, they have developed themselves in an exceptional way; in fact, I do not believe that there is a possibility of inconvenience arising from a scarcity of gold, for I think mankind would immediately set to work to find substitutes; and it most certainly can be proved that these substitutes for gold have largely increased within a recent period. If you will allow me, I will just draw attention to the table. Take the postal orders, which were only established in 1881–82. The postal orders in 1881–82 were in number four-and-a-half millions, and in amount 2,000,000*l.* sterling; in 1885–86 they were in number twenty-five and three-quarter millions, and in amount 10,750,000*l.* sterling. During the same period, postal money orders, which to a certain extent may be said to compete with them, remained nearly stationary, that is to say, the amount in the first period was 23,250,000*l.*, and in the second period 22,000,000*l.* Therefore it could not be said that the postal orders had displaced the money orders. Well, then, I have taken the following from our own experience: at Glyn's bank, 2,000 postal orders are dealt with daily now as against 500 postal orders six years ago. Then I come to the suburban cheques, which I maintain are especially used as an economy of gold, of coin. In 1880 Glyn's dealt with 620 suburban cheques daily, of which 93 were under 10*l.* and over 5*l.*, and 215 were under 5*l.* In 1887 they dealt with 1,258 daily, of which 245 are under 10*l.* and over 5*l.*, and 505 are under 5*l.*

6649. (*Sir T. Farrer.*) Would you say what you mean by suburban?—I mean by suburban banks, banks within a radius of seven or eight miles, or possibly nine miles of London; for instance the region with which I am most familiar is about Fulham, Walham Green, and such places. Anybody going down those roads will find that they abound with small shops which furnish the inhabitants of those districts, and till those people had banking facilities they were obliged to keep a certain amount of gold in their shop, but I think the suburban banks liberate those stores, in fact they act upon that class exactly as banks of the larger description act upon the richer class.

6650. (*The Chairman.*) Would these sums that you think were deposited and drawn upon in these suburban banks be to some extent a substitute for sums that were previously deposited and drawn upon in a central bank, a bank in Lombard Street for

instance?—No, I think that these banks have created a new demand altogether, that these traders are so small that previously they had no banking account and were therefore obliged to keep whatever money they had in a till. They now deposit it in the bank and in that way less coin is required, because the bank does not keep any more than it can help.

6651. Is that shown; can you tell by the increase in the total amount of deposits in the London and suburban banks taken together?—I have not with me the actual return of the deposits, but this I can tell you that the joint stock banks of England and Wales in 1873 numbered 121 banks with 1,100 branches, and in 1886 there were 119 banks, fewer banks, with 1,755 branches. Therefore there was an increase of 655 branches between 1873 and 1886. I should also like to state something with regard to country cheques, and to compare three days in 1880 with three days in 1887. In 1880 the total number of cheques drawn on country banks for which Glyns acted as agents was in three selected days 19,950, and the number of them under 1*l.* was 462, or 2½ per cent. of the whole. In 1887 the total number of cheques in the three corresponding days was 35,090, against 19,950, and 1,481 of these were under 1*l.*, 4 per cent. of the whole, so that in these seven years the per-centage of cheques under 1*l.* has increased from 2½ per cent. to 4 per cent., and the total has increased from 19,950 to 35,090. Then over 1*l.* and under 5*l.* in the first period, 1880, there were 5,229 cheques in three days, or 26 per cent. of the whole; and in the second period, 1887, there were 11,682, or 32 per cent., so that the ratio of increase is largest in the small denomination, and that I think is a strong argument in favour of what I have said, that if there was any scarcity of gold, substitutes would be found which would remove any inconvenience, or would obviate the evil of any such scarcity.

6652. (*Sir T. Farrer.*) Is a larger proportion of your business done by cheques than was formerly done, that is to say, out of the whole business is less done by payment of money over the counter and more done by cheques?—More by cheques, I think, certainly. Now, as to the scarcity of gold, I have no doubt the Commission have had this before them, but the average bullion in the Bank 12 years before 1873 was 18,500,000*l.*, and 12 years after 1873 it was 25,000,000*l.* The average bank rate 12 years before 1873 was 4½ per cent., and 12 years after 1873 it was 3½.

6653. (*The Chairman.*) You have given the average amount of bullion 12 years before and 12 years after 1873. Now, supposing there be a scarcity, where else besides in the Bank of England could that scarcity in your view be apparent?—I have always failed to see where the scarcity is; it must be apparent in some form. I imagine that none of us feel in our individual capacity any scarcity of gold. I believe that a scarcity of gold, if such a thing were possible, could only show itself in the dearness of money; I fail to see in what other way it could show itself.

6654. Taking the first period; besides the bullion in the Bank of England, the only other place in which bullion would be found would be either in the other banks or in the pockets or tills or coffers of individuals?—I imagine that would be the case, with some exceptions.

6655. Then first as regards the banks, other than the Bank of England, is there any reason to suppose that they held less bullion in the 12 years subsequent to 1873 than they did in the 12 years before 1873?—Speaking from our own experience, we hold much more, greatly against our wish. Our experience is that gold accumulates, and we have extreme difficulty in parting with it. That is owing to light gold. Light gold is now accumulating in the hands of bankers in a very inconvenient proportion, but that, I suppose, is owing to its being worth less than its nominal value.

6656. Then so far as regards private individuals, the statistics that you have given would tend to show

that they keep less money than they did before, and deposit more with the banks than they did before?—They would show that they keep less gold in their own hands.

6657. (*Mr. Birch.*) That amount of light gold which you say you are forced to keep against your will would, as a matter of course, suppose it were full weight, be paid into the Bank of England, and would increase our stock?—No doubt; no banker wishes to keep gold if he can help it, because it is a dead loss.

6658. (*The Chairman.*) You have stated that, in your view, a cheap rate of money would serve rather as an indication that there was not a scarcity of gold. On the other side, a contrary view has been suggested, that experience has established that at times when gold was unquestionably very plentiful, on the occasion, for example, of the new discoveries in Australia and America, that the rate of interest was high and not low?—The rate of interest, after the collapse which took place in 1857, became very low indeed, and, if my recollection serves me, money till 1860 was at a very low rate. After a collapse of credit money has, undoubtedly, a tendency to fall. The experience of all panics shows that—1847, 1857, and 1866—the ordinary way in which a panic acts is that money is driven up to a very high rate, that failures take place, a collapse occurs, and money becomes comparatively worthless, and that no doubt affects prices; no doubt there is an effect upon prices.

6659. (*Mr. Birch.*) At the time of a panic a high rate of interest may be no indication of a scarcity of gold, but rather of a want of confidence; the gold may increase in the bank, and the rate may yet remain high on account of the want of confidence?—The usual form is, exchanges take an unfavourable turn, gold leaves the country, prices rise, weak persons are pinched, and suspend payment. There is a general collapse of credit and confidence, and money becomes of comparatively very small value.

6660. (*Sir T. Farrer.*) Is not the rate of interest in this case, when it is paid, the price that is paid for gold?—Clearly the rate of interest is raised in order to retain that commodity in the country.

6661. (*Mr. Barbour.*) Would you say that the interest is paid for the use of capital or for the use of gold?—I am only speaking now of the experience of what has happened. The Bank of England, upon an export of gold taking place, raises the rate of discount, that is to say, bids higher for gold in the markets of the world against its competitors, and experience shows that by so doing it obtains the commodity for which it bids a higher price. The gold may be said, I suppose, to be capital, because it forms part of its stock, it forms that which it wishes to retain.

6662. (*Sir T. Farrer.*) Is it not at that period that gold becomes especially important. When credit is good, gold is not so important, but when credit is bad, and there comes a panic, then gold becomes of more importance?—Well, I should say when gold in the bank falls below a certain point the public becomes uneasy and has less confidence, and the bank must resort to the only way of increasing the quantity of gold by raising its price.

6663. (*The Chairman.*) I understand the suggestion to be that the scarcity of gold has not only affected this country, but that the smaller quantity of gold produced has had to serve the purposes of nations which have previously used silver. Of course so far as that view is sound it would not matter from which country to which country gold flowed for the moment, as regards prices?—The production of gold, as I understand, has been enormously greater in modern times than it was in any previous times. It is now stated that between 1850 and 1875, more gold was produced than during the whole previous period. That surely must have supplied mankind with a larger stock of gold than they ever had before.

6664. Then I think it is put as against that, that mankind are more numerous than they were before?—Then I answer to that, that we use banking facilities

which they did not use before, and the more civilized nations become the less gold they want.

6665. You have given us some important statistics with reference to the increase of banking facilities in this country. I do not know whether you are able to give us any information as to whether banking facilities have increased in other countries, such as Germany, France, and Italy, which have of late used gold either in place of silver or where before they did not use it?—To that I can only give you the general answer, that since 1860 great credit establishments have arisen in France, such as the Société Générale and the Crédit Lyonnais, which attract deposits, and which by their published returns show that their deposits are equal to those of our principal banks; therefore, I suppose there can be no doubt that persons not formerly in the habit of depositing money in banks now do so. In Germany I suppose it would be the same, but I cannot speak with so much certainty.

6666. (*Sir W. H. Houldsworth.*) Have you made any calculation as to the banking facilities, including postal orders and the other things that you mentioned, whether the proportion is at all equal to the increase of the population?—I think the statement I made will show that, because if postal orders between 1881 and 1886 have increased from $4\frac{1}{2}$ millions in number to $25\frac{3}{4}$ millions in number, and from 2,000,000*l.* in amount to 10,000,000*l.* in amount, I imagine the population has not increased in an equal proportion.

6667. (*The Chairman.*) You have hitherto been speaking of the effect of the existing standard, and of a change in the value of gold in relation to commodities in this country; have you considered specially the question of the change between the relative values of gold and silver as affecting the relations commercial and financial between this country and India?—I hear a great deal of that because I am connected with the Government of India, and of course I have heard many complaints made, and a great many remedies proposed. I am extremely sceptical as to any benefit that will arise from legislation on that point. I cannot help thinking that if silver ever is produced, as I have seen it stated by some recent writer, at a price like 5*d.* an ounce, it will become thoroughly discredited and obsolete and will cease to be used as the money of the world. But if such a thing is to happen, I think that all that legislation could do would be to follow the habits of the people, and that it would be extremely dangerous and ill-advised for the Government of India to take any steps in advance. All the steps that have been recommended and of which I have any knowledge, appear to me to be highly dangerous, very uncertain in their operation, and almost certain to aggravate the evil.

6668. I gather that you allude to the financial inconvenience of the varying relation between silver and gold in reference to dealings between this country and India?—I am chairman of the Finance Committee of the Council of India, and therefore it is a subject which I hear very frequently mentioned; I am very much alive to its inconvenience.

6669. But I gather that your view is that the suggested remedy of those who advocate bimetallism would not be a satisfactory one?—What I would wish to insist upon here, if what I say has any weight at all, is the utter unwisdom of our attempting such a remedy. About India I am in a difficult position. Although I disbelieve in all the suggested remedies, I should like to appear here simply to say that any tampering by legislation with the standard in England would be one of the most fatal measures that could be adopted, and I think I can prove that a great part of the prosperity of this country and its commercial supremacy depend upon that; and as to India, if any remedies can be found out I think they must be found out in India itself. I think the people themselves will, if the necessity arises, by some process of selection, arrive at the proper remedy,

*Mr. Bertram
W. Currie.*

8 July 1887.

Mr. Bertram
W. Currie.

8 July 1887.

and that anything that legislation could do would do no good, whereas it might do infinite harm.

6670. Confining your view to its effect upon this country, would you first of all tell us why you say that the financial prosperity of this country is greatly due to the present standard?—I say it for this reason, that the fact that Great Britain is the only country where there is a real gold standard, the only place where, if a man has a bill for 100*l.*, he knows what he has got, and he knows that in all cases he can obtain for his bill for 100*l.* a certain quantity of gold at a certain weight and fineness, attracts business to this country, and I think it can be asserted without fear of contradiction that the main reason why the great financial establishments of Europe have come to London and established themselves here is the fact that this is the only country in which there is a real gold standard. I daresay the Commission know that the gold reserves of the Continental banks all over Europe,—Germany, Austria, and France,—consist largely of bills upon London, which are looked upon by those banks as an absolute gold reserve. They are also held by the great railway companies in France who have their money accumulating, who have deferred payments to make, and wish to have a medium of exchange which is of absolute certainty. Therefore they hold bills upon London. The effect of that is to make bills upon London the cheapest in the world. Bills are very often discounted under the ruling rates in order to be sent abroad for those banks to hold. That is a decided gain to this country. No bill can be drawn upon London without a profit of some sort being paid. There is another fact I would mention in illustration. Quite recently the London exchange on France has been above the gold point, and on Italy largely above the gold point. The meaning of this is that gold is not to be obtained freely either in France or Italy. Of course, if it were to be obtained as easily in France or Italy as it is in England exchange could not rise above the point which represents loss of interest together with the charges for sending gold from France or Italy to London. In the case of Italy this recent rise in exchange meant a loss of $1\frac{1}{4}$ per cent. That is the tax they pay for not making their gold standard effective. If you hold a bill for 100 *lira* on Italy or 100 francs on France, you cannot go and get gold for them, and I maintain that it would be most unwise for this country to follow such an example. The man who takes gold from us does not commit an unpatriotic action, as he is considered to do in Germany or France, because he does not take the gold without paying for it. Any interference with the absolute convertibility of the banknote into gold of a certain weight and fineness would, in my opinion, be suicidal in this country.

6671. Do you think it would be practicable?—No, I do not. I believe that if Parliament in its wisdom were to attempt to enforce anything like this bimetallic arrangement, the principal dealers in the city would immediately contract themselves out of it. I feel quite convinced that, if such a thing were possible, banks would say “I will lend you 100*l.*, but “on condition that you will pay me in gold.” My belief about silver is that, as far as we are concerned, it is obsolete, and discredited, and that it is not laws which make silver and gold valuable, it is the belief and practice of mankind. As far as I understand, in India the belief of mankind in silver is still unshaken. They value it there, but in Europe they are ceasing to value it. All nations have shown the greatest alacrity to get rid of it. We never heard anything of bimetalism when gold was taking the place of silver. It is only when there is a prospect of silver coming back again to displace gold that we hear of proposals to give it an artificial value.

6672. (Mr. Barbour.) That is, there were no complaints so long as the fixed ratio was maintained?—

Yes, but the fixed ratio really always acted to drive out the dearer metal.

6673. There were no complaints when gold was taking the place of silver, and the fixed ratio was maintained, but as soon as gold began to alter in reference to silver, and was not maintained at a fixed ratio, complaints began to be made. If the fixed ratio had driven out gold and given you silver, complaints ought to have been made when silver was being driven out?—I think it is the alarm people feel when they see their gold stock replaced by silver stock which causes all the trouble.

6674. (The Chairman.) Then you think the preference for gold over silver is not based upon any law, but upon the tradition or experience of the people?—Entirely so. I think it is based upon an experience of its greater convenience, and that it would be perfectly hopeless to persuade people now to exchange their gold for silver.

6675. (Sir W. H. Houldsworth.) Do you think that that feeling will find its way into India gradually?—I cannot help thinking, if I may be allowed to indulge in speculation, that in the course of time some substitute for gold may be found in this country, and that India may find some substitute for silver. But it is evident, I think, that silver cannot continue to be used as money if it is produced in those enormous quantities which some writers pretend.

6676. (Mr. Birch.) I suppose you refer to the tabular system?—I had a paper sent me in which a writer makes out that silver can be produced at 5*d.* an ounce. What amount of truth there is in it I do not know.

6677. I never heard of silver being produced at that price?—It is possible some individual producer may produce it at that, and make a difference of profit, but the cost of production at different mines varies a great deal, and the profit of the miner is the difference between the cost at which he produces and the price of silver. It is the price paid for the production of silver at the least productive mine that would regulate it, clearly.

6678. So that the fact that a miner produces silver at 5*d.* an ounce would only affect his individual profits?—It only affects his profits. I am not for a moment saying that it is not so; I am merely saying it is stated that silver can be produced in large quantities at 5*d.* an ounce.

6679. (The Chairman.) It is quite clear that the price would be that at which it can be produced at the least profitable mines. Would there not be rather a tendency, if you had a mine where it could be produced very cheaply, to bring down the price?—It would depend, I think, upon the quantity of cheap silver; I imagine that the cost of production is not exactly the same in any two silver mines. The conditions are different, and no silver mine can be permanently worked which does not leave some profit.

6680. (Mr. Fremantle.) And therefore the tendency would be to shut up the least productive mines?—No doubt a fall in silver actually does shut up the least productive mines.

6681. (The Chairman.) And to shut up the least productive mines, to reduce the price to that at which it could be produced at some profit, in mines that were not shut up, mines something short of the least productive?—I imagine a fall in the price of silver, like a fall in the price of any other article, tends to limit the production. There is a price at which people cannot grow wheat or turnips, or anything else, and if the commodity falls below that price the production stops.

6682. (Mr. Barbour.) Do you hold that the supply of gold has no effect on prices?—I think it has only a very doubtful and indirect effect.

6683. But you would not go so far as to say that it has no effect?—No; I do not say it has no effect in conjunction with other media of exchange.

6684. If it was as common as copper, prices would

be very much higher than they are now?—Yes; I imagine they would.

6685. Have you formed any opinion as to why gold and silver have varied in relative value?—I imagine that they vary in value according to the quantity produced; I can see no other ground upon which they vary.

6686. Not according to the demand and supply?—You mean the relative demand for gold, or the relative demand for silver.

6687. According to the ordinary principles one would say that the value of silver depended on the supply of silver and the demand for it?—That is the thing which governs the value of silver—the quantity produced, and the demand for consumption.

6688. And in the same way the value of gold would depend upon the supply of gold and the demand for it of all kinds?—Certainly.

6689. So that if the demand for gold increased, the value of gold would rise?—If the effective demand for gold were to increase while the supply remained stationary the price of gold would rise.

6690. You say that there have been great economies in the use of gold in recent years. These economies have been chiefly in the western countries?—Yes; those of which I am aware are in England.

6691. England, France, Germany, and so forth?—Yes.

6692. And I believe that in the eastern countries where silver is used, these economies have not been carried to the same extent?—I imagine not to the same extent.

6693. So that, so far as that is concerned, one would rather have expected gold prices to rise and silver prices to fall?—Well, I cannot admit that; because, although gold may be one element of price, I altogether deny that it is the only element.

6694. There must be other elements?—There must have been other elements of prices.

6695. By inventing expedients for economising gold, you reduce the demand for gold?—Less gold is required.

6696. And therefore gold would become of less value *pro tanto*; and consequently gold prices should be rather higher?—It might be in fact. But I feel myself unable to answer. That is the sort of question to which I can only reply by saying what has happened; not what might have been expected to happen.

6697. I am only asking is not that the tendency?—Yes, other things being equal it must be so, I think.

6698. You say that it is of great importance to this country that persons who buy bills on London should know that they can certainly get gold?—I look upon it as of very great importance.

6699. We have had some evidence here to the effect that in commercial transactions gold is hardly ever required?—It is rarely required, because it is certain to be got.

6700. But it is of importance that you should be able to get it in case of necessity?—I think it of primary importance, and I think it would be much oftener asked for if those who might require it were not certain that they could get it when required.

6701. Then is the supply of gold in this country sufficient to meet all likely demands on it?—I think so, and if not the supply could be easily supplemented by an increase in the rate of interest.

6702. Where would the gold be drawn from in that case?—It would come, I imagine, from the reserves of other countries; where experience shows it does come from.

6703. But would it not be just as cheap to a man who wants gold to get it direct from the other banks, as to get it from England and force England to get it from other banks?—But I imagine we are speaking of the policy of this country. The evidence I have come to give I understand is this, that it is not expedient for this country or Her Majesty's Government to make any change. I maintain that it would

be most unwise, and suicidal for this country to depart from its gold standard.

6704. But I merely ask you whether there was any inconvenience in getting gold if a man had to come to England for it and England could not supply him unless she got it from abroad. Are you not in the last resource driven abroad for gold?—As long as the Bank of England charter lasts, the Bank of England is bound to pay its notes in gold. I can exchange the due bills which I hold for notes and I can exchange the notes for gold. The Bank of England, as experience shows, has been able to pay gold without any difficulty, and I do not want the system altered.

6705. (*Mr. Birch.*) Is not the reason rather that when a man takes a bill abroad, on England, he knows that he will receive gold for it, and that if he takes a bill upon any other country, he takes a bill not knowing whether it will be paid in gold or silver?—I contend that the preference that a man has for a bill upon London, and the reason why he uses it as a gold reserve is due to its being indisputable that it will be paid in a single metal of a certain weight and fineness.

6706. (*Sir John Lubbock.*) He knows what he will get for his bill?—The way in which it acts I think is this. The great continental banks and French railways get bills on London, which they know they can make no loss upon. They know they will always get the gold price in their own countries, or what must be equivalent in gold, minus the charges.

6707. (*Mr. Barbour.*) Might not that be in some respects an inconvenience to England. Supposing there was a panic somewhere, a great deal of our gold might be drawn away?—I disbelieve that. I think if it is drawn away it is a profitable operation for us, not an evil. We only lose it for value.

6708. Does not that for the time being cause a fluctuation in the rate of interest?—It is a minor inconvenience. You could only get a steady rate of interest by not employing your money closely. If you employ it closely, interest will be very sensitive, and fluctuate. I have nothing to show that anybody has suffered. I do not know what the evils are.

6709. (*Sir John Lubbock.*) They cannot demand payment of the bills until they become due, and the bills that are held are undue bills?—Yes.

6710. (*Mr. Barbour.*) Then it is rather our banking than our commercial supremacy that depends on the gold standard?—Perhaps I should have said our financial supremacy, but the two are intimately connected.

6711. Does not England enjoy a great many natural advantages which she would not lose no matter what the standard was?—I do not say she would not keep them if she parted with the gold standard, but if she did so she would be in very great danger of losing her supremacy. I do not know any other reason that attracts these great credit establishments to this country.

6712. Then if France could get rid of her silver entirely, or Germany, and have a purely gold standard our financial supremacy would practically come to an end?—That I am not prepared to say at all. I do not go farther than this, that we have got the supremacy and we must keep it; if we tamper with our standard we should render it very doubtful whether we could keep it; that is what I think is the danger.

6713. I think you have said that experience has shown that gold is the most satisfactory standard that could be found?—I think nothing better has been found as yet.

6714. Do you mean as a standard for deferred payments, or do you mean for the purpose of banking?—I am aware that objections have been taken to it as a standard for deferred payments, and it is possible that something better may be invented. I by no means assert that mankind in the course of time will not develop something better. My own opinion is that possibly something will be invented by the ingenuity of the commercial class to take the place of gold, but that cannot be done by Government, and it would be premature at present for Government to interfere.

*Mr. Bertram
W. Currie*

8 July 1887.

Mr. Bertram
W. Currie.
8 July 1887.

6715. You think its inferiority as a standard for deferred payments has at any rate not been proved?—I think objections have been made to it which are plausible.

6716. I believe we have had a long experience of the gold standard in this country?—We have had about 70 years.

6717. The silver standard was formally abolished in 1816?—Yes.

6718. And I think I am right in saying that we have practically had gold as the standard of value since the time of William III.?—I believe so.

6719. Since the time of the great recoinage gold has been practically the standard?—Yes.

6720. If you take that date as 1700, do you think it may be said that we have practically had a gold standard for 187 years?—I imagine we have.

6721. Are you aware that from 1700 to 1872 the relative value of gold and silver remained almost constant, or at any rate that there was no very great change. I can give you the figures. In 1700 the market ratio was 1 to 15, and it fluctuated somewhat after that, but the lowest average to which it went was 1 to 14·56, and the highest point to which it went was 1 to 15·83, and in 1872 the ratio was 1 to 15·56, so that there were few serious fluctuations in that time?—I am aware that the fluctuations were small.

6722. But during the last 15 years the relative value has fluctuated from 1 to 15½ to, I believe, about 1 to 21½, so that if you take the whole time over which our experience of the gold standard extends—187 years—we find that for 172 of those years we had comparative fixity of relative value in gold and silver, and for only 15 years have we had serious fluctuations?—Yes. One reason why that is so is that the production of gold has been enormous and extraordinary. It has been stated by a writer of repute that more gold was discovered between 1860 and 1875 than during all the previous period. Therefore nations which had a preference for gold were able to do what they never did before; they were able to get gold and substitute it for their silver.

6723. Are you aware that there was some reduction in the production of gold in the early part of the present century?—I do not say it was always equal, but the production of gold in California and Australia was on an entirely different scale.

6724. Well, as matter of fact, the relative value of gold and silver remained pretty fairly constant for 172 years, and for 15 years there have been great fluctuations?—That is true. The price of silver has fallen to a degree that it never did before.

6725. May it not be a question whether gold has been as good a standard during those 15 years as gold and silver were during the previous 172 years?—I say that silver has not been so good a standard. I do not know that gold has failed to perform any of the functions of the standard.

6726. Do you think gold would have been as good a standard between 1800 and 1872 if there had not been a bi-metallic system in France?—Yes, that would not in my mind have affected the thing at all as a standard for this country.

6727. Did not the existence of bi-metallism in France in 1820 facilitate the resumption of specie payments by England?—That, I am sorry to say, is a subject which I have not considered, and a question which I feel myself unable to answer.

6728. But at any rate I suppose you would agree that the existence of bi-metallism in France in 1848 and subsequent years prevented the depreciation of gold?—Well, I have great doubts myself whether the maintenance of that system has not aggravated all our evils; whether it has not given an artificial value to the metal which ought to have declined, and I question whether the decline of silver would not have been far more gradual and less injurious if it had not been for this artificial stimulus given to it.

6729. But was not the artificial stimulus after 1848 given by bi-metallism to the value of gold, and

not to the value of silver?—The way in which the bi-metallic system answered after the gold discoveries was no doubt to banish silver and introduce gold into circulation. The metal which was the cheaper at the time took the place of the metal which was the dearer.

6730. That is to say, the bi-metallic system held up the value of gold?—It held up the value of gold no doubt.

6731. If there had not been bi-metallism at that time would there not have been greater depreciation?—Probably. That is to say, unless France had discarded its silver and had adopted gold.

6732. You are no doubt aware that there has been a great demand for gold for America since 1876; that whereas before 1876 America was largely exporting gold, since that time she has been importing gold?—Yes, I am aware of that.

6733. And you are no doubt aware that there has been a considerable change as regards the import of gold into this country, that before 1876 we were importing on the balance, and that since that date we have not been doing so?—Quite so.

6734. If bi-metallism had existed in the Latin Union and in America, would it not have been an advantage, inasmuch as that demand by America for gold could have been met partly by silver?—Yes, I deny the principle. I deny that there has been any such strain on the gold supply as to cause an inconvenience to us.

6735. But I think you said that a demand for gold increased its value. If there were a fresh demand by America, gold must *pro tanto* have increased in value?—But what evil is done thereby if it has?

6736. Do you think that a fall of prices due to an appreciation of the standard is no evil?—I think a fall in prices is no evil.

6737. A fall of prices due to a cheaper production of commodities would be a gain?—I ask no questions as a consumer. A fall in prices benefits me.

6738. You think it makes no difference whether a fall in prices comes from cheaper production of commodities or appreciation of gold?—I deny altogether that the fall has arisen from a scarcity of gold. When I buy commodities it seems to me that I should get as much as I can for as little money as I can. That is my object, and the object of all the community.

6739. Do you think that if bi-metallism was established in this country silver would not circulate?—I think it would not be received in payment.

6740. If it were made legal tender, could you help receiving it?—I understand in America there is extreme difficulty in getting people to receive it.

6741. I believe there the Government does not force you to take it or allow free coinage?—You cannot force me to take it, because if you have to pay me 5*l.*, I will not take it in silver. I maintain that you cannot make people use a money which they are not accustomed to.

6742. You have heard of Gresham's law, which says that the cheaper money drives out the dearer; do you think that would not be effective in putting silver into circulation?—Not if mankind refuses to take the cheaper money.

6743. That assumes that mankind universally refuses to accept silver, but if Parliament passes a law making silver a legal tender, at least half the country must be in favour of it?—But if silver, why not coal, or shells, or leather. I believe silver to be obsolete. It is discredited, and you could not force it on the English people any more than you could get them to take shells.

6744. I will read you a passage from Ricardo on this subject: "It is not then a matter of chance; it is not because gold is better fitted for carrying on the circulation of a rich country, that gold is ever preferred for the purpose of paying debts, but simply because it is the interest of the debtor so to pay them." Would you agree with what Ricardo

says, that the debtor will pay with the cheaper metal?—He is doubtless speaking of a country in which debts may be legally paid either in gold or silver, but that is not the case as regards this country.

6745. You think the English people would prefer gold, and want gold?—I should think they would if they could get it.

6746. Are you aware that the free coinage of silver in this country was stopped by legislation in 1798?—Yes, I have read so.

6747. It has been said that before that date the English people had taken to gold because they preferred it?—Yes, I have heard that said.

6748. I will read you a portion of the Act of 1798. It was passed about 100 years after the time in which gold practically became the standard, so that the English people then had had experience of gold for 100 years. This is what is written in the preamble of that Act: "Whereas from the present low price of silver bullion, "owing to temporary causes, a small quantity of silver "has been brought to the Mint to be coined, and "there is reason to suppose a still further quantity "may be brought, and it is therefore necessary to "suspend the coinage of silver for the present; be it "therefore enacted." Assuming that the English people chose gold owing to a preference for that metal, and not because it was the cheaper metal for paying debts under the circumstances of the day, is it not remarkable that 100 years later they should have begun to coin silver again just at the moment when it happened to get cheaper. In 1798 a law was passed to prohibit the coinage of silver because, owing to the cheapness of silver, it had begun to be coined. At that time the English people had had experience of gold for 100 years, but the moment silver became cheaper than gold for the payment of debts they began to coin silver. Is not that a proof that people chose, not gold as against silver, but that metal which was the cheaper, for payment of debts?—I should say that the preference which they have for gold—I do not say it is a preference which has always existed, because I imagine at earlier stages of mankind silver was unquestionably used—I am only speaking of the present state of things, and I deny that you could now make the English people, who have had at any rate 70 years' experience of gold since 1816, use silver as money in the place of gold. That is my contention.

6749. (*Mr. Fremantle.*) But was not the legislation of 1798 simply the result of that fact, that if persons brought silver to be coined at the Mint they could do so at a profit. They bought the silver in the market and used it as money?—I imagine that the silver coinage then was a real silver coinage, not a token currency.

6750. So that there was a profit upon its conversion into coin at the Mint, and that was quite sufficient reason for its being brought in and coined?—I imagine that the legislation of 1798 took place because silver was being substituted for gold.

6751. (*Mr. Barbour.*) No doubt; but that coinage of silver and substitution of silver for gold was being done by the action of the people, and the Legislature interfered to prevent it?—The Legislature interfered to prevent it because they were afraid of losing their gold.

6752. (*Mr. Birch.*) You say that low prices are a sign of prosperity in some way, but if they are so low that you cannot cover the cost of production are they beneficial?—I do not think that I said that low prices were a sign of prosperity. I said that I could see no evil in low prices; that the object of mankind individually and collectively is to get their commodities as cheap as they can.

6753. Mr. Barbour questioned you as to what would be the effect if the gold standard in France and Germany was made effective, and he asked you whether in that case those countries would take the supremacy from us. Now, I suppose you would allow that besides the question of the gold standard there are many other things which combine, and that

the gold standard is only one point, but one essential point?—Certainly many other things combine.

6754. With reference to the rate of discount and its effect on our stock of gold, I think it must be borne in mind that foreigners generally keep heavy balances here, and that at times in a panic they withdraw these balances, and the raising of the Bank rate has not always an immediate effect?—Well, I think you must distinguish what you mean by panic. I do not see why foreign balances should be withdrawn simply because money is dear.

6755. Foreign balances are certainly not withdrawn because money is dear, but I refer to a panic arising from a want of confidence, a shaking of confidence in bills?—But large sums of money come, when the continent is disturbed by war or revolution, from foreign nations, and that money would not be withdrawn merely on account of dearness of money.

6756. There is an idea abroad that the suspension of the Act of 1844 is a suspension of specie payments. Should the Act be suspended they get frightened abroad and think they will not get their gold when the bills fall due; sometimes they withdraw very large balances, and the effect in the rate of discount is felt immediately. That is one of the effects of it?—It naturally would be if such apprehension were felt.

6757. Then I gather from what you stated that, although you acknowledge that there has been a certain appreciation of gold, inasmuch as a sovereign buys more commodities than it did some years ago, that this rather arises from a depreciation of commodities, say a fall in their value, than from any serious scarcity of gold?—Yes, my belief is that the fall in prices is not the result of any scarcity of gold.

6758. And that banking facilities have taken the place in a great measure of the precious metals?—And that the prices of many commodities may be shown to have fallen in value utterly irrespective of gold.

6759. (*Mr. Chaplin.*) When you say that you see no evil in low prices, do you mean however low?—Prices cannot fall below a certain point. Cheap goods are better than dear goods I maintain.

6760. If the price for agricultural produce for instance, and for mining products were to fall so low as to put a great quantity of the land of England out of cultivation, and to cause a great number of the mines to be shut up, would that be no evil in your opinion?—I doubt if such a thing is possible.

6761. Is it not a fact that owing to the low prices, large tracts of country that were formerly profitably cultivated in England have gone out of cultivation and are now producing nothing?—If that is so it is because they are unsuited to the production of these commodities.

6762. But I am speaking of land which produced these commodities at great profit not very long ago?—That is the general fate of mankind. Somebody else has found that he can produce them cheaper and better.

6763. Well, we will deal with the question of mines. They can produce only what is in the mine, and you think it no evil that the price of iron or coal is so low as to cause those mines to be shut up?—I should think it would be no evil at present if a certain number of mines were shut up, because they are worked unprofitably.

6764. You think it would be no evil to the general interests of the country, though it might affect injuriously some particular interest?—I do not think the opening of mines is necessarily desirable in itself; it is only desirable if the business can be conducted at a profit.

6765. And if owing to the present state of things that business had ceased to be able to be conducted at a profit, that many mines were shut up, and that thousands of people were put out of employment, would you still say that that is no evil at all?—I would not say that it is no evil, but it is a necessary evil, and one that would correct itself.

*Mr. Bertram
W. Currie.*

8 July 1887.

Mr. Bertram
W. Currie.
8 July 1887.

6766. Then you admit that there is some evil which arises from the present state of things?—There is always an evil when any individual or any body of men is in want, but the question is whether the remedy proposed would not aggravate the evil.

6767. There may be differences of opinion as to the remedy, but as to the fact you do admit that there may be some evil?—Well, I should say the sooner an unproductive industry is stopped the better, be it agriculture, or mining, or anything else. If it ceases to be productive it is no benefit to the country to continue it.

6768. If the fact of its ceasing to be productive has arisen as some people think from the fall in the price of silver?—There I may say that I am so utterly unable to connect the two things that I do not see what connexion they have at all.

6769. You do not see that the fall in the price of silver may have very seriously affected certain industries in this country?—No, I do not see it.

6770. You do not know any instance in which it has?—No, I do not.

6771. Now let me ask you one or two questions with the view of ascertaining from you whether, supposing my information is correct, the agricultural industry in particular, has not been seriously affected. You admit, I suppose, what has been stated by a great number of witnesses, in evidence, that the rupee in India still maintains its original purchasing power, whatever that may have been?—Yes, I have no reason to think that it has very much changed.

6772. Well now, are you aware that the Indian producer, as a matter of fact, is getting more rupees for his wheat now, although he only gets 1*l.* 10*s.* per quarter for it in England, than he did when he was getting 2*l.* a quarter?—Yes, I should be willing to admit that; that, practically, the price is about the same as far as I know.

6773. The English producer of wheat, on the other hand, is losing at least 10*s.* a quarter—that you admit?—If you say so I have no doubt it is so.

6774. Under those circumstances I suppose you would agree that he is competing at a very great disadvantage with the Indian producer of wheat?—I admit that.

6775. And this great disadvantage has been brought about solely by the fall in the price of silver?—I would not admit solely, but that to some extent that has stimulated the production of wheat, I think is probable.

6776. You admit that to some extent it has imposed a great disadvantage on the English producer of wheat?—Yes, I can admit that; but it is no more an evil than in the case of any other manufacturer or dealer—any person who can undersell. I do not see the evil.

6777. I grant you do not see the evil, I had passed from that question. What I was trying to elicit from you now is, whether you had not arrived at the opinion that there were some industries which were suffering directly from the fall in the price of silver?—Directly, I should doubt. That the wheat growing industry is suffering from the competition of Indian wheat I have no doubt, and that one of the causes of the depreciation of Indian wheat is the fact that the people are ready to take a certain amount of silver in exchange for it. That I admit.

6778. Then you admit that the fall in the price of silver is one of the things which has seriously affected the wheat-growing industry of England?—Well I should prefer to put it in this way: is one of the things that has lowered the price of wheat.

6779. But one of the elements which has lowered the price of wheat has been the fall in the price of silver—you admit that?—It has had the effect of stimulating the Indian production; I would not say it is the sole element.

6780. Then we have arrived at this, on your own admission, that there is one industry which has been injuriously affected by the fall in the price of silver?

—There is one commodity the price of which has been lowered by the fall in the price of silver.

6781. And the fact of the price of that commodity having been lowered would injuriously affect that industry which produces that commodity?—If it is always desirable for industries to produce at a high price.

6782. I think I gather from your answers that you do admit now that the wheat growing industry in England has to some extent been injured by the fall in the price of silver?—I admit that the wheat-growing industry in England has had the severe competition of Indian wheat, and that the production of Indian wheat has probably been stimulated by the fall in the price of silver.

6783. (*Mr. Birch.*) But in the same way that Russia having a paper currency has come in, in a greater degree, to affect us?—And Chili, with its copper.

6784. I mean all these competitions come in from countries which have a debased currency?—Yes.

6785. (*Mr. Chaplin.*) Well then the adoption of the bi-metallic theory would obviate that particular disadvantage so far as it arises from the fall in silver?—I ventured to say before that I believe it to be impossible.

6786. But assuming that it was possible and was adopted?—Yes, but I understood that what I was asked was, did I think it possible or desirable. I consider it impossible and undesirable.

6787. A great many witnesses have agreed that it is desirable and perfectly possible, and on the assumption that it was done, I want to know whether you do not admit that it would do away with this artificial advantage which the Indian grower of wheat has at present over the English grower?—If you could persuade mankind that 15 portions of silver are as good as one of gold, if they would accept that decision apparently it would have that effect.

6788. That is to say, the adoption of the bi-metallic theory would equalise the position of the English and the Indian grower of wheat in that respect which I pointed out to you?—To whatever extent the Indian grower is stimulated by the fall in the price of silver undoubtedly it would, but I do not think that is the only advantage which the Indian grower has got. I think he has got others, better climate, better quality, and lower wages.

6789. (*Sir T. Farrer.*) The stimulus you speak of, assuming it to exist at all, would only exist pending the fall. Supposing that we had silver and gold at a permanently fixed ratio, for the future there would be no such stimulus in the export of Indian wheat as Mr. Chaplin has spoken of?—No, there would be no stimulus in the future at present prices.

6790. But the advantage which the Indian producer has had in consequence of the making of railways in India, and the opening of the Suez Canal, and the lowering of prices would remain?—It would undoubtedly.

6791. Have not those things had a greater and more permanent influence in lowering the price of Indian wheat than anything that may happen in regard to silver and gold?—I said silver has had a certain effect, but certainly it has by no means had the sole effect in stimulating the cultivation of Indian wheat for exportation. It has been stimulated by many causes, and especially by facilities of transport.

6792. Those are the *vera causa* which must continue to exist?—And increase I should say.

6793. The fact whether gold or silver has affected it is matter of dispute?—Yes. It is not for me to pronounce any decision upon it.

6794. The extension of facilities of transport, the making of Indian railways, and the opening of the Suez Canal are true causes, certain and permanent causes of reduction in the price of Indian wheat?—They must be so.

6795. And those same causes operate to reduce the price of American wheat and other wheat all over the world?—I should say that they must be the same.

6796. Therefore, assuming it would be a good thing to raise the price of wheat, the English wheat grower would get very little advantage out of the alteration of the relation between gold and silver?—I do not see how he would benefit by it.

6797. I want to understand distinctly what is the position of London as regards the financial centre of the world. Is it that it is a sort of clearing house to which all debts are referred and through which they are paid?—Yes; I think its peculiar position is, that it is the only centre upon which bills from all parts of the world can be drawn. Wherever there is an exchange of any sort there is an exchange upon London. Bills upon London are always in the market; everybody has debts to pay in London, therefore everybody wants bills on London.

6798. Just as it is the centre of the business of England it is the centre of the business of the world?—It is.

6799. Bills from all parts can be sent to London and exchanged there?—Yes. A New York merchant wishing to buy goods in the East is obliged to supply himself with a credit upon England. That is distinctly to the benefit of London.

6800. London becomes a sort of bank for the whole world?—Yes.

6801. (*Mr. Barbour.*) Granting that there is a facility in drawing on Hong Kong from America through London, is that facility due to the existence of the gold standard in England?—I do not know of any such facility.

6802. (*Sir T. Farrer.*) London is a sort of centre of banking which never existed before?—Yes.

6803. The gold sovereign is the language in which it carries on its transactions?—Yes.

6804. To disturb that language might very easily lead to the disturbance of that practice?—I have a very strong conviction that anything which would shake the faith of mankind in the fact that what 100*l.* means is a certain amount of gold of a certain weight and fineness, might disturb it very materially.

6805. If we were to say 1*l.* represents so much gold or so much silver, that might very likely disturb the relations which exist between London and its customers over the world?—That is my belief.

6806. In fact, you think it a dangerous thing to interfere with the tokens and the names and the forms in which that business is carried on?—I do. I believe that mankind have a preference for gold, that they universally wish to acquire gold, and that what they seek for in a bill upon London is a certain amount of gold. That they do not often use it I quite admit, but that is because they know that they can get it.

6807. There are two different things, are there not; gold operates in one way as a medium of exchange; but this it does only occasionally and to a very small extent; it also and in another way operates as a standard for all transactions?—Yes.

6808. And you think that it would be a very dangerous thing for the financial supremacy of London to alter that standard?—I do.

6809. It would be like altering the yard measure in a trade?—Yes. I think what mankind wish for is certainty in their dealings, and that they have a great dread of uncertainty or of dispute as to what is the value of the commodity that they have got.

6810. You have said that the value that people attach to currency depends upon their habits and their desires, and that the law is effective where it follows these habits and desires. Should you think that the habits and desires of the community of London are in favour of gold?—I do most emphatically think so.

6811. And you think that if the law said they should receive so much silver instead of gold, or so much silver as equivalent to so much gold, there would very likely be a revolt against that on the part of financial people?—My belief is that they would immediately associate themselves to repudiate it, and that they would say: "Whatever the law is, our dealings are to be in gold."

6812. And they would do that whether the new

bi-metallic ratio was 20 to 1 or 15 to 1, or whatever it was?—I do not think they would care anything for silver; it is looked upon as an obsolete and discredited medium of exchange.

6813. You would then have the law saying one thing, and the habits and customs of the people another?—If it is conceivable such a law could be passed.

6814. But by such a law people would be entitled to pay debts in silver?—It seems to me that the only effect of such a law would be to enable persons to discharge their debts in a depreciated standard.

6815. (*The Chairman.*) But would not that practice of contracting out of such a law apply in the main to the wholesale and large transactions which are now not settled by any metal passing at all, but by a system of set-off?—Undoubtedly they would. They must apply to large transactions rather than to small.

6816. But then in those cases, inasmuch as no actual metal would pass, might not silver be set off against silver, as well as gold against gold, by a clearing system?—I do not believe that it would be possible to establish a ratio between silver and gold. You might establish it by law, but there would be an agio upon gold, and the effect would be to drive gold out of circulation.

6817. But as regards the transactions here. Do you think there would be an agio upon gold where people did not want the metal in payment and did not get it, but the whole thing is settled by bankers through the clearing houses. In that case, would there be any agio upon gold?—One of the reasons why I think it desirable that there should be no change is, that no one can tell what the change would be. I believe in the inherited preference for gold. I know the feeling of the class to which I belong, and I know that any change is diametrically opposed to our feelings, and that whatever change is made, to whatever extent we can, we will be clear of it. If we lend a man 1,000*l.*, we will say to him, "understand we are not to be paid back in this new stuff; we must have gold."

6818. (*Sir W. H. Houldsworth.*) Do you think that that contract could be legally upheld, because if the law were passed, and a debtor tendered silver, it would have to be accepted; although he had made a contract, supposing he repudiated it and presented the money in silver, would that contract be upheld?—As an answer to this question I would refer to the history of the usury laws of this country, which forbade the lending of money at a rate higher than five per cent. It is notorious that money was lent at six, seven, and eight per cent. in spite of these laws.

6819. But is that quite the same thing, because although the contract had been made, if the debtor felt it to be his interest, which it would be, to pay in the cheaper metal, and presented it to the creditor, it could not be refused under the law?—No; but a great number of the transactions in London are carried on upon an honourable understanding. Many of the transactions on the Stock Exchange could not be enforced by law, and a man might repudiate them. Such conduct as you suggest would not interfere with dealings to any great extent. If a man did that to you, you simply would not deal with him again. A great deal of business is conducted by understanding—not by law.

6820. I think it could only be in large transactions and between individuals who might be willing to perform an honourable understanding; would not that be a very small per-centage of the whole transactions of the country, including retail and payment of wages, where you could scarcely imagine contracts being made?—The large monetary transactions form a very large proportion of the whole transactions of the London clearing house; the large sums are the important sums. Taking the cheques which Messrs. Glyn pay through the clearing house on an average day, it is found that cheques of 1,000*l.* and upwards constitute one-thirteenth of the total number of cheques dealt with and three-fourths of the aggregate amount.

*Mr. Bertram
W. Currie.*

8 July 1887.

Mr. Bertram
W. Currie.

8 July 1887.

6821. But are they a large proportion of the whole transactions of the country, including the payment of wages and all retail transactions?—That I am not able to judge. If you take the clearing house returns of any day the sums would be found to be very large.

6822. You would admit that this contracting out of the law could not be universal?—I beg to say it is only the expression of my opinion. It is not susceptible of proof, but I do believe this that so inherent is the preference for gold over silver, that it would be impossible by law now to make the great financial establishments of this country accept silver at the rates of 15 to 1 or 20 to 1 as equal to gold.

6823. Did that take place in France when the bi-metallic law was in operation; are you aware whether the people there contracted out of the law?—No, I do not think they did, I do not think the French had any preference at that time for gold or silver; I think they were accustomed to silver money and contented with it until they were able after 1850 to replace their silver by gold.

6824. (Mr. Birch.) With regard to contracting out of it, it is a thing that is done every day. You could not prevent people drawing upon you payable in gold. In the trade between the United States and Havana, the Havana houses arrange that they will not take bills on New York except they are drawn payable in gold?—Exactly the same thing would happen here. These large transactions would be made payable in gold. A bill would be drawn payable in gold, and the man who had to accept it and to pay it would not pay in silver if he had contracted to pay in gold.

6825. (Mr. Barbour.) Would it not be dangerous for a bank to hold a quantity of gold if the legal ratio differed very much from the market ratio? Supposing the legal ratio was 15½ to 1 and the market ratio was 20 to 1, would it not be dangerous for a bank to hold a large quantity of gold. I ask the question with reference to what occurred in France in 1860. The Bank of France had a large quantity of silver at that time and a small quantity of gold. There was a premium on the silver. Fears were entertained of a run on the bank to force payment in silver on which there was a premium, and the Bank of France sent a couple of millions of silver over to the Bank of England, and got gold in exchange from England. If a bank were known to hold a large quantity of the more valuable metal might there not be a run on it?—I am not able to follow what would happen if such a thing were done. I think it is a monstrous assumption that we should pass a law departing from our time-honoured practice unless some overwhelming necessity were proved. I am unable to see the evil which it is sought to cure.

6826. (Mr. Fremantle.) You said that if in the future there were found to be a deficiency of gold among civilised nations, some substitute would be found by the commercial world. Would you explain what you think might be the nature of that substitute?—I alluded to the idea which I believe was first promulgated by Professor Jevons. Without saying that such a plan as he suggests is practicable as yet, it occurs to me as not impossible at some future time. But if it were adopted by traders it is probable that no legislative change would be made until its use had been established by custom. I believe that if gold for any reason fails to perform its function as a medium of exchange mankind may be trusted to find a substitute. Gold is the latest phase of development, but it would be rash to predict that no further development can take place. But this is merely a speculative opinion.

6827. (Mr. Barbour.) But you think nothing would induce them to accept silver?—I look upon silver, as far as Europe is concerned, as discredited and obsolete.

6828. (Sir W. H. Houldsworth.) You are aware no doubt that for many years before 1873, the relative price of silver and gold was almost stationary at 15½ to 1?—That is the London price; yes, within reasonable limits.

6829. You are aware also that since 1873 the divergence has been very considerable?—Yes, I am aware of that.

6830. Can you account for these two facts; that during that period when the production of gold and silver varied very considerably at different times; that still that ratio was practically maintained, and that since 1873 it has varied considerably?—Well, I ventured to account for it in an answer to a question put to me by Mr. Barbour, that the production of gold from 1850 to 1875 enormously increased, and was greater, or equal to the whole production of the world, before. That clearly would have produced a most disturbing influence, had it not been for the fact that nations finding a superior medium of exchange, replaced their inferior medium, silver by gold.

6831. (Mr. Barbour.) What were the nations that substituted gold for silver?—The United States and France mainly.

6832. Was not that done under the operation of the bi-metallic system?—Certainly, and the very fact that the silver was displaced would tend to lower the price of silver, because, being repudiated as a medium of exchange, it would become to that extent useless. The demand for it for that purpose would cease, and therefore Mr. Laughlin says, and with perfectly sound reasoning, that a great production of gold, to whatever extent it displaces silver as the medium of exchange, tends to lower the price of silver.

6833. (The Chairman.) The use of silver for coinage purposes by the re-establishment of the bi-metallic ratio would raise the price of silver by creating a greater demand for it?—Clearly; if the Master of the Mint was to go into the market and make a very large purchase of silver for coinage purposes, the price of silver would be raised.

6834. I suppose in your view, even if such a law were not completely obeyed, it would be to some extent obeyed, and to that extent would tend to raise the price of silver?—To whatever extent purchases are made in the silver market, there is of course a tendency to raise the price.

6835. Then the effect would be, as far as the law did operate, to increase the price of silver and diminish the price of gold, and so to bring the ratio back again to some extent nearer what it used to be—to redress the disturbance that has taken place?—Yes; such a law, if it were effective, undoubtedly would have that tendency. My belief is that you cannot by law disturb the natural preference which mankind has for gold, and that every kind of stratagem would be used to secure gold instead of silver; and that if any international or bi-metallic arrangement were made, each nation would seek to increase its store of gold and diminish its store of silver.

6836. But, of course, it is very desirable that the currency should be as stable and uniform as possible?—I think that any change is to be deprecated which would affect its stability and uniformity.

6837. That the standard should not move in relation to commodities, that you might have a difference between the standard and commodities owing to the fall of commodities, but that the value of the standard itself should be as stationary as possible?—But the value can only be expressed in exchange for something.

6838. Still it is assumed is it not, that what is called a fixed standard is the most desirable, a standard that changes as little as possible?—I think the theory is this: you arrive at a certain standard. You will take gold or silver, as the case may be, of a certain weight and fineness. If anybody produces that to the authorities at the Mint they will certify that it is of a certain weight and fineness; but the present system in England is this, that any man bringing gold to be coined may have it coined at a small charge by loss of interest, and thereupon it passes current from hand to hand as certified to be of a certain weight and fineness. It appears to me that that is the sole duty of Government in the matter. I maintain that gold on the whole performs its function as well or better than anything else that has been proposed. That

being so, I am altogether unwilling to depart from it as the standard.

6839. (*Mr. Barbour.*) But if the function of Government ceases with the coining of gold why should Government have forbidden the coinage of silver?—The Government has undertaken to say what the legal money shall be, and having once decided upon it, it keeps to it. The Government in 1816 said, “in future all payment shall be made in this country in gold. For convenience sake we will coin a certain amount of debased silver for small transactions, but that shall not be accepted in payment above a limited sum.”

6840. If it was right for a Government to come to a decision in 1816 as to what the standard should be, would it not be equally right for a Government to change that decision if sufficient cause were shown?—I maintain that all that the Government of the day did, in 1816, was to register and consecrate the practice of the people; and when Governments go beyond that they will fail utterly.

6841. But if they happen to be equal in value would there be any difficulty in inducing people to believe it?—But I deny it; no law in the world can make me believe that a ruby is equal to a diamond, or that an amethyst is as good as a pearl.

6842. If in the market one pound of gold was worth 20 pounds of silver, would you not believe it?—I deny the possibility of fixing the relation by law. I should wish to keep the gold for myself and let you have the silver.

6843. (*Sir John Lubbock.*) You stated that it is the financial rather than the commercial prosperity of this country which is promoted by the present system of currency, but I gather from other portions of your evidence that you would also consider that manufacturing and other industrial undertakings are benefited by the confidence felt that there would be no after tampering with our monetary standard?—Certainly, I think the whole fabric rests upon a common foundation, and the direct effect would be upon financial interests, but the indirect effect would be upon the whole commerce and industry of the country.

6844. Might I ask you as a London banker whether you have had any evidence that our trade with the East has been materially interfered with by the fluctuations in exchange?—I believe it has shown a steady increase ever since 1873, that is since the fall in the price of silver.

6845. Then, although there may have been moments in which the trade has been checked by fluctuations in exchange, you do not think the trade has permanently suffered from that cause?—Certainly not.

6846. Mr. Childers has expressed an opinion that the fall in prices has been very much due to the long continuance of peace which has led to a great increase in the production. Do you concur in that view, and, if so, to what extent?—Well, if I were asked for the greatest reason of all, I should attribute it to the telegraph, which I think has equalized prices in the most remarkable way, and has no doubt tended to lower them. Business is conducted now in a totally different manner from what it was before the invention of the telegraph. The London price of commodities is known in every market in the world, and there is a general tendency I think to equality of prices and consequently to lowering of prices. Then the facilities of communication have immensely increased; owing to the great development of shipping, freights have fallen to a point which was never known before. To what extent peace has had its effect on the fall of prices I cannot say; but certainly war has an opposite effect, because it tends to the waste and consumption of commodities.

6847. Now, with reference to the production of Indian wheat, in relation to the production of wheat in this country; you admitted, I think, that while the exchange was falling that had the effect of giving the producer of the Indian wheat an advantage over the English producer. But assuming that silver remains at its present value, and that there is no

further fall in the value of silver, do you then consider the fact that there has been a fall, gives the producer of Indian wheat any advantage over the English producer?—I think that the fall in silver must have given the Indian wheat grower a considerable stimulus, that whereas his transactions were not profitable when the rupee was worth 2s., now that he can sell his wheat in Calcutta for more rupees in exchange for his draft on London, that that must stimulate the production of wheat.

6848. Suppose, for the sake of argument, he was to send over his wheat to the London market, would the existence of a low but not a falling price of silver give the producer of Indian wheat any advantage over the English producer?—A fall in silver would not affect him. It would depend on what he took in exchange. If he sends his wheat to London, the question is what he wants in return. He wants something in return. If he is ready to accept payment in silver, he gets a larger quantity of silver.

6849. (*The Chairman.*) When the Indian producer has lowered his gold price in consequence of being able to get as many rupees as he did before, and has sold on that assumption, that has brought down the price of Indian wheat. When that point has been arrived at the stimulus ceases as regards the Indian producer, because he is no better off than he was before?—If the price of English wheat is maintained he would undoubtedly have been better off, because he would have been willing to accept in exchange for his wheat more rupees, and he would get more, and apparently the fall in exchange and the fall in prices are simultaneous as far as we can judge. If you could imagine exchange to fall and prices not to fall, the Indian exporter would have benefited, because he would get a higher price for his wheat, and with that higher price he could get more rupees, and those rupees, as is contended, have not lost their purchasing power, but buy the same amount of commodities, so I believe that a fall in silver has stimulated Indian exports.

6850. (*Sir John Lubbock.*) When you say that the rupee has not lost its purchasing power, you mean the relative value of the silver, *i.e.*, of the rupee in India, has not fallen, while in this country, we having a gold standard, there has been a great fall both in silver and in wheat. If the wheat and the silver have both fallen 25 per cent. in this country, then the price of silver measured in wheat has suffered no diminution in this country any more than it has in India?—If the price of commodities fall at the same time with the exchange, as they appear to do, then the Indian producer does not benefit or lose, no doubt; but if you could arrive at this, that the price of wheat was maintained while exchange fell, then ultimately he would receive more rupees and he would be in a better position than his competitor.

6851. No doubt about it. But when the process had ended, when the silver had fallen in consequence, and the exchange had fallen, supposing the price of silver to remain stationary, the question is whether you consider the low price of the silver gives the Indian producer an advantage over the English producer, and I gather that under those circumstances you do not think it would be so?—No.

6852. So that the advantage is a temporary advantage, and would then have come to an end?—It is an advantage as long as the exchange is falling.

6853. (*The Chairman.*) Though it is an advantage to the Indian producer, the suggested disadvantage to the English producer remains, namely, that the prices have been brought down?—Precisely; prices have been brought down.

6854. (*Sir T. Farrer.*) Unless the illustration is that gold equally will buy more of wheat in England and other things than it did before. In that case there will be no advantage or disadvantage to either producer?—I think the producer in England is disadvantaged by competition, if he finds a number of other persons who can sell the same article that he sells at a lower price.

Mr. Bertram
W. Currie.

8 July 1887.

Mr. Bertram
W. Currie.

8 July 1887.

6855. The greater facilities of telegraphing, the development of shipping, &c., have so far encouraged the Indian producer; but that is a different question from the one whether he is encouraged by the diminution in the value of silver. The two questions are quite distinct, and I now gather that while the exchange was falling the Indian producer had the advantage, and that the English producer is to a certain extent damaged by the fact of the introduction of the telegraph and the increased facilities of communication, but when the value of silver is brought to an equilibrium satisfactorily, the increase in the value of silver does not give the Indian producer any advantage over the English producer?—Yes.

6856. (*Mr. Chaplin.*) If you say that the silver having ceased to fall, the disadvantage to the English producer disappears, I must ask you some more questions to clear up the point?—When the price of wheat has fallen to the same point as the price of silver, then I do not say that there is any further advantage.

6857. (*The Chairman.*) Supposing that the fall in silver has ceased, but that owing to that changed relation of silver to gold the Indian producer can sell at a lower price than he could before with the same advantage to himself, does not that still give him an advantage in competition, supposing the position of the English producer remains the same. I mean that although he may have brought down his price to a point which will afford him no stimulus that he had not before, because he gets only exactly what he did before, yet is not the fact that he can, with as much profit to himself, sell at a lower price, which the English producer cannot do, a certain advantage still remaining to him?—Well, I think it acts in this way: A man in Calcutta has a certain number of quarters of wheat to sell. If the exchange is 1s. 5d. that gives him a certain number of rupees, if the exchange is 1s. 4½d. that gives him more rupees. He says "That will do for me, I will now sell, I will get more rupees." I think in that way a change in silver does stimulate exports. It makes an export transaction profitable which was previously unprofitable.

6858. (*Sir John Lubbock.*) That again is a question of falling exchange, but supposing for the sake of argument that silver was worth no more than copper, why should that give the Indian producer an advantage over the Lincolnshire producer?—He will get more money, he will get more rupees, but he cannot eat rupees. When he came to exchange them for anything else, he would have to give so many more rupees. The contention is that his fixed charges, rent, living, taxes have not risen, and that if he gets a larger number of rupees he is a richer man in these respects.

6859. As regards the fixed charges in rupees, if he has to pay a fixed number of rupees for rent, and wages do not alter, so far he has an advantage, but not in any other respect?—When he sold his commodities he would receive more rupees.

6860. But when he came to exchange them for clothes or any other requisite, if silver had fallen, he would have to give so much more for his clothes. But it is contended that the price of commodities has not risen in India. That is to say, the fall in commodities has been equal to the fall in silver, therefore that the relation between commodities and silver remained the same; and so in this country, if you estimate the price in silver, you probably would not find they had fallen, because the fall in silver has been approximately the same as the fall in commodities?—But I imagine, if you take an exporter of wheat at Chicago and another at Calcutta, if the latter is willing to receive silver or rupees, and the Chicago man wants value in gold, the Calcutta man has an advantage, as he is willing to receive in exchange what is no use to the other man.

6861. (*Sir T. Farrer.*) In that case there would be a large export of silver to India?—There would be, and that is partly arrested by the Council Bills.

6862. Supposing that we depreciated our sovereign

coinage by issuing an extra issue of paper, or by putting more alloy into our sovereign, do you think that would stimulate our exports?—I do not believe that it would stimulate our exports, unless we got more in the foreign than in the home market.

6863. (*The Chairman.*) Supposing the fall of silver is at an end, the result has been that an Indian producer can get the same number of rupees, with the same purchasing power, that he previously could by selling his wheat at 30s. instead of 40s., so that the fall in the price from 40s. to 30s. leaves him just as he was before. But the English producer, who has also had to reduce his price from 40s. to 30s., is so much worse off, by only getting 30s. instead of the 40s. that he got before. Then does there not still remain an advantage to the Indian producer in the competition between him and the English producer, namely, that the person who can sell at the lowest price with the same profit to himself, though he may be in the same position as he was before, has an advantage in competing with the person to whom any reduction in price becomes so much more loss?—Yes, I think he has an advantage; I think the Indian producer benefits, because he is ready to take in exchange a commodity which the English producer is not willing to take in exchange.

6864. (*Mr. Barbour.*) Do you think he benefits permanently?—It occurs to me that he does.

6865. (*Sir John Lubbock.*) The assumption put to you by the Chairman is this,—there has been, we will suppose, a fall of 10 per cent. in all commodities, including silver. Is it not true that though the English producer would get nominally 10 per cent. less in money, yet when he came to exchange his money for articles in England he would get 10 per cent. more for it, whereas when the Indian producer came to exchange his money for commodities in India he would only get the same for it. Therefore, though it is quite true that the English producer would lose nominally 10 per cent. in the price, what he would get for his money would be 10 per cent. more?—That would depend upon the conditions under which the thing can be produced. I was thinking of rent, of fixed charges, because the great number of the charges which the producer would have to pay are fixed, are they not?

6866. (*The Chairman.*) Unless rent, taxes, wages, and the cost of production come down, say 25 per cent., the Indian producer would have an advantage?—Yes.

6867. (*Sir John Lubbock.*) Is it not the case then that the real advantage to the Indian producer is, in the first place, the facility of communication with England; and, in the second place, that if he has to pay a fixed amount for the land, and a fixed sum in wages, then as the rupee is worth less, although he has to pay nominally the same he is really paying less for those fixed charges, and, therefore, can afford to sell his goods at a lower price in this market. That is what I understand to be your opinion?—The advantage which the Indian producer has over the English or American producer is that he is willing to receive, in exchange for his production, rupees which no English nor American producer will accept. As those rupees are worth as much to him as they were before he has an advantage. I should say the lowering of the price of wheat is due in some measure to the power of the Indian producer to ship wheat to this country.

6868. When you say they are worth as much, you mean that he can buy as much for his rupees as he could have done before?—I believe he can.

6869. There has been a fall of 20 per cent. in the rupees, therefore you assume that there has been a fall of 20 per cent. in other articles?—Yes. I assume that rupees in India will exchange for as many commodities as before.

6870. In England, on the contrary, the producer has to take a price 20 per cent. less, but then, on your assumption, prices are 20 per cent. less, or in other words, his money is worth 20 per cent. more?—I believe most prices have fallen in this country.

6871. Then, although he gets a smaller price, the price which he does get will enable him to pay 20 per cent. more, and, therefore, he gets practically the same in England as he did in India?—Well, you would have to go into the whole question of what is the cost of producing wheat in this country, what his fixed charges are, what he can afford to spend. If he gets 30s. a quarter a great part of it goes to pay for labour, rent, rates, and taxes.

6872. Do you consider that the advantage depends on the question of fixed charges, or has he any other advantage?—I consider this, that the producer in India is willing to receive in exchange for his wheat a commodity which the other producers will not, and of which the others can make no use. That commodity to the Indian producer represents his money, which he can turn into anything that he requires, and therefore I believe that the depreciation of silver as it relates to gold has acted as a stimulus to the Indian producer, just as depreciated money would do, as long as it maintained its purchasing power in the home market.

6873. (*The Chairman.*) Supposing, taking the illustration that has been put, in the case of India, the producer receives, getting a lower gold price, the same number of rupees as before, and that he has to pay taxes and wages in these depreciated rupees, then while I suppose them to be nominally the same amount they are actually 25 per cent. less. That is what I understand Sir John Lubbock put. But supposing the price of commodities in England has fallen to the same extent, yet if the producer here taking 25 per cent. less has to pay the same amount of rent, wages, and taxes, he is really paying 25 per cent. more in rent and in wages and in taxes, and those who get the advantage of that 25 per cent. are the people who receive the wages and the rent, and the taxes, and the position of the producer here is worse?—Yes.

6874. (*Sir John Lubbock.*) The position I put is that really the fixed charges and payments of the Indian grower are less, and therefore he can afford to sell his article at a lower price. It is not that the silver has fallen in itself, but it is that his fixed charges being in silver, and silver having fallen, enables him to sell the article at a lower price. What I understand you to mean is this: that the fixed charges of the Indian producer, being fixed in silver, have fallen, and that consequently he can undersell an English producer?—The fact may be granted that the Indian producer can at the present moment undersell the English producer.

6875. (*Mr. Chaplin.*) With the present rate of exchange?—With the present rate of exchange; he could not before, or not to the same extent.

6876. (*Sir T. Farrer.*) Would the establishment of the bi-metallic ratio permanently prevent the Indian producer from competing with the English producer?—I think it would act in the direction of lessening his power of competing. There is a great controversy about that; it was laid down by Mr. Bagehot, and his reasoning appears to me to be sound.

6877. Mr. Bagehot's notion appears to be this, that the silver became less valuable here, but that it was a thing which the Indian would still receive, that consequently the silver would go to India, the wheat or the jute or anything else would come to England, that prices in India would be adjusted in consequence, and that, after a certain time, all things would be as before?—He did predict that; that was his idea. But his predictions have not all been fulfilled. No doubt Council Bills compete with silver as a mode of remittance, but silver also goes, and if a merchant finds that it is more profitable to buy silver in London and send it to India, than it is to buy Council Bills he will do so. If there were no indebtedness of India to England, no charges to pay in London, silver would go apparently to the amount of the whole of Council Bills, if other commodities did not go.

6878. (*Mr. Chaplin.*) When you speak of the stimulus which is afforded to wheat growing in India,

under the present system, would not that stimulus be to the extent that the English grower loses, and the Indian grower, owing to the rate of exchange, gains by getting 30s. for his wheat in England instead of 40s.?—Do you mean that he gets the whole benefit of the difference between 30s. and 40s.?

6879. Whatever the stimulus is, it is a stimulus to the extent of what one man loses and the other gains?—My view is this, that if there were 100 quarters of wheat for sale in Calcutta and 100 quarters of wheat for sale in London, if the man in Calcutta is ready to take silver, and the man in London is not ready to take silver, the man in Calcutta has the advantage, because he can with that commodity go and buy anything he wants, whereas the Englishman cannot use that commodity as money.

6880. What I want to arrive at is this. Is it not a fact that at this moment he is able with the 1*l.* 10s. that he gets for his wheat in London to buy more rupees than he got for 2*l.* before?—It is about the difference between 2s. and 1s. 5*d.*

6881. Whatever the difference is that would be his gain?—That would be his gain if prices had remained the same, but prices have fallen.

6882. That would be his gain, the difference as between the price at 40s. and the price he is getting now at 1*l.* 10s. There is no question at all that if the Indian producer would have gained because he would have received perhaps 40s. converted into rupees, he would have got a very largely increased amount of rupees?—He would have benefited to the extent that the slightest fall in exchange makes a transaction profitable which was not profitable before. It is a matter of experience that bills in Calcutta come forward when there is a fall in exchange. If you meet with a producer of wheat in India he is ready to accept silver, but a producer of wheat in England will not accept silver. They each have what they prefer. The Indian producer will accept silver because that silver has a value to him, which it has not to you.

6883. (*Mr. Barbour.*) But practically the wheat that is exported is paid for by commodities and not by silver?—Quite so, but the producer in India sells his wheat for rupees, the banker gives him rupees for it.

6884. (*Sir L. Mallet.*) You are of opinion that the low rate of interest now obtainable on money is inconsistent with the alleged scarcity of gold?—I am of opinion that the scarcity of gold, if there were such a thing must show itself in relation to the rate of interest.

6885. Do you then consider that there is any necessary connexion between the rate of interest on money, and the relation of money to prices. Is there not a radical distinction between the exchange value of money estimated in money, that is, the rate of interest on money, and the exchange value of money estimated in goods?—Well, I should prefer to say, if I am asked if gold is scarce, if it has appreciated I fail to see any evidence that it has appreciated. The mere fact that there is a fall in prices does not show it, I think.

6886. Do you think that the low rate of interest proves that it is not scarce?—I can imagine no other way in which it would show itself. If in all the banks and centres of the world the balance of gold tends to increase, I cannot see how it can be said to be scarce.

6887. But do not the rate of interest on loans of money, and the power of money to purchase goods, tend to a great extent to vary in opposite directions. For instance, an active demand for discounts on bills or advances from bankers tends, does it not, to raise the value of the use of money?—An active demand tends to raise the value of the use of money.

6888. While, so far as such money is wanted to purchase goods, it will cause a rise in the price of goods and a fall in the purchasing power of money. The more money is wanted to buy goods, the higher prices will be; that is to say, the value of money will

*Mr. Bertram
W. Currie.*

Mr. Bertram
W. Currie.

8 July 1887.

fall, which is an opposite effect to that which is produced to the value for the use of money. The two things appear to me to vary in opposite directions, that is, the rate of interest falls when prices are high, and *vice versa*?—No doubt prices are acted upon by the quantity of money, but I do not think by gold only, but by all the instruments of credit. If there is any great abundance, prices have a tendency to rise, but, after all, gold forms now a very subsidiary part of the whole, and I believe it is impossible that there can be any scarcity of gold, because there are so many substitutes used for it. As a matter of fact there is no scarcity. Gold is as plentiful as it ever was. I cannot see the connexion between the undoubted fall in prices and any scarcity of gold.

6889. Are not higher profits likely to be attended by a high rate of interest, when profits are high, traders being ready to pay a high interest on loans?—Undoubtedly they are, and when traders compete for them.

6890. When the difference between interest and profit is small, will not capitalists rather lend their money on interest than embark on commercial and industrial enterprises?—Certainly the result of experience is that when commercial profits are very low there is a tendency to invest money in permanent securities.

6891. Well then, how could an appreciation or depreciation of the currency affect the rate of interest on money, the money and the interest on it being equally the subject of such appreciation or depreciation. Four per cent. is always four per cent., and if 100*l.* is worth more than it was before, 4*l.* will also be worth, equally, so much more than it was before?—I say they are arguing without evidence, those who say that there has been a scarcity of gold. I fail to perceive it; I see no signs of it.

6892. You think that the low rate of interest is a sign that there is no appreciation?—I think that it is a sign. I think if there had been any scarcity of gold, stocks in the banks would have diminished, and the price of money must have risen. It seems to me so.

6893. (Mr. Barbour.) Are you aware that Mill holds that there is no necessary connexion between the quantity or value of money in circulation and the rate of interest. He says: "From the preceding considerations it would be seen, even if it were not otherwise evident, how great an error it is to imagine that the rate of interest bears any necessary relation to the quantity or value of the money in circulation. An increase of the currency has in itself no effect, and is incapable of having any effect on the rate of interest"?—Yes, that I have no doubt is true; but I have simply argued in this way: I disbelieve in a scarcity of gold, and that prices have fallen because gold is scarce, and I then say that if there had been any appreciation of gold, which I disbelieve, I think it must have manifested itself in some palpable form; in some way we must have been aware of the scarcity of gold.

6894. By the fall of prices?—That is only another name for the same thing. A scarcity of gold should mean this, that other nations that formerly did not use gold do so now, and that there is not enough to perform the functions; that is what I deny.

6895. The contention is not that there is not enough to perform the functions, but that there is not enough to perform the functions at the old scale of prices. I think that is the contention?—That I cannot believe.

6896. You are aware that in recent years in England there has been on the balance, according to the trade figures, an export of gold?—A small export.

6897. And we know that there is every year a consumption of gold in the arts, so that, on the whole, the quantity of gold in England is now actually less in all probability than it was some years ago?—I think that is very likely.

6898. Then your contention would be, not that there is not less gold here, but that any reduction in

gold has been compensated by banking expedients?—If there were any scarcity of gold I maintain that it would be met by substitutes immediately, and that the effect on prices is not that of gold only, but of credit notes, cheques, bills, &c.

6899. But would there not be a limit to the extent to which you could use substitutes for gold?—Well, that limit has not been reached yet. I think there never was a time when there were so many. In my early days the stock of gold was a very serious question. That has ceased to trouble us altogether. I do not think anybody ever entertains a doubt that he can get gold for his note, so gold does not play the important part that it formerly did. The main object of the legislation of 1844 was to establish beyond all doubt that the bank-note should always represent its value in gold. That is a question that has ceased to trouble us, and gold now performs a minor part in the circulation of the country.

6900. (The Chairman.) Has the increased purchasing power of gold anything to do with them; if gold increased in purchasing power the note would increase in purchasing power too?—Well, if gold were the only thing that affected prices it would be so, but prices are affected by many other causes.

6901. By all that a man possesses which he can give in exchange for commodities, and which is not represented by the gold which he has, but by all the credit which he can get or the property that he can turn into gold?—By the purchasing power that he has, and that purchasing power in its relation to gold has enormously increased. Gold performs a much less important function than it did. The use of gold has decreased; other things have increased; credits, cheques, drafts, all those subsidiary portions of the currency have enormously increased.

6902. You expressed the opinion that if the bi-metallic ratio were created, and silver made legal tender at that ratio, contracts would be entered into in relation to gold, owing to tradition and habit, would not that be with reference to what I may call international transactions only. Would there be any reason for such bargains being made in relation to internal transactions in commodities?—Well, the way that it strikes me that it would take effect would be in loans. Bankers called upon to lend to a corporation or a public body 100,000*l.* for a term of five years would say, "Now I will lend you this money in gold." That is to say, it occurs to me that in the larger transactions people have got such a preference for gold that no legislation would persuade them that it was not more valuable. They would guard themselves against being paid in silver. If the state says debts contracted in gold may be paid in silver, why not in shells, stones, anything.

6903. In regard to internal transactions which are settled through the clearing house, and which do not require any transfer of any metal from one person to another, it would not matter to the person entering into the transactions how they were carried out, whether by silver or whether in point of fact they would not be carried out by either. They would be carried out by a transfer at the Bank of England from one banker to another of the balance of the transactions; but I do not see regarding the great bulk of ordinary commercial transactions, that there should be any tendency to contract for gold or for silver?—The particular form it would take I am unable to predict, but the preference for gold over silver has nothing to do with law, and no law which can be passed would ever make bankers willing to be paid in silver instead of gold. We would take some precautions to show that we would not be bound by this. I have ground for assuming that, because it has actually been done.

6904. As far as all the money you owed to your customers, for example, if they were bound to take silver from you, it would not matter whether you took silver or gold in regard to what you had to give them, so that to this extent it would be partly operative?—My contention is that such legislation would fail, because large dealers in money would contract them-

selves out of it. As an illustration of the manner in which a community will provide itself with currency I should like to call the attention of the Commission to the experience of the United States. After 1860, when the fractional token coins began to disappear from circulation, the Government, in order to retain these coins, passed a law prohibiting the issue of paper money of less denomination than one dollar. Thereupon tickets, tokens, and other instruments of exchange were immediately issued by companies and individuals and acted as substitutes for the displaced silver token coins.

6905. (*Mr. Barbour.*) Does not that also tell in the other direction? When, owing to the depreciation of the currency, it became profitable to export the fractional coin it was exported?—Well, notwithstanding the law made to prevent it, the more valuable

money was exported, and the less valuable remained. What I wanted to argue was this, that if you attempt by law to deprive people of the money required for their transactions they will invent some substitute for themselves.

6906. The United States Government passed a law with a view to keep fractional money in the country, and it failed because the fractional money had become of more value as metal than it was as money?—Yes.

6907. The fractional coin ceased to circulate as soon as its intrinsic value exceeded its legal value, and the United States Government not having provided any other fractional money the people made fractional money for themselves?—Yes, they made a money which represented nothing but credit, in the shape of tokens and tickets.

The witness withdrew.

Adjourned till Monday.

Twenty-eighth Day.

Monday, 11th July 1887.

PRESENT :

THE RIGHT HON. LORD HERSCHELL, the CHAIRMAN, presiding.

MR. D. M. BARBOUR, C.S.I.
MR. J. W. BIRCH.
SIR T. H. FARRER, Bart.
MR. C. W. FREMANTLE, C.B.

SIR W. H. HOULDSWORTH, Bart., M.P.
SIR JOHN LUBBOCK, Bart., M.P.
SIR LOUIS MALLET, C.B.

MR. GEO. H. MURRAY, *Secretary.*

Mr. H. L. RAPHAEL called and examined.

6908. (*The Chairman.*) You have carried on business for many years as a bullion banker in the City of London, and have been concerned in considerable financial operations there?—Yes.

6909. Do you think that an international agreement could be made for the free coinage of gold and silver as legal tender money at a fixed ratio?—An international agreement could be made if the principal nations, namely, the United States, France, Germany, and England, found it to their interest to do so. The United States as a large silver producer, and France with a large silver currency would favour such an agreement, but on the other side there would be Germany and England who have no such reasons for favouring it. I will explain later the reasons why I think that Germany is likely to be opposed to it, and as regards England, many of my replies will explain that the interests of England are opposed to it. But, speaking generally, I think that such an arrangement might be made if the four nations found it to their interest to do so.

6910. Then, the next question I would ask you is whether, in your opinion, it is in the power of governments to maintain such a ratio if agreed upon?—If the four principal governments were to agree to an arrangement, it is to be presumed they would have the power of maintaining it; but I, for my part, am afraid that circumstances would, before long, occur which would cause some of the governments, whilst carrying out the letter of their agreement, to depart from it in spirit. As an ammunition of war, gold will always be considered more important than silver. It is easier to transport, and besides, gold possesses a glamour which silver has not, in fact people think more of gold than of silver, and most likely that will be the case during the present genera-

tion, whilst that effect is on our minds. With the jealousy existing between Germany and France, if gold were exported largely from one country to the other, a feeling of mistrust would be certain to arise, and suspicions would be aroused that the gold was being acquired in a surreptitious manner, namely, by purchase at a premium. In case of war, or even of fear of war, I have no doubt that the military powers, France and Germany, would seek to strengthen themselves by the acquisition of gold by purchase, if it could not be obtained otherwise. Then again, is the arrangement to be made for a short period as a trial, or is it to be made perpetual? If for a short period, I have not the slightest doubt that immediately there would be developed a desire on the part of each nation to increase its gold reserve, and not to part with its stock of gold, in order to be prepared for the termination of the agreement, and a possible return to a monometallic standard.

6911. Do you consider bimetallism possible on any other ratio than $15\frac{1}{2}$ to 1?—I consider the only possible bimetallic ratio to be that of $15\frac{1}{2}$ to 1. To avoid the sudden alteration of value, bimetallicists have talked of a ratio of 20 to 1, which would be near the present ratio, which, as you are aware, is 21 to 1. If this ratio of 20 to 1 were adopted, instead of two metallic currencies there would be three. There would be gold, the old silver coinage of $15\frac{1}{2}$ to 1, and the new of 20 to 1. It is not to be expected that the two coins would be looked upon as identical, when the one contains 30 or 35 per cent. more silver than the other. As soon as a balance of trade necessitated an export, the only silver that could be exported would be the new coinage, and in consequence it would be certain to command a premium. In view of this contingency, which arises

*Mr. Bertram
W. Currie.*

Mr. H. L.
Raphaei.

11 July 1887.

in every country from time to time, there is not the slightest doubt that every bank and every trader would keep in reserve the new coinage, to be prepared to secure that premium, when an export demand occurred. To put it in a more forcible form, if at the time when gold was discovered in Australia and California, it had been proposed to increase the amount of gold in the sovereign—to day it is 5 dwts. $3\frac{1}{4}$ grs.—suppose it had been determined to meet the trouble of superabundance which then occurred in people's minds, as it does to-day about silver; suppose it had been determined then to raise the weight of the sovereign to 6 dwts., do you think that the 6 dwts. sovereigns, the heavier ones, would have circulated, side by side with the old sovereigns of 5 dwts. $3\frac{1}{4}$ grs.? It would have been evident that at the first export demand, and an export demand does occur in this country every three, six, or nine months, the heavy sovereigns would have been the only sovereigns exportable, and naturally, the Bank of England, and every trader would have kept them in reserve until an export demand arose, when they would have commanded a premium. If it were determined to change all the coined silver in existence to the ratio of 20 to 1, and call in the old coinage, these insurmountable difficulties would arise:—Firstly, the re-coinage of the old coin would take a generation. Of course, it could be decreed that the rupee is henceforth to pass at a reduced value of 30 per cent., or whatever it may be, and instead of being worth 16 annas, it was to pass for 11 annas, or that the 5-franc piece, instead of passing for 5 francs, should pass for 3 francs 50 cents, but then who is to bear the loss of the 30 per cent., the Government or the people? If the Government, in the case of India, it would cost probably a sum of 80,000,000*l.* or 100,000,000*l.* sterling. If it were determined that the loss should fall upon the people, well, I should say then, I give it as an opinion, that it would cost England 100,000,000*l.* sterling to quell the discontent and prevent the loss of India.

6912. (*Mr. Barbour.*) Do you propose to re-coin the rupee in India, in case there is a bimetallic agreement with the ratio of 1 to 20?—I say it would either have to be re-coined or you would have to decree that the rupee is henceforth to pass at a reduced value of 30 per cent., and instead of being worth 16 annas, is to pass for 11 annas. I say that the two coins could not remain in circulation together; the one on the basis of $15\frac{1}{2}$ to 1, and the other on the basis of 20 to 1.

6913. But there are only silver coins in India: why should they not remain as they are?—But you are going to introduce a coin of the ratio of 20 to 1, which is $4\frac{1}{2}$ upon $15\frac{1}{2}$, or 30 per cent. more. Bimetallicists propose to adopt a ratio of 20 to 1. How are you to deal with the fact that you have two coins, one coin which has $15\frac{1}{2}$ of silver in it, and another which has 20 of silver in it. It is not possible that the two could remain in currency at the same time.

6914. (*The Chairman.*) You are assuming the bimetallic arrangement to extend to India. I think Mr. Barbour was suggesting that you might have your bimetallic arrangement and leave India out altogether?—My argument applies to France just as much as to India. I have not the slightest doubt in my own mind that it would not be expedient to make a bimetallic arrangement and leave India out.

6915. (*Mr. Barbour.*) But if you did, all you would require to do would be to coin a new gold coin worth 20 rupees. There are no gold coins in India at the present time?—They have mohurs.

6916. But they are not coined as legal tender?—No; but the question is about silver. When I talk of England coming into such an arrangement, I include India as being with England, and I say that if you adopt a standard of 20 to 1, you will find yourself in this difficulty, that you endeavour to keep two silver standards in circulation at the same time, one with $15\frac{1}{2}$ of silver and the other 20. Well, I maintain that the 20 silver would not remain in circulation.

It would be reserved for export when a balance of trade occurred.

6917. I was speaking of India; and I cannot see how your argument applies to India?—I thought that if England came in you would not exclude India from the advantages, if advantages there are. Well then, again, in regard to France. They would have to face the same difficulties. There the loss would have to be borne by the Government or by the nation. The silver held by the bank of France to-day amounts to 44,000,000*l.* sterling. If there is to be a loss upon those 44,000,000*l.* of 30 or 35 per cent., why it will be twice the capital of the Bank of France, and therefore, I contend that the only coinage which is possible, if it were determined to adopt bimetallicism, would be on the basis of $15\frac{1}{2}$ to 1, the same as existed before the demonitization of silver by Germany.

6918. (*The Chairman.*) What would be the effect of our mint being opened to the free coinage of silver at the ratio of, say, $15\frac{1}{2}$ to 1 of gold, supposing an international agreement to have been made to that effect?—I propose to answer your question in two parts:—Firstly, as to the effect bimetallicism will have on the precious metals, and secondly, as to its effect upon trade and the general prosperity of England. Now as regards the precious metals. I take for argument's sake the annual production of silver at the present price of silver to be 24,000,000*l.* sterling, and of gold 20,000,000*l.* sterling. I do not put these figures forward as authentic, although I think they are not far from the mark, but I repeat I only use them as a basis of argument. Now if the value of silver be raised by international agreement 30 or 35 per cent., it is evident that the respective annual production would be 32,000,000*l.* sterling of silver, and 20,000,000*l.* sterling of gold. If you decree that silver instead of being worth its present market value, 44*d.*, is worth, say, 60*d.*, which is $15\frac{1}{2}$ to 1, you immediately add to the value of the silver which is found the difference between 44 and 60; therefore the proportionate production of gold and silver, which is now as 24 to 20, would be raised to 32 to 20. Then if 32,000,000*l.* sterling be the value of silver produced by the mines, how much more will be produced with the price at 60*d.*, when 16*d.* per ounce extra profit is offered as an inducement to the miners to produce silver? This looks like a rule-of-three sum. Of course it is not to be worked out in that way, but there is no doubt that the extra profit on silver would add enormously to its production. With the silver mines yielding such extraordinarily large profits, would it not have a damaging effect upon gold mines and diminish the annual yield of gold? That might occur in this way:—Mining wages would rise enormously. Silver mines making an extra profit of 16*d.* an ounce could afford to pay much higher wages. The cost of machinery, no doubt, would increase; the necessities of life would also increase in price, and all these taken together might prevent some gold mines from being worked under the new order of things. What I stated before as to the proportion of silver would be a fact, there is no contradicting it, and as for giving an extra profit of 16*d.* per ounce to the silver miner, it is a matter of certainty that the production of silver would largely increase. As regards the gold falling off, it is only a theory that I suggest, which might be established by fact or not I think it would. I think gold mining would fall off, because there would be a greater attraction for silver mining. Now as regards the effect it would have upon trade, I think that the raising of the value of silver 30 per cent., which would be really bringing very much more of the precious metals into circulation, would, no doubt, produce an inflation in values. This inflation would only be temporary in regard to its general character, like all other inflations which are overdone and which come to an end. We witnessed a great inflation caused by the American War, when America suspended specie payments, and her specie was released, and found its way into Europe. We also witnessed another inflation after

the large indemnity which was paid by France to Germany. In Germany things rose to a frightful state, but it was only a question of a year or two before the collapse occurred. However, I have no doubt that there would be an inflation, but it would not last long. This accounts for the various Chambers of Commerce in England favouring bimetallism. These bodies are composed of merchants, manufacturers, coal-owners, mill-owners, and people of that sort. They see an immediate profit by its adoption, and although they would be ready to acknowledge that the inflation in the price of manufactures would not be lasting on account of the universal competition there is in the world, yet each one would hope to have secured his harvest before the re-action set in. This would be an immediate advantage for them. If they were asked about the position of the working classes under this inflation, they, no doubt, would reply that higher wages will compensate for increased cost of living; but we all know that increase of wages has always to be fought for, and in nearly all cases is resisted by employers. Some trades, assisted by their unions, might succeed in enforcing higher wages, but what a small proportion are these to the bread-earning population of England. The following classes have no unions to look after their interests: shopkeepers, clerks, Government employés, sempstresses, &c. Now, as regards the permanent effect that bimetallism would have on the price of food and those food products which we are compelled to purchase from abroad, which, as you know, form a large proportion of our imports. England receives from abroad enormous sums annually for capital invested. A proof of the enormous sum is the difference between the imports and the exports, the imports being nearly twice the amount of the exports. A certain amount may be reckoned for freight and a certain amount for insurance, but still the imports never could reach that total, could not be kept up to that total for so many years, unless the amount of money owing to England was something enormous. Well, a large part of this enormous sum is payable to us in gold, and under our present gold standard we can purchase at the present day silver 30 to 35 per cent. cheaper than we could formerly or than we could if we adopted the bimetallic basis of 15½ to 1, and with that silver, which we buy cheap, we can pay India and China and other silver-currency countries. We buy it at a reduced price, and can pay them with it for our food. Nor are our advantages confined alone to our purchases made from silver currency countries. If wheat from India could not, owing to the cheapness of silver, be imported at the present low price, America, from whom we draw by far the largest part of our supplies, would refuse to sell us at the price existing to-day. She would demand 8s. to 10s. per quarter higher, and would, no doubt, obtain it. Therefore, not only have we this advantage on all the food which we import from India and China, but America, the great purveyor of the world, is obliged to take the lower price. The essence of free trade is that the necessities of life should be obtainable at the lowest possible price, in order that wages should be as low as is compatible with existence. Those gentlemen who demand bimetallism would be quite as consistent if they were to ask the English Government to spend annually 50,000,000*l.* sterling, to raise it by loan, and to spend it on ironclads, fortifications, and all sorts of things. The greater part of the money, or the whole, would be spent in this country; and there is not the slightest doubt that it would give a revival to trade, and stimulate it for the time, and all these gentlemen would derive great advantages; but what would be the position of the lower classes, of the masses? They would have to pay for the whole thing. As a proof to what extent low silver has cheapened food, although our consumption naturally is greater than it was years ago, owing to the increased population, and there being more mouths to feed, yet the payments for food which we have to make abroad are smaller.

6919. (*Mr. Barbour.*) Do you mean our payments

in gold or our payments in commodities?—Our payments in gold for food which we import. I can only reckon gold which is the standard. I cannot tell you how many manufactured shirts you send for a quarter of wheat. I can only reckon it in gold; that is the use of gold, to settle values. We have got out of the age of barter, and are in the age of gold. Statistics would hardly forward us, because I think that every one will allow, that perhaps with the exception of coffee, which owing to a special cause went up last year very considerably, from the fear of a short crop, every other article of food has been steadily and persistently declining; and this decline has been contemporaneous with the decline of silver. The cause of our agricultural distress, I believe, has been rightly ascribed to the competition of large tracts of land in the United States which pay no rent, but there is no doubt that, as regards the agricultural interest, the decline in silver has had a very damaging effect; in fact, it has been the finishing stroke to a long course of suffering, originating in the competition from free land in the United States. I do not question this agricultural distress being a serious matter for England, because in a political point of view it drives our labourers into towns, where they become enervated, and no longer form the backbone of our fighting power. However, it might be wise to take the duty off tea and put it on corn, but we are not here to discuss that matter to-day. I only mention this point to explain what appears to me to be the absurdity, that in order to give relief to agriculture to a certain extent, we should adopt a supposed cure, namely, bimetallism, which would raise the price, not only of wheat, but nearly every article 30 or 35 per cent. But take wheat alone, which we are obliged to import in enormous quantities, you would adopt a ruinous course for the sake of relieving our agricultural population which might be relieved just as easily, say, by taking the duty off tea and putting it on corn. But, however, whether you do that or not, in order to give a certain amount of relief you propose to make the whole of the population pay considerably more for the food that they consume. Now, the wealth of England, other than the accrued wealth, namely, the interest which she draws from her investments abroad, consists, as we all know, in her iron, her coal, and in the manufacture of iron and other metals, and in a great quantity of other manufactures, such as cotton, wool, jute, and the like. If by adopting bimetallism and paying foreign nations dearer for our food, which would be the inevitable result, is there such a certainty that they would buy more of our manufactures? If we paid America 8s. per quarter more for her wheat and corn, is it so certain that she would take more iron from us in return? Her manufactures, as you know, have been so stimulated by protection, which on iron is 50 to 60 per cent., that to-day she can manufacture for her own use a sufficient quantity. But even if she is obliged to import, it does not follow that she will come to England because we pay her more for our food. She would go to Belgium or Germany, if there she can buy cheaper. Now, as regards our other manufactures, would it not be a disadvantage to have dear cotton, dear wool, and dear jute? There is no doubt that things have changed as regards competition. There was a day when the English manufacturer was alone in the field, but to-day other nations have grown up and the English manufacturer has to use his brain, has to content himself with smaller profits than formerly, and has to compete very much more with other nations. Now, if we are to make a stand against that competition, is it not evident that the most favourable circumstances for us are that we have cheap food, which means low wages, and that the raw produce should be obtainable at low prices, which mean increased consumption. Therefore, in answer to this question No. 3, I think that the effect would be a very bad one, as far as England is concerned. As regards India, I shall have occasion afterwards to allude to that in answering one of the other questions

Mr. H. L. Raphael.

11 July 1887

Mr. H. L.
Raphael.

11 July 1887.

6920. (*The Chairman.*) To what extent do you consider that the commercial or financial position of this country is due to the single gold standard now in use?—I think that the single gold standard has contributed to the high financial position occupied by this country, not so much on account of its being a gold standard, but because the sovereign has existed for so many years and no alteration has been made. The chief reason for England's pre-eminence in her financial position is the universal feeling that it is the safest country in the world to deposit money, because it is not exposed to internal disturbance and the risk of invasion. I have no doubt in my own mind that if France had a gold standard and England the double standard of France, that England would still maintain her financial supremacy over France.

6921. (*Mr. Birch.*) But do you not consider that the gold standard has been a great advantage to England in this way: whenever a bill was drawn in any part of the world, they knew that it would be paid in gold, whereas if drawn on France, at various times, they have paid in five-franc pieces, and at others in gold. Do you not think that that is an important element?—An idea perhaps, but not the real fact. The real fact of England's supremacy is that she is safe from inland disturbance and risk of invasion, and I have no doubt that the sovereign having existed for so many years, and no alteration having been made, has had a great effect.

6922. (*Sir T. Farrer.*) Then, that being so, it having existed for so many years, what do you think would be the effect upon England's financial position of an alteration made at the present time; do you think it would have any effect for good or for evil?—Not as long as all the others stuck to that agreement, but if there was an idea that one was playing false to the other, then England would be in a very sorry position.

6923. But you do not think that the mere alteration of the gold sovereign into bimetallic money, half gold, half silver standard would affect England's financial supremacy of itself?—No, I think it depends on other circumstances. I know that the German Government changed its currency because it thought that an exclusive gold standard would give it a supremacy in trade, or at any rate would put it on a footing with England. That was the idea in altering the currency. There may be reason in it, but I fail to perceive it. I think that the great inducement for people trading with England is that they know their money is safe there, and that there is no such fear as of the Germans entering France, or the French entering Germany, nor of any revolution.

6924. You do not think that, the facts being as they are, the alteration of the gold standard would at all injure her financial position?—All I can say is that I know that that was the German idea, that they would get advantages. There may be advantages, but I fail to perceive them.

6925. (*Mr. Birch.*) But do you think that with regard to Germany it has had the result that they expected?—Germany has increased her trade to an enormous extent, but then the trade follows the flag, you know. It is her great political ascendancy that has most likely given her this advantage.

6926. (*Mr. Barbour.*) Do you think that the adoption of the gold standard by Germany is the cause that has led to the large increase in German manufactures?—That is naturally due to the protection which has been given to traders, which has stimulated trade to such an enormous extent.

6927. I believe at one time in England we had depreciated paper—in the beginning of this century?—Yes.

6928. That, of course, was an inconvenience, but it did not destroy our commercial supremacy at the time?—No, it did not; but then you must remember that at the time that we had that depreciated paper all the other nations had the same. It was a time of general war, when all were on the same footing. There

was no comparison to be made at that period between paper and gold.

6929. (*Mr. Birch.*) My question was simply with regard to banking, whether there are not a great many more bills drawn now direct upon Germany than formerly were drawn upon England, for German account, more direct business, is there not, a great deal?—Yes.

6930. Do you think that that may in a certain extent be attributable to the better state of the currency of Germany?—I think it is due more, as I said before, to the moral and political effect of her victories.

6931. (*The Chairman.*) To what do you attribute the fall in the value of silver since 1874?—Well, it is a very short history. The fall in silver was originated by the demonetization of that metal by Germany. To guard against the loss of their gold the mints of the Latin Union were closed, so that Germany should not pour its silver, which it wanted to get rid of, into those mints, and exchange it for gold. The Governments of Belgium, France, and Italy closed their mints. There ceased to be an outlet for silver to any country that, hitherto, had coined it on the ratio of 15½ to 1. The quantities produced had then to depend, firstly, on the 24 millions of dollars coined under the Bland Bill in the United States; secondly, on the demand for India and China; thirdly, on the requirements of silver for token money in England and other countries; and, fourthly, on the demand for manufacturing purposes. All these demands combined were insufficient to absorb the whole production. With the exception of the one use in the United States, namely, the coinage, which was for a fixed amount of 2,000,000 dollars a month, all the other demands were of a variable nature, both in regard to time and to amount. Therefore there occurred times in recent years when silver had forcibly to be shipped to India as the only outlet. The position was aggravated by the competition of the Indian Government drawing on India. That depressed silver, and silver, in its turn, depressed the price of the rupee, and hence the fall.

6932. The main element, as I understand, that you give, is that one of the sources of demand was dried up?—Well, it was not a source of demand, you know. As long as the Latin Union was there to coin it at the ratio of 15½ to 1 there was an endless outlet. That endless outlet has ceased to exist.

6933. And the other uses for silver only remained what they had been before?—Except the Bland Bill.

6934. But the Bland Bill was not enough to counteract the effect produced by the others ceasing to coin?—No.

6935. Then do you anticipate a further fall?—That question it is hardly possible to reply to, as it depends on so many issues, all of which are uncertain. Were the Bland Act repealed, which, however, is not expected by the best authorities in America, a further fall would undoubtedly take place, but the future of the price will depend greatly on the production; to judge of the price at which the production will fall off, a long time will be necessary, because a company or a private person possessing a mine would go on working that mine for years before closing it. In fact, if the owner made a loss, he would not shut up the first year, but would go on until his capital was pretty well all exhausted, knowing very well, that if ever things improved, and he had to re-open the mine, it would cost heavily for new machinery and setting the works in motion again.

6936. I understand you to mean that the fall in the value of silver would have to go on a considerable number of years before it diminished production, even though it should ultimately result in diminished production?—Yes. I mean to say, even supposing silver at 44d. an ounce is a price which prevents a good many mines from working with profit, it will take a long time before that is proved. Owners will go on working,

although there is a loss, sooner than close their works and have their machinery become worthless.

6937. What do you think would be the effect in this country and its dependencies of the suspension of the Bland Act?—The repeal of the Bland Act would undoubtedly produce a fall in silver. The amount coined under this Act is so much added to the currency of the United States, as although the silver itself does not go freely into circulation, certificates are issued against the silver deposited in the United States Treasury, and pass as bank notes. But in the present state of affairs in the United States, the fiscal arrangements there are in what may called an impossible state, on account of the rapid redemption of the national debt. The issue of national bank notes, not greenbacks, is based, as you are aware, upon Government bonds deposited with the Treasury. As these bonds are called in, a similar amount of these national bank notes have to be cancelled. Practically therefore the increase in demand for currency on account of the great growth of population and emigration has to be met by the annual finds of gold in the United States and by the silver coined under the Bland Act. You will perceive therefore that, if this coinage, which amounts to 4,800,000*l.* sterling a year, were stopped, there would be a demand for currency which might have to be supplied by an import of gold from Europe, if Congress did not alter *in toto* the currency laws. Assuming that money were plentiful in Europe, the gold shipments would produce no great effect, but if the shipments produced an important increase in the value of money in Europe and in England, they would cease at once. In that case there would be a fall in values in the United States, and prices would adapt themselves to the reduced currency. Therefore the repeal of the Bland Act would at first produce an increase in the value of money, which is the same thing as an increased demand for gold, but this would only be temporary. Of late years we have seen two instances, firstly, when Germany forcibly sold her silver and took large amounts of gold, and when Italy returned to specie payments. These large amounts of gold were abstracted from different parts of the world, and have never left these two countries, yet the effect was only passing; for the moment it produced dear money, but for the last few years we have had cheap money. Towards the month of October, when we have to pay for our raw manufacturing material and supplies of food, we have had a dearness in money which lasted two or three months. The remaining months were characterised by extreme ease in the money market. This has been invariable in later years.

6938. (*Mr. Barbour*) By dear money you mean a high rate of interest?—They are synonymous.

6939. (*The Chairman*.) When you use the word "dear" money in the sentence you have just used, what do you mean?—Dear money and the demand for gold are the same thing. Well, then the repeal of the Bland Bill would have the effect of making money temporarily dearer, as when Italy and Germany took gold, but it would only be temporary. England has so much money abroad that a period of two or three months of dear money is sure to bring some of it back. Sometimes it may require one, two, or three months of dear money, but it is sure to come back. As regards England's dependencies, I think the effect produced in those colonies having a gold currency would be very much the same as in England. If money were temporarily dearer in the mother country it would get temporarily dearer in these colonies; as regards India it would have a contrary effect. The silver no longer absorbed by the United States would have to find its outlet in India, and there would be no other outlet for it. The rupee must depreciate in proportion to the fall in silver. Those who draw their income from India would lose, and the Government loss on exchange, no doubt, would be greater than it is now, but the trade of the country would not suffer, indeed, it might benefit by it. Till now the decline in the value of the rupee has had a marked effect in increas-

ing the trade in India. In every country prices have fallen, but in India they have not, reckoned by her silver standard, as the depreciation of the rupee kept about pace with the fall in produce in gold-currency countries. Now I will explain what I mean in figures. If wheat were 40*s.* per quarter in England, and the exchange 2*s.* (these are only arbitrary figures for the purpose of demonstration), the price in India would be 20 rupees, because 20 rupees at 2*s.* is 40*s.* a quarter. I do not reckon freight and insurance, because I am not reckoning closely. With wheat in England at 32*s.*, which it is to-day, and the rupee at 2*s.*, is it not evident that exporters could pay only 16 rupees per quarter for their wheat in India. Therefore, if the rupee had not depreciated, you must have had a fall from 20 rupees per quarter to 16 for wheat to be exported. The present price of Indian wheat in England is about 32*s.*, and the rupee is, you are aware, 1*s.* 6*d.* This makes wheat in India 21½ rupees per quarter. Now the Indian grower gets as much for his wheat, in fact a rupee more, with wheat in England at 32*s.* per quarter, than he did when the price was 40*s.* If we compare the position of the American with that of the Indian grower; when wheat was 40*s.* per quarter, the American got 10 dollars per quarter—4*s.* is the dollar. With wheat at 32*s.* a quarter he gets only 8 dollars. The American, therefore, gets 20 per cent. less than formerly, and the Indian somewhat more. It may be said that if the fall in silver were beneficial to the Indian grower, on the other hand he would have to pay more for his imports, but that until now has not been the case, because prices of goods have fallen to such an extent in the countries from which he imported them. If the rupee continued to fall, it does not follow that the price of goods imported into India would fall also, but I only mention what has occurred, and wish to demonstrate that till now the Indian nation, the masses, and the producers there, have gained by the fall in silver.

6940. Do you think that any measures could be taken by this country, short of entering into a bi-metallic union, which would give increased stability of value to silver?—I do not see that any measure other than bimetalism can be taken by this country to give increased stability to silver. An important demand would take place if all the governments agreed to abolish entirely the duty on manufactured silver. In this country it is 1*s.* 6*d.* per ounce. Of this, as you know, the Government gets 1*s.* 3*d.* and the Goldsmiths' Company 3*d.* for marking. If the entire duty were taken off, and the charge for stamping reduced, I have no doubt that the use of silver for household purposes would be enormous, and for other purposes large amounts would be used. Every married couple, as far as they could afford it, would buy silver, as they would look upon it as a reserve in case they wanted to turn it into cash, but to-day they cannot do it, because they have to pay 70*d.* or 80*d.* per ounce, for what would realise 44*d.* In India, we know that enormous amounts of silver are used for ornaments, and I have not the slightest doubt that throughout Europe, if the paltry duty, which brings our Government in 70,000*l.* a year, were taken off, in course of time there would be an enormous amount of silver used by the people, and, after all, it is the use of a commodity by the million that makes the demand, not its use by the upper classes.

6941. Do you consider that any material inconvenience has been felt by the trade or interests of the country in consequence of the fall or fluctuations in the value of silver?—I suppose by considerable inconvenience you mean pecuniary loss?

6942. Well, it has been suggested that, even apart from its producing a calculable loss on particular transactions, it hampers trade by introducing an element of uncertainty, and that anything which hampers trade, on the whole, is bad for trade; that has been the suggestion?—I think, in many instances, it must have caused loss, because the effect of the fall in silver was not to be foreseen. It might be contended that people trading with India were exposed to loss on the ex-

Mr. H. L.
Raphael.

Mr. H. L.
Raphael.

11 July 1887.

change. Well, of course, there was an element of risk, but that element of risk exists in trading with every country that has not a fixed basis of exchange. If you trade with the River Plate you have the value in paper, but there are means of guarding against that risk. It has altered the mode of conducting trade, but I doubt very much whether it has ever prevented any man from carrying on his business with India, any more than with countries with a paper currency.

6943. It was suggested, rather in the case of China, that it hampered the trade by introducing an additional element of trouble and uncertainty which did not exist before?—Well, I am not in the China business, and I cannot say, but I should think the proof would be whether the trade with China had fallen off or not. That can easily be ascertained. I esteem figures more conclusive than theories.

6944. I suppose the suggestion would be that though it had not fallen off it had not increased so much as it otherwise would have done?—There has been a period of depression the last few years, and the total trade of the country in sterling figures has fallen off. The total of quantity should be considered, not the sterling value.

6945. I understand you to say that in the first instance at all events, there would be inconvenience felt in the trade by the fall, because being unforeseen they would lose so much on the transactions before they became aware of it?—Yes, for instance, those engaged in the corn trade could not foresee that wheat would decline to 32s. a quarter. I myself did not foresee the effect of the fall in silver. I have no doubt other traders did not see it, and consequently they have lost.

6946. Do gold coins and silver certificates circulate freely in the United States?—I believe that gold coins are not used much in the United States, because they prefer paper money, but silver certificates are taken the same as bank notes.

6947. (*Sir T. Farrer.*) Except in California, where there are gold coins?—California has gold, entirely gold.

6948. (*The Chairman.*) Can gold be obtained without difficulty in exchange for notes at the Banks of France, Germany, and Italy?—The Bank of France gives gold in exchange for notes for small amounts, but not for large, which of course would be required for export only. In that case special application must be made to the bank directors, who have always been ready to sell a certain amount of their gold bullion, not coin, at a premium. The highest premium I have known of late years has been $5\frac{1}{2}$ per mille; but the 20-franc pieces are so light from age and wear, that even if 20-franc pieces were obtainable at par, it would be preferable for exporters to pay this premium. The Bank of Germany gives large and small amounts of gold in exchange for their notes. They have been known, however, to make themselves unpleasant to bankers who have withdrawn large sums, for they guard their gold very carefully, and raise their rate of interest as soon as an export demand sets in. I do not know if the Bank of Italy gives small amounts of gold, but it certainly refuses large amounts. In fact, within the last three months gold has been at 1 per cent. premium in Italy; therefore that speaks for itself.

6949. (*Mr. Fremantle.*) But is the Bank of Germany bound by law to pay its debts in gold?—Yes, and does pay. Formerly when a banker took a large amount of gold they made themselves unpleasant. They are more sensible now. When anyone goes to the Bank of England with banknotes and demands gold he gets it at once, however large the amount. The bank, if it thought desirable to stop the gold demand, would raise its rate of discount.

6950. (*Mr. Birch.*) I think they pay at the Central Bank, at Berlin, but not at the branches?—That is a matter of detail. You cannot expect them to keep an unlimited amount of gold in all their branches. You go to the Bank of England at Liverpool and ask for 1,000,000*l.* sterling of gold, would they be able to give it you?

6951. (*The Chairman.*) Turn now to a different question. To what do you attribute the fall in prices which has been in progress in this country since 1874?—Well, I think if you refer to the Royal Commission on the depression of trade, their report would be much more valuable than my opinion. However, I will answer your question. The fall has not been continuous since 1874. From 1879 to 1882 there was a great recovery in prices, notably in coal and iron. From 1850 to 1874 there was a continuous rise in prices. First came the enormous find of gold in California and in Australia; then in 1860 occurred the American war, which released all the specie in that country, which went to a great premium, was of no use, and consequently exported. Besides that, a huge debt was created in a short time. This debt was so much wealth created in two or three years, because it was interchangeable for commodities. It was taken by England and Europe, and in fact discounted the labour of the people of the United States for years to come. Then in 1870 occurred the war between France and Germany.

6952. What were those bonds given in exchange for?—To pay the expenses of the war.

6953. But I mean, they were the purchase-money of materials that had been supplied to them?—Yes, and for the payment to their troops.

6954. Thus, so far as they represented a loan, it was only a change in the form, was it not; people had lent them money, and got in return the bonds?—There would have been no means of lending the United States money unless they created something to give as a security. They created a national debt, and Europe lent them money on the security of it. Just look at our wars. As England was developed by the increase of her national debt, so was America by the creation of her's. In two or three years this 600,000,000*l.* debt was created, which would not have existed but for the war. The debt formed a means of their obtaining money which they used after the war for the purpose of building their railroads and developing the country.

6955. (*Sir T. Farrer.*) It formed an addition to the medium of exchange?—Exactly so; it was not currency, but it was an addition to the medium of exchange.

6956. (*The Chairman.*) But do you mean that every additional loan by a foreign state adds so much to the wealth of the world?—I mean to say that it is mortgaging the labour of future years. It is wealth as long as future generations work to pay the interest and the capital. Then, again, in 1870 occurred on a rather smaller scale, but still on a large scale, a war between France and Germany, an enormous release of gold, owing to the suspension of cash payments by France and a creation of debt. Thus, you see, from 1850 till 1874 there was a constant increase of wealth—first the Australian gold discoveries, then two big wars, with the enormous increase of national debts. That brings us up to 1874, when the reaction began to set in. Another reason for the depression has been that the whole course of trade has changed. Formerly middlemen, which have almost ceased to exist, were obliged to keep a stock. Now, to-day, the consumer is brought into direct communication with the producer. It is not necessary to keep stocks so large as formerly.

6957. (*Sir W. H. Houldsworth.*) Was not that cause in operation to some extent before 1873, in fact, largely progressing before 1873?—Not to the extent. In 1873 we were not in communication with distant countries. I do not think we had a cable to Australia so early as that. I do not know the year in which the cable was laid to Australia, but now we are in communication by cable with every part of the world.

6958. But still, there was increasing communication of all kinds at 1873?—It had been increasing gradually; people did not adapt themselves to the new state of things. They saw prices decline, and thought they would recover, as experience led them to believe; but there were causes at work

which they did not perceive. One of these causes was the improved machinery in use. Take the article of sugar; the fall had been as much as 50 per cent. It is a little better now than it was; but still it has fallen to nearly half price. Well, that is owing entirely to the improved culture of beet in Germany, and not only to the improved culture of beet, but to improved machinery by which they are able to extract all the saccharine.

6959. Do you not think, taking the whole trades of the country, the improvement in machinery was much greater between 1850 and 1873 than it has been from 1873 to 1887?—It is questionable.

6960. Taking the standpoint that you were at 1850?—I should say the standard of improvement is higher now than it was then. Now a man has to improve upon improvement. Great improvements were made then, but they are refined improvements that are made now.

6961. That is just the point, that the great improvement which lessened labour and increased quantity, was that not rather made between 1850 and 1873 than between 1873 and 1887?—I think it has become more general of late years. You cannot take a greater example of it than sugar. The French first directed their attention to beet-root sugar, and they stood first in the market. They invented new machinery; but then came the Germans, who improved upon their machinery to such an extent that they ousted the French entirely from the market.

6962. Assuming, which you do, I think, that there was a certain improvement, I should say in most of the trades the largest improvement in the machinery, between 1850 and 1873, are you able to trace, from the statistics that you have looked at, any fall in prices at all due to that cause during that period?—I told you the reason why prices went up during that period, and afterwards began to fall, owing to the cessation of these enormous national debts, and the nations being obliged to labour more and produce more in order to pay them off.

6963. The improvement of machinery had no effect during that period?—Then came the great competition between nations. To-day we find that the United States and many other nations are competing with us in improving machinery. In fact, no man can be certain that his new machinery may not be improved upon to-morrow. Well, then as regards copper. The fall is distinctly traceable to the enormous new production in recent years in America and in Spain. Well, iron; what has caused the fall in iron? The increased manufacture in America, Belgium, and in Germany, and the competition between these countries, as well as the means discovered of producing iron and steel at a much cheaper rate. As regards wheat, I have explained the cause of the great depreciation.

6964. (*The Chairman.*) Do you consider that the country is suffering from any serious contraction of the currency due to a scarcity of gold?—The country is not now, nor has it been of late years suffering from a scarcity of gold, the proof of which is the low rate of money ruling now and of late years. Our accumulated wealth abroad is so great and our advances in cash and on credit to foreign traders are so large, that when gold does get scarce the Bank of England has only to raise its rate two or three times sharply, and gold is sure to flow in from abroad. Sometimes the effect is produced quicker than at other times, but the ultimate effect is invariable.

6965. To what extent and in what way are prices affected by the quantity of gold in this or other countries?—When gold, namely, money, is abundant, there are more buyers in every market, and sellers are less willing to sell, as they can hold their stocks upon borrowed money on such easy terms. Under this state of things prices rise. When gold, namely, money, is scarce, the reverse takes place; there are few buyers and all people are anxious to sell, and prices fall. The first state of things is called inflation, and the reverse depression. They always follow each other, but the only thing that varies is the interval

of time, but they follow each other just as surely as Tuesday follows Monday. After depression you have inflation, after inflation you have depression, only the intervals of time are not in all cases the same.

6966. Would you explain to the Commission your views as to whether an average high rate of discount indicates a scarcity of gold, and a low rate the reverse?—Well, in the event of an important bank failure, I have known discount to rule high without there being a scarcity of gold. When Overend and Gurney failed in 1866, the public, afraid of further bank failures, withdrew their money from the bankers and locked up bank notes. In 24 hours the reserve of the Bank of England was exhausted and it had to obtain permission to issue beyond the amount fixed by charter. The Government stipulated that whilst the over-issue lasted the rate of interest should be kept at 10 per cent. No further failures took place, and within two months the rate of interest was two or three per cent. Except in such a contingency it is impossible for money to be dear, without a scarcity of gold, or to be cheap without an abundance. It is equally impossible for money to be cheap and gold scarce, or money to be dear and gold abundant. As a proof that money is gold and gold money, and the scarcity or abundance of one cannot take place without the other, I must refer, which I daresay you know, to the working of our currency system. The Bank of England can issue notes against the amount of gold it has plus about 15,000,000*l.* All the bankers keep their balances at the Bank of England, therefore the bank holds not only its own reserve (the money which it has unemployed), but the reserves of the banks. Now, if I draw 500,000*l.* on a banker by cheque and pay it away, that money has no effect on the money market; it comes out of the London and Westminster account, and is put to the account, say, of the Union Bank; it is only a change of accounts at the Bank of England, but the amount of the balances which the bank keeps, the reserve, is not altered at all. But now, the only way in which the reserve can be diminished is by the withdrawal of gold either for home circulation or for export. If 1,000,000*l.* of gold is taken from the bank, whether it is for home circulation or for export, the Bank of England and the banks have 1,000,000*l.* less to lend. If 1,000,000*l.* of gold is imported, the bank reserve increases 1,000,000*l.* They have 1,000,000*l.* more money to lend than they had before the gold came. This, I think, proves conclusively that gold is money and money is gold.

6967. So that in your view it is impossible to have a scarcity of gold combined with the readiness of the bank to lend at a low rate of interest or discount?—That is the same thing; it is positively the same thing. What gives the bank and bankers money to lend is the amount of gold that flows in, and what makes the money scarce is the amount of gold withdrawn. It makes no difference when 2,000,000*l.* is taken from the account of the Union Bank and goes to the Westminster Bank, the balance remains the same; it is only the gold withdrawn for circulation or export that can have an effect one way or the other.

6968. (*Sir L. Mallet.*) But the question I want to clear up is this. I daresay you are aware that all the most authoritative writers on political economy, Mr. Mill among others, have contended that there is a radical distinction between the exchange value of money estimated in money, that is the rate of interest on a loan, or money and the exchange value of money estimated in commodities. We want to know whether you think that there is any necessary connexion between the rate of interest on money, on loans, on advances, and the relation between money and prices of commodities, because if you hold that opinion it is very interesting, and I should be extremely interested to know what your opinion is?—I have known times when the Bank of England had more gold, and I have known times when they had a smaller amount of gold than they have now. As regards the circulation that has varied considerably. The greater number of banks the less necessity there is for money circulating.

Mr. H. L.
Raphael.

11 July 1887

Mr. H. L.
Raphael.
11 July 1887.

6969. You think that the fall in prices, which you admit, is not due to any diminution in the quantity of money in circulation?—I certainly think it is not, and I think that the causes which were mentioned before the Commission on the Depression of Trade were so strong that I think it is absolutely settled, as far as human judgment can go, that it has nothing to do with it.

6970. (*Sir W. H. Houldsworth.*) And you do not think that the fall in prices is due at all to the extra demand for gold in Germany?—No.

6971. (*Sir T. Farrer.*) And you think further that the rate of interest paid for getting gold is an indication of the greater or less scarcity of gold; that is to say, that when a high rate of interest is paid gold is comparatively in demand?—This is what occurs year after year. After we have paid for our raw material, money gets cheaper and discount declines, gold returning to the bank. Then ensues the competition to lend money. The Bank of England has a large reserve, and together with the bankers forces the rate of interest down. It is at the present moment at 1 per cent. This drives money away from England, and in October or November they are obliged to use forcible means to bring it back.

6972. By charging a higher price for it?—Yes. Year after year it is the same thing, but that has nothing to do with the permanent scarcity of gold; it is owing to the avidity of bankers to compete with each other. The bankers take bills 1 per cent. below the bank rate, and then the Bank of England puts the rate to 2 per cent., and then bankers go to 1 per cent., or below that. It is a moral certainty that the Bank of England has to raise its rate again to bring back the gold. Therefore I contend you cannot say that the raising of the bank rate, or the lowering of the bank rate, has anything to do with the general scarcity or abundance of gold. My own conviction is, that if the Bank of England never went below three per cent. there would not be such frequent or violent changes in the rate of money. Neither the Bank of France nor the Bank of Germany ever go below three per cent. The consequence is that their changes in discount are about one quarter what they are in the Bank of England. I think that the raising or lowering of the rate of discount by the Bank of England does not prove a continuous abundance or scarcity of gold.

6973. (*Mr. Birch.*) What would be the effect of the raising of the rate of the Bank of England; does it attract gold now just as much as it did previous to 1873?—Just as much.

6974. We have the same command over the markets of the world as we had previous to 1873?—If the rise of the bank rate is an effective one it is sure to bring back the bullion, and the more effective it is made the sooner the bullion will come back.

6975. (*Mr. Barbour.*) I think you said that if there was an international agreement for bimetallicism and there was a chance of war the nations on the continent might begin to draw in gold and so excite the suspicions of the other nations, the other members of the bimetallic agreement?—Yes.

6976. But does not the same thing take place under present arrangements; if there is danger of war the Bank of France tries to get as much gold as it can?—Yes. You asked me whether I thought that they would adhere to that agreement? I do not think they would.

6977. What would be their object in not adhering to it; how would they gain by not adhering to it?—To obtain gold, which is a much more effectual agent than silver. A door can be opened with a gold key which a silver key would not open.

6978. But wars have been carried on very effectively by nations that had only a silver standard. For example, Germany, in the last war in which she was victorious, had only a silver standard?—But she had the command of gold and got gold for the purpose of carrying on the war.

6979. Does it not follow that if a country with a silver standard can get enough gold to make war

successfully, *a fortiori*, a country with a bimetallic standard can get enough gold?—Well, I contend that if you are going to swamp the world with silver gold will be such a scarce article that it will be more difficult to obtain. You ask me a simple question whether I think they would adhere to that arrangement? I think not. First of all, in Germany military considerations go before anything, and she will think that gold is a more effectual agent than silver, and, as I said before, she has an idea that the gold standard has given England the pre-eminence in trade, and she wishes to imitate her in that respect.

6980. In speaking of trade, we get away from the question I raised, which is a question of war. Germany with the silver standard found gold enough to be successful in a great war, therefore it was not necessary for her to abandon her silver standard in order to find as much gold as was necessary for war?—She had not gold then; she went to war in spite of having silver; but now, having gold, she will make herself as strong as possible on the gold basis.

6981. (*The Chairman.*) Do you think mistaken motive will operate again in urging her to hold her gold, rather than her silver?—She will hold her gold, which will always have a greater attractive power. It will appeal to the weaknesses of mankind more than silver, at any rate, during our generation.

6982. (*Mr. Barbour.*) I think that you hold that great benefits have accrued to England from the decline in the price of silver?—Yes.

6983. Would you put any limit to these benefits if silver continued to fall; is there any stage at which the fall in silver would cease to be beneficial?—As regards England I should say no, the lower it goes the better it is. As regards India there comes the disarrangement that it would produce in Indian finance. I do not think it would do any harm to the country, but it would increase the loss which the Indian Government would make. The question is whether the loss which can be measured certainly in certain millions of sterling would not be small in comparison to the enormous benefit the nation would derive.

6984. At what point do you consider the advantage would cease, and the loss begin?—I do not think it is worth taking my evidence on such a point.

6985. One of the great gains that England has made arises from the fact that she is owed a great deal by foreign countries, and gets more commodities in payment of the debts due to her?—Yes.

6986. She is owed a great deal by India?—By the whole world.

6987. By India and Canada and Australia?—Yes. The Argentine minister stated at a dinner given last Saturday that the Argentine Confederation owed 100,000,000*l.* to England.

6988. And a portion of the benefit is drawn from India and the English colonies?—What benefit?

6989. The benefit to England from the fall in the price of commodities. The English colonies and India, owing to this cause, have to send more commodities to England to pay their debts?—Naturally. That is why we get our commodities cheaper.

6990. I think you said that if the Bland Bill were repealed there would probably be an increased demand for gold to take the place of the silver in the American currency; that if the rate of interest was high abroad the Americans would have to do without that gold, and American prices would fall?—Yes.

6991. And if American prices fell, would not that lead to an additional export of commodities from America?—Probably we should get more commodities, and that would be another reason why we should be able to buy them cheaper.

6992. And would not the balance of trade be turned in favour of America, and would not gold go there to pay for those commodities?—No, the amount of money which is outstanding in America for English account is so large that the bankers have but to draw it in to turn the balance of trade. The amount of English money, bankers' money, at loan for short periods in the United States is something enormous at the present moment.

6993. (*Sir T. Farrer.*) Could you put any figure at all?—No, I do not like to put figures, but it is large, very large.

6994. Much larger than the Argentine Confederation?—Oh no, not 100,000,000*l.* In America it is bankers' money which could be called in within 60 days, and which would be quite enough to check any power of America to take gold.

6995. (*Mr. Barbour.*) Then you think no matter what the fall of prices in America might be, gold could be kept from flowing from this country to America?—If the Bank of England deemed it right that her reserve should not be any smaller, she has the means of preventing it, as she has done on many occasions.

6996. She has the means of preventing gold from flowing out of the Bank of England?—Yes, of preventing her reserve decreasing, and of increasing it.

6997. Has she the same power over other gold in the world?—I do not know who would call in his money, whether he trading with America, or France, or Germany, or the Netherlands, but I mean to say that the collective amount of money abroad is so large that sufficient would be called in. They would not find it any longer profitable to keep their advances out, and they would call them in, and thereby the position of the bank would be strengthened.

6998. I think you said that the fall in silver was due mainly to increased production and reduced demand, putting it generally?—I said it was caused by there being no longer a permanent outlet. There was an outlet formerly when the mints of the Latin Union were open, there was an outlet for it to any extent.

6999. I included that under the head of reduced demand?—I think it should not be so included.

7000. And that affected the value of silver?—I should say there has been an increased demand, to have worked off an increased annual production, in addition to the large amount that Germany has sold.

7001. But the German silver that was sold is all out of the market years ago?—Oh, yes.

7002. Then what is the cause of the present low price of silver?—I have stated the cause previously.

7003. The demand is reduced below what it was in former times?—I do not say the demand is smaller than former times, but the supply is much greater.

7004. Where is the demand larger?—The amount of silver which is produced in the world has nearly doubled itself, yet the excess of silver is not large. The production has increased very much, but there is not an enormous amount of silver weighing on the market.

7005. Would it be easier to get 20,000,000*l.* or 30,000,000*l.* of silver now than it was 20 or 30 years ago, if it were wanted for a special purpose?—Not so easy. Formerly one had but to take French or German coin from circulation, which is only feasible when silver is about 60 pence per *oz.*

7006. So that if a special demand for silver arose, like that which arose in the time of the Indian mutiny, there would probably be a very large temporary rise in the price of silver?—Yes, a very large temporary rise.

7007. That would interfere with business a good deal for the time?—Well, any violent change interferes with business. Many people like it, I do myself.

7008. We have had some evidence given to the effect that silver was quite discredited in Europe. Is that your opinion?—In Europe it is no longer coined except as tokens.

7009. Would the nations of Europe that have got silver find it practically impossible to get rid of it?—The loss would be so enormous that it would be practically impossible.

7010. I suppose if a nation that has got silver went to war and issued paper very largely, it might drive the silver out?—If their paper went to a greater discount than silver is to gold.

7011. But excepting in that way you do not see any chance of their getting rid of their silver?—No.

7012. (*Mr. Birch.*) You said that the Bank of France at present holds about 45,000,000*l.* sterling in silver. Have you any idea what amount of silver is in circulation?—Well, it is only an idea, I have no basis for it. I should think the public hold from two to three milliards francs.

7013. Of course, all the money that is in the pockets of the people, supposing the ratio were changed, would have to be taken into consideration as well as the 45,000,000*l.* held by the Bank of France?—Oh, naturally; if you were to decree that it shall be all recoined, the nation or the Government would have to bear 35 per cent. loss.

7014. You were asked also with regard to the probable future of the silver market. From time to time we have heard of the possibility of China being developed with railways. Anything of that sort would make an extraordinary demand for silver in all probability?—Well, it might. But I never prophesy unless I know, and I do not.

7015. In regard to what Mr. Barbour said just now, an active demand for silver might lead also to a very active demand for manufactures, for railway plant and other things. Supposing China did start railways, there might be a demand for silver, for currency, and at the same time there might be a very large demand for railway engines, rails, and other things, and revival in trade generally?—I read in the paper, I do not know whether it was to-day or yesterday, that the Chinese were to build their own railways and find the capital there. That being the case, I do not see that it would produce a demand for silver at all.

7016. It might make a demand for railway material?—It would make a demand for rails, which they would have to pay for. That would not make a demand for silver, but the reverse, therefore it is no use discussing the future, which no one can speak of with certainty.

7017. I think you said gold in Italy commands about 1 per cent. premium?—No. I said within the last three months.

7018. Then she has not derived the advantages she expected when she made her loan for improving her currency?—I do not know. At any rate, it has been a nominal return. She may have derived advantages by this artificial return, but I cannot say.

7019. (*Sir T. Farrer.*) You say you do not like to prophecy, but can you form any opinion on this point. We have been told that if this country were to adopt bimetalism at a ratio of 15 to 1 or 15½ to 1, people in the city of London would still make their contracts payable in gold. Can you form any opinion on that point?—Well, it is quite possible. In America, during the war, and after the return to specie payments, and even to-day with gold obtainable to any amount, contracts are made, loans are contracted, and it is stipulated that the interest and the capital shall be payable in gold. I think it is possible that people might, in lending money for a lengthened period, guard themselves by taking such precautions, and I think that making a loan payable in gold would be a means of making it attractive. There is a large amount of American loans which are made payable in gold.

7020. That, of course, was for the purpose of borrowing abroad chiefly?—And at home.

7021. You have spoken of the quantity of debts due to this country abroad, and one sees various estimates; are you able to put any figure at all upon the amount of English capital invested abroad; do you think it is possible to do so? Are those debts increasing or diminishing; are we lending or are we drawing in capital. Can you form any opinion?—I should think that we are always going on lending. One of the principal outlets for our savings is to lend foreign nations, and they come to this market. There are other markets which are open to them now which they had not in former days, but still they do come to England very freely.

7022. (*Mr. Fremantle.*) Speaking of the price of silver, I think you said that the German Government

Mr. H. L. Raphael.

11 July 1887.

Mr. H. L.
Raphael.

11 July 1887.

had disposed of its stock of silver?—No, not all, but a large quantity.

7023. Is it known how much remains?—The Bank of Germany does not publish their stock of gold and silver.

7024. I suppose there has been another reason for the fall in the price of silver, and that is the constant uncertainty as to what might be thrown upon the market from one source or another, especially during the period shortly after the demonetization of silver by Germany?—Well, of course, there have been moments when fear has acted upon the holders of silver, and has produced a great fall, but there have been periods when, for months, there has been a steadiness, which has proved that fear was then absent from their minds.

7025. Do you think there is any fear now as to the future?—No, not just at present, but it might be induced if Congress meets, which they are bound to do before December, to re-arrange their currency laws, and if they were to repeal the Bland Bill.

7026. (*Sir W. H. Houldsworth.*) Do I understand that your main objection to an international agreement for the adoption of bimetallism is the fear that, under certain circumstances, some of the powers so agreeing might depart from the agreement?—I did not give that as my main objection. That would be one of the reasons why I think if they did agree that they would not carry it out, but that was not my objection. My objection had very much higher grounds than that. In answer to a question in which I was asked whether it was in the power of governments to maintain a ratio if agreed upon, I answered that governments were all potent, and had the power to do anything, but I think circumstances would arise which, from jealousy and other reasons, would induce them, even if they observed it in the letter, to violate it in the spirit, by buying gold, but I did not give that as my reason why I was opposed to bimetallism.

7027. Putting aside that objection for the moment, may I ask you what your objection to the adoption of bimetallism by an international agreement would be?—I think I have already pointed out that we are deriving great advantage from the present state, that we are getting all our debts paid in gold, and that we are able to pay silver currency countries in silver and use the silver countries in competition with gold countries, and oblige them to sell their produce to us on similar terms.

7028. It would be that the interests of England are decidedly against such an arrangement?—Are most decidedly against it.

7029. Would the interests of the other powers be the same?—The other powers are not in the same position as England. They have not got large sums abroad. They are not large creditor countries. The United States is a silver-producing country, and has a double standard, and France has the double standard, therefore, are both likely to favour an arrangement. If you got into a mess you would be very glad if all your friends got into a similar mess. That is the feeling they have.

7030. You said, I think, that low food meant low wages; do you think that that is so?—Is not the lowness of the price of food dependent upon the supply and demand of food, and is not the rate of wages dependent upon the supply and demand of labour, and is it not possible to conceive that you might have a state of the labour market and a state of the food market which would produce a different result from that stated?—I should think, if the state of the wages market were in contra-distinction to the state of the food market, it would produce an effect, but that effect would be one which would be revolution and discontent. The people must live, and I cannot conceive that for any length of time wages can be low and food high.

7031. Take the reverse supposition, however, that you had low food, and that the labour market was not overstocked, that you might have wages continually rising?—That is what you have seen during the last few years. You have seen that wages have not fallen

in the same proportion as produce, and therefore the people are in a happier and better fed state than ever they have been.

7032. Do you attribute that to the state of the labour market; do you consider that the labour market is so placed that wages have not come down; is that the reason you give?—No, I only know that the wages of the people have not increased, but taken as a rule they have not decreased, whereas as to the necessities of life, they can obtain for their wages a great deal more than they could formerly. They live more as human beings ought to live, in fact.

7033. Well, you think that the fall of gold prices, which has manifested itself in commodities, will not ultimately reach wages?—I really cannot prophesy about what may take place; the unexpected takes place. If you ask me my tendency of opinion I think values have reached a very low point, and most likely will recover. It may take some time. Just the same with produce as with mines, it is a long time before a man will give up working his fields because they leave a loss. I find in commercial affairs everything has its balance. If you have very low prices the inevitable effect ultimately is to bring about causes which will work a cure, a rise, but it takes time.

7034. But are you not aware that manufacturing trade is very unprofitable at the present moment?—I am not aware of it. I was talking, only last night, with one of the most intelligent men, and he said: "The whole thing is changed; what an English manufacturer wasted a German could live on." He said: "For a man to succeed now he is obliged to give his whole mind to it; he is obliged to look after economy, and where that is done profits are made, but where the work is carried on in the old style, and there is no thrift or economy, there of course people do not do well."

7035. And you think that now manufacturers are making as much profit as ever they were?—No, I do not say that, but they are making a profit. I think the age of large profits is past.

7036. You are not aware of any manufactories or industries that are declining or decaying?—I daresay there are plenty of them; men who have not got the intelligence, or if they have the intelligence, have not got the opportunities. You may just as well ask me if every intelligent man in business succeeds? I say no. I have seen great fools succeed and intelligent men go to the wall, but I say in general the character of English trade at the present moment is that the profits are not anything like so great as they used to be, but there are profits and fair ones.

7037. Can you give any opinion as to whether the labour market is overstocked at the present moment?—I cannot, but the population increases so fast in this country that over-population is the chronic state. There must be a large emigration every year, otherwise the labour market would be overstocked to a great extent.

7038. Do you not think that it is a serious evil, although it may be temporary, to the industries of the country when gold prices of all risks to manufacture decline, and when certain elements of cost, such as rent and wages, do not fall?—No, I think it is a great advantage. It is a great disadvantage for the capitalists, but a great profit for the million; for the masses have the advantage if their wages keep up, and they can buy more for them, and therefore I believe at the present moment that affairs are shaping themselves in a very desirable way, that big fortunes are not so easy to acquire as they were, but that the people are working themselves, have worked themselves, into a better position, and will work themselves into a better still.

7039. But you said, I think, that it was an evil to the capitalist?—To the capitalist it is an evil, if you call it an evil. Mr. Morley, the other day, said it was a great public benefit, and I dare say he knows what he says. He said there were only 90 people who paid 50,000*l.* a year income tax, and a very good thing that there were not more, and a pity there were not

less. He says it is a disadvantage; I do not see that it is a great advantage to a country that there should be so many enormously wealthy people.

7040. And I think you do not believe in the depression of trade at the present time?—No, I do not; but all those things can be proved. If you take the figures you will find that the sterling amount of the trade is smaller, but not the quantities.

7041. (*Mr. Barbour.*) And I suppose the capitalist gets great advantages in the increased amount of wealth he receives on account of foreign debts?—He receives a great advantage, yes. Well, he shares the advantage with the masses; but it is more to the mass of the public than it is to himself. If he finds his household commodities 20 per cent. cheaper, it cannot make a very great difference to him.

7042. (*Sir W. H. Houldsworth.*) You have referred to the report of the Commission on the Depression of Trade. Are you aware that this sentence is in it; speaking of the fall in prices caused by the appreciation of the standard of value, "We desire to give it a leading place in the enumeration of the influences which have tended to produce the present depression"?—No, I was not. On the contrary, I thought their conclusion was that it had a very slight effect upon the depression.

7043. (*Sir John Lubbock.*) You stated a short time ago that prices had fallen everywhere excepting in India. Do you really mean to say everywhere, or were you thinking of comparison with this country. Have prices fallen in other silver countries, such as Chili?—I do not know what has taken place in Chili, but I see no reason to doubt that the effect in Chili would be very much like what it has been in India.

7044. Therefore, in countries where there is a real silver standard you would be disposed to think that, as in India, prices would not have fallen?—Prices would not fall, most decidedly.

7045. Therefore, you did not mean by that answer to say that in other silver-using countries prices had fallen?—I mean in the gold countries. I was comparing India with the gold countries, and I said, in India they had not fallen, whereas in all other countries—I mean gold countries—they had fallen. Of course, the effect in one silver country and the other would be about the same.

7046. You mean, in fact, that prices, in your opinion, have not fallen in the silver-using but have fallen in the gold-using countries?—Yes.

7047. When you said it was impossible for money to be dear and gold firm, I gather that you used the words "dear money" not merely as we all of us do, as an ordinary colloquial expression, but as implying, in your opinion, that dear money really is identical with a high rate of interest. Of course, I might myself talk about dear money, but I should do so merely as a colloquial expression; but I gather you intended to express the opinion that the fact of the rate of interest being low showed that there had been no increase in the relative value of gold to commodities?—That there was an abundance of the circulation, or the medium for circulation.

7048. Well, when you expressed that opinion were you thinking of the value of the gold or of the stock of the gold?—I am talking of the stock of gold. It shows it by the reserve at the Bank of England, whether the bank and bankers have much money to spare or whether they are short of money.

7049. But you surely do not mean to say that we always have a high rate of interest when there is a low amount of bullion at the Bank of England, and a low rate when there is a high amount of bullion at the Bank of England?—Yes, most decidedly.

7050. Is it not the case that in 1851, for instance,

the stock of bullion in the Bank of England was 14½ millions?—Very likely.

7051. And the rate of interest was 3 per cent.?—Very likely.

7052. In 1866 the stock of bullion was in round numbers 15 millions and the rate of interest was 7 per cent.?—Yes.

7053. Therefore, the rate of interest was more than double, and yet the amount of bullion in the Bank of England was greater?—Yes; but these 14,000,000*l.* of gold may have been as efficient as 20,000,000*l.* or 24,000,000*l.* is now. Since 1851 notably there are 36 years, and you have had an enormous increase of circulation. You have had an enormous increase of the prosperity of the country, but then again you must take the other items of the bank. If all the other items of the Bank of England are in proportion, they may have been relatively as strong with 14,000,000*l.* as with 20,000,000*l.* to-day, if her engagements were in proportion. I think when you look at the stock of bullion in the Bank of England, you must look also to what the engagements of the bank were at the time, what her other securities were, the circulation of bank notes, &c.

7054. That is quite sufficient for me. You now say you must take all the circumstances into account, that is just the point on which I wished to obtain your opinion?—The other items of the bank's account must be taken into account.

7055. When the gold discoveries were made there was great apprehension that gold would fall very much in value, was there not?—Yes.

7056. And you, I presume, would argue that we were wise not to alter our standard under the influence of an apprehension which has turned out to be quite unfounded?—Undoubtedly, we were wise not to do it.

7057. And that is part of your argument, as I understand it, why we should not alter our standard now?—No, I said that when gold was found in such abundance, if we had altered our standard and made all the new gold that was coined the weight of 6 dwts., whereas the existing gold was 5 dwts. 3¼ grains, the new coin would not have passed into circulation, but would have been kept back for the purpose of export. I merely mentioned that for the purpose of showing the absurdity of having two silver coins of different weights in circulation at the same time. I wanted to show the absurdity by bringing it home and applying it to gold, and to show that sovereigns weighing 5 dwts. 3¼ grains, and sovereigns weighing 6 dwts., could not remain in circulation side by side.

7058. There were many who were anxious to alter the standard, under the influence of the gold discoveries, and under the idea that gold would very much fall in value?—There were people.

7059. You think it is very fortunate the change was not made?—Yes. Whatever amount of gold, although 50,000,000*l.* of gold came in to-morrow, there would be no sense in altering the standard. Prices would alter, and the thing would adjust itself, but there would be no need to make any alteration of the standard. If there was such an abundance of the circulating medium then prices would conform to it.

7060. You stated in part of your evidence that the Bank of England held the reserves of all the other banks. You are aware that the banks also hold reserves in their own vaults?—No, I am not aware that they hold reserves in their own vaults. They may hold a small amount of bank notes to meet the daily demand, but if you went to any of these banks and asked them for 50,000*l.*, they would give you a cheque on the Bank of England to obtain it.

7061. You are aware that they have always denied that statement entirely?—Have they? I am not aware of it.

Mr. H. L. Raphael.

11 July 1887.

The witness withdrew.

Adjourned till Friday.

Twenty-ninth Day.

Friday, 15th July 1887.

PRESENT:

THE RIGHT HON. LORD HERSCHELL, the CHAIRMAN, presiding.

MR. D. M. BARBOUR, C.S.I.
MR. J. W. BIRCH.
MR. HENRY CHAPLIN, M.P.
MR. L. COURTNEY, M.P.

SIR T. H. FARRER, Bart.
MR. C. W. FREMANTLE, C.B.
SIR JOHN LUBBOCK, Bart., M.P.
SIR LOUIS MALLETT, C.B.

MR. GEO. H. MURRAY, *Secretary*.

Sir EVELYN BARING, K.C.B., K.C.S.I., called and examined.

Sir
Evelyn Baring,
K.C.B.,
K.C.S.I.

15 July 1887.

7062. (*The Chairman*.) You were for some time Finance Minister in India?—I was. I should wish, before giving my evidence, to say that it is some three or four years ago since I devoted close attention to this difficult subject, and my knowledge may be a little rusty; if my answers, therefore, are not so full as is desirable, I would beg the indulgence of the Commission.

7063. But you have no reason to suppose that the aspect of affairs has materially changed since that time as regards the relation of silver to gold?—I should think it has got more serious as regards India.

7064. You necessarily had your attention directed to the fluctuations in the value of silver in relation to gold?—I had; but the question had not assumed anything like its present proportions when I was Finance Minister of India, and specially when the larger reforms of 1882 were carried out; although there had even then been a considerable fall in the value of the rupee.

7065. I do not think we have the date that you left India?—I left India in September 1883.

7066. So that your practical experience in India was for some years prior to that?—My practical experience was for three years prior to that.

7067. (*Mr. Barbour*.) And before the time of which you speak you had had some experience of India during Lord Northbrook's administration?—I was for four years in India as private secretary to Lord Northbrook; from 1872 to 1876.

7068. (*The Chairman*.) Would you be good enough to assist the Commission by giving them the result of your experience with reference to the financial effect on India, as regards the Indian Government, of the fall in the exchange value of silver?—Of course, that is a very big question and covers a very wide ground. The effect is, I think, of the most inconvenient description, more especially on account of the very great instability in the value of the rupee. The low rupee is a very serious thing. I do not at all want to underrate its importance, but within certain reasonable limits it would be possible for the Indian Government to adjust its financial system to a rupee of any value. I do not think you can carry that argument so far as to say that the Government could, for the present, at all events, adjust its system to a rupee of 10*d.* or 1*s.*, but I repeat that within certain reasonable limits it would, no doubt, be possible for the Indian Government to adjust its finances to a rupee of whatsoever value. But what is so disastrous to India is its constant instability. The Finance Minister forms his budget at the beginning of the year, and as matters now stand, it is a mere matter of speculation how his budget will turn out. He cannot tell within

several hundred thousands of pounds. I look on the budget now as really little more than a matter of gambling. This is a most serious matter, which, I think, requires the very earnest attention of the Government and of Parliament. I think since I was instrumental in carrying out the large reforms of 1882 the rupee has fallen from 1*s.* 8*d.* to as low as 1*s.* 4½*d.*, that is about 3*d.* difference. Well, that represents three crores of rupees, 3,000,000*l.* Of course there is some compensating advantage on the other side, but not enough, I think, to compensate for the large loss that has been sustained, and certainly not to compensate for the great instability. That, I think, is the great point.

7069. It has been suggested that the people of India have gained industrially by the fall in the value of the rupee, and that, therefore, additional taxation might be imposed to meet the deficit caused by the fall resulting from the necessity of transmission for the purpose of gold payments here. What do you say to that?—As to the question as to whether the people of India have gained industrially, I leave that aside for the moment. To answer the second part of your question, I should say that up to a certain limit the imposition of additional taxation is possible, but not to a very large extent. The first thing, I think, that has to be remembered by every Finance Minister in India is, that the people are extremely poor, and although it seems rather paradoxical to say so, to a certain extent they are becoming poorer by reason of our good government. What I mean by that is, that by reason of sanitation, which, to a certain extent, prevents disease; by reason of the adoption of the principle that nobody should die of famine; and by reason of the railways and canals, which prevent people from dying of famine, the natural checks on the population which existed in the old Mahomedan days are taken off, and very properly taken off; but still the result is that the survival of the fittest argument does not hold good in India any longer, as it did in the old days of Mahomedan government; the population is becoming more and more dense; there is a greater pressure of population on the soil; therefore, in spite of these improvements, a great part of the population are as poor, and perhaps even poorer, than heretofore. When I was in India, Mr. Barbour, who was my financial secretary, was good enough to prepare a calculation as to the wealth per head of the population of India. It was extremely difficult to make, but as far as my recollection serves me, I think he calculated that 27 rupees per annum was the average income of an individual in India. I need hardly say that that is an extremely small sum, and the result is that the native of India is one of the most untaxable creatures in the world. Now as to the different items which admit of an increase, of

course the first and great item is the land tax. Well, it might be argued, and it often has been argued as a mere matter of academic interest, that, inasmuch as the Government has to pay more rupees for its material, such as rails, &c., and more rupees for the interest on its gold debt, therefore, the rupees to the Government are worth less than the rupees at the time the settlements were made, and, therefore, that it would be perfectly just for the Government to take more rupees from the landowners and cultivators in the shape of the land tax. I have always looked on that as a matter of theoretical argument and nothing more. Certainly I do not think that any finance minister or any Government would ever dare in India to propose such a thing as a *pro rata* raising of the land tax during the currency of a settlement on such an argument as I now indicate. It would, of course, be possible as the settlements fell in. Some of the settlements are temporary, and as the settlements fall in, it would be possible, though extremely difficult, to have some sort of sliding scale or arrangement under which the land tax could be raised in proportion to the relative value of gold and silver. That would be a process of very slow operation, because the settlements only fall in very gradually. I look therefore upon the land tax as almost impossible to touch. There are political objections to touching it, which are so serious, that I do not think any Government would dare to do so. Indeed, I go so far as to say, that if India were ever to be in such a position as to be obliged to choose between an arbitrary and *pro rata* raising of the land tax and a partial repudiation of the debt, I really think it is a questionable thing which is the least objectionable of the two. In fact, I look upon the raising of the land tax in the form of which I speak now, as perhaps the most objectionable measure possible in India. It is the most revolutionary measure conceivable, and I do not think any Government would dare to propose it. Well now, that cuts away at once something like two or three and twenty millions of the revenue. Then there is the salt revenue. Certainly, although it is very objectionable to raise the salt duty, it does admit of being raised. When the duty was lowered in 1882, it was publicly declared in my budget statement that it was lowered with the view to constituting a financial reserve. It was thought undesirable to dwell in public very strongly on the possibility of raising the tax, but certainly in my own mind at the time I was very much struck with the weakness of the financial position by reason of the absence of any financial reserve, and I thought the salt tax was the best reserve. Of course I am quite prepared to admit that the weak part of the argument is that two rupees a maund, which is now the amount of the tax, is hardly low enough to constitute a really good reserve, but I had hoped possibly, as consumption increased to make good the amount which was lost by taking off the tax, that the tax might in the course of some years be brought down until it reached one rupee, and then it would constitute a real reserve.

7070. Has the consumption increased?—Mr. Barbour would be better able to give you information as to the increase, but I think when the duty was lowered the loss was about 1,400,000*l.*, and it has recovered to the extent of perhaps rather less than one-half of that amount, about 500,000*l.* To continue my answer on the larger question which was suggested to me as to the possibility of raising further taxes, I think that the salt tax might be raised, but the increase would all fall upon the poorer classes, and it would be a most undesirable thing to do; but still it is a possibility, and it was a possibility which was present to my own mind when the salt duty was lowered. Excise is one other large item of revenue. Well, no doubt, as the population increases, the excise revenue will increase gradually, but there are some very obvious moral arguments that apply to excise questions. You cannot, particularly in India, treat excise in the same way as any other purely fiscal question; no great

increase of the excise revenue is, therefore, to be anticipated. Opium is another very large item. There, certainly, nothing that the Government can do can raise the revenue, and I have always looked upon it as dangerous to rely even so much as at present on opium. I look upon the opium revenue for several reasons, which I could indicate if it were worth while to do so, as rather a precarious revenue, and I should be very sorry indeed to see further reliance placed upon it.

7071. (Mr. Barbour.) Are you aware that the price of opium has fallen considerably since the recent convention came into force?—No, I was not aware of that; but that strengthens my argument. Then there are the Customs duties. I have dealt very summarily with every one of the large items of revenue except the Customs duties. If it became a question of life and death to India, it would be possible to impose the import duties again. I think it would be a most extremely objectionable measure, and I should be very very sorry to see it done; and I may mention that when the Customs duties were taken off, although, as I mentioned, the silver question had not attained its present importance, still I foresaw that it very likely would become very important; but I thought at the time that one of the best ways of putting India in a position to meet its difficulties was to allow India to exchange its produce at the best possible advantage with other countries. I shall always maintain that the measure was taken strictly in the interests of India, that it has been very beneficial to India, and that it was one of the very few questions in which we were justified in going rather in advance of native public opinion. At the same time, it was a very good thing, from a political point of view, to get rid of a question which was a constant sore between this country and India.

7072. (Sir L. Mallet.) You have dilated in your observations on the difficulty of increasing taxation in India. I should like to ask you one or two questions with regard to some of the items. To begin with the last,—the Customs duties. You are aware that there is a very strong feeling on the part of a great many people in India, especially among the better class, that the repeal of the Customs duties, and more particularly the abolition of the import duties, with some rare exceptions, was a great mistake, and the Government of Lord Lytton, which commenced that reform, and the Government of Lord Ripon, which completed it, under the financial guidance of Sir John Strachey in the first case, and your own in the second, has, as you know, been exposed to very severe criticism in consequence of the removal of what was considered an important source of revenue in the face of the great financial danger involved in a possible fall of the rupee. Well, you have stated, generally, the reasons which actuated you, at all events, in pursuing the course of the reform and completing the policy which you found had been already commenced by your predecessors, but I gather from your evidence that you desire to place on record before this Commission your distinct opinion that those measures of tariff reform, so far as you are concerned, were adopted deliberately, but that you were quite aware of the possible danger impending over the exchange, and that, notwithstanding, you considered that the advantage to India from a free trade policy and from alleviating its trade from the burden of import duties was more than sufficient to counterbalance that consideration, and if you had again to make a decision you would see no reason to alter the course which you then took?—Certainly, that is my opinion. I should only like to qualify it in one respect. I think the only really fair criticism that I have heard advanced against that measure was that we should have dealt with the export duty on rice before we dealt with the import duties. I have always thought that that was a fair criticism, and it was brought against me, I remember perfectly well, when I was arguing the case in the Legislative Council. I always recognised that the criticism was an ex-

Sir
Evelyn Baring,
K.C.B.,
K.C.S.I.

15 July 1887.

Sir
 Evelyn Baring,
 K.C.B.,
 K.C.S.I.
 15 July 1887.

ceedingly fair one, and I am not prepared to say that if we could go back to 1875, and deal with the whole question once again, that it would not be wiser to take off the export duty on rice entirely, and make a *pro rata* reduction of the import duties, rather than do as we did. But, doing as we did, I think it was an enormous benefit, economically and politically, to India, and I do not in the least regret that it was done.

7073. Was it not the fact that when the abolition of the cotton duties was decided upon, the trade had been so hampered by the previous step that had been taken by Lord Lytton's Government, that it then became a matter of almost urgent necessity for Lord Ripon's Government and for you to take the course that you took?—That is clearly the case as regards Lord Ripon's Government; but I have so far been rather considering the question as a whole, and not merely in the aspect in which it presented itself to me in 1882. The position with which I had to deal was rather a peculiar one. I found that the duties on grey goods, the lower class of goods, had been taken off because they acted protectively. I also found that the duty on certain articles had been taken off in what was called the general tariff, which created a number of very great anomalies. I cannot remember them now in detail, but they will be found in the statements at the time. This situation of affairs rendered it imperative to deal with the import duties in a very comprehensive spirit; it was necessary either to go back to the tariff of 1875, and thus repeal the alterations made by Lord Lytton, or to sweep away the import duties altogether. I had no alternative under these circumstances but to sweep away the import duties altogether. I quite admit it is a fair criticism that the export duties ought to have gone first, because the abolition of the export duties would have been extremely beneficial to India, more especially in view of the rupee difficulty.

7074. I gather from your remarks that, although you admit that under the particular circumstances of the time, it was necessary to commence by a reform of the import tariff, that you consider as an abstract question that the export duties were even more urgent in the interests of India?—Certainly.

7075. That being so, of course I presume that you consider that the abolition of the export duties is still a question urgently required in the interests of India?—If money were available, I have no hesitation in saying, so far as my own knowledge goes, that it is the very first step that should be taken; I look upon that as the most important fiscal reform that can be made in India, and I always immensely regret that while I was in India I was not able to crown the free trade edifice by abolishing the export duties.

7076. Therefore you are of opinion, I presume, that a very important and urgent financial reform which would benefit the trade and people of India is postponed indefinitely in consequence of the present financial difficulties in which the Government of India finds itself, largely owing to the uncertainty in the value of silver?—Certainly.

7077. Then with regard to the opium question; you are aware that in this country it is a political question which very often causes a great embarrassment to the Government, and I gather from your remarks that you are of opinion that the opium revenue is a source of revenue which the Government of India can only look to with very great qualifications as a permanent source of income?—I think it is precarious for several reasons. To begin with, the crop itself is a precarious one. The poppy is a very delicate plant. Occasionally hailstorms happen at a critical moment, and in a few hours the greater part of the crop is destroyed. During the three years while I was financial member of Council of the Indian Government I think there were certainly two, if not three, extremely bad crops. The result was that the opium reserve fell to a very low point, and we began to be rather doubtful whether we should have enough opium to sell. Then there is

another element of precariousness, and that is, that other crops may take its place, and the Government may have to pay more to the ryots for cultivating opium. There is a third element, which is that I think any revenue which depends on taste must always be open to considerable danger. I imagine, for instance, that cigarette smoking must have influenced the trade in cigars in this country. Certainly anybody who has given any attention to the history of tastes in wine in this country must know that there have been very great fluctuations in taste during the last century. In the same way as regards the Chinese smoking opium, I think the revenue is open to the danger that the Chinese may not care about Indian opium, but may care about other opium—their own opium to wit. There is also the fact, as to which I collected a good deal of evidence, that the Chinese opium is increasing in quantity, and, I believe, improving in quality; it may take the place of Indian opium. The opium question also excites hostile attack in Parliament, although I have not heard anyone in Parliament say how the opium revenue is to be got rid of; at the same time members of Parliament attack it, and that is a source of danger.

7078. As regards the salt duties, I think I gathered from your remarks that you have personally regarded them very much as a possible reserve in the case of any sudden demand for war or other purposes; that part of your financial system had been rather to look to the possibility of making the salt tax a reserve. Such a policy, of course, rests entirely upon the possibility of fixing the permanent rate of the salt duty so low as to make it perfectly clear that in the event of being obliged to raise it, you would get a larger revenue. I think I gathered also from what passed that the effect of a reduction which was made during your administration had been to diminish the total amount of revenue on the salt duties?—Yes, that is to say, the consumption increased, but it did not naturally increase at once to the extent to make good the loss of revenue. It increased progressively year after year, and in the course of years it no doubt will rise to the figure it was at before the duty was lowered, but it has not done so yet.

7079. But does it not follow from that that the permanent rate at which the salt duty is at present fixed is not sufficiently low to make that source of revenue available as a reserve, because in the event of your being obliged suddenly to add to the rate, you could not increase your revenue?—If you raise the rate, say four annas a maund, now, you might diminish the consumption a little, but still the revenue would be a greater one than you get at present. To that extent it does constitute a reserve. I should be very sorry to see it done. It would diminish consumption, but still the practical result would be to increase the revenue. *A fortiori*, if you went back to the figure there was in my day, two rupees and eight annas a maund, you would get a considerable increase of revenue at the cost of a greater diminution in consumption. I ought to mention that the whole increase in the consumption of salt is not, I think, to be entirely attributed to the taking off of the duty, because, even before the duty was taken off, there was a normal rate of increase, due to the increase of population, so that there would have been a certain amount of increase anyhow.

7080. But is it not desirable, to make the salt tax a reserve, to fix it at a low rate?—Certainly. It would be very desirable to fix it at one rupee a maund instead of two; but there is no present prospect of getting it to that figure.

7081. One of the objects of Lord Northbrook was to reduce it to one rupee a maund. I do not mean to say that it was averred publicly, but that was the figure that was in our minds—the figure that was discussed?—Yes.

7082. I should be glad to have your opinion as to the effect on the population. There is a very strong opinion held by many people that the salt tax, unless it is kept within very narrow limits, operates very

injuriously upon the health of the population and upon agriculture. If that opinion is correct, it is a tax which it is very difficult and undesirable to look to as a source of increased revenue by increased rates?—There was certainly prior to 1882 a want of salt in some parts of India, Rajpootana particularly. But this very often depended on the distance of the place from the railway. The salt question should be considered in connexion with the improvement of communications throughout the country. I can only say that I should be very sorry to see the tax increased. It would be a very bad thing to do, but at the same time it is a thing that is possible within reasonable limits.

7083. What is your opinion as to the possibility of increasing the revenues of India by direct taxation? You are aware of the controversies, and the process of legislation with regard to the income tax. Is it your opinion that the principle of direct taxation can be safely carried further than it has been in India?—My view about the direct taxation question was this. There was a very long controversy, as you are no doubt aware, going on for years about direct and indirect taxation in India. When I had to deal with the question I came to the conclusion that, especially as the indirect taxes were to be abolished, it was absolutely necessary to impose some direct tax, and further that direct taxation in India can be justified by excellent reasons; because without any direct tax all the wealthy mercantile classes escape taxation. Therefore it was to be justified by the most thoroughly sound fiscal arguments. The only arguments against the tax were the political argument that it was unpopular with influential people, that we had endeavoured to impose a direct tax on India which was not quite suitable to the ideas of the country, and further that we had changed the tax over and over again, and had created great instability and great dislike to frequent changes. My view was that a direct tax of some sort, call it what you will, a license or income tax, should be incorporated into the fiscal system of India, but I was and still am very distinctly of opinion that a direct tax cannot be used in India as an engine for rectifying budget inequalities as it is in this country; that having been once established it must remain at a certain figure; and I am also of opinion that the direct tax should not extend too low down, because many of the arguments, very good and sound in their way, which were advanced against direct taxation were of this nature; that there were a number of poor people taxed, that the subordinate machinery for levying the tax was untrustworthy and open to corruption, and that if you went too low down you would have to deal with people who could not defend themselves against any illegal or unjust demand on the part of the tax gatherer. Whereas people in a better position and more wealthy would do so. The limit is now 500 rupees I think. That is certainly the lowest limit to which I would go, and indeed I should have preferred to fix the minimum limit a little higher, if I had had to do with it. It may be objectionable to do so on account of loss of revenue. I do not think, however, that you can go further in the direction of direct taxation; I mean I do not see any means of developing it. When I speak of development, I am of course aware that the revenue from the tax will gradually increase, probably with every year. I do not know if the assessments are made annually or not; but when the assessments are made, a certain number of people may be presumed to come under the operation of the tax who did not do so before. There may be some gradual increase, but it will be nothing at all to rely upon as any heroic remedy to put right such a state of things as we have now to consider.

7084. (*Sir L. Mallet.*) Is it your opinion that so far as the income tax is concerned, although there will be naturally a progressive increase, it cannot be looked to in any sense as a mode by which the Government of India could recoup itself for its loss on exchange?—Certainly not; most distinctly not.

7085. There is another branch of the question you

touched upon, the excise duties. You are aware, no doubt, of the controversy which I see at present going on as to the policy of the Government with regard to the sale of spirits. What is your opinion as to the possibility of pursuing the present course of policy with regard to the sale of spirits, without exciting undue unpopularity or without stimulating consumption unduly?—I am not quite aware whether there has been any change of policy since I left India, in that respect; but I do not think you can look on the revenue from spirits from a purely fiscal point of view. I think the principle generally laid down, namely, that the object to be attained is the minimum amount of consumption with the maximum amount of revenue, is fairly correct.

7086. I have only one more question to ask, which is, what has been the effect of the uncertainty attending the value of silver on the facility of obtaining capital for productive works in India?—As regards the influx of private capital for private undertakings, I really cannot give any facts, for I have not got them at my hand; but I cannot help thinking that it must rather have checked any tendency that there was to the influx of private capital into India. I think I am right in saying that it has depreciated the price of the silver debt, in fact it has *pro tanto* increased the indebtedness of India. It has also obliged the Indian Government to borrow at a higher rate than it did formerly, and the main fact of the whole question is that the Government of India and the taxpayers of India are obliged to pay as interest on the gold debt a very much larger sum than they did a few years ago.

7087. Was it not a fact, when you were financial member of the Government of India, that on one or two occasions it appeared possible that you would obtain the capital necessary for the construction of railroads without guarantee?—Yes; I was exceedingly anxious to get private enterprise to make the railways, for a variety of reasons which I need not go into now, because they must be sufficiently obvious. The endeavour was very generally thought to have failed. I do not altogether admit that. I think something in that direction was done. The Bengal and North-Western was made, if not without Government help, with a very small amount of Government help. But, afterwards, for one reason or another, nothing much was done in that direction. I am opposed to the system of guarantees. I think there should be State enterprise or private enterprise; I do not like the half-and-half system which is involved in giving a guarantee; but in answer to the original question put to me, I have no doubt that the instability in the value of the rupee acted as an important check against private enterprise taking up Indian railways.

7088. Are you aware that on the last occasion when we had to start railways, the Secretary of State was obliged to give a guarantee of four per cent.?—Yes, so I understand.

7089. (*Mr. Barbour.*) Are you aware whether the uncertainty as to the value of the rupee has more than once had an injurious influence upon the public works policy of the Government of India, as regards the construction of railways?—Undoubtedly it must have done so, because it has rendered it impossible from one year to another to know what the Government have to spend; it affected the public works expenditure and the whole budget. In fact, I look upon the Indian budget now as a mere matter of speculation; nobody can tell how it will turn up out at the end of the year.

7090. (*Mr. Birch.*) Do you not consider that the great fall in the exchange gave a great impetus in the development of India; that the rupee falling from 1s. 10d. to 1s. 5d., or whatever it is, assisted a great deal to help the export from India?—No doubt, if gold prices had fallen, and the rupee had remained at the same value as it was before, that amount of wheat which now goes home would not have gone home. There is no doubt about that, but

Sir
Evelyn Baring,
K.C.B.,
K.C.S.I.

15 July 1887.

Sir
Evelyn Baring,
K.C.B.,
K.C.S.I.
 15 July 1887.

I look upon the two things as necessarily going together. It is a debateable question whether the fall in exchange and the fall in prices are cause and effect. I look upon them as intimately connected.

7091. But then we bring a great deal of wheat from other countries. India only gives us about 10 per cent. of what we receive, and she has to come into competition with all other nations which send wheat to this country; that is an important consideration?—Yes; still admitting to the full, for the sake of argument, that the fall of exchange has benefited India by sending home a lot of wheat which would otherwise not have gone home, even then I say that the compensating disadvantages are so great as to more than counterbalance that benefit. In the first place there is the instability, which is a consideration of the greatest importance. There is no security whatever that the Government of India two or three years hence will not be bankrupt; none whatever in the present condition of affairs. Neither do I think it possible to separate completely the interests of the Government of India from those of the population of India. The first and greatest interest of the population, considered as a whole, is that the financial position of the Government, who are the trustees of the population, should be one of assured solvency.

7092. We have been told by all the witnesses that we have had up, that in the event of a ratio being established between silver and gold, the only one that can be established would be $15\frac{1}{2}$ to 1?—That is a very moot point.

7093. Well, in the event of that being the case, surely that would come with tremendous effect upon India, raising the value of the rupee. Now, we send a rupee to India for about 1s. 4d. or 1s. 5d., and then the rupee would cost 1s. 10½d.?—It is very difficult to foresee what the full effect of that would be. My answer to the question would be that, in the first place, the rise in exchange would cause a rise in gold prices which would go far to rectify the inequality, and thus tend to bring home the wheat all the same. That is the first thing that would happen; and in the next place, a further advantage gained would be that there would not be so much to pay for the gold debt, which would enable the Government of India to carry out fiscal reforms and benefit the population. They would be able to reduce the freights on railways, and give an advantage there. They would be able to take off the export duty on rice, and give the rice merchants and cultivators an advantage. I do not suppose the wisest man would foresee what the full effect would be. It would be perfectly impossible to tell, but it would be a great mistake to suppose that there are not counterbalancing advantages in the direction in which I am stating.

7094. In a despatch from the Government of India, dated the 2nd Feb. 1886, I find the following passage: "Notwithstanding the additional burden imposed on the Indian finances by the fall of a penny in the rupee, which occurred in the three years above referred to (1882–1885), the steady growth of the revenue more than covered the additional loss by exchange, and the estimates of 1885–6 showed that the actual position of the finances was thoroughly sound, and that there was a larger margin of reserve than there had been in 1882–3"?—If that is the case it must be mainly on account of good harvests and not on account of the fall in the value of the rupee.

7095. (*Mr. Barbour.*) Do you think that the benefit to a country from its export trade consists in the amount of produce or manufactures sent out of the country, or in what it receives in exchange for its exports? Is there any advantage in sending a large quantity of produce out of a country unless you get something equivalent in return?—Certainly not. The case is illustrated now in Egypt.

7096. If a fall of gold prices in this country made it necessary for India to export more produce in order to meet the gold obligations of the Secretary of State, that would increase the export trade

of India, inasmuch as an additional amount of produce would be required?—I think I agree in your line of argument, but let me put an illustration which, I think, is in the nature of what you mean. At this present moment the position of Egypt is that it has a gold debt, the interest of which is about 5,000,000*l.* a year, which it has to pay. It is an agricultural country, and it must pay in exports. The result is that Egypt has to produce a great deal more to pay that debt; it has to increase the volume of its exports without getting anything in return for them. There is no benefit to Egypt in this state of things. Egypt had to pay 5,000,000*l.* some time ago, which represented, say, a fixed quantity of pounds of cotton, and so on. Now it has to pay a great many more pounds of cotton and quarters of wheat in order to make up that 5,000,000*l.*, and I do not see that it gets any equivalent for it.

7097. (*Sir John Lubbock.*) Do you state that the interest is 5,000,000*l.*?—Yes; the sinking fund is now a very trifling figure, scarcely worth mentioning.

7098. (*Mr. Barbour.*) On the other hand, to the merchant every increase of the amount exported is an increase to his trade, and brings him additional profit?—It may be so, although it is to be remembered that low prices diminish his margin of profit.

7099. From his point of view an increase of the export trade, from whatever cause it may arise, would be a gain?—But the cultivator; I do not see that it affects him beneficially. The cultivator in Egypt has to pay a land tax in gold, and he has to sell more produce to get that land tax than he had four or five years ago; considerably more.

7100. (*Mr. Birch.*) But what you consider is that the gold prices have fallen on account of that?—That is another and very difficult question. I am aware that there are a great number of theoretical considerations which may be brought to bear on it. I find it, I confess, extremely difficult to believe that the disturbance in the value of the precious metals has not caused the fall in gold prices, and the point that has struck me more than anything else is a table prepared, I think, by Mr. Barbour. If you look at that table, which gives the prices for the last great many years, you will see they run in parallel lines with the relative values of gold and silver to such a remarkable degree, that, apart from any question of economic theory, it seems to me almost proved that there is a direct connection between the fall in gold prices and the disturbance in the relative value of gold and silver. That diagram went very far to convince me that the two were very intimately connected together.

7101. (*Mr. Chaplin.*) I gather, from what I have heard you say, that beyond all doubt the fall in the price of silver has seriously affected, and does seriously affect, the Indian revenue?—It affects the expenditure more; it affects Indian finance. If you use the word "revenue" in the sense of Indian finance, most certainly it does affect it. It raises the amount that India has to pay in the form of its gold debt.

7102. And another further fall in the price of silver, I think you said, you would regard as serious in the extreme?—Very, indeed. I can only say that if I were Finance Minister of India, and I found the rupee go to 1s.—and there is no guarantee that it will not go to 1s.—I should not have any idea whatever how the difficulty was to be met; and that is the point I want particularly to insist upon before this Commission. I have heard a great many people here say that the difficulty is one which the Indian authorities must get out of in the best way they can, but the practical thing that anybody who has to deal with the question has to consider is how they are to get out of it; and with a rupee much lower than it is now, I have no idea whatever how the Indian Government will be able to pay its way.

7103. The difficulty, at all events, you are quite clear, could not be met by increasing existing taxes or raising new ones?—Within reasonable limits it may be counteracted. The salt duty might be raised.

I do not say that you have got to the extreme limit of what is possible in the way of increasing the revenue; but still, if I bear in mind the fact that only a few years ago the rupee was 1s. 10½d., and that now it has gone down to 1s. 4½d., and I know no particular reason why it should stop there, then I think the situation is a most serious one.

7104. That is what I wanted to arrive at, that, assuming that there were a further considerable fall in the value of silver, then you would be unable to counteract it by any alteration of the existing taxes or raising new ones?—It depends, of course, on the amount of the fall. I quite agree with that as a general statement.

7105. What is your idea as to the probability of any further fall in the price of silver?—I wish I knew. That is beyond the range of my knowledge. I think it is extremely difficult for anybody to answer that question.

7106. But you are quite clear as to this, that if any considerable fall did occur it might create the greatest possible difficulties in India?—Yes. I am quite clear on that point.

7107. You have studied the bimetallic theory?—Yes, I did some few years ago.

7108. And do I understand, then, that you are in favour of its adoption as regards the interest of India?—That is going into a branch of the subject as to which I hardly anticipated that I was to be asked any questions, but as I have been asked the question I have no objection to stating very briefly what my view is, although I am anxious to say that the subject is so very intricate and complicated that I do not know that I should at present be prepared to submit to cross-examination on it. I went into the whole of this question some years ago with certainly a prejudice in favour of monometallism, and an idea that bimetalism was a currency fad and nothing more. After giving a very long time to the consideration of the question, I came to the conclusion that the monometallic argument that gold and silver are merchandise, like wheat and beans, of which the relative values cannot be regulated by Government, is wholly untenable. I think the bimetallic theory is a perfectly sound economic theory. I considered it essential to form an opinion on the theory; because if I had found that the bimetallic theory was unsound as I consider protection to be unsound, I should have cast it aside directly. I maintain, however, that the bimetallic theory is perfectly sound from an economic point of view. As regards giving practical effect to it, I am aware that it is extremely difficult. But, generally speaking, I may say that I am a bimetalist. In the interests of India I should be very glad to see any measure adopted which would give stability to the rupee, and I think that the matter is one which requires the most attention from the Government and Parliament of this country.

7109. I think you admitted that the fall in silver has to some extent been advantageous to producers in India?—Yes, I think it has. It has sent home more produce than otherwise would have been sent.

7110. But it does not in any way compensate for the general mischief?—I think certainly not.

7111. Well now what is the effect on the producer at home, we will say of wheat?—That depends rather upon whether you consider that the fall of prices is due to the disturbance in the relative values of gold and silver. I maintain that it is, and if so it has enabled the Indian producer to compete favourably with the cultivator here.

7112. You entertain the same opinion which has been advanced by great numbers of witnesses here that the effect of the present system is to give the Indian producer of wheat an artificial advantage over the producer of wheat in England?—An advantage certainly, but I do not know that I should call anything artificial that comes from the natural operations of trade.

7113. Now is the producer in Egypt affected in the same way?—The producer and the Government of

Egypt are affected in this way. If it is contended that the fall in the value of the precious metals has nothing to do with the fall of gold prices, then I think the effect on Egypt has been very trifling, but if it be held, as I hold, that the two may be considered as cause and effect, then it has affected Egypt in this way, that the cultivator has to pay more produce for his land tax, which is fixed in gold. The Government also is very greatly affected because it is the largest proprietor in the country. It owns 800,000 acres of Domains and Daira land. It sells its produce at a lower price than it did some years ago, and therefore it has to produce a larger quantity in order to pay the interest on its debt. The result is that the Domains and Daira deficits, which have to be made good out of its general revenues, instead of mounting as they would have done a few years ago to 50,000*l.* or 100,000*l.*, now amount to 350,000 or 400,000*l.*

7114. You trace the fall in the price of silver a great deal to the demonetization by Germany and the other countries in Europe?—Yes, certainly more, I think, than to the increased production of silver in America, but I am not at present well up in this branch of the subject.

7115. (*Sir T. Farrer.*) I think you said you did not come here prepared to enter upon the difficult theoretical questions which are connected with the bimetallic theory, such as the appreciation of gold, the effect upon exchange, &c.? If you did not, I shall not think it needful to ask you any further questions upon these subjects?—No. I have gone into those questions very attentively, but it is several years ago now, and if I am to be cross-examined on them I should like to study them more, which I have not the time to do now.

7116. (*Mr. Fremantle.*) Can you say whether any estimate has been made of the loss to private persons in India, that is to say, officers who have to send money home, in consequence of the great fall of the price of the rupee?—No, I should think that such an estimate was very difficult to frame.

7117. But it would represent a large sum?—To the individual officers a very large sum, no doubt.

7118. Are all the covenanted and uncovenanted officers paid in rupees?—You are talking of pay. Yes. In India there is no pay in sterling at all.

7119. But then in the military establishments are they paid in silver?—They are paid in rupees, and the soldiers get the rupee at a fixed rate. I do not know what it is now.

7120. But the civil officers and the military officers are paid upon different systems?—The civil officer gets his pay in rupees, so many rupees a month, and the military officer also gets his pay in rupees at so much a month, but the soldier used to get an amount which was fixed at a certain rate of exchange. It varied from time to time, if not every year, at all events from time to time.

7121. The officers pay is originally fixed in sterling, is it not?—No, it is in rupees in India.

7122. Then how is it decided how many rupees he is to receive?—It is so many rupees per annum. A lieutenant has so much, a captain so much, a major so much, and so on.

7123. The mere fact of his landing in India alters his payment from sterling to rupees?—Yes.

7124. (*Sir John Lubbock.*) Under the circumstances I will only ask you a very few questions, but I should like to obtain your views with reference to some of the difficulties which have been suggested with reference to bimetalism. You expressed an opinion, I think, that the value of gold and silver was regulated by different laws from those which determined the values of other commodities, and that therefore, we cannot consider gold and silver altogether in the same manner as we should deal with other commodities?—Yes. When I speak of gold and silver, I mean, of course, gold and silver legal tender money.

7125. Well, in the case of gold and silver however, there is a very large consumption in the arts and for

Sir
Evelyn Baring
K.C.B.,
K.C.S.I.

15 July 1887.

Sir
Evelyn Baring,
K.C.B.,
K.C.S.I.

15 July 1887.

other purposes than coinage, is there not?—Yes. Of course very large is a relative term. As compared with the use of money for currency purposes the amount used for the arts is small.

7126. Are you prepared to state what the proportion is?—No, that I cannot tell.

7127. (*Mr. Barbour.*) Do you mean that the amount withdrawn in any year for the use of the arts is small in proportion with the amount that is actually circulating?—I mean that the amount of gold and silver in the world used for the arts is very small as compared with the amount used for currency purposes. My recollection is that there is something like 700,000,000*l.* used for currency purposes.

7128. You do not mean that the total amount that is hoarded, or that has been used in the arts in past years is not large, but you mean that the amount withdrawn in any year for the arts is small compared with the amount used for currency purposes?—I should imagine that both are true, that the amount of gold cups, and so on, is small compared with the total amount of the currency, and as to the annual production, the larger proportion goes to currency purposes and not to the arts. Though I do not know the figures, I imagine that is the case.

7129. (*Sir John Lubbock.*) When you said just now that the proportion used in the arts was very small in proportion to the currency, you do not mean that it is very small in proportion to the amount annually used for coinage, do you?—I really forget what the figures are, but I conceive that of the total annual production of gold by far the greater part is used for currency purposes, leaving only a small proportion for the arts.

7130. But you are not aware what the proportion is?—No, at this moment I cannot say.

7131. And if the amount used in the arts is larger than that which is used in currency, then you would admit, would you not, that the value must be largely determined by the use in the arts?—If the amount was larger for the arts than for currency purposes, that would be a very important argument, but at present it is far smaller.

7132. Supposing it was as large or even larger, say one-third, would not that be a very important element to take into consideration?—It would be an element, certainly.

7133. Now, supposing bimetallism were adopted, at what ratio would you propose that the two metals should be taken?—I am not prepared to give a definite answer to that point, for I think it is the most difficult question connected with this branch of the subject. I do not think, so far as I know, that it would be possible to go suddenly to the 1 to 15½ ratio. It would be such an enormous disturbance in all monetary transactions; but I cannot help thinking that there might be some means of arriving at it gradually. That, however, is the particular point which, supposing the theory were held to be sound, requires very careful examination, and upon which I should not certainly be prepared to give any opinion myself, without going through the process which the Commission is going through now, that is to say, hearing witnesses, and so on. It is by far the most difficult point connected with the whole question.

7134. It has been suggested to us that the ratio of 15½ to 1 should be adopted. Would you not think that there would be a great injustice to many interests in India if that ratio were adopted, and the great alteration in the value of silver which it would entail was suddenly produced? At present the rupee is worth 1*s.* 4½*d.* or 1*s.* 5*d.* To adopt the ratio of 15½ to 1 would increase the value of the rupee to 1*s.* 10½*d.*, and all those who had undertaken to pay amounts of rupees when the rupee was 1*s.* 5½*d.*, would suddenly find themselves compelled by legislative enactment to pay the same number of rupees when the rupee was 1*s.* 10½*d.*?—The counter case is that of a man or a Government which has engaged to receive rupees which were worth 1*s.* 10½*d.* at the time of the engagement, and which are now worth only 1*s.* 4½*d.*

7135. In the first place that has been a very gradual process?—I should be prepared to admit that to go by a sudden jump to the 1 to 15½ ratio is open to very strong objections, but that is a point upon which I must decline to give any definite opinion, because if I were to give any opinion about it, I should like to go thoroughly into the question, examine witnesses, and go through, in fact, the same process as the Commission is now going through.

7136. And the fall in the value of the rupee has not been due to any legislative action on the part of the Indian Government?—None whatever.

7137. And the rise in the rupee would be due to legislative action. Would you not consider that that would make a very great difference between the two cases?—I do not see that that makes any great difference, provided the legislation were conceived in a just and careful spirit.

7138. I suppose you would agree, would you not, that if the proportion of 15½ to 1 were adopted, it would give a great stimulus to silver mining?—Yes, I presume it would. It would increase the production of silver.

7139. And do you not think that it is possible that it might increase the production of silver so much, that in effect the result would be in a few years to drive gold out of circulation?—Where is it to go?

7140. Into the arts?—I do not believe in that. The arts could not absorb all that amount of gold.

7141. At any rate it would become a much smaller proportion of the total amount of circulating medium than it is at present?—Possibly.

7142. Is it not clear that the effect of adopting such a ratio would be to discourage gold mining and encourage silver mining?—I do not think it would discourage gold mining; I do not see why it should do that.

7143. But at any rate you think it would encourage silver mining?—Yes, I think it would.

7144. Well, would not the result of that be that practically the currency of the world would be mainly silver, with a continually decreasing amount of gold?—Under my hypothesis, if gold mining is not discouraged, the amount of gold would not decrease.

7145. If you increase the quantity of silver and do not affect the quantity of gold, then, practically, the proportion of gold to silver must continually decrease?—Yes, certainly; I imagine there would be more silver in proportion to gold than there is at present; that I should fully admit.

7146. Then the circulation on the hypothesis would consist partly of gold and partly of silver, but with a continually increasing proportion of silver, so that it would be determined practically by the value of silver?—I do not quite follow you.

7147. The theory of bimetallism is that the debtor should be allowed to pay in whichever metal he chooses, and therefore of course, if silver is the cheaper metal, he would choose that?—I do not admit that it would be the cheaper metal.

7148. If the production of silver is continually increasing, the silver must become more cheap, and the debtor having the option in which to pay would select it?—No; my contention would be that silver would always remain at the same price; it would get to the price determined by the ratio. At the ratio of 15½ to 1 it would get to 60*d.* an ounce.

7149. Directly you make silver legal tender, there is no question as to price of silver, because it would be its own price. If you went at once to 1 to 15½ there would be a large stimulus given to the production of silver for the moment?—More silver would be produced, there is no doubt about that, and that is all.

7150. Whether you go at once, or whether you go gradually, the effect of such a law would be to give a stimulus to silver mining; I think you admitted that that would be the case?—Yes, I do admit that.

7151. Then if you give that stimulus to silver mining, and if silver becomes continually a larger

proportion of the stock of the precious metals used for coinage, and if you allow the debtors to pay at their option in either the one or the other, of course they would adopt the cheaper metal, and would not the effect be that the currency would be continually decreasing in value?—To answer that question fully would lead to a very long controversy. I do not see how silver would be the cheaper of the two metals, because the relative value of the metals would be determined by the fixed ratio.

7152. Of course less gold would be produced?—There would be more silver in the world than there is at present, but gold and silver would also be at the same ratio, the same relative price; that is the bimetallists' contention.

7153. Silver would be at the same ratio in proportion to gold, but silver would not always be in the same ratio in proportion to other commodities. What I was endeavouring to elicit your opinion upon was, whether practically the value of the currency would not be regulated in such a case by the value of the silver. Assume, for the sake of argument, that after bimetallism was introduced silver could be produced in great quantities at the rate, we will say, of 35*d.* Then, would not that practically regulate the price of commodities; would you not practically in that case have, to all intents and purposes, a silver circulation?—No, because you will always have an enormous amount of gold, which will have to be used, and I think would not be used in the arts. At present you have more silver than you have gold. My contention is that at the present moment you have got bimetallism in its worst form. You have unrated bimetallism. If we had bimetallism in the sense in which I speak of it, you would have rated bimetallism. At present you are using gold and silver. If you had an amalgam of the two metals, every single coin, made partly of gold and partly of silver—

7154. The gold would follow the value of the gold and silver, I quite agree; but I am now speaking of the relation between silver and commodities. I ask you to drop gold out of your mind for the moment. I ask whether silver being a legal tender, and if you assume that silver can be produced in unlimited quantities at 35*d.* an ounce, would not the silver used be the element of the currency which would regulate the price of commodities?—If all prices were regulated in silver only, and silver could be produced in unlimited quantities at 35*d.* an ounce, there would certainly be a rise in the prices of commodities, but bimetallists contend that silver and gold rates would go together naturally, and they also contend that a fall of gold prices has been an incidental effect of the recent disturbance in the relative values of the precious metals. I should like, by the way, to qualify my evidence on one point. I have never thought that this question of the rise or fall of prices was the most important part of the whole business. I do not think it is in the least the business of the Government to step in and regulate prices. I think gold prices have fallen by reason of the changes in value of the precious metals; but if that was the only consideration, I do not think it is the affair of the Government to step in and endeavour to regulate it. Where the Government has the right to step in is to regulate the stability of the two metals, because now silver fails to fulfil one of the leading functions of a standard of value, which is stability; more especially is it the business of the English Government to step in because the present instability very seriously affects the well-being of India.

7155. What I understand you to wish is that the value of silver should be stable. Then the point to which I was directing your attention was that the practical effect of the adoption of a ratio of silver of 1 to 15½ would be to stimulate the production of silver, and that silver would be the metal which would regulate prices?—I have never said the ratio should be 1 to 15½. I declined answering that question because I said that it was an extremely

difficult one, but I may say that I think there is a great deal to be said in favour of another ratio, say 1 to 18. The present ratio is 1 to 21, or something of that sort. I have never given any opinion about its being 1 to 15½. I think that is an extremely difficult question, upon which I should very much hesitate to give an opinion.

7156. Several witnesses have expressed the opinion that that is the only ratio which is practically possible?—I am aware that is the case. But it would be impossible to adopt it at once because it would create such an enormous disturbance in all monetary transactions.

7157. That I quite understood. I am passing on to endeavour to ascertain your opinion assuming that we adopted it gradually. I think we got to this point that practically the silver would be the dominating element in the currency, that therefore if the silver could be produced at half its present cost of production, practically prices must be modified accordingly?—I think the argument, as you state it, is an argument, not against bimetallism, but against the 1 to 15½ ratio, but before I give a definite opinion in regard to that I should like to hear the whole case a great deal more.

7158. But assuming that was the case, that the ratio of 1 to 15½ was adopted, then practically prices would be regulated by the cost of the production of silver, would they not?—And of gold too, because they would always be at the same stable ratio.

7159. Yes, but you expressed the opinion already that gold would not be affected, that there would be no reason to suppose that more or less gold would be produced than there is at present, but on the other hand silver would be largely affected, and a great stimulus would be given to the production of silver. Under these circumstances would not prices be regulated by the cost of the production of silver?—I really must decline to answer such a question as that more fully than I have already done without giving further thought to it.

7160. (*Mr. Barbour.*) Do you think that the stimulus to the production of silver might cause the existing silver mines to be worked out sooner than would otherwise be the case?—Of course no one can tell how much silver is in them.

7161. It is just possible that the production of silver might fall off after a time notwithstanding the increase in relative value, if the mines should happen to become exhausted?—Exactly so; nobody can tell how much silver there is, or how much gold there is for that matter.

7162. (*Mr. Chaplin.*) When bimetallism prevailed on the continent before, was the production of the silver mines ever stimulated so as to drive gold out of circulation?—That is a matter of statistics. I believe that was not at all the case, but then it must be admitted that there have been, I believe, a great many silver mines discovered since that date.

7163. But there is nothing, so far as you are aware, in the experience of the past to lead to the expectation that a return to bimetallism would have that effect in the future?—No, I should say certainly not, because I maintain that bimetallism did succeed up to the time that the French abandoned it.

7164. (*Sir John Lubbock.*) You expressed the opinion, did you not, that bimetallism would fix the value of silver. You did not mean of course in relation to gold?—I said that bimetallism would keep the relative value of gold and silver legal tender money nearly constant.

7165. And you do not think that the fact of there being such a large consumption in the arts would make it difficult to retain them both in circulation at a fixed ratio?—I should say certainly not, because I think the amount in the arts, though I have not the figures by me, must be considerably less than what is used for currency purposes.

7166. You found that upon the assumption that the consumption in the arts is much less than the consumption in coinage?—Yes.

Sir
Evelyn Baring,
K.C.B.,
K.C.S.I.

15 July 1887.

Sir
Evelyn Baring,
K.C.B.,
K.C.S.I.
 15 July 1887.

7167. Well, then you expressed the opinion that the fall in the value of the rupee gave a great stimulus to the production of wheat in India. Several of the witnesses who have been examined on that point have considered that it did give the Indian producer an advantage, because his fixed charges, that is to say, mainly taxes and labour, became less, and therefore that as his fixed charges, which formed so very large an element in the production, are diminished, he can really produce at a smaller price. That, no doubt, gives him an advantage. Do you consider that that is the only advantage that he has, or the main advantage, or do you consider that the fall in the rupee gives him any other advantage in the production of wheat?—It has given him this advantage, because prices in India have not yet gone up, as Bagelot and other economists imagined they would do. In course of time, if there is anything in economic science, prices ought to go up, and then the Indian cultivator would no longer have this advantage; but it takes a very long time for an economic law to operate over so large a continent. Prices have not gone up, and until they do so the Indian cultivator has a considerable advantage.

7168. All changes in India are very slow?—Very slow.

7169. But you would regard those advantages as temporary, and not permanent?—I should think so.

That is matter of theory. I have always regarded the rise of prices in India as a matter of time.

7170. (*Mr. Chaplin.*) When you say “matter of time” you mean a long time?—A long time.

7171. (*Mr. Barbour.*) If a fall of gold prices occurs corresponding to a fall in exchange is there any reason why silver prices should rise? The exchange having altered, a corresponding adjustment in gold and silver prices must follow. That adjustment may take place, either through the gold price falling or the silver price rising. If, as matter of fact, gold prices have fallen sufficiently to balance the fall in exchange, is there any reason the silver prices should rise?—No; put in the way you have put it, there is not.

7172. (*Sir John Lubbock.*) You have based your arguments in favour of bimetallism mainly on the advantages which, in your opinion, would result to India. I do not know whether you did go into that question at all, but how do you think that should be effected in England?—Of course I have given most attention to the subject in connexion with India. I may say that I do not think it would do any harm here; but I am not prepared to go very fully into that branch of the subject.

7173. (*Sir T. Farrer.*) In what you have been saying you assume that India joined the bimetallic league?—Yes.

The witness withdrew.

Adjourned till Monday.

Thirtieth Day.

Monday, 18th July 1887.

PRESENT:

THE RIGHT HON. LORD HERSCHELL, the CHAIRMAN, presiding.

MR. D. M. BARBOUR, C.S.I.
 MR. J. W. BIRCH.
 MR. HENRY CHAPLIN, M.P.
 MR. L. COURTNEY, M.P.

SIR T. H. FARRER, Bart.
 MR. C. W. FREMANTLE, C.B.
 SIR JOHN LUBBOCK, Bart., M.P.
 SIR LOUIS MALLET, C.B.

MR. GEO. H. MURRAY, *Secretary.*

Mr. H. D.
Macleod.
 18 July 1887.

Mr. H. D. MACLEOD called and examined.

7174. (*The Chairman.*) You are a barrister-at-law?—Yes, my lord.

7175. And you have given great attention to the subject of banking, and credit, and the economic questions connected with the currency?—I have.

7176. And you have prepared the paper which has been put before us to express your views with reference to the elements to be taken into account in investigating the relation between the standard of value and prices?—I have.

7177. I understand that the conclusion at which you arrive is that the measure of value does not consist merely in the amount of the precious metal, which is called the standard of value, but also in all forms of credit?—Credit in all its forms has exactly the same influence on prices and production as an

equal amount of bullion, and I say that the phrase standard of value is entirely misleading. There is no such thing as standard of value, it is contrary to the nature of things. A standard of value, and a measure of value proceed upon totally different foundations of the nature of value.

7178. Those differences you have developed in the paper which we have before us?—To a certain extent. Of course I was confined within moderate limits in answering this question, but I placed a work of mine in your hands, which, as a lawyer, I would ask you to look at where the thing is quite developed. Of course the question that arises here is one of the most stupendous questions that can be asked of anyone. You might write a volume upon it. I was obliged to confine myself within as moderate limits as I could in answering the question.

7179. Then as the result of your study of that subject, do you think that there is a direct relation between the diminution or increase of the amount of the precious metal by which values are measured, and prices?—That depends to a great extent upon the organisation of credit. Credit is so enormously greater than the quantity of bullion, that all the most profound mathematicians in the world could not tell the relation between the two, and besides the system of credit is organised in such different ways. For instance, I have given a very cursory notice here of the banking system of Scotland. The banking system of Scotland is peculiar to itself, and that has the most powerful influence on the subject, because 17. notes there almost entirely supersede the use of sovereigns; in fact I may say that in my younger days I am confident that not one person in three in Scotland ever saw a sovereign in their lives.

7180. I understand your view to be that the more highly organised the system of credit the less effect will be produced by variations in the quantity of the precious metal by which values are measured?—Most assuredly, because the more you develop the system of banking the more transactions are settled by the transfers of credit, and not by bullion at all. If you have a very low system of banking, then you require a very considerable amount of bullion, but the larger a bank is the more the chances are that the customers of the bank deal amongst themselves, and their transactions are settled by mere transfers of credit by the bank, and the more organised the system of banking is the greater the amount of transactions which are managed simply by transfers of credit; by the clearing system, for instance. So that the better organised and the more extensive the system of banking is the less bullion you require to carry on commerce. In fact, money is never used in commerce now, except to pay balances of debts. All commerce is now carried on by the creation, the transfer, and the extinction or obligations.

7181. Do you see any evidence of this country suffering from what has been called a scarcity of gold?—I cannot perceive the slightest evidence of it, because this country can always command gold.

7182. Supposing that there was any great diminution in the supply of gold, so as to create what has been called a scarcity, how would you expect that to show itself?—I think that would be a very difficult question to answer. I think this country could always command a supply of gold.

7183. Why do you think so?—This is the leading commercial country in the world, and gold naturally flows to this country, beyond any other in the whole world, I think.

7184. As a kind of commercial and financial centre?—Yes. Besides, you can always attract gold by the rate of discount.

7185. Take some other country, suppose not our own country, as a financial and commercial centre, how would the scarcity of gold, if gold were the standard, show itself. I mean by diminished reserves in the banks, or in what other way?—I presume that it would, but that is a very difficult question to answer off hand.

7186. I understand you to say that the effect produced by the diminished supply of gold, supposing that to be the standard in any country, would depend on the extent of the organisation of a system of credit in the country?—Most assuredly; why the whole commerce of Scotland, the whole agriculture, every public work in Scotland, is conducted entirely by 17. notes; it is not by gold at all; gold is scarcely ever used in Scotland.

7187. I do not know if you can tell us whether there has been within the last 15 years any increase in the organisation of credit?—Of course the system of banking has vastly increased in England, and I believe that it has in France and in Italy also, and certainly throughout Europe the system of banking has been very much developed. In this

country the development of banking has been something enormous. I saw a statement in the papers the other day, that in deposits alone, which are banking credits, and not cash, as many people suppose—a deposit is a credit in the bank—that in the city of London alone the deposits in the banks amount to 525,000,000*l.* I will take the case of Scotland as another instance. On a reserve of very little more than 4,000,000*l.* the banking liabilities of all classes in Scotland are about 100,000,000*l.* Those 100,000,000*l.* of credit in Scotland produce exactly the same effect as an equal amount of gold on prices, and the more banking habits are cultivated among the people the more the system of banking grows. Of course banking has increased enormously in this country.

7188. (*Sir L. Mallet.*) But it is a question of time. Has there been any great increase of credit for the last 15 years; is the proportion of credit to bullion greater now than it was 15 years ago?—Very much greater; the proportion of credit is very much greater. Look at the progress of the joint stock banks.

7189. (*Mr. Barbour.*) Is the amount of business done also very much greater than it was 15 years ago?—Of course it is.

7190. (*The Chairman.*) But in your view, would the amount of business done affect the question of the relation of the precious metal to the transactions, if the transactions were managed by means of banking arrangements?—No. If all commercial debts were equal you might carry on any amount of business without the use of a single coin. France is a very striking example of that which I mention. You ask the relation of a standard of value to prices; by the standard of value, I suppose you mean money. Very well, then, I will give you an example. Before the foreign bankers used to discount bills of exchange, foreign merchants used to make their bills not payable at their own houses, where they would require cash to meet them, but there were certain fairs on the Continent, at Lyons, Antwerp, Brussels, and Nuremberg, and the foreign merchants used to make their bills payable only at these fairs. On a certain day at the fair they had a meeting. Of course their acceptances circulated throughout the whole country, and they performed the part of money. They used to meet, and they then interchanged their acceptances one against the other by the principle of compensation. Boisguillebert, who is one of the most celebrated of the early French economists, said that there was a commerce of 80,000,000, I suppose that he means livres, which was settled without the use of a single coin; therefore, if all commercial debts were equal you might carry on any amount of commerce without the use of a single coin, because commerce is carried on by the principle of compensation, and money is only used now to pay the balance that arises from commercial debts. Money is now used only in small retail transactions. Look at the system of the Clearing House. That is a system by which banking credits are transferred from one bank to another, precisely as credits are transferred in the same bank from one account to another. Upon the average there are about 6,000,000,000*l.* of banking credits transferred in the London Clearing House alone, let alone the country Clearing House, and other Clearing Houses in the principal towns of England and Scotland. Now I will give you an example how commerce is carried on by credit without a single coin. When in the Revolutionary War, the Bank of England suspended cash payments; that never extended to Scotland. The Scotch bankers met, and they came to a resolution that they would not pay their notes in gold at all. They never paid their notes, and during the whole of the Revolutionary War, the whole of the commerce of Scotland was carried on entirely by Scotch bank notes, and during the whole of that time, though they were liable to an action for not paying their notes, there was not a single action brought against a Scotch

Mr. H. D.
Macleod.

18 July 1887.

*Mr. H. D.
Macleod.*

18 July 1887.

back for not paying their notes. Therefore the whole commerce of Scotland was carried on for 20 years without a single sovereign.

7191. (*Sir T. Farrer.*) And the people accepted it?—They accepted it; there was not a single case of an action brought against a Scotch Bank for not paying their notes.

7192. (*Mr. Barbour.*) I think you said that credit in all its forms has exactly the same effect on prices as an equal amount of money?—Certainly, that you will find in any book on political economy.

7193. And the amount of credit in this country is very much greater than the amount of gold. I see you put it down, taking a rough figure, at 6,000,000,000*l.* of credit and 100,000,000*l.* of gold?—Of course it is impossible to state the exact amount, but Mr. Slater, of Messrs. Morrison, Dillon, and Co., made an abstract, and laid it before the House of Commons. You will find it in the Parliamentary report. I have got the amount here, and it shows that only about 2 per cent. of transactions were settled in money, and the remaining 98 per cent. by credits of various forms. That was his opinion. Of course, that is only a very rough estimate; you can estimate it at something of that kind by that scheme. In Scotland we have a perfect account of the statistics of all the Scotch banks, therefore we know how much coin there is in them and their liabilities, but most unfortunately there is nothing of the kind relating to the English banks. That would have a very great bearing on this Commission if you could obtain a complete statistical account of all the English banks, the same as you have of the Scotch banks. In Oliver and Boyds' Almanack, where the statistics are published, you will find that they have just 4,000,000*l.* of gold in reserve, and that they have liabilities of about 100,000,000*l.*

7194. I suppose if that 6,000,000,000*l.*, which we may take as the amount of credit in England, were reduced by 120,000,000*l.*, it would make very little difference in prices?—Credit is created by mercantile transactions. If you multiply mercantile transactions you multiply the amount of credit.

7195. But the fall in prices to balance a reduction of that amount in credit would be very little?—I should say extremely little.

7196. But do you think the result would be the same if 120,000,000*l.* of gold disappeared from England?—Of course you require a certain amount of gold to keep up credit here. I do not know what the amount of gold in England is.

7197. There would be an immense failure of credit?—The currency of the country would be reduced to so many bits of paper.

7198. And therefore the withdrawal of 120,000,000*l.* of gold would have a much greater effect on prices than a reduction of credit by 120,000,000*l.*?—It is not possible to conceive that 120,000,000*l.* of gold should be drawn from the gold of the country.

7199. But supposing it were, for the sake of argument?—Then the whole system of commerce would collapse.

7200. Have you considered what happens if inconvertible paper is issued. If it is over issued is there not immediately a rise in prices?—Of course there is.

7201. Though the amount of inconvertible paper issued may bear a very small proportion to the credit in the country?—Well, yes, to a certain extent.

7202. You say there is 6,000,000,000*l.* of credit in this country; suppose there was 6,000,000,000*l.* of gold too, would not prices rise enormously?—Not if the gold were merely substituted for the credit, because credit is only a substitute for gold. Money and credit are the circulating medium, and the same effect would be produced by an equal addition to credit.

7203. But suppose credit was as much used as it is at present, and in addition that there was 6,000,000,000*l.* of gold brought into this country,

would not prices rise enormously?—Yes, most enormously; of course they would.

7204. They would more than double, would they not?—I think it is scarcely conceivable what they would rise to.

7205. Therefore 6,000,000,000*l.* of gold would have a greater influence on prices than 6,000,000,000*l.* of credit?—No, the one is a substitute for the other. If you add the one to the other it would no doubt make a difference.

7206. So far as credit takes the place of gold, gold may be withdrawn with impunity?—Yes, because credit is purchasing power over and above gold. If a man buys with credit, that produces exactly the same effect on prices as if he buys with gold.

7207. You know, of course, that there has been a great alteration in the relative value of gold and silver in recent years?—I am aware of that as a fact.

7208. And gold and silver prices would vary in accordance with that alteration in the value of gold and silver, would they not?—I presume so.

7209. Well, do you suppose that the rise in silver prices and the fall in gold prices is due to credit or to anything connected with the two metals?—I think the fall in prices throughout the world is very much due to the state of credit, much more than has ever been appreciated.

7210. That it is a contraction of credit in the gold countries?—It is, most undoubtedly.

7211. And do you consider that owing to there being no contraction of credit in the silver countries, the silver countries being countries that do not use credit very largely, prices remain practically the same?—No, prices in the country are estimated by the amount of money and credit together, and unless you thoroughly investigate the system of credit you cannot understand the theory of prices. Now, for instance, take France; you may recollect that 40 or 50 years ago, in 1839, all prices were in silver five-franc pieces. Very well, but then the prices in France were a great deal lower than they were in England in 1839. And what was the reason of that? The reason of that was that the whole currency of France consisted of nothing but silver pieces, with a very small amount of credit, while the currency of this country consisted of money and an extremely large amount of credit.

7212. The evidence we have had, I think, has been rather to the effect that there has been a great extension of credit during recent years. I understand you would agree with that?—In this country the development of credit has been something enormous.

7213. Then why have gold prices fallen. If the fall of gold prices is due to a contraction of credit, how is that consistent with the great extension of credit?—For this reason, that there has been comparatively extremely little speculation of recent years. It is speculation which gives rise to this gigantic increase of credit. In times of speculation bills of exchange are multiplied, and then those bills of exchange are discounted by bankers, and that gives rise to the extension of banking credits, and that gives rise to an enormous multiplication of credit. Now you will observe that the great fall in prices has been since the year 1873. That was the year of great speculation, and speculation has collapsed almost since the year 1873. There has been no speculation in any country whatever. In times of speculation credits are increased and multiplied. Then the system may increase from the general commerce of the country without speculation.

7214. But was there not a great fall of prices in 1877?—I am only speaking offhand, but I imagine that the great decadence in prices arose after the collapse of speculation about 1873, and there has been a very general fall throughout the world since that time. The fact is, you, as acquainted with mercantile affairs, know perfectly well that the depression of prices since 1873 has been something without a parallel.

It has always been observed in previous times that every great depression of prices gives rise to speculations, and those speculations produce those mercantile crises. Now before 1825 there was a great depression of prices, and people began to speculate then, but ever since the year 1873 speculation seems to be perfectly dead in every country, and people, as I say, seem to live from hand to mouth.

7215. Can you assign any special cause for that falling off in speculation since 1873?—I suppose people cannot discover things to speculate in. You will observe that in all times of previous speculation prices rose immediately to an enormous extent; after those great mercantile collapses you will find that prices fell to an enormous extent, and the reason was because so many people were ruined. They could not create bills of exchange, so there were no bills to go to the banks to be discounted. It is always observed that after a commercial crisis the deposits in banks fell off immensely. That is simply because the banks have not got mercantile bills to discount.

7216. Is there anything in the returns of the banks of the present day to show that there has been a great falling off in the amount of credit?—The system of banking has certainly not been increasing so fast as it did in previous years. You find that all the banks are complaining of want of business.

7217. (*Mr. Birch.*) You state in this paper that we have got before us that bank notes, bills of exchange and banking credits payable in gold, have exactly the same effect as an equal amount of gold. That is, so long as you are certain that those documents will be payable in gold, but in the event of there being a large export of gold, and a scarcity of gold, then of course they would vary?—If there was a large export of gold from this country that would come upon the rate of discount.

7218. Then you think that raising the rate of discount would always attract gold?—Yes, I think we may lay that down pretty certainly, because all banks in the world now are managed by the rate of discount. If there is an export of gold from this country, you immediately raise the rate of discount, and if you want to attract gold to this country, if the state of the market allows it, you raise the rate of discount. You know a lower rate of discount between this country and any other will produce an export of gold from this country, because, if the rate of discount is very low in this country, foreign merchants send over their bills to this country to be discounted. And besides, if there is a difference between the rate of discount in London and Paris, we will say more than sufficient to pay expenses, I daresay you know perfectly well that the bullion merchants fabricate bills for the express purpose of exporting gold.

7219. I was only thinking specially of the volume of the currency which of course would be diminished by the export of gold?—Yes, to a very slight extent.

7220. With regard to prices, a period of prosperity leads to enlarged production, and the expansion of any branch of industry stimulates others?—Yes.

7221. You attribute the fall of prices largely to the increase of production, do you not?—Of course, there are special reasons affecting every article of product, but I attribute the general depression throughout the world to the absence of speculation.

7222. The bimetallists generally assert that the present depression of prices is mainly the consequence of a scarcity and appreciation of gold; that gold is now appreciated owing to its supply being inadequate for its purposes. You do not agree with that?—The absolute effects, I venture to hold, of a minute increase of gold, or a diminution of it are so extremely intricate that it is impossible to say what they are.

7223. And they also assert that to create a new standard of value, combining gold and silver in a permanently fixed ratio to one another, would enlarge the mass of the measure of value and relieve prices from the disturbing influences to which they are now

subject. You do not agree with that?—Ah, that is too profound a question to go into off-hand.

7224. (*Mr. Chaplin.*) You say in your paper that the quantity of money in any country bears no necessary relation to the quantity of other goods in it, nor to their prices?—I do.

7225. Would you make the same statement with reference to the money and the goods in the whole world?—In a certain way, because the quantity of money required depends so very much on the methods on which business is transacted.

7226. Then it would make no difference, you say, to the prices?—I say it might or it might not. I say that there is no absolutely necessary relation.

7227. But then it might have a relation to the prices of goods in a certain country?—It might have. I said no necessary relation.

7228. Well, supposing you suddenly took away a very large proportion of the gold in any particular country, you think then it probably would have an effect upon the prices?—That would upset the banking system, because the banking system is carried on by the basis of gold. If you were to withdraw, for instance, from the Bank of England 11,000,000*l.*, quite suddenly of gold, why that would upset the whole banking system of the country.

7229. And consequently would affect prices?—Of course it would, because it affects the rate of discount, and the rate of discount has one of the most powerful effects on prices.

7230. And supposing that silver was legal money as well as gold and you withdrew a large portion of the mass of the metals, that would equally affect prices?—If silver were a legal tender equally with gold of course it would, because the whole credit system of the country is based on the supposition that it is payable in gold, and you must have a certain amount of bullion to maintain the credit system of the country, but then there is no fixed quantity which is necessary. That depends very much upon the organisation of credit.

7231. But what I gather from you is this, that if you were to largely increase or largely diminish the amount of the mass of the precious metals either in the country or in the world, that must affect to some extent the prices of commodities, either by raising them or by causing them to fall?—Of course it must be; but the questions are so intricate that you cannot give a definite ratio. You are aware that there were great gold discoveries in the 15th and 16th centuries. That no doubt affected prices to a certain extent, but all the best authorities at the time agreed that prices only rose about half what might have been expected from the increased quantity of the metal, and the reason is this. There are two great branches of commerce. There is, first of all, the commerce in commodities, and in the next place there are commercial and mercantile bills and loans. Now one part of money goes to exchange with commodities, and another part goes to buy and sell debts. One part of the money goes to affect the prices of commodities, and the other affects the rate of interest. As an instance, I will take this country alone, which will give a good example of it. You know that prices have risen enormously since the days of William the Conqueror. What has raised prices so much? Of course there has been a certain amount of increase of metal. What has raised prices so enormously in this country since then? Why, it is the development of credit, because credit has exactly the same effect on prices as money. In the days of Charles II. 10 per cent. was the legal rate of interest. When the banks were founded in this country depositors in banks used to receive 6 per cent. interest upon their daily balances, which they do not receive now. But what has reduced the rate of interest so much in this country? It is the prodigious development of banking credits, because a banker never advances money for a bill of exchange. He discounts the bill by writing down the amount to the credit of the customer. He does it by means of a bank credit. As banking has developed, these credits have increased

*Mr. H. D.
Macleod*
18 July 1887.

Mr. H. D.
Macleod.
18 July 1887.

They bid one against another and they brought down the rate of interest in a very short time from 10 per cent. to 3 per cent. It is the quantity of banking credits in this country that has brought down the rate of interest, therefore an increase of money or credit, which I treat as the same, has an effect on prices, and on the rate of discount or interest.

7232. But I gather that you attribute the rise in the price of commodities since the days you mentioned much more to the organisation of credit than to an increase of the metals?—I do.

7233. (*Mr. Courtney.*) I understood you to estimate the amount of credit in this country at 6,000,000,000*l.*?—I only take that, as you will understand, as a very rough basis. I take Mr. Slater's account as what you may consider as common in general, but of course you will see that that is very rough.

7234. My question does not refer to the accuracy of the estimate. I want to know what is included in that 6,000,000,000*l.*?—Banking credits and bills of exchange of all kinds; credit in all its forms I may say.

7235. Do you mean what the customers of a bank owe to the bank or what the bank owes to its customers?—Well, each of those is an article of credit; a bill of exchange is one credit, and a banking deposit is another credit.

7236. So that if I have got a balance of 5,000*l.* at my banker, and my neighbour owes 5,000*l.* to the same banker, the two together make 10,000*l.*, part of the 6,000,000,000*l.*?—Yes, because the asset which a banker holds is one article of credit, and the banker's liabilities to his customers are another article of credit.

7237. I am only endeavouring to find out what you mean, and you mean banking debts whether owing to or by a banker are part of the sum of 6,000,000,000*l.*?—I should say so, but I only put it in a very rough way in order to show the enormously greater amount of credit than there is of money. A banker's assets are his property, the bills of exchange are his property, which he can buy or sell or do anything that he likes with, and the deposits are the property of his customers. They are credits which can be put into circulation by cheques or notes.

7238. And if a banker advances 50,000*l.* on a mortgage, would that be part of the sum total?—That credit would not get into circulation; that is not the same thing.

7239. I am not going through the reason of the thing; I only wish to know what you mean. You told me that if a banker lent 50,000*l.* to a man, that was part of the total you sum up to make the estimated 6,000,000,000*l.* Now if a banker lends 50,000*l.* to a man, on mortgage, is that also a part of the sum total or not?—No, I am talking of commercial credits, in the ordinary course of commerce.

7240. Then you do not mean that what a banker owes to a customer or is owed by a customer, necessarily forms a part of it. Somehow or other, you know, you go through an addition sum to make up that 6,000,000,000*l.* You take the case of a banker, and you put down, as I understood, what a banker owes to his customers. You take his ledgers, and you see that he owes so much to A, so much to B, and so much to C and D. They are debts due by the banker to his customers. Then there are also debts due by the customers to the banker. Have you added those up in the total?—Yes.

7241. Suppose one of those debts took the form of a loan on mortgage, would it form part of the total?—I did not consider that case. I took the case of an ordinary banker. I say the quantity of credit in circulation, merely taking these figures, may be estimated at about 50 times the amount of metallic money in the country.

7242. Well, do you mean by that that the amount of payments made in the course of a year are 50 times the stock of bullion in the country?—I mean to say this, that taking the quantity of circulating credit in this country which goes into commercial transac-

tions, it may be estimated at about 50 times the amount of specie.

7243. Well, those transactions might of course include many cross entries, signifying no passage of money whatever?—That is exactly what I say, that an immense amount of the business of the country is carried on simply by compensation of credit, and not by money at all. That is the stupendous difficulty in forming any estimate of the relation of money to prices, because transactions are carried on by a species of barter.

7244. Well, now 6,000,000,000*l.* represents the total payments made in the course of a year, I understand?—No, the quantity of credit in circulation. A piece of credit may circulate like a piece of money. If you have 100*l.* that may pass through 100 payments, and so on, but the quantity of actual specie—I know that some people put it at 100,000,000*l.* and some at 120,000,000*l.*—but I say the quantity of actual credit in existence, rights of action of various sorts, is estimated to be about 6,000,000,000*l.*

7245. But I thought we had come to understand that this total of 6,000,000,000*l.* meant the actual payments made in the course of a year?—No, the quantity of credit.

7246. Well, I wish you would just in imagination give me the items, or class of items, that make it up?—Very well, there are first of all banking deposits, then there are mercantile bills of exchange.

7247. If you are to stand on banking deposits I come back to the question with which I started. Is a bank debt secured on mortgage a part of your total?—Well, you see the question here I was referring to commerce in general; I was not referring particularly to money advanced on mortgage by a banker.

7248. But why not?—Well, because a mortgage is not part of the circulating medium. I am talking of the credit that forms part of the circulating medium.

7249. Then is 6,000,000,000*l.* the total amount of debts at any one amount, or of daily debts added up throughout the year?—No, credit existing at any particular moment.

7250. Well, now go to the question that the Chairman asked you. You are aware, as an historical fact, that in the years 1848 and 1860 there were great discoveries of gold?—There were.

7251. And additions to the stock of gold in circulation in consequence?—Yes.

7252. Those exercised some influence, I do not care whether great or small. Suppose those discoveries to cease, or rather afterwards to cease as suddenly as they came into existence, what do you conceive would be the effect of the cessation of the supply upon prices?—I think it would be utterly impossible to say.

7253. It would, in your mind, have some reference to this 6,000,000,000*l.*?—Well, it would depend so very much upon the state of credit.

7254. In the United States during the great war there were great changes of prices?—There were, but then gold and silver disappeared from circulation, and private notes were almost entirely used; private credit was used. It was said in the papers that you could not get any change. If you went to get your hair cut, and tendered a dollar, the man gave you a promise to cut your hair five times more; there was no change for a dollar, only promises to pay in goods or services of that kind; gold and silver disappeared.

7255. Now, prices went up to double what they were, at one time during that war?—Very likely.

7256. Would you attribute that fact to the paper circulation being double what the coin circulation had been?—Most probably.

7257. Quite irrespective of the amount of credits?—Well, you must take the two together. You speak of the greenbacks, do you not?

7258. To the notes that were in circulation, the inconvertible notes?—Well, of course they increased. The enormous issues of these increased prices to an enormous extent. In the first war of independence, when they issued inconvertible paper currency, it came to this, that a pair of boots cost six and thirty

thousand pounds, and so in the French *assignats*, and other cases.

7259. Suppose we assume that the inconvertible paper circulation in the United States in the year 1864 was 500,000,000*l.* sterling. And before the war there had been 200,000,000*l.* inconvertible paper and coin?—Yes.

7260. Do you conceive that the scale of prices at the time that there was 500,000,000*l.* of inconvertible paper in circulation would bear the same ratio to the scale of prices at the time of convertible paper and coin in circulation, as the 500 to the 200, or not?—That would be difficult to say, because the quantity of specie to prices bears a great relation to what it has to do.

7261. Well, the country being, suppose otherwise the same, would the proportion of prices be a function of the proportion of the total inconvertible paper to what had been the amount in convertible paper circulation?—It would very probably be a function of it, but I doubt whether any mathematician could say what the function would be.

7262. You would not presume to give any assessment or valuation?—No, I would not.

7263. (*Sir T. Farrer.*) Does not gold, the *l.* for instance, serve two functions; it is a medium of exchange, and it is also—you do not like the word standard—but it is also a measure of value?—Certainly.

7264. Well, the two functions, though they work together, are two really separate functions, are they not?—Perfectly separate functions.

7265. Consequently you might cease to use the *l.* as a medium of exchange, and yet there might be a demand for it for other purposes than currency?—Yes, there might.

7266. Consequently, if you increase or diminish the quantity of gold in the world in proportion to the demand upon it, even if there were no demands at all for currency, you would alter your ratio of value?—Yes, I think so.

7267. Because I think that this reconciles a good deal that has been said. Assume for a moment that we had arrived at a perfect state of barter in this country, and that no gold was used as a medium of exchange at all, still we might retain the gold *l.* as a measure of value, might we not?—You might use it as a measure of value without being money at all. I will give an example of that. In the times of the Homeric poems there was no such thing as money. In one part we find a case of pure barter. Commodities were exchanged against commodities without any reference to a common measure of value. But in other places we find that they had seen the advantage of referring things to a common measure of value. They estimated various things as being worth so many cattle. But these cattle were in no way used as money. That is a striking instance of a commodity being used as a measure of value without being used as money.

7268. And then if you supposed a mountain of gold were suddenly discovered which made the whole quantity of gold in the world double what it was before, and other demands upon gold remained the same, the gold *l.* would be only half the value it was before?—Well, it would vary very considerably.

7269. It would diminish very much the value, and that would alter the value not of every *l.*, as we have assumed that there are no pounds in the country, but every nominal pound represented by credit?—Certainly, I think so.

7270. And is not that one reason why prices are altered when the currency is depreciated; it is not merely because you increase the quantity of the media, but it is because you diminish the real value of the standard; the gold ceases to be the standard?—I think so.

7271. Well, now, I should like to ask you a further question. Do you think that there is any fixed relation between the quantity of gold and the quantity of

credit in a country?—Certainly not, because that depends on the organisation of credit.

7272. Quite so. Well, then, you think that credit may continue to be more and more organised so as to require a smaller amount of gold with a larger superstructure of credit?—Most unquestionably so. The more people cultivate banking habits and pay their gold into the banks, the larger the superstructure of credit, and the more are the transactions which are carried on on credit, and then these payments are made by what is called the principle of compensation, one credit is written off against the other, and you may have that to any extent almost.

7273. Now let me take an instance. A short time ago I believe that in Liverpool the balance of cotton transactions was paid every day in cash?—Yes.

7274. Within a few years a cotton clearing house has been established?—Yes.

7275. And now no money passes at all?—Quite so.

7276. At the end of each day the clerks of the different offices used to go carrying the balance in gold, notes, or cash from one office to another?—Yes.

7277. Now that is done away with altogether, and the whole thing is effected through the medium of a clearing house, without a sixpence passing?—Yes.

7278. That is an instance, is it not, of the increase of the organisation of credit to which you have referred?—Certainly.

7279. The establishment of provincial clearing houses in Manchester and Liverpool is another instance, is it not?—Yes.

7280. And it is possible that a great many more retail transactions are paid by cheques and cleared by the banks than was the case formerly?—Yes.

7281. I heard it stated that at one of the greatest banks in Manchester, where they used to do half their transactions over the counter, they now only do one quarter of their transactions in money over the counter, and that three-quarters are now done by clearing houses, without any money passing?—Quite so.

7282. All these are instances of the increase of the organisation of credit, are they not?—Quite so.

7283. Have you paid any attention to that, are you at all able to say to what extent that has progressed within the last 15 or 20 years in this country or other countries?—Well, no; I could scarcely say that.

7284. Then I want to ask you to go to another point. Is the relation between gold and credit in a country a fixed relation in another sense, or does it fluctuate with the condition of speculation and of trade. Does the reserve which banks are required to keep bear a fixed relation to the superstructure of credit?—Well, it ought to do so.

7285. Do you suppose that at a time when speculation is very rife and sanguine the amount of gold kept in the banks bears the same proportion to the amount of credit that it does when trade is dull or when we are approaching a panic. You do not know that?—I do not know that.

7286. I asked you that question because I wanted to see whether any difference of that sort will clear up the difficulty which Mr. Barbour put to you. You told him that credit has been progressing, and you at the same time told him that credit had ceased to be as prevalent as it was in the booming times of 1873. Now, I wanted to ascertain whether it was possible to reconcile those two things by saying that the organisation of credit has progressed, while the amount of credit, owing to the depression of people's spirits or a difference in their hopes and fears, has caused them to speculate less and consequently has caused credit to be less inflated?—I think that it is exactly as you have said, the spirit of banking and banking habits have increased very much in this country and abroad, but at the same time the spirit of speculation is dead.

7287. Then you think that there is more credit at a time of great speculation?—Most undoubtedly.

7288. (*The Chairman.*) I understood you to say that the kind of credit which you speak of as having

Mr. H. D.
Macleod.

18 July 1887.

Mr. H. D.
Macleod.
18 July 1887.

increased is that credit which consists in banking expedients, in every-day use for the purpose of making payments and credit which is not as great now as it was, is the credit consisting of the readiness to lend money for the purpose of adventure?—Exactly so. The volume of business naturally increases with the growth of the country, and therefore the system of credit must increase naturally, but what I call speculative credit is unnatural credit, a feverish kind of credit, for some particular reason, as there was in 1873 for railroads, and many other things.

7289. (*Sir T. Farrer.*) Credit, according to the notion that you have developed so fully in this paper, means the bringing into the present, and making convertible people's beliefs in the distant and the future?—Credit is the present value of future profit. Every future profit and every future payment has a present value. Supposing that you know that you have got the sum of 100*l.* payable to you this day month. You have a right to that 100*l.* this day month, and you can sell that credit. A credit is a right of action against a person for a sum of money; it is the present value of a future payment.

7290. And must depend to a certain degree on a person's estimate of the future, must it not?—Of course.

7291. And at a time of great speculation people's estimates are higher than at a time of dulness?—At the time of the corn famine of 1847 people thought there was to be a great rise in the price of corn. They sent orders to their agents all over the world to buy corn at the advanced price, and then you know in time of speculation they multiply accommodation bills. They grasp at anything they can to buy up to meet the future demand. During the Crimean war there was great speculation in shipping.

7292. When credit increases in that way is it represented by any additional quantity of gold?—Not necessarily.

7293. Therefore the quantity of gold in relation to the credit is smaller in time of sanguine speculation than in time of dulness?—Yes, of course it is.

7294. Then that does account for the apparent inconsistency that Mr. Barbour endeavoured to point out when you said that on the one hand credit had progressed, and on the other hand credit had collapsed?—Exactly so. I do not think there is any inconsistency in that. I mean speculative credit had collapsed, but naturally in the progress, and improvement of trade, the system of credit will grow greater and greater throughout the world.

7295. You say that money is needed only for settling the balance of transactions?—In a general way.

7296. And, amongst other things, it is needed for the purpose of settling the balance of international transactions?—To a certain extent; but then there is another thing in the development of credit, which has greatly increased in recent times. At the present time public securities of all kinds, and bills of exchange, form part of the foreign exchanges exactly in the same way as material commodities do, and they enter into foreign exchanges exactly in the same way. Suppose you are in America, and you send a lot of railway securities to be discounted in this country. Does not that produce the same effect on the foreign exchanges as so many commodities imported? By this means the whole theory of foreign exchanges is an insoluble puzzle, because the securities pass through the post, and not through the Custom House. There is no possible method of ascertaining the quantity of securities imported and exported from a country at the same time. M. Léon Say says, in his official report on the payment of the French indemnity, and as I had already observed in my "Banking," that they are an insoluble puzzle, because securities of all kinds, bills of exchange, public securities and obligations are exported and imported, and they produce exactly the same effect on the foreign exchanges as commodities.

7297. Therefore, the statistics of the actual import and export of gold tell us nothing at all?—Nothing at

all. You cannot understand the theory of the foreign exchanges by any reports that you see in any of the papers, because an enormous amount consists of public securities which come through the Post Office and not through the Custom House.

7298. Then all this mode of transmitting money between nations economises gold in that way, does it not?—Most undoubtedly it does.

7299. And you cannot tell to what extent?—It is utterly impossible to tell to what extent.

7300. So that what we read in the books about the transmission of gold from country to country, and its effect upon prices, we may put aside as useless?—Well, for all practical purposes you may. The only thing to be considered is the state of the exchanges at any time, that is the only guide it is possible to have.

7301. (*Sir John Lubbock.*) You say in your memorandum that credit has exactly the same effect on prices as money?—Yes.

7302. Well, now, I should like to take a particular case. Suppose that Messrs. Baring and Rothschild agree to advance the Manchester Ship Canal Company 4,000,000*l.* to enable them to carry out that undertaking. The result of that is that a credit is opened in their books in favour of the Manchester Ship Canal Company for 4,000,000*l.*?—I believe so; yes.

7303. Do I understand you to maintain that that operation would have the same effect upon prices as an addition of 4,000,000*l.* to our stock of gold would have?—All the credit that is put into circulation would.

7304. There you introduce the words "into circulation;" but what I ask you is whether the fact of Messrs. Baring and Rothschild opening a credit of 4,000,000*l.* in their books, upon which of course the Manchester Ship Canal Company can draw for 4,000,000*l.*, does that have, in your opinion, the same effect on prices as an increase of 4,000,000*l.* on the stock of our bullion?—Yes, for this reason. Suppose they made it in money it would not have any effect on prices until the gold was introduced into circulation.

7305. Well, we have been told that the operation has been effected, and you have seen no increase in prices?—But then, you see, that is only one transaction. You cannot tell it.

7306. But do you not think if 4,000,000*l.* were suddenly added to the amount of gold in London, that would have an effect on markets?—It would have an effect very likely on the rate of discount.

7307. But this operation to which we have alluded has had no effect on the rate of discount?—The operation you spoke of just now is how every public work in Scotland is carried on.

7308. No doubt; but what I wanted to elicit from you is whether that has the same effect as the addition of the same amount to the stock of gold, and I understand you to say it has?—Yes. Every railroad is carried on by the credit of the Scotch banks, which is exactly a similar operation to the one you mention.

7309. Then you say bills of exchange have exactly the same effect as an amount of gold?—Yes.

7310. Suppose one American house in London draws bills for 1,000,000*l.* sterling, say on its correspondent in New York, and sells to another American house in London. Do you allege that that addition of 1,000,000*l.* sterling to the amount of bills of exchange would have the same effect as an increase of 1,000,000*l.* sterling to our stock of gold?—Well, I imagine so.

7311. At any rate your opinion is that the opening of a credit in this manner, or the drawing of an additional amount of bills, has the same effect on prices as an addition to our stock of gold?—You will find that in every book on political economy. I quite agree with them as far as they go, but I think they have not a proper appreciation of the magnitude of the thing.

7312. I know it is in some, but I wanted to know whether that really was your opinion?—It is my opinion, because if you want to buy a thing you must either buy it by money or credit, and I say that credit has the same effect on prices as money has.

7313. Then I understand you to say that the establishment of a clearing house is an organisation of credit. Is it not rather an economy in the use of the currency?—Well that I think comes to very much the same thing. It is the perfection of the system of credit. The use of the clearing-house is to transfer credits from one bank to another, just in the same way as a credit is transferred from the two customers of one bank from the account of one to the other, that is what I mentioned here; it saves the waste of money.

7314. Before the establishment of the clearing house each banker in London used to send clerks round to the other banks and received what was owed them while at the same time they paid over the counter the claims which other banks had upon him. Then they established a clearing house at which these different cheques were interchanged, and the balance only was paid over?—Yes.

7315. But then there is no difference in credit in such an arrangement; the difference is that the cheques are more conveniently paid, and there is economy in circulation?—Yes, what I call an economy of money, but I divide credit into two parts; one is an economy of money, and one is a purchasing power over and above money.

7316. Then in that case the effect you ascribe to that improvement is that it effected an economy in the use of money?—Most assuredly.

7317. And you do not attach to it any other effect, excepting so far as it was an economy in the use of money?—A great deal more than that, it released that quantity of money. I consider that equal to an augmentation of capital. It releases that money which used to be dancing about from bank to bank, and enables it to be applied to other business.

7318. And that is a very important and beneficial result; but you do not attach any importance to it excepting in so far as it effected an economy in the use of the currency. It enabled those transactions to be concluded with the use of a smaller amount of currency?—Perfectly so.

7319. And is not really the effect of credit altogether the economy which it may effect in the use of the currency?—No, because I consider, as you find every economist says, credit is purchasing power over and above money.

7320. Then you attach to credit an effect entirely over and above that which it may produce in the economy of the currency?—Most undoubtedly. A merchant's purchasing power is his money and his credit. Credit is purchasing power over and above and additional to money.

7321. Now take the case of a man who draws bills on his customers and pays them into a country bank. By doing so he obtains credit on the country bank, in the books of the country bank?—Yes.

7322. Supposing that country bank pays those same bills into a London bank and the London bank opens a credit for the country bank in their books on the same bills. Do you consider that the effect of those bills, upon the currency, is, in that case, doubled?—I consider that every exchange of credit from discount of a bill is the creation of credit. When a banker discounts a bill it is usually said he lends money on the security of bills of exchange. That is an entire mistake. When a banker discounts a bill of exchange he buys the right of action; that is one piece of credit. And how does he buy it? By writing down a credit in his books in exchange for that. This is an exchange, the banker buys one credit by creating another credit.

7323. Therefore, supposing a customer or a number of customers pay, say, 1,000,000*l.* worth of bills into the country bank. The country bank sends them up to a London bill broker and discounts them with him, and the London bill broker rediscounts them with the Bank of England; then you consider those bills would produce three times the effect?—It depends on whether it is a transfer of property or not. If you sell a bill it is like selling any other commodity.

7324. Then you consider that those bills would produce three times the effect?—If it is a transfer of property.

7325. You have laid down the proposition that bills of exchange have exactly the same effect on prices as the equivalent amount of gold; therefore 1,000,000*l.* worth of bills have the same effect on prices as 1,000,000*l.* of gold?—Yes.

7326. Then I put to you this question. 1,000,000*l.* worth of bills, which have been paid into Manchester banks, had the same effect as have 1,000,000*l.* of gold. Now suppose they are then sent up to London and discounted by a bill broker. You told me that you considered they had the same effect as another 1,000,000*l.* worth of gold, if I understood you correctly?—If they are discounted you must have 1,000,000*l.* worth of credit to discount them with.

7327. And then if they are paid into the Bank of England they will produce the same effect again?—Yes.

7328. But what I wish to ascertain from you is, do you consider that the effect of this 1,000,000*l.* worth of bills is multiplied by every time that they change hands. You say that the bills have the same effect as 1,000,000*l.* worth of gold. The bills are paid into a country bank, and they have produced thereby the same effect, in your opinion, as 1,000,000*l.* worth of gold?—Yes, because you must create an equal amount of deposits in a country bank to buy them with.

7329. Then the country banker sends them up to London and discounts them with the National Discount Company. Then I ask you, does that produce the same effect as another 1,000,000*l.* worth of gold, or is the effect exhausted, in your opinion?—When the country banker sends them up to be discounted they become the property of the National Discount Company; and if the National Discount Company buy these bills they must create a credit equal to the amount on which the country banker may draw.

7330. Then, according to you, 1,000,000*l.* worth of bills may produce a very much greater effect than 1,000,000*l.* worth of gold. They pass through several hands and produce on each transfer a similar effect?—Well, they may have; it is perfectly possible. If you buy and sell property of one kind or another, you must have some property to exchange against it. If a banker discounts a bill of exchange he buys a right of action, and by doing that, that is an exchange, and if he re-discounts his bills with somebody else he sells them to somebody else, and he must create a credit in exchange for that. Then take the ordinary case of goods used; suppose the goods pass from the importer to the wholesale dealer, and from the wholesale dealer to the retail dealer, is not a bill of exchange created on each transfer of goods?

7331. What I understand you to say is, that every time a bill of exchange changes hands it produces the same effect as a similar amount of gold?—That is what I said.

7332. (*Sir T. Farrer.*) Your contention is not, as I understand it, that in a given period, say a year, a bill for 100*l.* or a bank deposit for 100*l.*, is equivalent to or does as much work as 100 sovereigns, since, in order to arrive at any such conclusion, we must know how often each of these circulates. But your contention is that, assuming Mr. Slater's account of his practice to be a fair sample of the whole business of the country, it shows, that if the same amount of business which is now done by means of credit and gold as circulating media, were to be done by means of gold alone, without credit, it would require fifty times as much gold as now exists in the country to do it?—Yes.

7333. May I ask one question to clear up that point about the indorsement, because I do not quite understand it myself. Suppose that a bill is indorsed successively by a number of persons, on each occasion of indorsement there is a transaction between the holder of the bill, and the endorsee, and something passes from the person who becomes liable upon it?—A bill of exchange passes in commerce exactly like

Mr. H. D. Macleod.

18 July 1887.

Mr. H. D.
Macleod.
3 July 1887.

a sovereign. Every indorsement denotes that an exchange has taken place; it has been exchanged for goods or commodities of some kind.

7334. An indorsement is not placed there without the consideration passing to the indorser?—Of course not.

7335. (*The Chairman.*) But does a bill of exchange passing in that way produce any different effect from a sovereign passing?—Not a bit; exactly the same effect, and if you have 10 indorsements on a bill of exchange, it shows that a bill of exchange has been exchanged against eleven times the quantity of goods. Supposing you have 100*l.*, and you transfer that 100*l.* ten times, you have exchanged that against 1,000*l.* worth of goods. You do not indorse a sovereign as it passes in commerce, but an indorsement simply means that a bill of exchange has passed like a sovereign. Because there are 12 indorsements on a bill of exchange that does not make 12 bills of exchange.

7336. (*Sir T. Farrer.*) No, but it makes 12 transactions?—It is 12 transactions; exactly so.

7337. (*Sir John Lubbock.*) I should have thought that the effect of credit consisted in the economy that it produced in the use of the precious metals, but I understand that in your opinion it goes far beyond that?—Far beyond that. As Mill says, everything that is purchasing power is wealth. Credit is purchasing power, the same as money. A merchant's purchasing power is his money and his credit.

7338. (*The Chairman.*) I understand that the credit which you speak of as the same as money is the credit which you have the confident assurance can be, at any time you wish it, exchanged for money?—Quite so.

7339. But which, in point of fact, you do not change for money; and so long as you believe that the banker will honour your cheques, either to the amount you have deposited with him, or to the amount which he tells you he will give you credit beyond that, that is just as good for you as if you knew that he had that amount of bullion labelled with your name in his strong box?—And for the country, and in prices generally.

7340. Then I understand your view to be that prices are regulated by the number of people who are in the market to buy, and the money that they have to give for it?—The money and credit.

7341. I am using now money in the sense of money, or the capacity of getting money?—Quite so.

7342. And if a man is in the market to buy, and he has the belief that he can get 50,000*l.* in sovereigns if he wants it, from his banker, he is just as likely to give a good price as if he knew he had 50,000*l.* labelled with his name in the banker's strong room. I understand that to be your view?—Certainly.

7343. (*Mr. Barbour.*) Do you think that by extending credit in that way you could put prices up to any limit, theoretically?—If credit is as good as money, and anybody can create credit, I do not see any limit to prices.

7344. (*The Chairman.*) There would be no limit so long as you believe that you can turn your credit into money, but when once you begin to doubt your banker honouring your cheque, or making good the promise of credit he had given you, then you would not be in the same position as if you had money?—Credit is the present value of what you believe to be a future payment.

7345. (*Mr. Barbour.*) If credit is as good as money for purchasing, is there any limit to prices?—May not prices go up to any limit?—Why, the limit is simply this: it is exactly the same as if there was an equal amount of gold.

7346. (*Sir T. Farrer.*) Is not the limit to be found in this, the extent of how far your belief is well founded?—Of course it is.

7347. (*Mr. Barbour.*) And that depends very largely on the amount of gold?—That you cannot tell. Suppose there is a scarcity of corn, for instance, and you believe that prices will go up to a certain amount, you give orders to your agents all over the

world to buy corn at a certain price if you are satisfied your credit is sound, but if you have made a mistake, why, then—

7348. But if the person who wants to consume the corn can buy on credit why should not the price go up to anything?—That will depend on the supply and the demand.

7349. Take another case: let us suppose that there are two countries side by side, one using gold only and the other using credit very largely; can the country that uses credit extend its system of credit so as to raise prices in that country very much above prices in the adjoining country, the country that uses only gold?—From your statement I should say yes.

7350. If that were the case would there not be at once an immense import of commodities from the country using only gold to the country using credit?—Well, naturally there would be.

7351. And would not that go on until prices had been equalised?—To a certain extent, yes.

7352. So that in point of fact, if there are two countries, one using gold and another credit, the country using credit cannot by the use of credit force its prices much above the country using gold?—Not above a certain extent. That would depend greatly on the cost of transporting the commodities from one country to another.

7353. (*Sir John Lubbock.*) I should like now to continue my line of inquiry. The working classes by thrift and economies have saved many millions sterling, which they have deposited in savings banks, for which they receive a certain amount of interest. Do you consider that the 90,000,000*l.*, or 95,000,000*l.* in the savings banks, has the same effect on prices as the same amount of gold would have?—The 90,000,000*l.* in the savings banks do not pass from hand to hand; they are in savings banks, of course. If you have a hogshead of sovereigns in a vault that does not affect prices.

7354. Then you do not think that the deposits in savings banks do have the same effect as the same amount of gold would have, because I understood you to say just now that they do not pass from hand to hand?—Because they do not come into commerce.

7355. Then supposing that the richer persons deposit money with the other banks for the sake of the interest, is there any difference between these two cases?—They do not enter into commerce.

7356. Then when you speak of bank credits you must make very considerable deductions, must you not, because you have admitted that you must deduct from the banking credits mentioned in your first page, the savings bank deposits and the deposits at interest?—I mean the mercantile deposits, ordinary current accounts, which are brought into commerce.

7357. A man opens an account with me, and supposing that he keeps 1,000*l.* upon it. He draws out every day and pays in every day, and that is a facility to him, and for my remuneration he leaves 1,000*l.*, which would give me at the present rate of interest some 20*l.* a year; now how does it affect the question if he pays me in the way of leaving a fixed deposit instead of paying me 20*l.* a year cash?—Because you make a profit on the balance, and on the basis of this bullion which he leaves with you, you can create an amount of banking credit for which you can charge exactly the same price as if you advanced money.

7358. Then you would include current deposits left in bank among the credits which would have the same effect on prices as gold, because you say the banker would use them in discounting bills?—In building up a superstructure of credit for discounting bills.

7359. But the banker does exactly the same with the amount which he received at interest?—No doubt the actual money which he leaves with you enters into your general assets upon which you increase your credit in discounting bills. A depositor in a bank does not go passing a deposit receipt from hand to hand.

7360. If money is left with the banker for the

sake of the interest you would not include it in the bank credits which you consider to act in the same way as gold, and therefore you deduct deposits in savings banks and what are called deposits in banks?—Those deposits in savings banks were not in my mind when I wrote that sentence.

7361. Why should you include a current account where the same average balance is kept, and exclude a deposit account in which interest is paid?—Because in the common current account your creditor, your depositor, puts that into circulation, whereas a man with a deposit account keeps that locked up in his safe and only asks you to repay a little bit at a time, or something of that kind.

7362. But you are aware that it is a very common custom for people in business to keep a general balance of 1,000*l.* or 2,000*l.*, or whatever it may be, depending on the nature of the business, and they aim at keeping a sort of steady balance with the banker. That balance, you said, you would include in the banking credits which you considered to have an effect on prices, because the banker used it for the purposes of discounting?—Exactly so. The customer of the banker has no money, only a right of action against him for a sum of money.

7363. You include these balances, because the banker uses them in discounting bills?—Because the banker uses them in discounting bills.

7364. But, as a matter of fact, he also uses money left on deposit accounts in discounting bills. Why did you then not include them?—I did not exclude the money; it is a deposit receipt that I was speaking of.

7365. But supposing a man opens an account with the bank in the ordinary way in the country; and does not take a deposit receipt but leaves 1,000*l.* at a week's notice, and receives two or three per cent. interest. I understood you did not include such accounts in the banking credits in this memorandum?—Well, I was not thinking of them. I was thinking of the common working accounts which a banker has in his bank when he discounts bills.

7366. Then you think that the working accounts have a totally different effect on prices from the deposit accounts, because the one you consider affects prices the same way as gold, and the other you think has no effect upon prices?—I do not consider a deposit receipt has any effect on prices, because it is not put in circulation; it is only payable to the man himself. He puts it away in his desk. It does not come into commerce. I only consider those things have an effect on prices which come into commerce.

7367. Suppose that a man opens an account with me; he considers within himself: "I am to give my banker a certain amount of trouble, for which 20*l.* or 30*l.* a year would be a fair remuneration. I am not to pay him the money down, but I will leave 1,000*l.* as an usual amount in his hands. He will employ that and get the 20*l.* or 30*l.* back." Would you include an account of that sort among the banking credits which act in the same way upon prices as gold?—Well, I do not see why you should not. What I want to say is that a credit is a piece of property. It has exactly the same effect as money, and if you keep credit not in use it is like keeping money not in use.

7368. The average balance left on current account acts in a different way from the deposit of an amount bearing interest?—No, because that is thrown into your general assets; the money paid into you on deposit receipt at seven days' notice goes into your general assets and is part of your reserves upon which you rear up the superstructure of credit, by which you discount bills, and so on.

7369. (*Sir T. Farrer.*) Does it enter into the circulation till a cheque is drawn for it by the customer?—Of course not; it is only when the cheque is drawn. The origin of credit is the right of action which is created on a loan of money or a sale of goods. If you lend money at 5 per cent., it is a sale or an exchange. You cede the property to the borrower and in

exchange for that the right of action is created to demand 105*l.*, say one year hence. The right of action to demand 105*l.* one year hence is the credit.

7370. (*Sir John Lubbock.*) But when you speak of banking credits here, you now say you were not thinking at the moment, and you do not intend to include such banking credits as the amount in savings banks or deposit accounts bearing interest?—Deposit receipts you mean? I was not thinking of them.

7371. Now that you do think of them you do not intend to include them?—No, I should not do so because they are not brought into commerce.

7372. (*Mr. Courtney.*) A person who has a right to receive 105*l.* at the end of a year, and can transfer that right, is the possessor of a credit?—Yes, that is it.

7373. And supposing a man has a right to receive 100*l.* at the end of 10 years, and 5*l.* every year, in the meanwhile is he also in possession of a credit?—A credit is a right to receive payment.

7374. If I defer it for 100 years with a right to 5*l.* a year only, is that a credit?—Of course it is a public credit.

7375. Do the 700,000,000*l.* owed by this nation exercise the same influence on prices as 700,000,000*l.* of gold?—No, because it does not go into the circulation.

7376. They are saleable and transferable?—I know they are, the funds are a mass of exchangeable property, but still they are not used as circulating medium.

7377. Most credits are not used as circulating medium?—All credits are used as circulating medium; that is what the circulating medium is.

7378. (*Sir John Lubbock.*) You have just excluded deposits in savings banks and deposits at notice?—Circulation is when exchange takes place for commodities, either for money or credit, and the circulating medium is the medium which causes circulation, and the medium which causes circulation is money and credit.

7379. (*Sir T. Farrer.*) Supposing, as some people have contemplated, that you got a system by which you could transfer land by handing about a piece of paper and you handed it about, would that become circulating medium?—No, that is a different thing altogether, that is a title to land.

7380. (*Mr. Courtney.*) I do not understand what is your ground of distinction between a 100*l.* bill, payable 12 months hence, which I sell for what I can get, and which you call an instrument of credit, and 100*l.* 3 per cent. consols, which I also sell for what I can get. Why do you call one credit and reckon its influence as such, and not the other?—For this reason, that bills of exchange, notes, and cheques are used in commerce as circulating medium, but stock is not used as a public circulating medium.

7381. (*The Chairman.*) If you used 100*l.* of stock to pay for goods brought into this country in the same way as you do a bill, ought you to say it is circulating medium?—If it was so used, but it is not customary to use stock as circulating medium.

7382. (*Sir John Lubbock.*) When you say bills of exchange have the same effect as an equal amount of gold, you mean that such bills of exchange as are put in circulation have the same effect?—Yes.

7383. And bills of exchange which are locked up and held by the drawer until they are due, would not have that effect?—No, because they are not in circulation, but the original debt on which they were founded was an act of circulation. The basis of commerce is that bills of exchange are paid for commodities.

7384. Supposing a bill is drawn upon a country customer, and paid into a banker, and it remains in the banker's hands until due; would a bill so treated, in your opinion, have the same effect on prices as the same amount of gold?—No, because it has not got into circulation.

7385. Then from the bills of exchange and bank credits which are mentioned in your memorandum

*Mr. H. D.
Macleod.*

18 July 1887.

Mr. H. D.
Macleod.

18 July 1887.

as having the same effect on prices as so much gold, we must deduct savings bank deposits, deposit accounts, and also all such bills as are not discounted?—Exactly so, but the original transaction on which the bill was founded was a sale.

7386. (*Sir T. Farrer.*) It would be like money locked up in a chest?—Of course it would. If you have a quantity of sovereigns locked up in a box they do not get into circulation.

7387. (*Sir L. Mallet.*) I gather from your answers to-day that you think it is quite impossible to lay down any rule which will guide us in comparing the quantity of credit with the quantity of the metallic money in circulation?—Yes.

7388. Very well; what I want to ask is this: It has been mentioned in the course of the discussion, that the amount of credit, consisting of banking facilities and all the rest of it, may be very much larger at one time than at another on the same metallic basis?—Certainly.

7389. That seems to me not to be the question. The question that presents itself to my mind is this: Assuming that we had two periods of equal prosperity with the same banking facilities, and in which economical methods have been adopted precisely to the same extent; well then I say will 100,000,000*l.* of metallic currency enable a superstructure of credit to be built upon that larger or less than a metallic basis of 50,000,000*l.* By doubling the metallic basis will you be able to have a larger superstructure of credit, will you not, with the same banking facilities? I have been a diligent student of your excellent works, and I think you say that money and credit must rise and fall together. Very well, that means to say that 100,000,000*l.* sterling in metallic currency at a particular time, and with the same amount of banking facilities, will afford a basis for a larger amount of credit than 50,000,000*l.*?—Yes.

7390. And therefore the larger the stock of metallic money the larger the amount of credit which may be built up upon it, the same banking facilities being admitted on both occasions?—Certainly.

7391. Then there is another question. Is it not necessary in estimating the effect upon prices of money and credit, to look at the effect of the system existing in other countries. Must we not also look to the effect on prices of the systems in force in all the countries which constitute the great commercial unit of the world?—That is exactly what I said here.

7392. (*The Chairman.*) You have said that with double the amount of a metallic basis you might erect a much larger superstructure of credit. I gather from that that you mean that you might safely do it?—You might safely do it.

7393. But might you have a much larger superstructure of credit and a growing superstructure of credit, without any addition to the metallic basis until you come to the point where people distrusted

your metallic basis as not being sufficient?—Of course you might, because if people saw that the Bank of England had only, we will say, 500,000*l.* in gold to meet all its liabilities, that would shake the credit of the Bank of England.

7394. What I mean is, supposing the indebtedness of the banks suddenly to increase by means of the credit that they are giving, until you came to the point that the customers of the bank doubt whether they will get gold for their cheques, does it matter how much gold the banks in reality have?—No; but then you see of course in any system there must be a certain proportion to maintain the stability of the system. What I say is that the larger the banking system is, and the better organised the system is, the smaller is the basis of bullion which is necessary to maintain the stability of the system. But still there must be a certain basis. Supposing you were to have only 500,000*l.* of gold in the Bank of England, that would bring on a monetary crisis, and when the gold goes down in the Bank of England, what do you do? You raise the rate of discount, and that is for the purpose of checking the creation of bills, and also for attracting bullion from abroad, which it does. That is the great method of regulating the Bank of England now.

7395. (*Sir T. Farrer.*) And the amount that is necessary for that basis depends upon people's opinions?—Of stability, certainly. Why then now take the basis the Bank of England is now; of course it has got a certain amount locked up in the issue department which is of no practical use, because you cannot get that unless the Bank went into liquidation, or by breaking the Bank Charter Act, but it is perfectly astounding to see the small basis of bullion which is maintained by the Bank of England to maintain the vast mercantile system of this country.

7396. But I suppose that rests upon the confidence that the Bank can at any moment attract gold from abroad if it wants it?—By the rate of discount. Practically speaking, the whole amount of gold the Bank has are the notes in the banking department, and the gold and silver, because the gold in the issue department cannot be got at, and it is something wonderful to think that with that amount of bullion the whole banking system of this country revolves.

7397. (*Mr. Birch.*) I understand you to assert that the volume of the currency is increased by various instruments of credit which are equivalent to gold so long as there is confidence that for all intents and purposes they can, if required, be paid in gold?—That is so.

7398. If a banker advanced a customer 50,000*l.* on mortgage, the cheque which represented the amount would, for the time it was in circulation, increase the volume of the currency, and if the money was employed in the purchase of wheat or any other commodity, it might influence a rise in prices, more money being thus available for the purpose?—Just so.

The witness withdrew.

Adjourned till Monday.

Thirty-first Day.

Monday, 25th July 1887.

PRESENT :

THE RIGHT HON. LORD HERSCHELL, the CHAIRMAN, presiding.

MR. D. M. BARBOUR, C.S.I.
MR. J. W. BIRCH.
MR. HENRY CHAPLIN, M.P.
MR. L. COURTNEY, M.P.

SIR T. H. FARRER, Bart.
MR. C. W. FREMANTLE, C.B.
SIR JOHN LUBBOCK, Bart., M.P.
SIR LOUIS MALLET, C.B.

MR. GEO. H. MURRAY, *Secretary*.

MR. H. WOLLASTON BLAKE called and examined.

7399. (*The Chairman*.) You are one of the Directors of the Bank of England?—Yes, I am.

7400. And you have given some attention to the proposals of those who advocate bimetallism?—Yes, it is a matter that has often been before me.

7401. And to the alleged evils which those proposals are designed to meet?—Yes.

7402. First with regard to the alleged appreciation of gold in relation to commodities owing to monetary changes and a diminished supply, what have you to say?—My general opinion is that the supposed effect of a diminished supply of gold, if it exists at all, has been very greatly exaggerated, and I come to that conclusion from looking at the facts and statistics that have been given in various papers. The total quantity of gold in the world is estimated at about 800,000,000*l.*; and assuming that the annual supply from the mines, a certain number of years ago, was about 30,000,000*l.* sterling, and now 20,000,000*l.*, there would be an apparent difference of 10,000,000*l.* That would amount to only about $1\frac{1}{4}$ per cent., which in itself is an exceedingly small variation; but of course we have to regard the total circulation of the world, which does not consist, by any means, of gold only. Then, again, as an evidence that apparently there has been no appreciation of gold; in the last 30 years there has been a very large increase in the total production and in the supply of gold in the world. According to statements made, the quantity of gold in the last 30 or 35 years has been a great deal more than was produced during the 358 years, from 1493 to 1850, supposed to be 660,000,000*l.*, but at any rate it is estimated at about 890,000,000*l.* between 1851 and 1885. No doubt a large quantity of that has become absorbed in the currencies of Germany and other countries, and there is a certain quantity that has been used in the arts; but at the same time, allowing 250,000,000*l.* for such purposes there still would apparently remain a very vast increase of about 640,000,000*l.*, so that on the face of these facts there is no proof, as far as I see, that there has been any actual appreciation of gold. Then, again, there is the evidence which is given of the gold in the banks of Europe and the banks of America. It appears from carefully-prepared tables which I have seen, in which the circulation and specie reserves of all the principal banks of Europe and the United States are given, as they existed in 1873, and again in 1885, that there was an increase apparently of 29 per cent. in the total note circulation, but the gold reserve had increased 75 per cent. and the silver reserve 25 per cent. From 1870 to 1874 the gold reserve amounted to about 28 per cent. of the total note circulation, and 64 per cent. of all the specie reserves; but in 1885 the gold was 41 per cent. and the specie reserves 71 per cent., and, therefore, it would appear from these facts, the supply of gold has been really increased; at

any rate, there is no evidence, so far as I can see, of an appreciation of gold or a falling off.

7403. Where gold is the standard is it the only matter to be considered in estimating the effect of the currency upon prices?—My idea upon that subject is, that gold after all can only be regarded as the small change of commerce, used for settling differences between one nation and the other, and in respect of local circulation, for settling the differences between bankers and individuals. But the real ocean of circulation, as I regard it, in foreign trade, consists in bills of exchange; in local trade it consists of all the various expedients, of which you have heard so much in regard to banking, such as internal bills of exchange, bank notes, cheques, and especially the clearing house arrangements. By which transactions to the extent of 100,000,000*l.* are settled weekly on a gold basis without using any gold at all; and amongst the Associated Banks in America it is found that equally large transactions are completed with an interchange of gold of only half of one per cent. Under all these various systems the real total circulation which pervades the whole world is so enormous that the small variations which I have been speaking of, namely, one or two per cent. in the amount of gold become infinitesimal when put upon the great reservoir of the real means of affecting exchanges; and further it appears from certain statistics, which I did not mention previously, that according to Dr. Soetbeer's calculations, in 1877 he put the quantity of gold in a certain list of civilised countries at 145,000,000*l.*; in 1881 at 195,000,000*l.*; and in 1885 at 252,000,000*l.* In the face of that the gold has not diminished, and therefore again it cannot have appreciated; but compared, as I say, with the real currency of the world and the real currency of particular nations, it appears to me absolutely infinitesimal.

7404. It has been said that the appreciation of gold is established by the general fall of prices which has occurred since 1873 in almost all articles of commerce. Have you any observations to make in regard to that?—It appears to me that the fact of there having been a general depression since 1873 as regards prices forms the ground of an assumption but not a proof of a supposed appreciation of gold. I believe that in most cases the fall of prices in individual articles may be accounted for in various ways. In the first place there have been many improvements in manufactures, both chemically and mechanically, by which numbers of articles have been produced at a much cheaper rate. Then, again, there have been great improvements and diminution in the cost of transport arising from improvements in steamboats, and their very much enlarged character by which a ton of goods can be carried a vast deal cheaper than it formerly could. I think I can give some instances of cases in which it appears to me that the fall of prices can have nothing to do in any way with the supposed appre-

Mr. H.
Wollaston
Blake.

25 July 1887.

Mr. H.
Wollaston
Blake.

25 July 1887.

ciation of gold which I do not admit. There is no doubt that there has been a great depression in prices generally, and they have affected all nations, nations which have a currency based on gold, and those which have a currency based on silver or paper, and, in short, it is perfectly general. It affects those that have free trade and those that are under protection.

7405. (*Mr. Barbour.*) Have prices fallen as much in silver countries as they have in gold countries?—I believe that in most countries—I do not know what it may be in India, but I suppose it is pretty much the same there—there has been practically speaking, a general depression of prices, arising from circumstances connected with the articles themselves.

7406. Has there been as great a fall, so far as you are aware, in silver prices as in gold prices?—I am not able exactly to answer that; but this is what I conceive really happened. From 1871 to 1873 there was a period of very extraordinary excitement. Prices were all running up to a very great height, and there was great speculation. There was an enormous expenditure. There was a rapid construction of railroads in various parts of the world. The Suez Canal was opened; then there was the German war; there was an immense indemnity and immense expenditure going on at that time, all of which raised prices to a most incredible extent. Then, prior to 1873, there was an extraordinary excitement in the engineering world, and there was a most remarkable demand for iron. In Prussia there was a great number of joint stock companies established with immense capital. It is stated that in 1872 700 joint stock companies, with above 100 millions of capital, were formed there. The same thing happened in the United States, and was carried on to a very great extent there. In 1873 there came a general crash, and there was an enormous amount of bankruptcies and failures. But what is most striking is to observe the prices of pig iron at that period. From 1871 to 1872 pig iron in America, and it was the same thing practically here in the same proportion, was 30 dollars a ton, 38 dollars in 1872, and 53 dollars in 1873. It was 38 dollars just in the intermediate time. Then there was a sudden collapse, an immense decrease of production, and then pig-iron, which was sold in 1872 for 53 dollars was 24 dollars a ton in 1874, 21 dollars in 1876, and 16 dollars in 1878. It appears to me that that sort of extraordinary variations must be attributed to some totally different cause than any change in the quantity of gold in the world; particularly when, as I said before, the variations in the quantity of gold are infinitesimal when put upon the whole reservoir of currency in the world, therefore, so far as I can see, that fall in prices and sudden rise before 1872 was dependent upon entirely different causes, and had nothing to do, practically speaking, with the currency or with the quantity of gold.

7407. (*The Chairman.*) Is there any other article with respect to which you would make a similar observation?—Yes; there was a paper read by Mr. Goschen, which I heard some time back, in which he gave a considerable list of articles, in all of which he showed there had been a great fall of prices, and he said that was so remarkable that he could attribute it only to a general cause, which he was led to suppose was the appreciation of gold. But when you come to go through them, almost all can be traced to special causes appertaining to a vast amount of articles. So far as I see there is a much greater tendency to produce a variation in prices by anything affecting credit and the credit circulation, than can be attributed in anyway to the variation of the gold itself. Now there were various articles mentioned by Mr. Goschen, and I will take all the principal ones. There were three or four, which apparently, according to other tables, clearly showed no diminution at all. They were comparatively unimportant, but I will take one which he mentioned, namely, sugar. There were very peculiar causes

affecting the price of sugar. It was about 1873 that the great development took place of beetroot sugar in France and Germany, and that was aided very much by bounties, and, in short, it increased enormously. West Indian sugar also, between 1877 and 1882, increased about one third. Beetroot sugar increased about 45 per cent. These increases were so great that there has been a steady fall in the price of sugar wholly irrespective of any supposed appreciation of gold, because sugar in 1830 was about 50*l.* a ton, in 1840 it was 40*l.* a ton, in 1880 it was 25*l.* a ton, and in 1886 it was 16*l.* a ton: showing a steady decrease for all those years, wholly irrespective of the question of currency or circulation of gold. It was dependent upon the amount of production of the article. Then the quantity in Germany was so vastly increased that they exported double in 1884 what they did in 1882. All these are indications of special variations as applicable to that particular article, and the steady decline has really followed the usual law of supply and demand. Production has increased and prices have gone down quite irrespective of gold, as I say. Then take tea. There has been a most enormous increase in the production of tea in Japan, India, Java, and Ceylon. India has quadrupled her exports of 1873. Then, as I mentioned before, freights have been extremely low, therefore that has brought the tea in at a much less cost, and hence a marked fall in tea has taken place. Then coffee. That is rather a peculiar article, and a very fluctuating one, as it is dependent on seasons, and one could not draw any very definite conclusion from changes of prices as regards coffee. But from 1866 to 1870, according to certain tables prepared by well-known statisticians, the price was expressed by number, 142; but from 1876 to 1882 it was 207. That indicated no scarcity of gold, if it was dependent in any way upon that. Then from 1881 to 1885 it went down to 139, but latterly, in the last year, it has nearly doubled, owing to failure of crops, and so on. Therefore I look upon it as regards coffee, that you cannot obtain any indication whatever, or can apply the theory that the change in prices in coffee can be attributed in any way to the scarcity of gold. Then we come to wheat. There is no doubt the depreciation of silver, to a certain extent, has stimulated the export of wheat from India and a much larger area has been brought into play. Then, again, the quantity of wheat produced in America has been enormously increased, and the transport very much cheapened. All these things will account for a great depression in wheat. I happen to be a director of the Great Indian Peninsula Railway, and therefore I see to a certain extent how the exports come down by that railway to Bombay. In the half year ending 31st of December last about 500,000 tons of wheat were brought down to Bombay for shipment. Of that 500,000 tons 420,000 were shipped from Bombay, and we knew its destination; the rest was still in the warehouses there and had not been shipped. For some time, I supposed, setting aside all the importation from America and all other places, these 500,000 tons came to Liverpool, invaded this country, and possibly accounted for a reduction of prices here, but, as a matter of fact (of course it supplied Europe), it did not deluge England, for of that 420,000 tons of which we knew the destination, 200,000 tons stopped in Italy, for the purpose of their manufactures, macaroni and so on, 50,000 tons stopped in Egypt, 100,000 tons went to France, a small quantity to Spain, and only about 40,000 tons came on to England at all. Then I have already mentioned about the variations in the price of iron; but I want to point out particularly the great improvements that have been made in the manufacture. In the first place, the fuel used in the manufacture of iron, owing to improvements, is only one half what it used to be; that makes a very great difference. Then in the machinery and in the rolling mills there have been enormous improvements. Steel rails which used to cost 22*l.* or 23*l.* a ton about 25 years ago have come down now to 4*l.* a ton, a

change wholly irrespective of currency and entirely due to improvements. Then, again, the fall of the prices of lead is due to the immense increase of production, especially in silver mines, because from the argentiferous ores they extract the lead in very large quantities. It is a bye-product that they sell at just what they can get for it. Then the same thing applies to copper; there have been enormous discoveries as regards copper, (I know this pretty well because I am rather a large consumer of copper in various ways as a manufacturer and an engineer,) and it has gone down to a half what it was before. I know in some evidence that has been given to you, that it is supposed, I hardly know why, that perhaps one half of that reduction is due to increased production, and one half of it to a supposed change in the currency, but it seems to me that it is perfectly accounted for without troubling ourselves about gold. It is really caused from the vast increase in the sources of supply, and therefore in production. In Mexico, America, and Spain, the discoveries have simply revolutionized the trade, and consequently between 82 and 85 the price of copper has gone down to one half what it was. I will not mention anything about tin. That is a very peculiar thing; but there, again, very large discoveries have been made, owing in a great degree to the speculations in 1873, and the high price to which tin was run up to. Then, if we go to other sorts of fabrics altogether, there is apparently a great fall in wool; that is an article which has fallen in consequence of a change of fashion. Long wools were used formerly, and then there was a complete change, and they took to merinos. The consequence was that there was a vast increase of that all over Australia and other places, and that brought about a distinct fall there and change of prices. And then there came the chemical discoveries, which are quoted in Mr. Goschen's table. Dyes have gone down, cochineal has ceased to be used, and has fallen, and other dyes have ceased to be used entirely from chemical discoveries. Aniline dyes from coal have destroyed the trade in cochineal and madder, and that is purely owing to a chemical discovery. Then, again, coal has gone down very much. It was run up to an enormous height by the speculations of 1873. Not only was there an increase of rails at that period, but there was an incredible expenditure of capital, and it excited the trade enormously, and coal went up, but they contrive to mine it now much more cheaply. There are other great chemical discoveries in paper, a point particularly mentioned in Mr. Goschen's list, as having had a very large fall, but that is practically entirely accounted for by the use of wood-fibre, and chemical discoveries in various ways, by which they have halved the prices actually of manufacture. The same thing applies to another article mentioned in the list, boots and shoes. The mechanical discoveries are so enormous that they make double and treble the number of shoes with the same machines that they used to do in the last few years. The fact was, that up to 1873, people had no time to do anything but produce, and they got great prices and they were satisfied. Since then the discoveries, both chemical and mechanical, that have taken place, have been enormous, and people have had greater competition.

7408. (*Sir T. Farrer.*) Do you say that greater discoveries have taken place since 1873 than in the years immediately preceding?—Very much greater discoveries, both chemical and mechanical.

7409. Which you attribute to the impulse given to the inventive faculty by the fact of depression and consequent severe competition, by which everybody was put on his mettle to see how cheaply he could produce?—Yes. Prior to 1873 people had only to work as hard as they could to meet the demand. After 1873 there came great competition and all their inventive faculties were brought into play, and hence the whole question of production of most articles has taken an entirely new phase, and has had to adjust itself in all commercial transactions, to meet an altered state of things, but altered from dis-

coveries, and not as I think with any relation whatever to the question of gold currency. But there is one item which I should have thought would certainly have gone down if it had been a question of currency, and that is wages. Wages have not gone down. They were immensely increased in 1873, but they, practically speaking, have retained a great portion of the rate. The wage-receiving class have benefited, because their power of purchase has been very much increased, owing to depression generally in prices.

7410. (*Mr. Chaplin.*) Do you include agricultural wages in that statement?—Well, I was applying it certainly a great deal more to mechanical wages, which I know much more about than I do of agricultural wages, but I do not think there has been any material reduction in mechanical wages.

7411. You are not aware that in some of the agricultural counties wages have fallen nearly 30 per cent.?—Wages have gone down by the vast increase of the area which supplies this country and Europe with corn.

7412. (*Mr. Barbour.*) Do I understand you to say that the money wages of mechanics and artisans have not fallen in any degree?—I see very little difference. I know that in my own factory at Soho there is little change in the skilled labour. I do not think there is any alteration. It rose, and it has retained its height.

7413. And the unskilled labour?—In unskilled labour there is perhaps some slight difference, but I do not think there is much difference as regards our average of wages, although there is much greater purchasing power.

7414. May we take the great cheapening of production of which you speak, as a sign that labour has become more efficient. The same amount of human labour will produce a very much larger amount of steel rails and other articles than it formerly could, and therefore labour is more efficient?—The labour is more efficient, due to mechanical improvements, but wages themselves have not materially fallen.

7415. Do you consider that wages have neither fallen or risen?—No, they remain pretty much at the spot that they did, rise to under the excitement and inflation at that period, so that it looks to me as if in all these cases that I quoted, the fall in prices has really been dependent on causes affecting the several articles and general improvements, and not, in my belief, on currency.

7416. (*Chairman.*) Now, with regard to the depreciation of silver, what is your view of the causes of the depreciation of silver?—I presume the causes of the depreciation of silver are, in the first place, large production, in the second place, the demonetization of silver in Germany and some other places, by which a larger quantity was thrown upon the market of the world; and it takes a considerable time for a metal of that kind, of which there is a large surplus, part of it temporary, no doubt, arising from the demonetization of silver by Germany, to get absorbed by the silver-using countries.

7417. Have you considered the effect upon India of the depreciation of silver?—I have nothing to do practically with the trade of India, but I only see it indirectly, knowing how the Great Indian Peninsula Railway and other railways are affected. My impression is, that in India generally the condition of the mass of the people has materially improved. There is no question at all about the exports from India having been stimulated and vastly increased, and I assume the people, in consequence, have become generally richer and better off, because they have been able to purchase much more largely and import more largely.

7418. And you say that the fact of an increased import is evidence that the position of the people has improved?—Yes; I infer that, certainly.

7419. You are of course aware of the loss that arises to the Government from the financial embarrassments caused by variations in exchange?—There is no doubt about that, that where the Indian Government has con-

tracted to pay in gold it suffers from the depreciation in silver; and, as far as employes are concerned, on that portion of their income that they have to remit home, they lose. But their bargain was to be paid in silver. If they had been in any other country that suddenly increased its circulation by a great expansion of paper, they would probably have been in a worse predicament; and those who had salaries before the American War, payable in dollars, of course had to submit to the dollar becoming 2s. instead of 4s.

7420. The financial difficulty in India, if it were to increase, would have to be met, I suppose, by increased taxation?—Well, I have no doubt the Government of India can devise means to meet their difficulties very easily. I should think they can increase their taxation when the general condition of the country is richer and improved; or they could modify their arrangements for their expenditure.

7421. Do you think that the perplexity alleged in regard to the varying rate of exchange is well founded or is exaggerated?—I think it is immensely exaggerated. It seems to me that all merchants can take very good care of themselves. From time immemorial they have had to incur risks, and they have had to deal with great fluctuations of exchange, arising from all sorts of causes. They are affected by wars and by depreciated paper, and revolutions and famine, and all these affect the exchange and the prices of articles, and merchants have always been able to do a fairly satisfactory business, and therefore I regard altogether the idea that they have been subjected to much greater risks and difficulties by a change in the value of silver (which is slow and gradual) than they had before, as a great exaggeration. And, furthermore, I really think it is the other way, because the enormous advantages of quick transport, bringing their goods much earlier to the market, the complete knowledge of all that is going on by the electric telegraph, the rapid arrangements that can be made for credits, all give them facilities which they had not before, therefore, my impression is that they are in a better state than they were in formerly.

7422. With reference to the fear that has been expressed that the appreciation of gold would continue, and that there would be an excessive fall of prices in consequence, what have you to say?—I think that is rather met by the fact that since these fears were expressed many countries have already adopted the gold standard. There is a great deal more gold in Germany, Italy, France, and Austria, and, Mr. Goschen says, more in England than there was a comparatively moderate number of years ago, and the supplies enable that to be met, and when you couple that, as I said before, with banking expedients and the enormous general reservoir of currency, I cannot conceive that there is any danger to be feared from that cause.

7423. I pass now to the suggested remedy, namely, the adoption of a bimetallic system by international agreement. One ground put forward for adopting this course is that any variation in the amount of the supply will be thrown upon the two metals instead of upon one. What have you to say with regard to that?—Well, to begin with, as I have mentioned two or three times, any variation of the kind is infinitesimal when spread upon the real ocean of circulation, but what they say is only very partially true, even assuming that these variations would produce an effect. For instance, if one metal varies, it is perfectly true that a variation of 10,000,000*l.* of gold, everything else remaining the same, would, if spread over both gold and silver, of course be diminished theoretically, but if the gold and silver varied together, the mass would move up and down just as it does now; therefore that argument produces no effect on my mind whatever, and it is too small to be appreciable in any event.

7424. Do you say that it can only be of importance in cases when the two do not vary in the same direction?—Exactly; when they both rise or both fall the argument fails. That is my notion; but, of

course, where they increase or diminish simultaneously then the rise and the fall would be the same as at present, assuming that they have any marked value at all, which I do not agree to.

7425. Then supposing that a ratio were fixed between gold and silver differing from the actual market relation now existing, what would be the effect?—I do not see how that is ever to be fixed in a satisfactory way. If suddenly you announce that there is a fixed ratio, by agreement, say of 15½ to 1, instead of 20 to 1, as at present, of course you at once benefit silver producers and silver owners. You give a fictitious value to silver; there is no question about that, so far as I see it, but I do not think the reasons given, both as regards the diminished variation being spread over a larger quantity, or the merchants' perplexity in dealing, or any of these causes, are a sufficient justification for interfering with our currency.

7426. Do you think that an arrangement of the kind suggested would be practicable and would be adhered to?—I cannot conceive any large number of nations agreeing to the terms of such an arrangement. There would be no penalty to compel them to comply; and the moment it was not the interest of the country to continue in the agreement, I think they would find means of getting out, as they did with the Latin Union. It broke up in consequence of some of the countries not keeping to their arrangement, and also because it did not suit France. Then, again, it would be very exceptional if the two metals were in currency at the same time. There would be a certain difference, and the dearer metal would disappear. In this country, for instance, during the period when there was a bimetallic currency, there was no gold in the country, it was all silver; and afterwards changes in the relative value took place, and the reverse happened. So it was in France. At one period it was all silver, at another period it was all gold, and that will go on in the future as it has done in the past, therefore I think that that is one of the evils which happened before, and will happen again. Then, to have to receive your debts sometimes in silver and sometimes in gold, when you wanted either one or the other, would be very perplexing and disagreeable.

7427. So that in your view the benefits of the introduction of bimetalism, as meeting the suggested evils, will be problematical, and you anticipate very real mischiefs from its introduction?—I think it would introduce evil, and that there is no proof whatever for the assumption made for altering what is an exceedingly good currency, and under which we get on remarkably well.

7428. (*Mr. Barbour.*) I think you said that any change in the supply of gold was quite infinitesimal as compared with the total medium of circulation?—Yes.

7429. Do you think that the supply of gold has simply the same effect on prices as the same amount of paper circulation, such as bills of exchange or cheques. Is not the influence of gold upon prices greater than the influence of an equal amount of bills of exchange?—The bills of exchange so far as I see represent actual transactions, and if the transactions increase the bills of exchange will increase. It is an automatic currency based upon gold and based upon credit, but if the credit were damaged it would have a much more serious effect than any question of the variation of gold which is only the basis of it all.

7430. Would not an addition to the stock of this country of 100,000,000*l.* of gold have a greater influence upon prices than the issue of 100,000,000*l.* in the form of cheques?—You mean that if 100,000,000*l.* were suddenly dropped by a magician's wand into this country.

7431. Came into this country by the natural operation of commerce?—For the moment I should think a sudden addition of 100,000,000*l.* would create a rise in prices in a number of articles, for those who had got the 100,000,000*l.* would have to set to work to find an outlet for it.

7432. But suppose the 100,000,000*l.* to remain permanently in the country?—That is what it would not do.

7433. Suppose the stock of gold in the world was doubled, so that England came to have 200,000,000*l.* of gold?—It would spread over the mass of the world; but it would take time.

7434. But suppose the total stock of gold we have in the world were doubled, would not prices rise? Theoretically in a country not dealing with foreign countries, no doubt if you doubled the circulating medium, whether it were gold or shells, there would be higher prices; but you are assuming a hypothetical case which I cannot imagine.

7435. I only wish to ask you whether an additional supply of gold must not have some effect on prices?—A sudden shower of gold would, I should think, temporarily create some increase of prices, which would soon adjust itself over the whole, or at least in a moderate time. The gold would not remain here. At the same time I cannot deal with hypotheses of this kind exactly.

7436. (*The Chairman.*) That, in your view, I gather, would depend upon the relation which this increase bore to the total circulation of the country, in which you include cheques and other things as well as the actual coin?—Yes, I think that the moment that this influx of gold took place it would find its way into the hands of a certain number of bankers who would set to work to try to make something out of it, so there would be a sudden increase of capital money to be disposed of, but as I say again I do not see that it affects the question at issue.

7437. (*Mr. Birch.*) It must come to purchase something, and therefore that would affect prices?—Yes.

7438. You could not have a sudden increase of 100,000,000*l.* of gold, except it rained from heaven, when I suppose it would be generally distributed. If it were imported in the ordinary way it would come to purchase commodities, and the demand for commodities would no doubt create a rise in prices?—No doubt, and after a time it would find other means of employment.

7439. (*Sir T. Farrer.*) Would not the fact of a sudden increase of credit of the same amount have an equal effect on prices?—When there has been a general feeling of confidence and excitement and a great development of credit, it always showed itself by an increase of prices; then the collapse comes, and a failure of credit, and down prices go.

7440. (*The Chairman.*) Supposing that people in this country were permitted to draw cheques on Australian banks to the amount of 100,000,000*l.*, so long as they believed that those cheques would be honoured, would not that produce precisely the same effect on prices as if you had had the gold from Australia?—I should think so, but, as I say again, I really cannot see in a moment through hypotheses, which I think are very vague, and which would, probably, never come about.

7441. (*Mr. Barbour.*) I think the hypothesis is definite, though it may not be probable?—The hypothesis is definite, but it is dealing with what I think is impracticable.

7442. I think you said that the cause of the variation in the relative value of gold and silver was the depreciation of silver due to the demonetization of that metal, and larger production?—I suppose that is the reason.

7443. And I suppose if the demonetization of silver affects its value, the monetization of gold in countries that formerly used silver would affect the value of gold?—I cannot exactly say what the effect would be, but I regard the gold mass as the real standard of value, and furthermore, that as far as gold itself is concerned, it is only used as small change, and that the question of whether it was monetized or not would, I should think, produce, comparatively speaking, very little effect.

7444. Why has a change of this nature a considerable effect in the case of silver and very little effect in the case of gold?—Because there was a sudden flood of silver thrown on the market, and had to be distributed over a vast region of the world, which takes time, and, therefore, it fell, because there was a large supply suddenly thrown upon the market, which takes time for diffusion.

7445. But I think all the silver that was thrown on the market by Germany was distributed in different countries a good many years ago?—I have no doubt that a great portion of that has been absorbed.

7446. And if, as you say, the larger production of silver reduces the value of silver, would not the reduced production of gold increase the value of gold?—The question of gold itself bears so small a proportion to the total currency which is required for the transaction of the world that there would be very little difference.

7447. Would not the same argument apply to silver?—I dare say it would.

7448. (*The Chairman.*) I understand your view to be that any variation in the amount of gold produced bears so small a proportion to the total amount of the currency founded upon gold, that you think it would not affect the prices in gold-using countries?—No, I do not think it would. I think any ordinary variations in the supply of gold would produce no practical effect upon prices whatever, merely because it is distributed over so vast a circulation.

7449. (*Mr. Barbour.*) You think bimetalism would do very little good as regards distributing fluctuations of supply over all the world?—I do not think it would have any special advantage. The silver-using countries exist now, and the gold-using countries exist, and moderate fluctuations I should think would not affect the question of prices.

7450. Gold and silver have altered in relative value rather more than 25 per cent., have they not?—Yes.

7451. Have not gold and silver prices altered in exactly the same ratio?—No, I do not think the fall in commodities has at all approached to the fall in silver; that is to say, I do not think they are concurrent. I do not suppose for a moment that prices have materially altered in India, which is a silver-using country, as regards the internal commerce of that country; I should think they are buying the corn or the wheat there much at the same price in rupees.

7452. Let us consider articles which are interchanged between England and India. Suppose that 5*l.* in gold purchased a ton of wheat 15 years ago, and at that time 5*l.* was worth, say 50 rupees. The gold price of wheat was 5*l.* a ton, and 50 rupees would purchase a ton; suppose that the price of a ton of wheat is now 4*l.* in England, and that the 4*l.* are worth 50 rupees as before, then the silver price of the ton of wheat would be 50 rupees, would it not, the same as before?—I suppose it would.

7453. The gold price would have dropped from 5*l.* to 4*l.*, and the silver price would have remained the same. Do you think it is a gain to India that the price remained the same?—I do not exactly follow the way in which you are putting it, but practically speaking, the merchant if he buys a certain given quantity of wheat for so many eighteenpences, which he does now in rupees, he has a stimulant; he can get a profit by the importation of wheat into this country notwithstanding a fall here, and a material fall.

7454. But what I wish to ask you is, whether you think it an advantage to India that her prices have remained nearly the same as before, that there has not been so much variation in prices in India as there has been in England?—You must deal with India itself. The wages and the cost out there, I conceive, do not vary materially. The producer finds a greater demand for wheat, and he puts more land into cultivation, and there is a bigger export, and he must benefit by that.

7455. Because he gets the same price as before?—It costs him about the same to produce, and he gets

Mr. H.
Wollaston
Blake.

25 July 1887.

Mr. H.
Wollaston
Blake.

25 July 1887.

the same price, and he gets a profit out of it, and he increases his general wealth.

7456. (*The Chairman.*) He gets the same profit on a larger production. Because there is an increased demand he finds that he can increase his production, and yet make a profit out of it?—They certainly have benefited.

7457. (*Mr. Barbour.*) And in that respect he has had some advantage over the English producer of wheat. The English producer cannot make a profit, I am told, or very little?—The English producer suffers in this sense of the word, because the general area of the world, which can convey wheat to England, is vastly increased, the price is lowered, and, therefore, the English producer suffers.

7458. Do you think that both gold and silver must continue to be used as money, or that it is possible to get rid of one of them?—I should think they would in various parts of the world; there is a vastly greater population which use silver now than gold.

7459. What do you think would be the best way of dividing the countries, between gold-using countries and silver-using countries?—I should let everyone do as they liked; I should not alter our currency, if you mean that.

7460. I know you would not alter our currency; but what do you think would be the best choice for other countries to make; what would be the most satisfactory arrangement?—I cannot give an opinion upon that point.

7461. Do you think it would be an evil if all countries chose gold for their standard?—I do not know that it would be any particular evil, I think it would have some advantages, if they were all monometallic.

7462. Do you think it would cause gold prices of commodities to fall if all the world chose gold as the standard, and silver was demonetized everywhere?—If gold was really the medium of exchange, and nothing else, if all the world then had to use gold, prices would fall, but it is a case that does not exist. I say that gold itself is but the article, which is convenient to move to settle balances.

7463. (*The Chairman.*) Yes. But if countries like India and China, now silver-using countries—with a system of credit not generally developed, at all events to anything like the same extent as in this country or Europe—were to adopt gold instead of silver there would be a disturbance?—I suppose there would, certainly at first.

7464. (*Mr. Barbour.*) Then it is not desirable that they should adopt the gold standard?—It is impossible to say what would be safe and what would be unsafe in a case of that kind. There are such enormous populations, and such a mass of silver used by them, that I cannot pretend to predict what would happen if you take the hypothetical case of gold being distributed over the world as the standard.

7465. But is there not this danger that all countries may take to gold and so cause a great disturbance?—I think if all silver was demonetized and all countries took gold, there would be some disturbance till countries settled down. In civilized countries there is an enormous reservoir of currency based upon credit, and in China and India, and other places in the East, they have not those advantages, and therefore there would certainly be a disturbance I presume in their circulation.

7466. And do you think it is not desirable that these countries should take to gold?—I should let things take their natural course.

7467. But that might result in very injurious consequences, everybody might like to take to gold?—I do not know what they might like, but in practical work it would settle itself; I feel quite satisfied about that.

7468. Are you aware of any period previous to 1873 at which gold was used as the sole standard unlinked to silver in one or more countries?—No, I have no information upon that subject; I cannot answer the question.

7469. (*Mr. Chaplin.*) In other words, that there was always a connecting link between gold and silver somewhere?—I do not know about the general currencies of the world. There was this connecting link in France, but sometimes France was all silver, and sometimes all gold; and ultimately they broke down the arrangement because it did not suit them.

7470. (*Mr. Barbour.*) Would it be a great inconvenience if people were paid sometimes in gold and sometimes in silver?—I think it would be very inconvenient.

7471. What would be the nature of the inconvenience?—If it was to be actually paid in silver I should think it would be exceedingly awkward to have a quantity of carts to transport the silver.

7472. But we have had evidence that in large transactions there is hardly any coin passes, that it is done by credit, so that it would make hardly any difference whether it was gold or silver?—But I may be paid by a cheque in silver, when I want the gold.

7473. Why do you want gold?—I want gold and not silver if I were a merchant, for instance.

7474. What is the advantage in having gold?—Because I might wish to send gold on to a country that might desire to have gold.

7475. But supposing that country coined gold and silver at a fixed ratio, would it make any difference?—It all turns upon the question whether those two metals are in circulation at the same moment. They never are, it is quite certain. In a bimetallic country from some cause or another, at one time there would be gold in it, and at another there would be silver.

7476. (*Chairman.*) Do you think it would be so if all the great commercial countries were bimetallic?—Yes, the same thing would occur if all the great commercial countries were bimetallic. There would be an agio upon the one metal, or an agio upon the other, according to circumstances and according to the demand, as far as I understand the question.

7477. If all the great commercial countries in the world were bimetallic at the same ratio, why should either of the metals leave one of those countries to flow to another?—Well, there will be always the other countries. You cannot get the whole world in. There will be other countries who will want one of these metals. There will be causes which will create a variation. It has always been so. It was so with the Latin Union, and France.

7478. Yes; but at the time of the Latin Union the whole of commercial Europe and the United States were not all bimetallic. What is suggested is, that that flow that takes place, and would take place if one or two only were bimetallic, would not take place if the whole commercial world, roughly speaking—Europe and the United States of America—were bimetallic at the same ratio?—I do not know exactly what would happen; but I feel perfectly satisfied, in the first place, that they would not agree, and in the next place, that it would not suit the purposes, occasionally, for one to remain any longer in the agreement; and I believe it would break down on that ground. But you put a hypothetical case that every one stuck to the bargain, and was perfectly satisfied either with gold or silver.

7479. (*Mr. Courtney.*) If such a thing happened, is it not the case that between countries possessing the same medium of exchange, there is to settle balances a movement of coin from one country to another?—Yes.

7480. So that when we say exchange is against a particular country, the movement of coin is out of that country?—Yes, that is it.

7481. Supposing you had the same bimetallic agreement between all the civilised countries, and at any moment the exchange was against England in favour of America, so that it was necessary to send coin from England to America, although gold and silver would be connected with one another at a fixed ratio when they got there, the less cost of sending gold would make gold the preferable thing to send?—I presume it would.

7482. (*Mr. Barbour.*) You say it is of great importance to a merchant to know that he could get gold?—If he wanted it.

7483. But I asked you whether, if all countries were bimetallic, silver would not serve his purpose equally well?—I think all countries would not be bimetallic. There would always be a certain demand for one metal or the other. There would be a variation in price to some extent.

7484. (*Sir T. Farrer.*) Some witnesses have told us that even if that agreement were come to by Governments, merchants and bankers would still make contracts payable in gold. Have you any opinion about that?—I think they would, because they know perfectly well that they are dealing then with a certain definite article which is the standard of value.

7485. You think they will obey the law now because it suits their habits; but if the law contradicted their habits they would make contracts to receive in gold?—At the present moment take America, which is a bimetallic country, the contracts there in a vast number of cases are always made payable in gold, simply because there is a doubt upon the subject.

7486. (*Mr. Birch.*) Do you not think that the cost of production of gold and silver has a great deal to do with the possibility of being able to maintain a fixed ratio?—I should think that the cost of production would have a very serious effect, because I cannot conceive that they could maintain a fixed ratio when the cost of production varied very much. I do not believe it would be possible.

7487. You know that at the present moment the ratio between gold and silver is 20 to 1?—Yes.

7488. Do you not consider that under these circumstances the inevitable result of opening the mint for the free coinage of gold and silver at a ratio of 15½ to 1 would be that silver would flow in and gold be exported to India and other countries where there is always a demand for hoarding purposes, gold being preferred even now at the ratio of 20 to 1?—Yes.

7489. Is it not evident that any fictitious value given to silver to the enormous extent proposed would tend under present circumstances to increase the production of that metal and reduce that of gold?—Yes.

7490. And therefore in time we might ultimately come upon a silver basis?—There might be a revolution of that kind.

7491. After all it is only speculative; but as far as your mind can contemplate it, it would be impossible to maintain that ratio for any lengthened period?—I should think it was quite impossible, looking at the fact that there would be always a vast mass of countries in the world that would not be in the agreement.

7492. A great deal has been said with regard to France acting as a parachute in certain periods. I do not know whether you have looked into that, but you would observe that during a large portion of that time when gold was very abundant silver was coined in very small amounts?—That I am aware of.

7493. That would prove that one metal was preferred to the other, and it can hardly be said that the ratio in the strict sense of the word was maintained?—It was not maintained in the bimetallic countries, and in France, particularly at one period, it was all silver. Then the variation took place, the gold discoveries took place, then the silver went out, and France suddenly became a gold country. Later, if they had not stopped the free mintage of silver they would have lost their gold of late years.

7494. And that, you imagine, was the reason why they stopped the coinage and why the Latin Union arrangement broke down?—They did not want to lose their gold, and practically they stopped the coinage and broke the agreement.

7495. (*Mr. Chaplin.*) When you say the ratio was not maintained during that time, is it not the fact that the mints were open to the free coinage of silver and gold at a certain ratio all over that period, and also

that all people could pay their debts all over that period, in either metal, as they pleased?—I believe that was the fact, but the currency did not remain equal floating throughout the country; it was one or the other.

7496. But assuming that people could pay their debts at that ratio in either metal, and that the mints were open to coin both metals at that ratio too, I do not understand how you can reconcile those facts with the statement that the ratio was not preserved?—The coinage ratio was preserved, but during this time that the nominal ratio was being preserved, there was constantly an agio. If you wanted the gold you would have to pay a certain extra price for it. They offered it to you in silver, and if you wanted it in gold you had to pay an agio.

7497. You mean if you wanted any number of gold coins for a specific purpose, you would have to give something for the advantage of getting them?—Yes, but supposing I wanted to export gold to a certain definite country that wanted gold, I should have to pay for that. They would not give it to me; they would give me what I did not want. I should have to pay really for what I did want.

7498. And you maintain that that was constantly the occurrence?—I think that was the occurrence. I do not know it practically myself, I only know what I read.

7499. You are not prepared to state that as a positive fact?—No, not myself.

7500. I understood you to say in reply to the Chairman, that the low prices of the articles mentioned in Mr. Goschen's list are not due to anything connected with the currency, but to other causes altogether?—Yes, or at any rate mainly.

7501. I want to take two of the items you mentioned, namely, wages and wheat, and I want to ask you one or two questions upon these. You limited your statement upon that to artisans' wages?—I did, because I know most about them.

7502. You could not say that in some parts of England the wages of agricultural labour have not fallen considerably?—No, I do not know much about it.

7503. Are you aware that there are and have been during the last winter an unusual number of agricultural labourers out of work altogether?—I fancy from the general depression of agriculture that it is exceedingly likely.

7504. Would not that fact modify your views to some extent that the low price of agricultural labour, assuming that it has fallen, has nothing to do with the question of the currency?—No, I do not think it has had anything to do with the question of the currency. It has had to do with the question there of demand. For instance, now I am speaking about agriculture, which you are much better versed in than I am, if in consequence of the low price of wheat a considerable amount of land has gone into pasture, fewer labourers would be wanted, and there would be a fall in wages.

7505. At present you are unable to trace it to anything connected with the currency question?—No, I do not see that it has.

7506. Well, I want to ask you one or two questions on that. The production of wheat in this country of course employs a great deal of labour?—Yes.

7507. A diminished area of land for the cultivation of wheat would throw then a considerable amount of labour out of employment?—I conceive so, yes.

7508. That would tend to reduce wages?—Yes.

7509. Well, I understand you to admit that the depreciation of silver had stimulated considerably the production and the export of wheat from India?—I think so.

7510. Which adds to the competition which the English grower has to meet?—Yes, it increases the general area of land which can send wheat to this country.

7511. That increases the competition of other countries, and tends of course to lower the price?—Yes, certainly.

Mr. H. Wollaston Blake.

25 July 1887.

Mr. H.
Wollaston
Blake.

25 July 1887.

7512. And you also acknowledge that the depreciation of silver is partly owing at all events to its demonetization by Germany and other nations?—I suppose so, yes.

7513. Well, then, would it not appear that the low price of one of the articles you have mentioned is very directly connected with the question of the currency?—It has a very indirect connexion. It is true in one sense that where the exchange varies you have a greater area which exports wheat to this country. In that respect the change certainly produces that effect; it has increased, but that is not the only thing, because there has been a vast diminution in the cost of freight, and sometime or other if it went on in India and prices rose, of course there would be an alteration.

7514. But the stimulus to the export of wheat from India, which you admit is caused by the depreciation of silver, is owing partly to the depreciation of silver?—It has been stimulated by that, and also by many other things, that is to say, cheap transport by railroads and cheap transport by sea have most materially helped.

7515. But the depreciation of silver has been a considerable element in the stimulus to the export of wheat?—I should think it had stimulated Indian merchants, no doubt at the present time, at any rate till the prices rise there.

7516. Then surely it becomes very difficult to reconcile the statement that the lower price of this particular article is not in any way connected with the question of the currency?—I especially apply it to the fact that it was not connected with the hypothesis of an appreciation of gold. I did not mention what happened as regards the silver.

7517. You replied to my question that the lower price of these articles was owing, not to anything connected with the currency, but to other causes?—I was talking especially of what is involved in the whole of this argument, namely, that the fall of prices depended upon an appreciation of gold. When I used "currency" I was dealing specially with what I called gold basis currency.

7518. The price of wheat now is about 1*l.* 10*s.* a quarter, I believe?—I dare say it is. The last published average was 34*s.*

7519. I am glad to hear that there has been a rise in something; but it was, not very long ago, I think, 2*l.*?—Yes, three or four years ago.

7520. The value of the rupee has fallen considerably in England within the last few years?—The value of the rupee has.

7521. But I think you said just now it retained all its original power in India?—It has not affected the price in India; the local currency has gone on all the same, so I am told.

7522. The 30*s.* that the Indian grower gets for a quarter of wheat would buy as many rupees, or even more rupees, than the 2*l.* did some years ago?—I dare say it would; the rupee has gone from about 1*s.* 10*d.* to 1*s.* 5*d.*, so that it is an easy calculation to make.

7523. Then the Indian grower, as a matter of fact, is realising as much profit for his wheat as he ever did before?—I should think he was, coupled, as I say, with all the other facilities.

7524. The English grower, on the other hand, is losing 10*s.* a quarter?—He is suffering from the general enlarged area, not only of India but of America. All these arguments apply. They can export wheat from America into this country at a profit, at the present low price, quite irrespective of India, which is a pure addition.

7525. What I wanted to arrive at is this, that one effect of the present system is, that though the price of wheat has fallen to such an extent at this moment that the English grower is losing 10*s.* a quarter, the Indian grower is realising as much profit as he was before?—I fancy he is.

7526. Now, I want to refer to one or two other points. You say the immediate effect of fixing an arbitrary ratio between gold and silver would give a

fictitious value to the latter; I suppose you admit that if the State has the right to give a fictitious value to one of the two metals, it has an equal right to give it to the other?—Yes, I certainly will admit that, but I do not admit that it has given a fictitious value to gold. It is the standard.

7527. Do you mean to say that if gold was demonetized by law, and its value as legal tender taken away, that that would not depreciate its value?—Certainly it would: I should think very likely.

7528. Then the fictitious value that you speak of as being given to silver by the adoption of bimetallism would only be exactly the same fictitious value as is given by law to gold at the present moment?—I do not admit that there is a fictitious value given to gold at the present moment. Gold, as I say again, is a very small factor in the whole affair.

7529. Then, if it has no fictitious value given to it by law at the present moment, how is it that it would depreciate in value if that legal position were taken away from it?—There is a fallacy in your argument which requires a little time to think about.

7530. You say that you see no advantage to England in adopting bimetallism, and you do not believe that any arrangement of that kind would be adhered to by different countries. What is your reason for thinking that?—Because having broken down in their last arrangement, and there is nothing to compel them, there is no penalty to make them keep together, and if it were their interest, for some reason or another, as it was with France to retain her gold they would break it.

7531. And you argue from the fact that Germany demonetized silver some years ago, that practically is what would occur again on the part of one or other of the nations, even if this agreement were made?—I think it is very doubtful that they would stick to it if it were against their interests.

7532. You speak of the difficulties of making such an agreement, which to your mind are insuperable. What are those difficulties?—I think every representative of a nation would have a different opinion; first as to what the relative value was between gold and silver—that would be the first dispute—as regards free mintage whether there would not be limitations upon it. There were limitations in the Latin Union. They were only to coin certain relative quantities in each country, and without pretending to have gone into that matter, I can see all sorts of questions that might arise, creating a difficulty in arrangement.

7533. Bimetallism assumes that the coinage of the two metals should be absolutely free, that the mints should be opened?—It was free in the Latin Union, but yet there were limitations.

7534. (*Mr. Barbour.*) Was there any limit to the coinage of silver by any country in the Latin Union before the French stopped coining silver?—I do not know the details of the regulations, but I know that Italy or the Pope broke them.

7535. (*Mr. Chaplin.*) But there were no limitations surely before 1873?—I cannot answer that question, because I have forgotten the year when the Latin Union was introduced.

7536. You say you cannot realise any benefits that would be derived by this country, and you recognise many disadvantages; would you say what, in your opinion, are the main objections to the adoption of the bimetallic system?—Well, I think I did mention in my evidence that I thought there were evils in the debtor choosing the metal in which he should pay his creditor. That is one evil.

7537. And what does the evil consist in?—The evil consists in this, that if I wanted to be paid in gold for certain purposes I should probably have to pay more for it than if the man paid me in silver, because he certainly would pay me in the cheapest metal.

7538. But if there was a fixed ratio between them how would one metal be cheaper than the other?—It never has occurred. There was a fixed ratio in

France, and yet the metals were never of the same value. Sometimes one left the country entirely and sometimes the other.

7539. Then you deny that it was the case that 15½ of one would always purchase one of the other?—Certainly, there was always a variation. If there had not been a variation, gold would not have disappeared at one period and silver at another period.

7540. Then one of the chief evils that you see is this: that the debtor might choose to pay his creditor in one metal, and the creditor might wish to be paid his debts in the other?—Yes, he may have given the debtor money in gold, and he might wish to have it back in gold.

7541. And you are of opinion that, notwithstanding that the bimetallic system should be adopted, he would be unable to purchase the equivalent amount in the metal that he particularly desired to have without incurring loss?—I think that would be the practical working of it.

7542. Well, what other disadvantage do you see to the adoption of the bimetallic system?—London is the great centre of the whole world; it is the general centre of commercial transactions and monetary dealings. At present it is so, because we have a gold standard, and no question at all about what our currency is and what we are dealing with. If we were dealing with two metals at a variable price I think that alone is an evil and might affect us as the great centre of exchange, which we are at the present moment.

7543. But is it not the case that London was equally the great commercial centre at the time when bimetalism existed in Europe before, and what reason do you see that leads you to think that the adoption, or the re-adoption of bimetalism again should alter in any way that position that we occupied at that time?—I think there are very good reasons given in Lord Liverpool's letter for the adoption of the monometallic standard. I had better refer you to the arguments in that.

7544. But have not the arguments used at that time been somewhat controverted by the experience of a great number of years since then?—Some people may hold different views, but I think the generality hold with Lord Liverpool.

7545. Then your second objection is that it would shake the commercial position which we enjoy at the present time?—I do not say it would do that, but I do not think it would be so convenient as having a sum which everybody understands.

7546. (*Sir John Lubbock.*) But at the same time you think it is a great advantage to British commerce and manufactures that there should be a confidence that the standard would not be interfered with?—I think that is a very great advantage that there should be perfect confidence, that in every transaction they should know that they were to have so much gold.

7547. Is it not notorious that in France, under the old system, if you were travelling and wanted a certain amount of gold you had to pay an agio upon it?—Yes, I believe so; I do not know it practically, that is what I have always read.

7548. And you consider that that would be a considerable inconvenience?—I think so.

7549. Mr. Barbour asked whether there would be any inconvenience if creditors were compelled to take silver; do you not think that for payment of wages there is a great convenience in having both gold and silver coins?—There is no doubt it is a great convenience.

7550. That the presence of gold and silver coins is a great convenience for the payment of wages?—It is a great convenience, but the silver, we all know, is a token, and can only be paid up to certain limits.

7551. But the question of both gold and silver being easily obtainable, is a great convenience in the payment of wages?—No doubt.

7552. And you consider that the practical breaking down of the Latin Union is an indication of what would probably happen in future if there was an

attempt made to re-establish bimetalism?—That is what I should expect. Though not intimately acquainted with the details, still I find that the agreement has broken down.

7553. And if the great countries which have had bimetalism have been unable to maintain that arrangement, you think the mere fact of our joining it, would not make such a difference as to enable them to maintain it?—No, I think not.

7554. You have expressed the opinion that bills of exchange are equivalent to currency; but you would probably agree, would you not, that the effect of bills of exchange on prices depends on the extent to which they effect an economy in the use of gold coins?—I regard it as an immense practical convenience; it is another form of the gold currency. All these banking expedients, whether bills of exchange, or bank notes, or cheques, are equivalent to increasing the general reservoir of the gold currency.

7555. Is that quite so. Is not their effect rather that they enable an economy to be effected in the use of gold?—Certainly, an immense economy in the use of gold.

7556. But would you attribute to them a greater influence than that of the economy in the use of gold which they enable to be effected? If we had not the clearing house, we will say, instead of the amount of gold which we now have, we should require a much larger sum?—Of course this is an economy of gold; all those banking expedients amount to an economy in the use of gold.

7557. And the effect they have is the effect they have in economising the use of gold?—Yes; and practically increasing its supply.

7558. Now, has your attention been drawn to the Appendix to the Report of the Commission on the Depression of Trade, in which it would appear that the supply of gold from 1881 to 1884 was 82,000,000*l.* sterling, of which only 16,000,000*l.*, or less than one-fifth was used for coinage?—No, I do not know that I have seen this.

7559. Would you consider that the demand for the arts being so great in comparison with that for coinage, it would be the demand for the arts that would regulate its value in relation to other commodities?—But the arts would take as its value the value that it has in coinage, would they not.

7560. We have a certain article which is used as regards one quarter for one purpose, and as regards three quarters for another purpose; would not the value be regulated rather by the greater demand than by the lesser demand?—It would if a common article, but this is an uncommon article. This is the standard of value; therefore, what is used in the arts would be regulated solely by the value which it held as currency.

7561. But at present the holders of gold can sell it for use in the arts at 20 times as much as the silver, that being the difference in value between the two metals?—Yes.

7562. Well, then, suppose that the value of gold being 20 times that of silver for purposes connected with the arts, but that for purposes connected with coinage you determine by law that it shall only be worth 15½ times that of silver; would not the effect be that the coinage of gold would be greatly checked, if not altogether arrested?—Yes, I think it is quite possible.

7563. If a person can sell his gold at 20 times as much as silver, for use in the arts, and is compelled by law to take 15½ times that proportion for the purposes of coinage, do you think that would not arrest the coinage of gold?—I think it is very likely; at any rate, it would modify the price at which the producers of gold commodities would give for it.

7564. A person would not be likely to part with his gold for coinage purposes at the ratio of 15½ to 1 of silver if, by using it in the arts, he could get 20 to 1?—Certainly not.

7565. Therefore, is it not probable that the effect

Mr. H. Wollaston Blake.

25 July 1887.

Mr. H.
Wollaston
Blake.
25 July 1887.

of bimetallism at the ratio of $15\frac{1}{2}$ to 1 would arrest, or, at any rate, greatly check, the coinage of gold?—The idea is new to me; but so far as it strikes me at first, it would have that effect.

7566. Well, therefore, if that be so, then, practically the adoption of a nominal bimetallic system of $15\frac{1}{2}$ to 1 would in reality be the adoption of a silver standard, because practically you think, as far as you can see, that it would stop the coinage of gold, and, therefore, the whole of our coinage in that case would be silver?—That I am not prepared to answer.

7567. (Mr. Barbour.) Gold is preferred for many purposes, I believe, solely because it contains great value in small bulk?—Yes, that is one of the reasons.

7568. Probably the main reason, is it not?—Very possibly. It is one of the reasons, certainly.

7569. If that be the case the higher the value of gold relatively to silver, the greater will be the demand for gold. The more value gold contains in the same bulk the greater the demand for it, because the more useful it becomes for certain purposes?—It may be so. I do not see the effect. I dare say you are right theoretically, but I do not see the practical working of it.

7570. (Sir John Lubbock.) Is not the greater value of gold for the purpose of the arts rather because it is a more beautiful metal than silver?—That is one of the elements.

The witness withdrew.

Adjourned till November 4th.

THIRTY-SECOND DAY.

Friday, 4th November 1887.

PRESENT :

MR. L. COURTNEY, M.P., in the Chair.

MR. D. M. BARBOUR, C.S.I.
MR. J. W. BIRCH.
MR. H. CHAPLIN, M.P.
SIR T. H. FARRER, Bart.

MR. C. W. FREMANTLE, C.B.
SIR W. H. HOULDSWORTH, Bart., M.P.
MR. S. MONTAGU, M.P., and

MR. GEO. H. MURRAY, *Secretary*.

Mr. J. C. FIELDEN called and examined.

Mr.
J. C. Fielden.
4 Nov. 1887.

7571. (Chairman.) You are a cotton manufacturer?—I am.

7572. And also the manager of a large mercantile business in Manchester?—Yes, I manage a business that turns over nearly 400,000*l.* a year in cotton goods.

7573. And you are also a director of an Eastern trading company, trading with silver using countries mainly?—With Singapore, Penang, Rangoon, Calcutta, Bombay, and Madras.

7574. And your acquaintance with the cotton trade is of long standing?—I went into the mill at 13, and I have been connected with the cotton trade 36 years.

7575. And you are acquainted with the position of the working classes in the trade in the cotton districts?—I have been connected with all movements in the cotton districts among the working classes since 1859; I have been the arbitrator for the operatives in all the great wage questions, where the question has been settled by arbitration. If a district gets into trouble with employers about a wage question, and it is agreed to be submitted to arbitration, the operatives send to me to ask me to take their case. I am not connected with any trade organization or trades union.

7576. You appear before the Commission at the request of the Manchester and Salford Trades Council?—Yes. I also appear in accordance with a resolution of the Blackburn Weaver's Association, and I wish to say that Blackburn is the greatest weaving town in the world. It contains one-eighth of the whole productive power of Great Britain, as far as cotton weaving is concerned.

7577. You propose to point out to the Commission, that if there has been a fall in prices, or assuming that there has been a fall in prices, only a portion of the benefit of that fall is enjoyed by the working classes?—Part of my statement is, that generally

speaking, in only about three-fifths of the total annual expenditure has there been any fall whatever. For instance, I can enumerate certain items, upon which it is quite clear that there has been no fall whatever, but in some cases a rise, such as the cost of Government and local taxation. There is no fall in the expenditure upon drinks, tobacco, temperance beverages, the food vended through hotels, public-houses, restaurants, &c.; railway charges for passenger traffic, the cost of supplying water to the community, and I may as well also say, the expenditure in the way of contributions to friendly societies, clubs, and unions of various kinds, the fees of doctors, lawyers, and the clergy; I may also say that the cost of education has increased, and the daily and weekly press are issued at standard prices. All these items constitute an expenditure, when examined, will be found to amount to at least 400,000,000*l.* a year.

7578. Now, can you give us any idea of the way in which you make up this sum of 400,000,000*l.*?—The cost of governing the country is about 90,000,000*l.*, and the local expenditure is 63,000,000*l.*, but I only take about 140,000,000*l.* for those two items, and I wish here to observe that it is a very curious thing that the cost of government has absolutely increased per head of the population, while all these commodities have been cheapening, and it seems to me that the Government is about the largest purchaser, and a cash purchaser, and that they have not been able to effect this economy which the working classes are expected to effect. The expenditure on alcoholic drinks is estimated at 120,000,000*l.* a year; it was 140,000,000*l.* twelve years ago, while the expense on tobacco is, at least, 8,000,000*l.* a year. I estimate all the other liquids supplied through the hotels and public houses of the country in the form of tea, coffee, various kinds of waters, at 30,000,000*l.* a year. I venture to say, from a very great experience, that these

items tend to increase in price. The passenger traffic on the railways is 32,000,000*l.* a year, I suppose we pay a penny a mile as usual as third-class passengers. The latest return I could get is that of 1884, which gives 30,000,000*l.*, and I estimate 2,000,000*l.* of an increase since then; the only object I have in putting forward these figures is simply to show that there is a very large number of charges that have not been affected by the fall in prices, as far as regards the actual payments. It may be that there is increased comfort. For instance, take education, that is another item, there may be better education, but it costs more money to the working people. I will take the press. I think a fair estimate of the expenditure on what you may call the periodical press—the halfpenny and penny daily press and weekly newspapers—is 20,000,000*l.*, and the prices are practically fixtures. As regards the payments to sick and friendly societies and to trades unions, these items I think I may fairly put down at 15,000,000*l.*, nearly a twentieth part of the income of the working classes. There is a very much larger contribution being made now throughout the country to support the unemployed. It is impossible to give anything like an exact estimate of the other charges named, but they must amount to a considerable sum. I took it roundly that 400,000,000*l.* of expenditure had not changed, as far as actual payments were concerned, notwithstanding the great fall in prices since 1874, and I think, of course, by these items it can be, and is easily shown.

7579. (*Sir T. Farrer.*) Do you look upon all these as a sort of fixed charges, which do not depend in any way upon currency?—I will endeavour to explain the bearing of the question. If a large fall in prices has taken place, and an estimate is made of what benefit that fall may have been to the people, you necessarily have to subtract from any benefit arising from that fall, all those large items of expenditure which have not fallen at all; so that I reckon two-fifths of the expenditure of the country has not been affected by the fall.

7580. And then do you connect that with currency?—Certainly; when you come to consider how far the purchasing power of wages has enabled a lower wage to make a man live equally well, then it becomes an important consideration.

7581. Yes. But how far do you suppose that these payments are independent of currency? Because, supposing that they have not fallen and are dependent on currency, that would go to show that currency has not affected prices?—No, they simply show this, that when a big fall in prices takes place, and everything is supposed to adjust itself to that fall, that the result is not so. I am pointing these out as very important items that do not adjust themselves to such a fall.

7582. They are a kind of fixed charges which are not affected by currency in the same way as prices are?—Well, I cannot call them fixed charges, because I will draw your attention later on to many fixed charges. For instance, I look on royalties and ground rents, and matters of that kind, as fixed charges bearing more heavily on traders, because of the fall in prices. The items I am considering are distinctly connected with expenditure on living only.

7583. (*Chairman.*) You mean, I think, this, that out of the estimated expenditure of 950,000,000*l.*, there is some 400,000,000*l.* which is not affected by a fall in prices?—Yes.

7584. That they are conventional prices to-day for certain services or commodities which do not decline with a decline in the prices of other commodities?—That is exactly what I mean.

7585. (*Sir W. H. Houldsworth.*) Do you consider that a temporary suspension, or a permanent suspension of the fall?—Well, the first two items, 150,000,000*l.*, are a very considerable proportion, seeing they are increasing year by year, that does not look as if there is any probability of a change for the better.

7586. (*Chairman.*) Perhaps we should get at it by going through the items. This 400,000,000*l.* you say,

in point of fact, shows no diminution, but, in certain items, shows an increase?—Absolutely.

7587. You say there is more money spent upon government?—I do, even per head; there is naturally more money spent as the nation grows, but there is more money spent per head.

7588. And a portion of the increase is due to the greater expenditure on education?—Certainly.

7589. (*Sir W. H. Houldsworth.*) That would be a permanent expenditure?—I should hardly call that a loss to the country.

7590. (*Chairman.*) But we are not talking about losses; one thing at a time. Then there are other items in which you detect an addition, such as the consumption of intoxicating liquors?—I suppose in connexion with Government, a very large portion is due to the increase in military and naval expenditure; very likely that would form a very large portion of the increase. I do not think it necessary to go into the separate points; I think the general argument to be drawn from the Government figures is this. That the Government, as the greatest purchaser of materials in this country, have never been able to show an advantage in their balance sheet out of this enormous fall in the commodities.

7591. But I mean other items, not the items of the Government. Other items, you say, show an absolute increase. I understood you to say that the charge for passenger traffic was larger?—I do not think that shows any increase except in the total results, not in the charge per mile.

7592. The cost of education; daily and weekly newspapers?—The cost of education shows an increase; there is no increase in the price of papers, as it would be in the price of papers themselves, but there has been no decrease. The penny postage stamp, the penny paper, they become standard things. There seems to be no fraction by which they can be altered, except they alter 50 per cent. to a halfpenny, which cannot very well be done.

7593. Do not the numbers of the papers go up and down?—That would be so in any circumstances, that does not affect the purchaser who pays a penny for his paper.

7594. Then you mean that a working man has so many shillings a week to spend, and in consequence of the fall in prices he is able to supply certain wants at a considerable reduction?—I think I have to say that in the paper later on, what he is able to supply.

7595. That would leave him a greater balance to spend upon other things?—It depends on whether his wages remain fixed.

7596. Assuming that in the first instance?—Certainly, if his wages remain at the old rate.

7597. And there might very well, therefore, be an increase in the apparent expenditure on other matters, due in fact to the fall in prices?—There might be, supposing there had been no fall in the wage rate.

7598. So that your argument of apparent permanence, or even an increase, of certain items of expenditure on the part of the working classes would not at all show that the working classes had not realised the benefit of a fall in prices?—My argument is that they have not realised it all round their expenditure; only on a portion of their expenditure. On food, for instance; they have realised some fall on food.

7599. On certain items of food they have realised it; on some other forms of expenditure they cannot realise it?—That is it.

7600. Because the conventional prices are fixed?—Yes.

7601. Do not they, in those forms of expenditure, realise it in the better supply of their wants, a better quality?—Well, I suppose the administration of affairs in the country is better; I do not dispute that local administration is decidedly better, but the fact remains that a man has to pay the same out of his salary for such charges.

7602. The increase of education?—Oh, in that respect I quite admit that the expenditure is wise

Mr.
J. C. Fielden.
4 Nov. 1887.

Mr.
J. C. Fielden.
4 Nov. 1887.

expenditure, but it does affect his position, that these things have not cheapened to him. There may be better education, but it does not become more cheap in a pounds, shillings, and pence point of view.

7603. But a good many of these items are voluntary items of expenditure?—Quite so; there is the expenditure connected with drink and with tobacco, that is voluntary, but I do not think the cost of government is voluntary. The necessary local expenditure, the necessity for doctors and lawyers, and the education of the country, and the newspaper, I should take all these to be necessities, absolute necessities. The club, the union, the friendly society, I take those to be necessities, and when I tell you that the working classes in two single societies have 10,000,000*l.* saved for sick and funeral purposes, I think you will see that ultimately there is an enormous gain to the other sections of the people of this country. They relieve the rates enormously by means of such societies.

7604. Still I think there has been an increase in the actual payments to the clubs?—Oh, very much so, as I will show later on.

7605. That always might be attributable to the fact that a diminution of prices allowed the working man larger means to subscribe to the funds?—Yes; but it arises from the fact that there have been so many people out of work, that they have been obliged to double their subscriptions in many of the organizations.

7606. Then, your argument is, that the reduction, if any, in the cost of living, on the part of the working man is, in fact, confined to the balance of 550,000,000*l.*?—Yes.

7607. And that even there it is by no means proportionate to the fall in the wholesale prices?—That is so, and I wish here to state that from one of the witnesses, Mr. Sauerbeck, who has put in evidence as to the fall in prices, I gather that the estimated fall is 29 per cent.; but in connexion with the expenditure even upon food, the same tables will show that the expenditure, even if were absolutely realised exactly in the retail prices as in the wholesale prices, must not be taken to indicate a cheapening of 29 per cent. upon the food that goes into a house because of the variation of the fall in prices between meat, vegetables, and other foods. Meat constitutes a large portion of the expenditure, and upon that the fall has been least, only 12 to 13 per cent. That is given in Mr. Sauerbeck's tables, while the fall in corn is about 40 per cent., so that when you come to average the thing, it will not do to take the prices in the form of an average. You have to consider what proportion of the expenditure is in animal foods, and what proportion is in vegetable food, and taken in that way, the fall in the cost of living as shown in the wholesale prices is not more than 25 per cent., that is upon food. Upon what would be the consumption of a house distributed fairly according to prices, the fall would not be more than 25 per cent. on the wholesale prices.

7608. If you take the budget of the working classes, what would be the reduction in the cost of food?—Mr. David Chadwick read a paper before the British Association upon the fall in prices, and how far it affected the consumption of a family in cheapening the cost of living. He has done this work for the British Association for 30 or 40 years at different periods, and he has covered a great deal of ground in obtaining the matter; and his estimate is that between 1860 and 1887, the cheapening of the cost of living to a family of five persons is only 5 per cent., but I estimate the cheapening myself at 10 per cent. since 1874.

7609. (Mr. Barbour.) Does Mr. Chadwick assume that the family lives equally well at both periods?—He takes exactly the same proportions of each article. There is a table showing how much he allows of each kind, and what it costs, and this is taken from 52 centres; and I beg to put this paper in as the best evidence I can obtain as to the reduced cost of living, arising out of the fall in prices.

7610. (Sir T. Farrer.) I see in Mr. Chadwick's paper, remarks of this kind: He gives you the cost of butter. He says butter cost the same in 1887 as in 1839, namely, 1*s.* 1*d.* a pound; but butterine, or margarine, which is much used, can be obtained at about one half this price. Then he says again, coals and candles cost the same in 1887 as in 1839, but at present petroleum lamps are used instead of candles, and petroleum oil costs only about half the amount. Clothing is taken at 3*s.* in the two periods; but the quality of clothing is in many cases superior in 1887 to that of 1839. These are only instances of the same thing that was mentioned before, that a working man gets many things of a better quality. It is not fair to take only the same things, but to see what he gets altogether?—But I wish to observe that that is 1839, and he gives a very different estimate of the advantage to the working classes since 1859. It is a very long way back is 1839. Every one of those facts are in regard to changes in the cost of living, and I think that Mr. Chadwick's investigations have been very carefully made indeed. Mr. Chadwick is very well known as an accountant in London, and he took this subject up as a native of Manchester many years ago, and he has on frequent occasions given papers on this question.

7611. I think it might be well if I read you the last paragraph of Mr. Chadwick's paper, and ask whether you agree with it. "In my former review of the wages paid in 1859, as compared with 1839 I remarked, 'that in 1859 the low prices of provisions and clothing, together with the high rate of wages and the facilities for education and mental culture, have placed within the reach of the working classes more physical comforts, and the means of obtaining more social and intellectual enjoyment than at any previous period.' I venture to think that in 1887 it is a matter for congratulation, that all those advantages have been further increased since 1859, when the above was written; and that although it may be a question whether wages have received more or less than an adequate share of the enormous increase of wealth which has been the result of our trade and commerce during the last fifty years, it is satisfactory to find that the improvement in the position of the working classes has been so great, and that it is likely to be generally permanent, and in many cases, progressive." That is the conclusion of Mr. Chadwick's paper?—I entirely agree with Mr. Chadwick as to the improved condition of the working classes since 1839, and I entirely agree as to the improvement that took place from 1859 up to 1874; but I think I should be able to show that a very considerable check has taken place since that time.

7612. (Chairman.) Well, but I understood you to say, that from 1874, down to the present time, there has been a greater decline in the cost of living on the part of the working classes, than from 1859 down to this time?—Certainly, I agree to that.

7613. So that the latter portion has been more beneficial?—Provided that their employment had been continuous, and that their wages had remained the same, those are the two conditions.

7614. I suppose you allow as a general principle that the margin of saving to the working classes is not considerable?—Well, if you take all their various methods of saving, of course, I only speak of Lancashire, for I am not much acquainted with the working classes outside of Lancashire, looking at their earnings, I think their savings are very considerable.

7615. If the necessary cost of living declined and wages remained the same, so that there was a greater margin left in the hands of the working man, would you say that a large portion of that margin would be saved or would it be spent in supplying other wants not hitherto gratified?—Well, I have been an observer and taken an active part in social and political movements since 1857, and I am very strongly of opinion that the progress in the working classes, towards

steady industry and thrift, and sober habits has been enormous within the last thirty years.

7616. That is scarcely an answer to my question. Supposing wages remained the same; take, for example, a family with 30s. a week, and that the necessary cost of living, of supplying the primary wants—food and clothing and house-rent—fell 4s. or 5s. a week, would the 4s. or 5s. be in large part saved, or would they be devoted to the supply of wants hitherto unsupplied?—Well, my own opinion is that a very considerable proportion of such saving would be spent in improving their means of living and their surroundings.

7617. And comparing a working man of the day with his family with the same man of 20, or still more, 40 years ago, he has many more wants supplied than were then supplied?—I have no doubt he has many other wants supplied, and he works a deal harder. I am speaking now of the cotton districts. Of course men can work better when they are fed better.

7618. He puts more energy into his work?—He has a better temper to begin with. As a considerable employer of labour I know that, but, in addition, a considerable amount of work can be got out of a man when he has plenty of good food put into him.

7619. You do not mean he works a longer time?—He is more effective while he is there; he works harder.

7620. He works harder by working with more energy while he is at it?—I might just say this to show the effect of it in connexion with the last shortening of the hours of labour in factories. I have been an employer since 1860. The last shortening of the hours of labour in factories was 2½ hours. It is quite certain that in less than 12 months afterwards there was not the smallest reduction of produce resulting from that shortening, even with the same machinery. I do not say that that is a principle that could be very largely extended. Of course either way it might be a fault, but it is a fact that I can record from absolute observation.

7621–2. Can you tell us what reductions have taken place in the wages of our artisans?—Before I answer that question, I am rather anxious to show that the ordinary methods of gauging the condition of the country by statistics are utterly fallacious so far as regards employment. You see in the first page of my rough statement the pauper and outdoor relief returns, the volume of imports and exports, and the property and income-tax returns. I take it that these three methods of testing the progress of the country have been very frequently put before us, and I think, so far as employment is concerned, they are extremely fallacious. But I will follow out your desire, only I do not wish these three points to be omitted; I think they are extremely important. I have taken wages and employment or want of employment together; I may say that I have here the original returns upon which this transcript that I am going to quote from is based. I could give the original written returns from the various authorities that I have taken. I may also, say, before I make any remarks upon this part of the question, that a great many of the trades unions will not supply returns to anybody, simply because the position in which they are placed is so barren and so bare, that they do not want anybody to know their position, even their friends; and I may also say, in further explanation, that I have taken the returns, both from employers as well as from the working men's secretaries, and wherever I have got a return from an employer's secretary, that the return states the case worse for employment and wages than even the operative secretaries themselves. The first return I have is from Mr. Samuel Andrew, the Secretary of the Oldham Master Cotton Spinners' Association. It is a return concerning both wages and employment. Since 1874, and wherever these returns apply, they are the changes that have taken place since 1874, so far as the investigation of the numbers of the unemployed, and the amount paid for relief by the trades societies. As data I have taken the years 1871, 1872, 1873, 1874,

and 1875, as representing a period that was not affected by the change in currency, and I have taken the years 1882, 1883, 1884, 1885, and 1886, as the last that could be obtained. Now, Oldham represents one-fourth of the spinning trade. It is the chief town for cotton spinning, and it governs all other districts in medium counts. Mr. Andrew sums up his return by saying in 1885 the reduction of 5 per cent. was made after a strike of 13 weeks, and the present standard list is therefore subject to a reduction of 15 per cent. That is since 1874, 15 per cent. reduction. That is the position of Oldham to-day.

7623. It is piece-work, not time?—Nearly every wage in the cotton industry is paid by piece.

7624. (*Sir T. Farrer.*) Is that an absolute reduction? Is it in any way compensated by an increased quantity of production, or an increased speed of production?—I will show later on that that does not benefit the people at all, when we consider this question of employment in the broad.

7625. (*Mr. Chaplin.*) The first return comes to a reduction of 15 per cent.?—15 per cent., and the final sentence in the return is as follows:—"I estimate that the loss of time through strikes, short time, and stoppages have amounted to about one month per year since 1876." Now that is 8½ per cent.

7626. (*Sir T. Farrer.*) Does he say what it amounted to in the previous period?—Well, he does not, because I only asked him since 1874. But I can tell you that I have known the cotton trade since 1851. Well, there was never any trouble about stopping only during the cotton famine up to 1874, and the strikes are themselves a view of this state of affairs. The strikes are against the reductions of wages. There has been no body of men who have ever worked for 25 years on the one rate of wages with less variations than the great cotton trade from 1850 to 1875, and of course I can give you authority because I can give you the lists. I can show how they worked without any change practically in wages, for 25 years, through all the prosperous times, and then when we came to these bad times there is a never-ending fight against reductions. These conflicts prove how times have changed.

7627. Did the rate of wages increase during that earlier period?—Well, there have been a great many statements made as to the changed condition of wages of factory operatives. I as a boy of 15 paid 450 workpeople every week, and I can safely say that in 1853 I was paying as much money to a four-loom weaver as I am paying to-day, and also for three or two-loom weavers. In 1853 on the average in Lancashire a weaver received as much as he does to-day. I am perfectly prepared to prove that from experience, and to bring other men who occupied the same position as I did in other mills, to make the same statements.

7628. Did wages rise from 1853 to 1875?—There was a rise of wages in this sense, that whilst the average rate of wages in payment of so much work done was practically the same, there was a gradual increase in the quantity produced, so that I estimate that up to about 1873 or 1874 there was a gradual change taking place through increased speed, and the better general condition of the working classes making them more fit for work by about 16 per cent. I used to write considerably on the cotton trade, and I gave that estimate at the time that I was a monometallist, so that it has not been made for this case.

7629. (*Mr. Barbour.*) Has the effectiveness of the workmen gone on since 1874 increasing?—I daresay the effectiveness of the machinery has gone on increasing, so that the workman turns out more work.

7630. Does he get higher money wages?—He does not get higher money wages than he got in 1874, but the fall is not as shown by this return. He turns out more work; but then if you take it in that way, it is very important indeed to consider that the population in Lancashire is growing four times as fast as employment; that is very important, and I venture to say that I will prove that position absolutely.

Mr.
J. C. Fielden.
4 Nov. 1887.

Mr.
J. C. Fielden.

4 Nov. 1887.

7631. Has there been any fall in actual money wages since 1874?—Yes, 15 per cent. on the rate.

7632. There has been a fall in the actual sum received by the workmen?—I should say the same; I think half the sum stated, viz., $7\frac{1}{2}$ per cent., the actual fall to the spinners and weavers I should consider about $7\frac{1}{2}$ per cent. in money actually paid.

7633. (*Chairman.*) There has been a diminution in consequence of the diminution of the price of piece-work of 15 per cent; but there has been an increase in the efficiency, whereby you get back $7\frac{1}{2}$ per cent.?—Precisely. I consider that a fair estimate from a practical knowledge of the trade.

7634. (*Mr. Birch.*) But 1874 was the very highest price?—Not of labour in the cotton trade. We had no change in the cotton trade from 1868 to 1874. You need not depend upon me; you might see Professor Munroe's paper read before the British Association, which gives the changes of the wage rate from 17th August 1853, so far as the cotton trade is concerned.

7635. (*Chairman.*) You do not allow anything to be affected before 1874, in consequence of stoppages or strikes?—Well, I say, excepting of course the cotton famine, there had been very little disturbance in the cotton districts for 25 years, and so far as employment was concerned, it was abundant up to 1874.

7636. Was there not a great strike at Preston?—That was in 1853; and it was in 1853 when this list of wages was settled. That was a strike of weavers, and I refer to the time after the 40 weeks' strike in Preston and up to 1874.

7637. (*Sir T. Farrer.*) Do you know at all what the proportion of yarn that is spun in Lancashire, and used at home is to the yarn sent abroad?—I should think about five-sixths, not more. You may take it roundly to be that one-sixth is exported.

7638. (*Chairman.*) I think Oldham is the place where the spinning has been conducted by limited companies in which the operatives are shareholders?—A large number of them; the shares in the mills, are from 1*l.* to 5*l.* or 10*l.* I have a list of the Oldham mills, which states their position at present in the market, and I do not know anything more disastrous to look at. Nothing. I should think the working people in South-east Lancashire must have lost 15 or 20 million pounds in connexion with the cotton spinning industry during the last 10 years.

7639. (*Sir T. Farrer.*) On investments in these mills?—On investments in these mills and in cottage property.

7640. (*Chairman.*) You mean the present selling prices of these companies, compared with what was put into them?—Not only the present selling price; they are nearly all at a discount, some of them at a very considerable discount; but the average yearly dividends are only about 1 per cent. during 10 years; and during this time some very large dividends have been paid in Bombay out of the work that should be done in Oldham, because they are very much better and cheaper producers in Oldham than in Bombay.

7641. Has the principle of association been also adopted in the matter of supplies, domestic and social?—Enormously. One single store alone has over 8,000 members, and they carry on very great work for the benefit of the people of the district, so far as education and other such matters are concerned.

7642. And they supply the articles required for domestic use?—Yes, and they take a dividend, and they give a dividend to the customers as well.

7643. In respect to the supply so obtained, a very much greater reduction of price would be secured?—A very much larger reduction would go to the artisan who buys through the co-operative store. That is one reason why Lancashire has stood so well through this period of pressure among the working classes, because there are so many of these stores.

7644. Well, can you give any estimate of the proportion of operatives in Oldham who so reap the benefit of reduction of prices through these associations?—I do not know that I could give an estimate, but I should think, perhaps, a full fourth they will

not get the same prices as a wholesale firm. There is the expense of buying and distributing. You cannot reduce retail prices exactly as wholesale prices. It is quite clear to anybody when the prices fall that the percentage of expense on the turn over becomes greater.

7645-6. You take Oldham as a pattern of cotton spinning?—That town represents half the spinning trade in medium counts. This Second Report is a report made by Mr. John Fielding, Secretary of the Operatives Cotton Spinners' Provincial Association, Bolton:—"Wages, or rather prices, in every department of a spinning mill have been reduced 15 per cent. since 1874, and stand at that point to-day. Generally speaking, the mills have been kept on full time during this period, except in 1879, 1880, and 1886, when short time and total stoppage were resorted to in a great many instances. Until 1880, none but loafers need be out of work many weeks together, but since then, work has gradually been more difficult to obtain, and it is quite common for a spinner to be without employment 12, 18, and even 24 months at a spell. Work was never so bad to find as at present." Bolton is the chief centre of fine spinning. It governs practically the whole of the fine spinning trade.

7647. (*Mr. Montagu.*) Is it not the fact that the coarse spinners are affected by Indian competition?—This is not affected by Indian competition, but by the stagnation of trade only.

7648. (*Mr. Chaplin.*) Does this return refer to Bolton alone?—Bolton alone, but is representative of Chorley, Preston, and all the fine-spinning centres.

7649. (*Sir T. Farrer.*) Would Bolton compete with Bombay?—No.

7650. (*Chairman.*) And in respect to Bolton, you get the same figure, 15 per cent. reduction in piece-price?—Yes.

7651. And there you have a similar recovery in efficiency?—Yes; there has been a great improvement in fact. These bad times have been in themselves a strong incentive to all improvements.

7652. (*Sir T. Farrer.*) That is always the case?—Certainly; adversity is the mother of invention.

7653. (*Chairman.*) Your correspondent does not give any estimate of the annual loss?—No, I come next to the coarse spinning, which is the spinning most affected, the heavy coarse counts. The mills spinning coarse counts of yarn are so scattered about in every little village that there is scarcely any large town from which a return could be had, of any value as representative of the state of this branch of spinning. But I may state that no branch of the cotton trade has suffered more. Mills engaged in this business can be had at almost any price. You can have a mill to-day, and I can sell a mill to-day at one-twentieth part of its cost. That is a mill engaged in the manufacture of these counts, and working now.

7654. What age would the mill be?—A good mill in good working order at the present time. "The valleys running through Rossendale, Todmorden, and Hebden Bridge have, with rare exceptions, been practically ruined, so far as capital is concerned, and, in addition, the want of employment has been most severely felt during the last 12 years throughout these districts." In fact, it is as if a simoon had swept over these valleys. You can see mill after mill with the roof off, never having been turned round for years; and as to the state of the operatives, there are some of the finest operatives in the kingdom in these valleys, they have had to disperse portions of their families in all directions.

7655. Then has the population diminished?—Yes, I have no doubt, if you get the population returns of the whole of the district from Waterfoot, Bacup, up to Todmorden and Hebden Bridge. Perhaps the wealthiest firm of cotton manufacturers in the world is at Todmorden, and with the exception of one other firm in Todmorden, every other concern has been swept away, has had to compound or go out of business. Some of them have compounded two or three

times; this refers to firms who were in business before 1874.

7656. And where have the operatives dispersed to?—I do not say the whole of these towns have dispersed, or even a considerable proportion. There has been no growth there through disastrous trade.

7657. (*Mr. Barbour.*) When the trade is destroyed, do the operatives emigrate? Have those who have been permanently thrown out of employment emigrated?—It is a matter of this kind, they go and press on the bigger towns for employment and return home at the week's end. I do not think there is any very great amount of emigration to America, because this very question is affecting America as well as us. There has been no inducement to go to Fall River. I read the American returns regularly, and they are worse off than we are, and through the same cause.

7658. Do you know whether wages have risen or fallen there?—They have fallen in America. There have been plenty of strikes, and the Knights of Labour are simply the symptom of this difficulty in America.

7659. (*Chairman.*) But with respect to those coarser cotton spinners, you say that their occupation has gone for a large proportion of them in Todmorden and about there?—I can say this safely. I am perfectly certain that to India, of coarse fabrics, we do not export per annum as much in one year as we did in three days prior to 1868 and that we do not export of coarse heavy fabrics as much as we used to.

7660. Of course, that does not imply a corresponding reduction of production here?—No; but it implies this, that a very large branch of trade has disappeared.

7661. And the workmen, what has become of them?—Well, I say, of course to meet a crisis like this, employers, in the first place, try to adapt the machinery to other things. We have a mill in that district, and we have gone entirely out of the coarse trade altogether. We have tried four or five times to find a fresh trade for that mill, and we have at last succeeded in the manufacture of belting, for driving purposes, woven belting. We never drew one shilling of rent out of that mill when we let it for 13 years at 600*l.* a year. The first difficulty in those districts, so far as the Indian trade was concerned, began with the import duty. The Government managed to half destroy the trade with the Indian import duty, and we thought when we were getting the Indian import duty off, we were likely to get our trade back again; but, unfortunately, the silver difficulty gave three times as much protection to the Bombay mills.

7662. (*Sir T. Farrer.*) The import duty was not a new thing?—It was first levied about 1861. It took a few years for the capitalist and the native to see that he had offered him 40 per cent. on his capital to build a mill in Bombay. That duty of 5 per cent. was equal to a 40 per cent. bonus on the capital required to carry on productive operations in coarse goods.

7663. (*Chairman.*) That is past history now?—Yes; but I wish simply to correct the impression, if any arises, that because we began to be very bad in 1872 in that district, that, therefore, the cause arises now outside the silver question. That suffering had begun from another cause of a similar character in its effects on our trade.

7664. (*Sir T. Farrer.*) When was the duty taken off?—In 1878 upon all coarse goods. The duty was taken off at twice. It was taken off goods that Indian mills could weave first, and then we in Lancashire made up shirtings to 30's and 40's; after that, the duty became comparatively unproductive, and they abolished the rest.

7665. (*Chairman.*) Your evidence goes to this, that in spite of the transformation of industry, and the introduction of new industries, the population has declined?—The population of that district is either stationary, or has declined. Taking the whole of the district, beginning from and not including Haslingden, as the key to the Rossendale district, right through the valleys to Todmorden and Hebden Bridge, as well as

in some corners adjacent to Yorkshire; in all those valleys, industry is absolutely checked; and from that I should conclude the growth of population has been checked.

7666. What would be the estimated area you speak of?—Well, it is a hilly district, along the trough of the valleys within the hills, and I daresay, as far as width is concerned, it is very narrow. It is a miniature Switzerland; but I daresay it extends 20 miles running along the valleys.

7667. The question of the stationary or declining character of the population could be easily tested, I think?—Yes, I think you could test that very easily. Of course, I have not gone into the census very particularly for these districts.

7668. (*Sir T. Farrer.*) Then, has the manufacture of these coarse yarns actually died out?—No; you see the largest customer we had, perhaps, for coarse yarns was India, and for coarse goods we have other markets. For instance, we make for South America, and, to some extent, we have been compensated by a very large opening up of Egypt since 1868. The Egyptian trade has done a very fair share in compensating us for the loss of the Indian trade in coarse goods, but that is simply taking the share of trade that is going, it is not providing for a growing population and we need constant expansion.

7669. So that the absolute export has not declined?—Oh, you never see the exports divided into classes. It is only the total number of yards, so that you could not possibly tell that.

7670. (*Chairman.*) Does that exhaust what you have to say about cotton spinning?—That exhausts cotton spinning.

7671. And are similar facts true of cotton weaving?—I might just say that the same state of the case goes precisely through, only, I think, if anything, weaving has been worse than spinning. They have alternated; sometimes weaving has been better than spinning, and sometimes spinning has been better than weaving. But, taking the last 12 years, and speaking with absolute knowledge of all the weaving centres, I will only briefly affirm that the weaving branch is exactly what the spinning branch is here described. I will read you my own report, if you like; it affects this very district that India is competing with.

7672. (*Sir T. Farrer.*) Is it the same story with respect to weaving, that coarse business is worse off than fine?—It is the same thing.

7673. (*Chairman.*) Will you read your report?—“Having been unable to obtain from any reliable authority a survey of these districts so far as the employment of people in the cotton trade since 1874 is concerned, I may state that I have had considerable business relations with these centres. For a considerable time prior to 1876, these districts, which include Rawtenstall, Newchurch, Crawshaw-booth, Bacup, Walsden, Littleborough, Todmorden, and Hebden Bridge, had suffered somewhat heavily from the tariff imposed by the Indian Government upon cotton goods entering that dependency. It was, in fact, mainly through the outcry of the above districts, that the Government of India were led to abolish, about the year 1878, the import duty of all cotton goods made from yarns below 30's and 30's, it being found that the Indian (Bombay) mills were practically enjoying a protection against the above districts, the principal manufacture carried on being T cloths, long cloths, domestics, or what are known as heavy fabrics; it was unfortunate for them that the abolition of the duty referred to, only came as silver by depreciation in terms of gold took the place of this duty forming a much larger productive duty to the new Bombay mills. These districts have gone from bad to worse, and so destructive have been the losses for the last 10 or 12 years, that there is scarcely an old-established concern that has not been swept out of the trade, whilst mills have been standing idle by the score. The population spread about in all the narrow valleys in villages, and hamlets, have either

"dispersed to other centres, or are existing very precariously. The wages rate has followed the general course of the Blackburn district, which practically governs two-thirds of all the looms in Lancashire, Blackburn itself possessing between one-eighth and one-ninth of all the looms in the cotton trade. In the district circumscribed by the sweep of a radius five miles in length from the centre of Blackburn would be found more than half of the power looms engaged in our cotton trade." I have only one more memorandum on the cotton trade. It is from a salesman engaged in the cotton trade, and he wished to state to me that he used to sell for a mill that spun yarn entirely for Japan, and he wrote to tell me why it was closed. I will read the letter:—"As bearing on the currency question, in which I know you take a deep interest, I may mention that about 15 years ago I used to sell amongst other goods the production of a throstle spinning mill in Preston. About nine years ago the price obtainable after a gradual fall, became so low, that it was necessary to stop the mill, and it has remained closed ever since." I do not think it is necessary to read any more of the letter, in which he tells distinctly that it is nothing but the silver question that has prevented the conduct of that business. The next are the subsidiary branches of the cotton trade, and that I will not trouble you with. They have to tell you the same story, only a little bit worse.

7674. (*Sir T. Farrer*.) And all attributing it to currency?—These men know nothing at all about it. My own contention is that it is the silver question. At present I am accumulating my facts. Now I begin with where we can get at some figures absolutely. My first report is from Mr. Robert Austin of the Amalgamated Society of Engineers. I look upon him as the most reliable man connected with the engineering trade. Their society in the years 1871, 1872, 1873, 1874, and 1875, had respectively 510, 324, 465, 674, and 1,076 men unemployed on their books. In the year 1882 they had 870; in 1883, 1,215; 1884, 2,438; 1885, 3,206; 1886, 3,710. The amount paid in relieving the unemployed, and I wish to observe that there is nothing included appertaining to sick funds, accidents, or anything, but simply the unemployed. In 1871 the expenditure was 12,357*l.*; 1872, 15,377*l.*; 1873, 15,562*l.*; 1874, 21,093*l.*; 1875, 31,560*l.*; in 1882 the expenditure was 23,043*l.*; 1883, 32,252*l.*; 1884, 62,310*l.*; 1885, 78,669*l.*; 1886, 86,460*l.* Now, I think it will be understood that their contributions are growing rather larger to their trades unions; this is only one of the iron trades.

7675. Do you suppose these sums are paid out of annual subscriptions, or out of capital?—They are paid mainly out of their annual subscriptions. Of course, I do not know the conditions of all the societies, but they have a plan of this sort in working-class societies, that if an extra strain comes upon them they double the contributions in order to prevent their finances giving way.

7676. (*Chairman*.) Well now, what is the general proportion; is it double?—The amount is about two and a half times.

7677. And what is the proportion of members during the time?—The number of members in 1871 was 37,790. It reached 44,000 the fifth year. The average would be 42,300, and the average of the last five years would be 50,600.

7678. (*Sir T. Farrer*.) Have you got figures of this sort for any earlier period?—No; there are such figures, but I had a very great amount of work getting these figures at all from some of the societies. But I may say this, that my selecting these two periods of five years is entirely to show the change that has taken place concurrently with the changes that took place in the monetary arrangements of Europe in 1873 and 1874.

7679. I quite see the reason; only it might be observed that that earlier period was a period of

great inflation and prosperity in trade?—Well, I can only give my own experience, that I have lived for years in the cotton districts, when if you had said five words to a man he would have put on his coat and left his work. It is a very different state of things now.

7680. (*Chairman*.) We are dealing at present with the facts. The facts which you put before us now are these: that the number of members of the association has increased about 20 per cent., and the amount spent on the relief of the unemployed has increased 225 per cent.?—That is practically the position. The next very large society is the Associated Iron Moulders of Scotland. Summarizing the figures, the first period gives an average of 4,500 out of employment, and the second period an average of 5,600. The first period is 1871 to 1875, and the second period is 1882 to 1886. The average payments for relief were 3,400*l.* a year in the first period, and in the second period, 15,000*l.* In the second period a man might be very much longer at a spell on the books. In one case you have a temporary period out of work, and in another case you have a long period out of work, so that their case is very much like the paupers. One man may be out of work nine or ten months, and another may be only receiving relief for a single week, and each is counted a case.

7681. What is the number of members during the respective periods?—I cannot give that for the moment, but this is the return of Mr. Joseph M. Jack, secretary of the society, and he says at the end of his return:—"The outlook is certainly for diminishing chances of employment, continuity (that is, regularity of work) being only known in a limited number of cases in each shop." Now steady employment is vitally important to get effective labour.

7682. Have you any notion yourself as to the proportion of iron moulders who are in the union?—Outside the cotton trade I could not give you any special information worth anything. I have to depend upon the authorities in these trades, and in every case I think I have taken the very best men in the respective trades. I think I could say this, that in the skilled industries, as well as the mechanical and building trades, you may take it that the great bulk of these men are in the unions. They find it to be an enormous advantage to be in a union. If a man is out of work in Swansea and applies to his union, they refer all over the kingdom in order to find him work, but a non-unionist or an unskilled artisan is in a miserable position in times like the present. The next is the report of the boilermakers and iron shipbuilders, by Mr. R. Knight, general secretary. I cannot give you the five years for this society. I wish to say I could only get from Mr. Knight the three years, 1873, 1874, and 1875. I suppose his returns do not go further back. His returns of unemployed were:—

1873	-	-	89
1874	-	-	223
1875	-	-	667
1882	-	-	170
1883	-	-	115
1884	-	-	2,946
1885	-	-	7,197
1886	-	-	6,480

7683. Can you give any explanation of the extreme discrepancy between those two years, 1883 and 1884?—Yes, I can. Of course about 1882 and 1883 a very great change took place in the construction of ships, and the development of certain kinds of traffic for live cattle and frozen meat and thus caused a great amount of shipping to be specially built. Then we have the reaction here in these figures.

7684. (*Sir T. Farrer*.) It is notorious that there was a great inflation of the shipping trade at that time, was there not, and a great subsequent relapse?—Well, I should only say this, if it had not been for the inflation of the shipping trade at that time we should have been in a serious position now

because the freights at which they carry for us now are a principal means to enable us to carry on business at all with some of our markets. I will give the expense of the comparative years, where I have got the employment. In 1873 the expenditure was 1,469*l.*, in 1874, 4,175*l.*, and in 1875, 16,635*l.* In 1884 the expenditure was 62,764*l.*, in 1885, 46,514*l.*, and in 1886, 38,966*l.* Mr. Knight, who is rather an intelligent man, says:—"As our trade embraces so many classes of work, and extends over the United Kingdom, I could not give the average rate (of wages) paid, but I am certain that there has not been any increase during the last 12 years in day rates. A large proportion of our work is done by the piece, and the prices fluctuate. In almost all the shipbuilding districts in England the prices are regulated by committees of our association and the employers' association, and no alteration is made on either side without a month's notice, when the question is again dealt with by the two bodies." Then there is the Iron Founders' Society of England. The report of Mr. William Henry Hey, the secretary of that society, I think is worth reading. The average out of employment is 410 in 1871 to 1875 inclusive. The average for the second period is 940. The amount of relief in the first case is 7,200*l.*, and in the second case, 20,000*l.* The effect upon the earnings of the men, that Mr. Hey gives in his return, is to reduce by non-employment, the average over the whole of the society from a wage of 26*s.* 3*d.* to 22*s.* 3*d.* I think there are some very similar reports of the iron trade which I will pass over, because they do not extend over a large body of men. I have a general report from Sheffield from Mr. S. Uttley, on the state of the trade in Sheffield. He does not give any figures, but he says the position of affairs is so serious that their treasury was empty in 1883, and they had to lock up the cash-box. They had no further money to assist their members with, and it is useless to give returns. They have ceased to give relief; they have no means, their funds are exhausted.

7685. (*Mr. Chaplin.*) What society is that?—The file cutters. The report of Mr. Day, the secretary of the Britannia metalsmiths, concludes by saying that, "in 1885, our trade was even more depressed than in the previous year, 1886; as you will see by the return of unemployed, there are 80 for whom employment cannot be found. Still the depression exists with almost equal severity with the 75 per cent. now in employment, who, although considered in work, in many cases barely exist." Those who are in work, many of them are only working part time. I have the next report for the trades of Wolverhampton and district, from Mr. W. F. Mee, the secretary to the trades councils, Wolverhampton.

7686. (*Chairman.*) Does that cover all the trades in Wolverhampton?—It does, practically. He gives a general description of how bad they are first, and then he goes on to say that "Wages have been reduced in the building trades 4*s.* 6*d.* per week during the last 10 years." That is a considerable reduction. He says, "In the tin-plate trades wages have been reduced by a process of discount;" that is, taking a discount of wages, so much per cent. off list prices of work; "locksmiths are the same, only the trade is worse. The average wages of a locksmith will not exceed from 12*s.* to 14*s.* per week, and not that for 52 weeks in the year." In the coal and iron trades things are worse now than they ever were, as far as wages goes. Well, of course I need not mention that the case of the chain-makers, which is worse than slavery. It is as far as wages go about 6*s.* or 8*s.* a week for men and women; and the nail workers in the district, embodying about 30,000 people. Putting these two trades together, the average wages for a long day's work is about 1*s.* to 13*d.* and 14*d.* a day. He says, "In the iron trade, mill-men, who roll the iron into sheets for galvanising, are about the best off for trade, but I believe their wages are regulated by either the selling prices of iron, or by the puddlers' wages."

Then he goes on to compositors. "Compositors have had a reduction of about 10 per cent. during the last two years. Shoemakers are pretty fair for trade, but prices have gone down. I cannot give you any figures of the number employed in the various trades, as I have no means of obtaining the statistics in the limit of time." I have also a report from Alexander Wilkie, of the Associated Shipwrights' Society, Glasgow, and one from the Steam-engine Makers' Society, but I will not go through those, as they are practically of the same kind as the previous iron and shipbuilding reports given. They just confirm about the same position. The report of Mr. G. D. Kelly of the Manchester and Salford Trades Council upon the state of trade and employment in Stoke, Burslem, Dunstall, Hanley, Shelton, and the Potteries generally, is a very short report. "Trade is better now than it has been for the past five years; but owing to changes in the patterns or designs the work is more difficult to perform, the work-people cannot earn as much money now as a few years back, the difference being from 15 to 20 per cent. less in their earnings. There are employed in the trade about 30,000 persons, including men, women, and children. The district has a population of about 150,000. The work is nearly (if not quite) all paid by piece. The earnings of the men range from 18*s.* to 30*s.* per week, and except in the case of a very small number indeed, never exceed 30*s.* Those engaged on sanitary appliances get a little more than the ordinary prices, and therefore make a little more money. The number of unemployed is far in excess of what it was 10 years back, and although it is not so bad, the number is increasing. There are also a considerable number on short time. This information (in greater part) I obtained from a member of the Burslem School Board. It applies to the principal branches of the pottery trade." I wish here to state, lest I forget, that in the cotton trade every operative in 1884 was using as much as two and a half times as much cotton as every operative in 1834, and that such important changes render an estimate of the numbers employed simply from a growth of imported cotton very unreliable.

7687. I suppose when he began his statement by saying that trade is better this year than it was in the previous year, he meant to say there was more employment going?—Perhaps so. I am giving the report verbatim. The operatives' secretary wanted to put it more in favour of the position than against it.

7688. There seems a little inconsistency between his first sentence and his last?—He says there is a considerable number on short time. Now, I wish to say with regard to the potteries, that the inspector of works for that district—I have not been able to get the report, but I read his report some time ago—states in his report to the Factory Inspectors' Department that there are young persons in the potteries who have been so accustomed to work four days a week for the last 10 years that they really began to believe that four days a week is a proper week's work. I have also a very elaborate report here upon the state of Birmingham. It would take a long time to go through it, so I will put it in.

7689. Who is the reporter?—It is a report by a member of the Birmingham Town Council. He will not allow his name to be used as yet; but it is a very able report, and every trade is very carefully gone into.

7690. Is it precise in its statement of facts?—Yes, it is very precise; and it shows the state of the workers in Birmingham to be very bad indeed.

7691. Well, what is the next branch?—There is another important trade; that is, the coal miners. The loss in wages since 1874 to the coal miners is 14,000,000*l.* a year. Of course I know all about the high price of 1874.

7692. (*Mr. Barbour.*) Do you mean the loss per year?—The loss per annum. But I have under-

Mr.
J. C. Fielden.
4 Nov. 1887.

Mr.
J. C. Fielden.
4 Nov. 1887.

stated the amount. You cannot get a return from any of the principal leaders of the coal trade, such as those that are in the House of Commons. They seemingly do not want to explain how badly they are situated.

7693. (*Chairman.*) How do you get your 14,000,000*l.*?—Well, there are 381,000 workpeople, and they have lost 1*l.* a week, that is 19,000,000*l.*

7694. (*Sir T. Farrer.*) You do not compare it with any previous period, 1860 for instance, or 1850?—Yes, I do. I say that there is 7,000,000*l.* per annum under a normal healthy period, say between 1860 and 1868.

7695. (*Mr. Montagu.*) The loss is 10*s.* a week below the normal period?—Yes, about that.

7696. (*Mr. Barbour.*) I have seen it stated that each miner turns out more coal than used to be the case?—Certainly; notwithstanding that he gets less money per week. The condition of the mining population of this country is simply deplorable.

7697. (*Mr. Chaplin.*) What is the percentage of loss of wages between to-day and what you have described as the normal time?—Twenty-five per cent. I have four returns from working men, the secretaries of different districts, and I have never had more difficulty to obtain information about any subject than I have had to get at the facts about the coal miners and their wages.

7698. (*Chairman.*) You mean to say that the normal rate was 2*l.* a week and is now 30*s.*?—The normal rate would be 28*s.* to 30*s.*; it is now less than 20*s.*

7699. You mean the average rate between 1858 and 1868 was 28*s.* a week?—From 1858 to 1868; and the average now is from 18*s.* to 20*s.* I will give you the reports of the men themselves; they are very short.

7700. Before you go into that, have you any figures establishing the first statement, that the average wages were 28*s.* during these ten years?—I have not, but I will undertake to bring the rate. I am only giving it from my knowledge, living near the coal centres, and knowing pretty well from a general impression how the miners lived. The report of Mr. John Weir, of the Fife and Clackmannan

Miners' Association, says, "In 1874 our men were "earning between 6*s.* and 7*s.* per day. At present "they are only getting between 3*s.* and 4*s.* I could "not venture a comparative statement as to employ- "ment." The report of Mr. John Nixon, from Newcastle, says, "I beg to inform you that the wages "in Northumberland are at present (1887) 50 per "cent. lower than they were in 1874. In 1874 the "men were fully employed. In 1886 we paid the "men out of work, 9,518*l.*" The managing director of a large colliery in South Yorkshire estimates the reduction from 1873 to 1878 in South Yorkshire at 57½ per cent., and they "declined to the same extent "during the years 1874 to 1878; and probably the wage "rate is at present 10 to 20 per cent. below the wage "rate of 1871," which I should take to have been the normal rate previously. Then I have a report from the Derbyshire Miners' Association, from Mr. James Haslam. He says, "I will do my best to "answer the two questions contained in the same, "but have only very imperfect data to go upon, still "I shall be approximately right. The wages re- "ceived to-day are very little, if any, more than half "what they were in 1874, and the time worked is "considerably worse on the average, I am sorry that "I cannot give you the exact figures, but we have "never been able to establish a local *bureau* of "information although I have tried continually to "do so." Now, I conclude my observations on these reports by a statement from Mr. Robert Neill, of the firm of R. Neill and Sons, perhaps one of the largest master builders in this Kingdom, and the Chairman of the Master Builders' Association of Great Britain. He estimates the reduction of wages in the building trades at a 1*d.* per hour since 1874. One penny per hour is about 1½ per cent.; and he winds up a very short report by saying that the outlook for the future of the building trades is very quiet. Now, I know that the building trades are the last trades to respond to a depression in the producing trades, and that building may go on for years comparatively well employed before the effect of the destruction of capital in the producing trades, such as iron and cotton and woollen, is felt; whatever may be done, the building trades have a very bad time before them in this country.

The witness withdrew.

Adjourned till Monday.

THIRTY-THIRD DAY.

Monday, 7th November 1887.

PRESENT :

THE RIGHT HON. LORD HERSCHELL, the CHAIRMAN, presiding.

MR. D. M. BARBOUR, C.S.I.
SIR T. H. FARRER, Bart.

MR. C. W. FREMANTLE, C.B.
MR. S. MONTAGU, M.P., and

MR. GEO. H. MURRAY, *Secretary.*

Mr. WILLIAM FOWLER called and examined.

Mr.
W. Fowler.
7 Nov. 1887.

7701. (*Chairman.*) You have given considerable attention to the subject with which this Commission has to deal?—Yes, I have.

7702. I believe you have written upon some branches of it?—I have written a paper which I call "Appreciation of Gold."

7703. Then we will take that branch of the question first, the suggestion that owing to a diminished supply of gold, and a consequent contraction of the currency,

prices have fallen, and commerce has suffered. What have you to say with regard to that?—Well, I should like to make one preliminary observation which, I think, is very important, as bearing on the whole discussion. I absolutely deny that there is a scarcity of gold, and I say that to assume that there is a scarcity of gold because prices have fallen is to beg the whole question at issue. That is the main contention that I think we ought to consider in the first

place. If I could establish that there is no scarcity of gold, a great deal of our talk might come to an end.

7704. I understand you to mean that prices may have fallen, either on account of some change in the relation of the commodities to gold, or some change in the relation of gold to the commodities, and so far as prices have fallen you think that the evidence points to the former rather than the latter cause?—Yes, I say that there have been enormous changes, during the time that I have lived, at any rate, in the means of production, and in the facility of distribution of products all over the world; changes so enormous and unprecedented, that it is difficult to measure them; and, I think, if you take any article you like, where there has been a considerable fall, and really analyse that fall, you find ample reasons for the fall, apart from any question of money whatever.

7705. The suggestion made is that the fall has taken place substantially since 1873, and that the changes in the facility of distribution and production have not been so great since 1873 as to account for that fall; many of these changes having, in fact, occurred prior to that date?—If you will allow me, I should like to leave that point—which I am quite prepared to discuss—till a little later; but I should like just to discuss the question as to what is the fact as to the existing supply of gold. Now I want to make one observation, which is personal, if you will allow me. I have been closely connected with the money market since the end of 1855—just 32 years, and I have been an interested spectator of what has been going on there ever since that time, and I say that we have never had so easy a money market, so low prices for money in the money market, and so little tendency to panic as since 1873, the very period when it is said gold has become scarce. And the importance of that observation lies in this, that England is a bullion money market. You cannot create a single note in England, Scotland, or Ireland without gold to back it—a new note I mean. You cannot, therefore, add to what is called, technically, the currency without having bullion, and I say, therefore, that if there had been any real scarcity of gold, it would have made itself felt in the money market. I know no test so good as to the condition of the money market as the condition of bullion—gold, strictly speaking. I know very well what is said on the other side, but I say that fact is very important to bear in mind. Some people have actually said in print that, for instance, the year 1876 was a year of feverish money; nothing more absurd was ever put down in print, as I know from personal experience. The year 1876 was a year of extraordinary ease, and of extraordinarily low rates of interest, although it came immediately after the effect of the great operations of Germany had been fully felt by us.

7706. You were at that time a partner in a house which carried on very large discounting operations?—We were, I believe, the largest discounters, by far, in London at that time of any individual house. And I am still connected with another concern of great magnitude.

7707. (*Mr. Montagu.*) Would not the plentifulness of money be accounted for rather by the diminished stocks of goods and the diminished prices of goods?—Well, I am not going to say that that would have no influence, but all I say, as matter of fact is, that going over a long series of years, not taking one year only—I only refer to that year, because it has been referred to by somebody else—but since 1873, we have had comparatively a continuous series of low interest money market.

7708. Have you not had a continuous fall in the price of goods of which this country used to hold large stocks?—In 1876 the fall was comparatively slight.

7709. Since 1874?—The fall was comparatively slight. It has become intensified, as I shall show presently, within the last two or three years especially,

and in a way which shows that it could not have been caused by money, because it has fallen far too rapidly in many instances—as for instance wheat—to be accounted for in any way by an alteration in money. Now, perhaps, I may be allowed to quote what I said on that particular subject, on page 14 of the little paper that I wrote: “Those who are familiar with the course of the money market will remember that the semi-panic of the summer of 1875, when enormous failures took place, was surmounted without a high bank-rate, and that the feature of 1876 was an excessively low market-rate—so low that vast sums of money were lent ‘at call’ during long periods at half to one per cent. per annum, and this before the general fall in prices had taken place, and at the very time when the effect of the German operations on silver was first fully felt, and the Indian exchange fell to 1s. 6d. in the rupee. Trade was no doubt depressed in 1876, and of course this was one cause of the want of demand for money, and the heavy fall in rates; but if gold were ever scarce, it should have become so when German demands had been so long ‘absorbing’ bullion on all sides. The general opinion was that during 1873 and 1874 German demands had diminished supplies of gold here; but by 1876 this special demand seems to have ceased, and as soon as it ceased the market assumed an aspect of excessive abundance of loanable capital.” I do not want to put too much on this point, but I do say that as far as the money market goes, there is no evidence of scarcity, but on the contrary a very important evidence of great abundance. But I do not rest there, I say that, during this present year, we have evidence as regards the reserves in the banks and in the United States Treasury, of gold, which goes to show that the existing amount of gold available for monetary purposes, and affecting the monetary world, is very much larger than it was six years ago. I take these figures, which I will venture to read to you, from *The Economist* of the 4th June this year.

SPECIE in the Great Depositories of the World.

1st January, 1881.

—	Gold.	Silver.	Total.
United States Treasury - -	£ 31,340,000	£ 15,800,000	£ 47,140,000
Bank of France - - -	22,569,153	49,121,749	71,690,902
Bank of England - - -	24,249,245	—	24,249,245
Bank of Germany - - -	9,010,184	17,096,366	26,106,550

1st May, 1887.

—	Gold.	Silver.	Total.
United States Treasury - -	£ 55,087,000	£ 48,563,000	£ 103,650,000
Bank of France - - -	47,651,632	46,483,974	94,135,606
Bank of England - - -	23,902,702	—	23,902,702
Bank of Germany - -	20,405,000	18,095,000	38,500,000

INCREASE and DECREASE in six years and four months.

—	Gold.	Silver.	Total.
United States Treasury -	£ +23,727,000	£ +32,763,000	£ +56,490,000
Bank of France - -	+25,082,479	- 2,637,775	+22,444,704
Bank of England - - -	- 346,543	—	- 346,543
Bank of Germany - -	+11,394,816	+ 998,634	+12,393,450

Mr.
W. Fowler
7 Nov. 1887.

Mr.
W. Fowler.

7 Nov. 1887.

I should like to add one word as to the specie in the Treasury of the United States at several dates.

	Gold.	Silver.	Total.
	£	£	£
1st January 1881 - -	31,340,000	15,800,000	47,140,000
1st January 1883 - -	34,301,000	25,000,000	59,301,000
1st January 1885 - -	47,000,000	36,080,000	83,080,000
1st January 1887 - -	53,620,000	47,800,000	97,420,000
1st May 1887 - -	55,087,000	48,563,000	103,650,000

Now if anybody can say that there is a scarcity of gold with these figures, I am very much surprised.

7710. (*Mr. Barbour.*) Do you know if the gold in the Treasury of the United States is readily available if it were wanted for any purpose such as export to Europe? How would you manage to get at it if you wanted it?—Well, that is a question which has a great deal disturbed our minds in the money market these last few weeks, and the Americans, with their usual ingenuity, have discovered means of parting with that gold. I do not say, of course, that the amount of gold is like gold in the reserve of a bank. I do not assert that, I only say that there is no evidence there of a want of gold, and at this moment the United States are lending that gold out in their own country, in order to have it used in commerce.

7711. But is it not the fact, that the accumulation of gold in the Treasury of the United States tends rather to tightness of the money market in New York than to ease?—Yes, of course it has, because they have a very curious law, by which the duty on import is so great, that the accumulation is very rapid; but I have no doubt some new law will be passed.

7712. (*Mr. Montagu.*) Would Mr. Fowler tell us how he gets his figures with regard to the silver held in the Bank of Germany?—I give you my authority, *The Economist*, 4th June 1887, and I do not know where it got the figures. I do not want to put it higher than I have stated; I should like to make one general observation on those figures, as illustrating the point that we shall come to presently, that the greatest bank of all, by far the most important commercially, I think we may say, without any vanity, has a decrease of gold in that time, that is the Bank of England; but nobody can say that the business of the country has decreased since 1881 I should think.

7713. (*Chairman.*) The decrease is not very great?—Only 300,000*l.* It is a peculiarity of our bank—of course anybody that is in commerce knows that—that we keep so little gold, and even to many of us it has been a subject of alarm, and I remember saying to the late Baron Rothschild that I thought it would pay the country to pay the Bank of England to keep a better reserve, in order to create confidence in the stability of our enormous mass of credit.

7714. (*Sir T. Farrer.*) But they have no difficulty in getting, if they want it, have they?—You may say, practically, that they have no difficulty. The theory of the Act of 1844 is, raise the rate of interest and you will get the gold you want, and I observe in Mr. Raphael's evidence before you, he lays great stress upon that, and says there is no difficulty whatever. I do not deny that at all, but as an *habitué* of the money market I have had some bad quarters of an hour, when it was a longer time in coming than I had wished it to be.

7715. (*Mr. Montagu.*) Have you at all calculated what the loss to the country is by raising the rate of interest unduly, I mean solely for the interests of the bank's gold reserve?—I do not know, I have never made a calculation; but of course it would be an enormous charge; but the curious point in reference to that is, that if you take the period since the supposed scarcity of gold, the rates have been excessively low, and according to that we must have saved a great deal of money by the supposed scarcity of gold.

7716. Is it not the fact that in France the merchant and trader can calculate on having his

money at three per cent. or under, over a course of years, whereas in this country he must provide for the contingency of the Bank raising the rate, which it usually does in the autumn?—I should like to read to you, with reference to that, some remarks that I made. There is one general remark which I think is interesting as showing the real condition of the money market. "That in the decade from 1866 to 1875, inclusively, there were 109 changes in the bank rate of discount; whereas in the decade from 1876 to 1885 there were only 61 changes." That is not exactly the answer to your question, but I think I have referred to it in this paper, in regard to the contrast between the Bank of France and the Bank of England. I have given the figures with regard to the comparative rate of the Bank of France and the Bank of England. In the note to page 19 I have said this: "Generally speaking, the rate of discount depends not on abundance of gold or silver, but on the organisation of credit, so that we see the lowest rates in those countries where there has been a comparatively small amount of bullion or coin. Compare, for instance, England and France. France has probably two or three times as much cash as we have"—that is, I mean by cash, bullion and gold—"but if we compare the rates charged from 1844 to 1877 by the Banks of England and France, we find that the Bank of England was at 3 per cent. for 2,682 days, and the Bank of France for only 1,518 days; and the Bank of England was at 2 per cent. for 1,391 days, and the Bank of France for only 270 days." Therefore if you take the figures of what Mr. Montagu referred to, you must also take the other side, that we have very low rates here for a long period, much longer than in France. I should like to put in, for the information of the Commission, the average rate of the Bank of England for each half-year, and for each year since 1873. I will not read them over now. I have only a general observation to make as to the lowness of these charges since 1873. The first year, 1873, $4\frac{1}{4}$. That was high, and why? Because of the panic in America, the worst panic they have ever had since 1842, and yet our rate was only $4\frac{1}{4}$ on an average on the year; 1874, $4\frac{1}{8}$; 1875, $3\frac{1}{4}$; 1876, $2\frac{1}{2}$; 1877, 2-17-9; 1878, 3-15-3; 1878, you will remember, was the year of the City of Glasgow Bank failure; 1879, 2-10-2; 1880, 2-15-3; 1881, 3-9-5; 1882, 4-2-9; 1883, 3-11-5; 1884, 2-19-2; 1885, 2-18-5; 1886, 3-0-11; 1887, 3-4-3.

7717. (*Chairman.*) You have given us your reasons for thinking that whatever the cause of the difficulties or changes that have taken place, scarcity of gold is not one of them?—I say as far as the evidence before me goes, there is no scarcity of gold, and that I do not know exactly where to get evidence, except from the condition of the money market, and of the stores of gold in the world. Perhaps I might be allowed, as it is somewhat germane to that remark, to say that an observation has been used, that gold in, for instance, the Bank of Germany, is somehow absorbed by the German nation. The word "absorbed" has been used. I do not know how gold could be in a more effectual form than coin, or in the reserves of the great banks. I remember an observation that Lord Overstone made before the House of Commons once. Somebody said: "Oh, it is no consequence what the reserve of the Bank of England is," and he said: "There is no gold so useful or so important as the gold in reserve in the Bank of England, because it is looked at by the commercial world, and it affects their movements." If, some fine morning, you came down and found there was only half a million of gold in the Bank of England, you would be frightened, and the whole business of the world would be upset, and so the amount of gold reserve in these banks is very effectual in the business of the world. It must not be regarded as gone and absorbed and of no use. I think the figure 200,000,000*l.* was used with regard to Germany, Italy, and America in some papers that were published some time ago, and, I think, in a speech by

Mr. Goschen. I always thought that that was a fallacious argument in regard to the absorption of the gold. I therefore only wish to say, that as far as I can see, there is no scarcity of gold, and therefore it does not do to assume that gold is scarce simply because prices have fallen. I think we are a little too impatient of low prices, and although it is not exactly to the point of what we are about now, I think that some economists have argued as if we should do something by the Government to raise prices. I must say that is a feeling that I have no sympathy with, though I have great sympathy with some classes who suffer from the low prices.

7718. I would not say that what you have stated is not germane, because one of the contentions has been that low prices were a bad thing, and that they arose from the existing state of the currency, and therefore we ought to alter the state of the currency?—It is very difficult to say what is high and what is low absolutely. You cannot lay down a law, but I think it is obvious that, to the great mass of the community, the low prices are an enormous benefit, and that for Government to go out of its way to try to raise the prices would be a very serious undertaking, whether it is by arrangements of the coinage or duties or any other way, and if the object of this agitation is to raise the prices, as I understand it to be, I must say that I have no sympathy with it, and I should be very sorry if it had that effect.

7719. I think that is only the view of some of those who advocate the change. I think there are many who advocate the change on entirely different grounds?—Yes, but I know there are some who take that view very strongly. I have a memorandum here, I do not know whether it is of any great importance, but it is a very curious fact that I can find no relation between the relative value of gold and silver and the relative stocks of the metals in different periods. As a matter of science it is a very curious point that one seems to see no relation. There was a most enormous increase in the production of gold as compared with silver, and yet silver never rose till 1873. I know how it is accounted for, and I dare say it is accounted for, but I do not quite understand why, between 1852 and 1857, there was so little change in the relative values of gold and silver, while silver practically was unchanged in production, and the production of gold was so enormous.

7720. (*Mr. Barbour.*) There was not much change in the relative value from 1800 to 1873; it was roughly between 1 to 15 and 1 to 15½?—I cannot carry my mind so far back as that. But according to the United States Mint, the production of silver really did not change during the whole period from 1851 to 1860; it was almost exactly the same, 8,000,000*l.* a year. It then rose to \$44,000,000, \$45,000,000, \$49,000,000, \$51,000,000, \$51,000,000, \$50,000,000, \$54,000,000, \$50,000,000, \$47,000,000, \$51,000,000, 61,000,000, \$65,000,000; and the first time we get a much larger production was in that very year 1873, when it got to \$89,000,000. And you know during the years beginning 1851, the production of gold for five years was enormous. \$132,000,000, in 1852; \$155,000,000 in 1853; \$127,000,000 in 1854; \$135,000,000 in 1855; \$147,000,000 in 1856; \$133,000,000 in 1857; and \$124,000,000 in 1858. I am quite aware of the different causes there were for that, but I think it is a remarkable fact and rather goes to show what will come out later, that it is very difficult to lay down a proposition which would make prices depend on relative quantities of gold and other articles. It is very difficult, and the precious metals are no exception to that difficulty. I do not want to carry it farther than that.

7721. (*Chairman.*) And there was no diminution in silver from 1852?—And a rapid fall in 1872. Of course we know how that is accounted for.

7722. Now, since 1850, have there been great changes in the course of trade?—I think as I said just now, that it is almost impossible to measure the changes that have taken place, and I would like to

enumerate them more in detail a little later on, but I would say that especially since 1873 we have had a very great amount of business. But the observation I wish now to make is that since 1850 there has been this prodigious amount of business done, and it has been done to a very large extent, at least as regards our own country, with a very small increase in our money. It has been done, as you may say, almost entirely upon credit, and there, I think, we come to a point which is of very vital importance as regards this inquiry, because if a change in prices results from causes, which have nothing to do with money, it would be a great mistake to alter money. If you want to alter prices it would be a delusion. Apart from the point that I just now stated, that there is no scarcity of the material money gold, I go farther, and I say that if your business is done without money, except so far as money maintains credit, then you would be on the wrong tack if you alter your money in order to maintain prices. Now, in order to show that this view that I take is not new, I will read some passages, if you will allow me, both from Mill and Tooke. I think the public have a most exaggerated idea as to the effect of quantity of money upon price. I believe, speaking generally, that the quantity of money has remarkably little to do with it, except so far as it affects credit, and that the great factors in all prices are the supply and demand of the article you are going to deal with. If I want to buy wheat, or I want to buy cotton, I do not talk about gold and silver, and inquire what the future of the money market is to be, unless the money market is in a bad state. If I think the money market is so queer that I shall not be able to get the money I want, and my bills discounted, then I will not buy. I then assume that something has happened which makes credit bad, but in the ordinary state of things, if credit is good and I have plenty of money at my back, if I know I can get it, I do not consider the question as to the amount of gold or silver in this country or anywhere else, I inquire what is the state of things in the cotton market? So about wheat: I look at the "visible" supplies. I look round to see what the harvest is to be; but as to money, it does not enter into business men's minds once a week, unless they see something about the gold having gone down in the Bank of England, and there is to be a rise in the rate; and if they are going to make money out of a speculation, nothing will stop them, if they can get the money, that is if they can get the credit at the bank.

7723. (*Mr. Barbour.*) If you have to buy in gold and sell in silver, would you not look at the relation between the two kinds of money?—Well, that might be; I might, certainly. I know what you are referring to very well. I shall come to that presently. I am dealing at present simply with the scarcity of gold, the appreciation of gold. I am quite willing to meet Mr. Barbour on Indian exchanges presently, but I do not want to discuss that at this moment. I think this is a very remarkable passage written by Tooke when credit was very differently developed to what it is now. In 1839 he makes a very curious remark in a note. He says: "It is a wonderful fact that there is 3,000,000*l.* turned over in the clearing every day in London." Why the daily average, I suppose, now is something like 20,000,000*l.* "Prices are the result of a certain ratio between the quantity of money entering into the markets for commodities, and the quantity of commodities offering for sale on the other; but the money, or that which performs the office of money, that enters into the produce or wholesale markets, consists in a very small, I believe in an infinitely small, proportion of bank notes. Nine-tenths, or more probably 99-hundredths, of the purchases and sales of the wholesale markets are transacted through the medium of book debts, or simple credit, and cheques on bankers. It is the balances only that require the intervention of bank notes. The Clearing House in London is a familiar instance of

Mr.
W. Fowler.

Mr.
W. Fowler.
7 Nov. 1887.

"the enormous amount of transactions, many millions adjusted by a few hundred thousand pounds of bank notes."—(History of Prices, Vol. 3, p. 275.) "An extension of the issues of bank notes, and a subsequent contraction, have been commonly the consequences, and not the causes, of occasional undue expansion alternating with collapse of credit."—(Ibid., p. 277.) It is, perhaps, hardly needful to get Mr. Tooke's authority for that statement, but it is very important, because I think it is so often forgotten.

7724. (*Sir T. Farrer.*) That is written in one of Tooke's arguments with respect to the principle of the Act of 1844?—I do not remember exactly. Perhaps, with regard to the Act of 1844, I may say that I am one of those who has always thought well of the Act of 1844, but I think for this question of price, it is not very important. I believe it is true that Lord Overstone and the authors of the Act of 1844 expected it to have an effect on prices, but they were mistaken, because they exaggerated the importance of bank notes; they did not sufficiently consider that bank notes are comparatively nothing. The circulation of this country, is not much bigger than it was 30 years ago. I have got the figures which I could give you if you like, but everybody knows that the circulation, especially in the country, tends rather downwards, because everybody is using less and less notes in business, and doing it more and more by cheques and bills and other instruments of credit, and the importance of bank notes was greatly exaggerated in all those discussions at that time. The public now do not trouble their heads about bank notes. One never sees one in a big business if his credit is right. He does not want any bank notes. I could discount 50,000,000*l.* of bills, and never see a bank note or a coin, and the idea that this question of cash is important is, I think, very much exaggerated, and people seem as if they have not even now become alive to the question of the importance of credit in price. Mill brought it very prominently forward in his book in 1845; he spoke strongly about it; but judging from recent things that I have seen, I must say, people talk a great deal more about the amount of money in the country, that is to say, bullion or coin, than they ought to do. I think it would be interesting in this connexion to refer to what Mr. Tooke has said about that wonderful period, between 1848 and 1856. There was an increase of 174,000,000*l.* in the gold of the world in those eight years, and 27 per cent. was added to the whole gold bullion of the world, and he has an elaborate argument in his sixth volume in which, I think, he proves to demonstration that, practically, it had no effect upon prices whatever. Now, I think, that is a point well worth the attention of this Commission, that during the period when you have had the biggest discovery of gold known since the Spanish American times, there was, according to the best authority I know, no effect upon prices from that mass of gold being drawn into the money markets of the world.

7725. (*Chairman.*) Where do you say that argument is to be found?—In the 6th Volume of Tooke and Newmarch's History of Prices. Now, all the instances of important variation in prices comparing 1857 with 1851, admit of being accounted for by circumstances affecting the supply and the demand. That is the point I want to urge, and I shall refer to that when we come to detail, if you will allow me presently, on the particular articles that have fallen. It is very curious, in a note to this particular argument, he uses this language:—"I leave out of this question," he says, "grain altogether," one of the biggest articles there is. Why? "Because the seasons are the most potent upon the price of grain." It seems to me a very extraordinary thing that grain should be left out of the calculation altogether—one of the most important articles in the world. But Tooke says:—"I cannot deal with that, because seasons affect the price of grain,

"so that you must leave money out," and I quite agree with him. You must leave money out in that case, and you may leave money out in a great many other things besides grain. Now, again, Tooke says that "the prices of commodities do not depend on the quantity of money indicated by the amount of bank notes, nor upon the amount of the whole circulating medium; but that, on the contrary, the amount of the circulating medium is the consequence of prices." (Vol. 6, p. 636, § 12.)

7726. (*Sir T. Farrer.*) The whole purport of Tooke's book was to show that the influence of money and of bank notes upon prices had been much exaggerated during the whole early part of the century?—Yes.

7727. He being a strong bullionist, said that the bullionists had exaggerated the effect of the over issue of bank notes?—He wrote a very remarkable essay on high and low prices, quite apart from his great book in which there is a most interesting analysis of every season for a long series of years, showing how the corn went up and down according to the seasons. Now listen to Mill: "Credit in short has exactly the same purchasing power with money, and as money tells upon prices, not simply in proportion to its amount, but to its amount multiplied by the number of times it changes hands, so also does credit; and credit transferable from hand to hand, is in that proportion more potent than credit which only performs one purchase" (Polit. Econ., Vol. 2, p. 61.) And then he points out the difference between a bank note which you can hand about, a bill of exchange which you can endorse, and a book credit which only helps the man who has it, and cannot be transferred, which is a very important consideration. I should like, if I may be allowed, to make one observation here with reference to the evidence of a witness who has been before this Commission, Mr. MacLeod. I do not think in cross-examination he quite kept up to his first statement. He put it rather more strongly than I should do in this way, that he did not sufficiently give weight to the mental influence of the presence of a great deal of gold coming into the country. He said, as I read him, 10,000,000*l.* of sovereigns do no more than 10,000,000*l.* of cheques. In one sense that is true, but the 10,000,000*l.* of cheques are a private affair floating about between individuals. Nobody knows anything about it. The 10,000,000 sovereigns go into the bank reserve, increase the bank reserve, raise prices of stocks, diminish the interest of money, and have a powerful influence on men's minds. In that sense I think that bullion and gold coming into a country are more powerful. Hence the secret influence, if you may so call it, of credit, the less palpable influence of credit; but when men are determined to buy, and want to buy, there is no difference. One is just as good as another. There is one other passage which, perhaps, I might read from Tooke: "The effect of brisk and rising markets, and the confidence created by the absence of severe commercial revulsions, have so powerfully stimulated enterprise and production in almost every part of the world, that hitherto the increased supply of commodities and the increased activity of dealings, have prevented even the addition of one-third to the former stock of gold from producing so far any marked or general rise of prices." (Vol. 6, p. 213.) Now it is a very curious thing that that was written on the eve of the panic of 1857, and I think it is an interesting observation for this Commission that the panic of 1857 took place just at the very culminating point of the discoveries of gold, when, according to this money theory, we ought to have been so very comfortable. But we were not. We had been trading too fast, as Tooke points out afterwards, in referring to the high rates of interest that prevailed. Then in 1856 and 1857 we felt the influence of the Crimean War, which had absorbed a great deal of gold. We had bad harvests in 1853 and 1855, which had absorbed a great deal

of gold, but it is a very curious thing that this passage should have been written then, and that there should have been that great commercial difficulty just at that time. That illustrates a point that I think is so important, that the commercial position depends upon the credit. If you so manage your affairs that your credit collapses, down goes everything, but if you maintain your credit you can keep up a very large amount of business with a very small amount of gold. And of course, everybody knows, take Europe through, the country that does the biggest business, has perhaps the least amount of cash per head in an available shape for business of any of the countries, because, as you know here, the greater part of our bullion has no effect whatever practically upon business; it is in people's pockets. It is not doing business at all, it is very busy in its own way, in the retail way, but it is not doing business in the sense of the word in which we speak of business in Cornhill and Lombard Street. And there, I think, we come upon one of these fallacies which I suffered from in 1882, when I brought forward the question of one pound notes. I was told that this was a great reserve, this cash in our pockets. I do not believe it is. I believe when the bad times come, there is more cash in one's pockets, not less, and that credit diminishes.

7728. (*Chairman.*) I understand you are citing these passages from Tooke and Mill, in support of the view which you desire to put before the Commission, that the amount of bullion and coined money in a country has comparatively little effect in determining prices, which are governed much more by the supply of the particular product, and by the demand for it, and the purchasing power at the back of that demand, which purchasing power is affected by credit to a much greater extent than by the mere amount of bullion or coin?—Yes. With regard to that, it may be interesting, perhaps, to refer to one very short set of figures (p. 12 of my pamphlet). “The total of our imports and exports from 1865 to 1875 was, in round figures, 6,000,000,000*l.*, and the total of bullion and specie imported and exported was in the same period 530,000,000*l.*, but the total of our imports and exports from 1876 to 1885 was 6,700,000,000*l.*, and this vast amount was moved with the aid of 493,000,000*l.* of bullion and specie. If we take the gold alone, we used about 327,000,000*l.* in the former decade, against 278,000,000*l.* in the latter.” Really the trade was larger than appears in the latter period, because the prices were lower.

7729. Your point is that during the latter decade a higher value of business was done with the use of a much smaller amount of specie?—Yes, by 700,000,000*l.*

7730. (*Mr. Barbour.*) Was it not the case that during the latter decade, the United States ceased on balance to export, and used up all their own gold? Would not that, to some extent, account for a smaller international movement of bullion?—I do not know about that, but I know the business was done. There is also a curious table which I am not responsible for, which I think is interesting. Mr. Mulhall says that the ratio of metallic money used in different countries to the total commerce of each country is as follows:—Spain and Portugal, 100 per cent.; France, 85 per cent.; United States, 58 per cent.; Italy, 40 per cent.; Germany, 34 per cent.; and Great Britain, 20 per cent. And I think it is interesting also to observe that, judging from what I hear on all sides, and from the stamps, the bills of exchange, especially the inland bills, have fallen off very much within the last 15 years. That observation was made to me by a very experienced man 10 years ago, speaking of the money market generally. And some figures that have appeared from the official returns seem strongly to confirm it, tending to show, I think, that, in larger proportion than formerly, business is done on a cash basis.

7731. (*Sir T. Farrer.*) When you say a cash basis, do you mean by cheque?—By cheque.

7732. (*Chairman.*) That is to say, that in the transaction of the business of the country, the functions which were discharged by inland bills of exchange, have become increasingly discharged by cheques instead?—Yes, because of the increase of wealth, I suppose. I do not know any other way to account for it. I know one large shipper told me that he used always to accept at four months for his freights. He told me, “I never now accept a bill; I take the discount.” I have sometimes thought—I could not prove it—that looking back to 1856, when I first went to Lombard Street, that there were as many bills floating about as there are now, with materially less money at the back, and infinitely less business done. There was an enormous mass of bad bills in those days, accommodation bills of every kind, an immense abuse of credit of which we have little or no sign at the present moment. But the business done of course has enormously increased since that time, and yet there is a tendency to continued diminution in the bills.

7733. (*Sir T. Farrer.*) Do you understand people pay ready money because they have more ready money to pay with?—I think taking the merchants in all kinds of business, there are people who can do without credit, and do a great deal more business than they used to do with the credit. I want merely to mention these figures about the stamps, I think they are very interesting. In 1874 the inland and foreign bill stamps amounted to 985,000*l.* Foreign, estimated for 1874, 303,000*l.* inland, estimated for 1874, 682,000*l.* In 1885 the inland were 342,132*l.*, and the foreign, 362,981*l.*, total 705,113*l.* It is an immense decrease.

7734. (*Chairman.*) And I suppose, undoubtedly, not represented by a diminution in the business to that extent?—Oh, no. I could mention to you people, whom it would not be right to name, who, years ago, used to bring large parcels of bills: men who do not, I believe, discount a bill at this moment, but keep them till they are due. That is merely, you may say, the accumulation of capital, but it has been going on, and I am one of those who think that although the times are very bad, accumulation goes on very largely. I am quite satisfied that it does, though not probably on the scale it did years ago.

7735. (*Mr. Barbour.*) Do you mean in particular trades, or generally?—Well, I think there is great exaggeration as to the badness of times. It is one of those things no one can prove or disprove; it is only an impression. I should say times are bad, because people do not bring enough bills, but then that on the other hand proves that the times are good, because they can do without them. I should like to make one observation more. I think there has been a very great tendency to forget that the precious metals are not used up; that they accumulate. It is, of course, an observation as old as the hills, but I think people forget it, and they speak a great deal about a large amount of gold coming in as if it was an important thing in the amount of the whole world. It is not. And they speak of a diminution of a few millions a year as if it was a very large reduction in the money of the world. While I admit that probably there is a large amount used in the arts, and larger than it used to be, and there is a considerable wear and tear, yet still, I think, there is a tendency to exaggerate the importance of that.

7736. (*Chairman.*) Before we pass from the question of credit, which we are dealing with, have you any observations to make with regard to increase in recent years in the economy of the use of gold?—I have only this general observation to make, that I was very much struck by the remarks made by Mr. Currie, and the figures that he gave, which entirely confirm my own impression, though I had not at hand similar figures, and also, I think, Mr. Birch gave some important figures in the same

Mr.
W. Fowler.

way, which I will not repeat. I entirely agree with those witnesses. I believe there is a constant and important tendency to use less and less money in business, and not merely in business—what I call business in the sense of large business, but take, for instance, postal notes. That is an illustration how strong the tendency is rather to use instruments of credit than cash, and I think one member of this Commission will agree with me, that we are very much deluded in not allowing our people to make use of one pound notes. It would be an enormous saving of the wear and tear of gold, and I do not believe would do any harm to any human being. I agree entirely with that general view that there is a continual economy going on as regards the use of gold as money.

7737. You think that the extension of the banking system by establishing branches in places of small population has led to the use of cheques, where formerly people would keep monies in their tills for their business operations?—I do not think there can be the slightest doubt of it. I could mention cases that have come under my own observation of that, but it would not be right to mention names.

7738. (*Mr. Barbour.*) Do you think the economy in the use of gold has proceeded at a greater rate in recent years than formerly?—I think it is one of those questions that it would be impossible to say much about. I think it proceeds on an increasing scale every year. I know Mr. Giffen has stated that years ago England was thoroughly banked. I never thought that was correct at the time. I do not think England is thoroughly banked, because it is not nearly so well banked as Scotland.

7739. But even if you take a country where this economy of gold is proceeding, will you not find, as a rule, that on the balance it imports gold, unless gold should happen to be produced in the country?—Well, we are very nearly even in this country. During a long course of years the export and import have been very nearly agreed, I think.

7740. I do not think that up to 1876 the export equalled the import, but the point I want to put is this, that the economy of gold has been going on for a long time. There is a great economy of gold, and there is also a great extension of business, still if you take most countries under ordinary circumstances, they are always importing some gold, that is to say, on the balance of all the demands and economies there is, as we may say, a demand for a certain amount of gold?—Well, I do not think that applies to us. For a long time we certainly were very nearly even.

7741. (*Sir T. Farrer.*) As to the question that the Chairman asked about economies in the use of gold by banking expedients, have you looked at some returns given in the "Journal of the Institute of Bankers," of June 1884 (p. 339), of the increase of deposits? There have been from time to time papers written by Mr. Palgrave and Mr. Dick, showing an increase of banking deposits in England as follows, viz., 553,000,000*l.* at one moment in 1870, 676,000,000*l.* in 1874, and 760,000,000*l.* in 1884, an increase at the rate of nearly 10,000,000*l.* a year?—No doubt there was a continual increase going on. There was a diminution in 1878 owing to the great failure of the City of Glasgow Bank, and some discredit ensued, but since that time it has been continually increasing.

7742. (*Chairman.*) I believe you have some observations to make with reference to the use of money in countries that are not so fully developed commercially as the leading commercial countries are?—I only wanted to say that I think it is a very curious fact, and rather a difficult fact to understand if the quantity of money is so important a factor in prices as it is said to be, that prices have not risen in India. Lately they have rather fallen according to the official figures, and yet silver is said to be in such excessive supply. And certainly India has received plenty of silver, and yet prices have tended downwards. It seems to me rather an illus-

tration that the prices depend upon other things far more than they do upon the amount of money, and I should like to make an observation with regard to Russia. I am assured that, in the inconvertible notes, in Russia, there has been no material advance in prices of late, and, on the contrary, as regards, for instance, oats, the unfortunate peasant, in many parts of Russia, is now only getting 2*s.* 6*d.* a quarter, that is to say, what is equivalent to 2*s.* 6*d.* sterling for his oats. I have that on the authority of a first rate merchant in the Russian trade. According to all the old theories, the exchange in those rouble notes having gone down from 37 to 21 at this moment, which I suppose arises from the excessive issue of those notes, prices as expressed in those notes ought to have gone up, but they have not. Prices are excessively depressed. Starvation, he says, it is in Russia, and we can get oats delivered in our houses at 16*s.* and 17*s.* a quarter, that we used to pay four and five and twenty shillings for.

7743. (*Sir T. Farrer.*) And we give so much less?—We are giving a great deal less than we ever did for oats, and Russia is now as to wheat the great competitor with England, a great deal more important than India, and what surprises me is that there is no material change in the value of produce in those notes.

7744. (*Chairman.*) Of course if that is the case, then as regards their sterling value, they could obviously be imported very much more cheaply?—Yes.

7745. What you would have expected would have been that as the rouble fell, the rouble price would have gone up?—I should have thought so. What has overcome it all, has been the supply. That is the point I want the Commission to understand, that I believe the vital question in these prices is supply and demand of the article, and not the question of money. I do not say the money is never important, but I say it is seldom important, and far less important than other things. I only wanted to make one more observation on the scarcity of gold. It is a very curious thing that the prince of bi-metallists, M. Cernuschi, denies that gold is scarce altogether. He says it is a delusion. He gives other reasons why he thinks it is a great delusion not to have gold and silver kept to such a ratio by Act of Parliament and international agreement. That is another point, but scarcity of gold, he says, is not a fact. I only mention that as a confirmation of what I have been saying.

7746. (*Mr. Montagu.*) Relative scarcity, is it not?—He speaks generally of scarcity of gold, as I read him. He repeated it in his last pamphlet, which he has just sent me, which is called "The Bi-metallic Par."

7747. (*Sir T. Farrer.*) At any rate, whether he says so here or not, it is the fact that M. Cernuschi has stated in previous publications that he does not believe in the scarcity of gold, is that not so?—Yes, that is so.

7748. (*Chairman.*) Then, in your view, does price depend on the quantity of gold at any given period, or on what other influences?—I have incidentally stated already, that I think the quantity of gold, without going so far as to say that it has nothing to do with the question of price, is a very minor consideration, and I think it is well illustrated by the way in which prices have kept even, as a rule, between France and England. Now, the commercial connexion between France and England, of course, is very close, and one understands perfectly that the price depends on the supply and demand of the articles passing from one to the other, and usual commercial considerations. But the amount of actual cash in France in proportion to business is very much greater than it is here. The quantity of gold in proportion to business is very much greater. And another point is very curious, the quantity of cash they use in their business is far greater. I find from a paper published in the "Journal of the Bankers' Institute," I think by Mr. Martin,

that about 44 per cent. of the transactions are effected by means of notes and cash, whereas in the London banks, only two or three per cent., and I believe even less now, of the transactions are thus effected. I think, therefore, that goes strongly to illustrate the opinion that prices depend on facts as to goods more than facts as to money. The French carry on their business in a different way. They use a great deal more money, and yet prices remain very much the same as they are here, except as they are influenced by duties and things of that kind.

7749. Then I think you have something to say about the comparative price of wheat and cotton?—I have. I mention those two articles, because they are very important articles, and no one can dispute that they are what you may call illustrative and typical cases of change of price. Now with regard to wheat, it will anticipate something that I am going to say, but I must say it now, because I want to bring out this contrast. The course of price as regards wheat is very curious. I will give you the exact figures. The price of January 1879 was 39s. 7d. a quarter; of January 1884, 39s.; January 1885, 32s. 6d.; and of April 1886, 30s. In the course of 1884 it fell 7s. a quarter, but no change of importance occurred from 1879 to 1884. Would any one in the world say that a fall of 7s. a quarter in one year was caused by a scarcity of gold, or that gold had anything whatever to do with it? It was not a year in which questions of money came up at all. Money was in good supply. There was nothing the matter with the money market, and I cannot conceive that anybody could suggest that it was caused by anything but enormous supplies from all parts of the world. The export from India that year was of importance, 21,000,000 cwts. I say, therefore, I think that that is an illustration of a sudden fall arising from an enormous supply. But I think the illustration of cotton is perhaps even more interesting. If you take the ten years before the American War and contrast them with the ten years after the American War, when the effect of the American War was over, you find the prices almost identical. These are the figures, and they are very interesting, I think: 1850 to 1860, price 6·40d., consumption of the cotton during 11 years, 44,000,046, or 4,000,000 per annum; 1875 to 1885, price 6·54d., consumption during 11 years, 82,559,000, say 7,500,000 per annum. The rise in price is only 0·14 of a penny.

7750. (*Mr. Barbour.*) The consumption of England, or all over the world?—In United Kingdom, Europe, and United States of America.

7751. (*Mr. Fremantle.*) What price is that?—It is the Liverpool price of what is called "middling Orleans." What I argue from that is, that if you have an article where the supply is only just about enough for the demand, the price keeps very even notwithstanding all changes of money, but where you have an article in excessive supply, down it goes, and you cannot keep it up.

7752. (*Chairman.*) Then what is the conclusion that you draw from this comparison between the price of cotton before the war, and the price of cotton recently?—I merely suggest it as an illustration of what I think is a fact, that when you have an article where there is no excess in supply, notwithstanding all the changes that have taken place in the time, the price remains pretty much as it was; but when you have an article as wheat, where the supply is admitted to have been enormous, so that one country is finding fault with the other for sending too much; there you have a great drop in price.

7753. (*Mr. Fremantle.*) And that would be the case whatever would be the supply or falling off of the precious metals?—Unless you influenced credit; unless you did something, or something arose which would cause discredit and alarm.

7754. (*Chairman.*) Then, in your view, the real causes of the variations of price are commercial?—Certainly; and I think that the greatest influence tending to lower prices, which we are so much dis-

cussing, is discredit. If you had a great excitement in trade, and a great deal of credit, and a rapid rise of prices, in consequence of great speculation followed by a sudden collapse, whatever the state of gold might be, prices would fall as they did in 1857, and again in 1866. There was a great reduction of price for a time in 1866, in consequence of the failure of Overend, Gurney, and Company. I was in Lombard Street in full possession of the facts at that time. I remember it well, prices were high during 1864 and 1865, when the average bank rate was more than six per cent., but they fell in 1866 in consequence of this great discredit which was the consequence, of course, of exaggerated credit before. And that leads me to make an observation on the effect of bank reserves on prices. I do not think bank reserves have much effect upon prices, except as they maintain credit, and if you have a sufficient reserve to keep the credit of one man with another going, as it were, prices will not be affected, except by the ordinary influences of supply and demand. But I have seen over and over again in England, that if once you let the reserve go down very low, then you get discredit and fall in price of stocks and shares and goods of all kinds, because people are not willing to buy, and people want to sell, more than others will buy; therefore, I think that a bank reserve is most important. I quite agree with what I quoted from Lord Overstone, that the money at the bank is as good and useful money as any money in the country, although it is not actually taken away and circulated. It is a very curious thing about 1864 and 1865; you may have high rates of discount accompanying rise in prices, though it is generally said that high rates of discount tend to lower price, because money is dear to buy, and that discourages transactions. It is not so at all times. During that period of 1864 and 1865, I recollect perfectly, we did an enormous business, and prices were high. Then in 1866 there was a collapse, and a good many prices fell. The cause was the fearful discredit. Well, what have we seen lately? Very low rates of discount, money very cheap to buy, falling prices. I think it is quite clear that people have got the wrong notion about that.

7755. But what has been suggested to us by some witnesses who take an opposite view to yours, is that that is what they would expect, inasmuch as a low rate of discount means that people do not want money, and they do not want money because trade is bad, enterprise is checked, and consequently people will not borrow, and will not use money for business purposes?—I know some people say that, but I do not agree with it at all. It is one of those things which is a question of opinion; it is not a question of figures, but the prices appear to me to depend upon the state of the goods, not the money; you may have prices very dear, and money very high, and you may have money very low and prices very low too and falling away. I think I have an observation about that which may be of some use. I see I have said this:—"Mr. Giffen says that, as increase of population and wealth demands more cash for the transaction of business, if fresh supplies of cash do not come to us in ordinary course, rates of discount must rise and values fall. But, recently, values have fallen without any serious advance in the rate of discount, with, in fact, a low average rate of discount. The old machinery does not work, for on several occasions the Bank has failed to raise the rate of discount, even when disposed to do so. It may be said that rates have not risen, because other causes have produced a fall of values which has brought about an 'adjustment.' If that be so, it seems to follow that other causes have been more powerful in causing changes of price than any changes affecting supplies of money. But it would be more correct to say that the supply of cash outside the Central Bank has been so great that permanent advance of rates of discount was impossible." That is a point that we have been seeing in London for years past. "The peculiarity of the

Mr.
W. Fowler.
7 Nov. 1887.

Mr.
W. Fowler
7 Nov. 1887.

" money market in recent years has been that, with
" a very moderate reserve, we have often had very
" low rates of discount—a condition of things which
" would not of itself tend to lower values, but values
" have fallen. It is hard to see how it can be said
" that want of cash for any purpose has led to the fall
" in such cases," p. 19. I should like to read in con-
firmation of the general view that I put forward here,
a remark by Dr. Bamberger in the German Parlia-
ment. It is extracted from Mr. Strachey's report on the
recent currency discussions in Germany (p. 26):—" To
" cause a low rate of interest two factors are necessary.
" There must be capital, and there must be circu-
" lating media to give it mobility. When either of
" these runs short, money is tight and dear. Money
" at 1, 2, or 3 per cent. is not thinkable, when no
" saved-up capital is available; nor can there be
" cheap money, when the actual circulating medium
" which represents that capital, and moves from hand
" to hand, is not forthcoming. The observation of
" facts shows that the rate of interest is far more
" dependent on the mechanism of the money supply
" than on the accretions of capital. With the modern
" banking system there is always more probability
" that money will be dear in spite of the presence
" of capital, than that it will be dear when there is
" available currency. The key to the whole is the
" state of the bank deposits. When banks lower
" their interest, and money is easy in trade and
" business, it may be safely assumed that the slackness
" of transactions is not a consequence of a scarcity of
" the circulating medium, which, on the contrary, is
" in excess of the demand. This is the vicious circle
" in which you (the silver party) keep moving round
" and round. You say, prices are falling and business
" stagnate, because the currency is short, and when
" you are told that money is abundant, you answer,
" that is why business is bad!" I do not think I
could put it much more clearly from my point of view
than that gentleman has done.

7756. I believe you have some facts that you would
communicate to the Commission with regard to the
range of prices?—Yes. I wish to make one obser-
vation about the index numbers. It appears to me
that there is a very great danger in trusting
much to the index numbers, so far as I have seen
them. It is clear that they frequently depend on
giving a most exaggerated importance to particular
articles as compared with other articles of far greater
importance. It goes on the system of averages. It
is all very well to take proper precautions, but it is
very misleading if you have not those precautions,
and I think the "Economist" list is defective in
that respect, and some of the others also. And the
German figures do not at all agree as regards the
rise and fall in prices with the "Economist" index
number or with any of our index numbers, I think.
There has been one attempt to get rid of the difficulty
made by Mr. Palgrave in Appendix B. to the Third
Report of the Commission on the Depression of Trade,
but that does not get rid of this difficulty altogether.
He endeavours to do it, but I do not think it is
possible. For instance, in the "Economist" list
they give indigo the same value as wheat in the
average. That that must be absurd. It cannot give
you any idea if you put indigo side by side with
wheat. And then they give two places to cotton
in the "Economist" list, and the "Economist" list,
therefore, during the American War is made an
absurdity, because the price of cotton was then so
high as to raise the whole average of those years, and
everybody admits that the price of cotton at that time
was raised by events which had nothing whatever
to do with the question of money.

7757. (Sir T. Farrer.) Is there not also this
difficulty about the averages, not only that the
proportions in quantity of the different things
render the index numbers untrustworthy, but that it
is a very questionable thing to take an average
between an article which may have been affected
by particular circumstances of supply and demand,

and other articles which have not been so affected?
—Yes, certainly.

7758. Does it not make it extremely difficult to get
anything like a fair average, supposing you have some
half-a-dozen articles which have not been affected by
anything but currency, and you have half-a-dozen
articles which have been affected by their own par-
ticular circumstances and supply and demand; does
it not make it very difficult to take an average of the
whole and say that that shows a general rise or a
general fall owing to a general cause?—Certainly; I
quite agree.

7759. (Mr. Barbour.) But if allowance be made
for the quantities of the different articles, do you not
get, practically, the same result?—No, not the same
result.

7760. I thought Mr. Sauerbeck got the same
result?—I am speaking of Mr. Palgrave generally,
Mr. Sauerbeck tried to do it, and also Mr. Palgrave.
It was not the same in Mr. Palgrave's case. I will
read you, if you like, exactly what I make out of
Mr. Palgrave's list:—"Treating each article as of
" equal importance, we get a number in 1869 of 2,200
" =100, and in 1885 a fall to 1,550, or 70, but the
" corrected figure is 1,669, or 76. The corrected
" figure of 1877 was 2,205, or 100, being 7 per cent.
" higher than that of 1871, and the figure of 1881
" was the same as that of 1871" (p. 22). So that it
is very curious that the corrected figure of 1881 was the
same as 1871, and the very heavy fall only began
after 1883. Now, if it was a question of gold, it
ought to have begun before that, in my opinion.
This is taking the corrected index number, the
figure for which for 1883 was 88, whereas the figure
for 1884 was 80, and in 1885 it was 76. And I
think, as I have mentioned in a note, it was rather
open to discussion whether Mr. Palgrave should
have taken the years 1865-69 as his datum line,
because they were a good deal affected by the
price of cotton. Sir Thomas Farrer asked me a
question about averages, I think. I will read you
a passage from Mr. Forssell's book. Mr. Giffen
has said that one great objection to the index
numbers, I think very justly, is that you take the
article from the price list without reference to the
different qualities of the article, and they vary very much.
It is exceedingly difficult to avoid error in that
respect: though he believes in the index numbers, he
admits that there is a difficulty in that. But
Mr. Forssell refers to a different point here:—"If
" from one year or decade to another the price of
" meat rose 20 per cent. (100 : 120), while the price
" of tea fell 25 per cent. (100 : 75), how could it then
" be considered as common sense to argue that both,
" taken together, had fallen (200 : 195) with 2½ per
" cent.? The only explanation of such a remarkable
" proposition would be, of course, that falling and
" rising prices are identical with something that in
" other words is called increase or decrease in the
" buying power of gold; and, consequently, that it is
" the buying power of gold, as compared with the
" two commodities, which is measured by the average
" calculation. Such a method of measuring the
" buying power of gold would, nevertheless, hardly
" be accepted by anyone, who, for 100 lbs. of meat,
" uses only 1 lb. of tea. He would soon find that if
" a pound of meat rose from 10d. to 1s., and a pound
" of tea fell from 4s. to 3s., the fall in price of the
" latter would be of little consequence to him, or to
" the buying power of his sovereign as compared to
" the rise in price of the former. While in the
" former period the two quantities of commodities
" would have cost him 4l. 3s. 4d. + 4s., they will
" now cost not 2½ per cent. less, or 4l. 5s. 1d., but
" 5l. + 3s., or 18 per cent. more. He will not be
" able to obtain more meat and tea for his 3l. 7s. 4d.,
" but, on the contrary, less. For him the buying
" power of gold has not increased by 2½ per cent.,
" but fallen by 14½ per cent. Thus, in striking an
" average of the buying power of gold, it is, no
" doubt, an error, and a serious one to omit from the

" calculation the 'quantities in exchange' of the various commodities. If, when dividing the total sum of the special price-figures by the number of the articles, you take each article as an entity, you will therewith wrongly admit each one to have the same influence on the final result, irrespective of its quantitative importance in the market. The articles coal and meat absorb far more currency than the articles buffalo-horn and cochineal. It is, therefore, quite unreasonable in striking the average, to allow the rise in price of buffalo-horn to play the same part as the fall in price of coals, or to let the decreased buying-power of gold compared to meat, be balanced by its increase in comparison with cochineal, which latter requires scarcely one ten-thousandth part of the amount of currency absorbed by the former" (Forssell, p. 25). That is a general observation of much force. Of course, it has been endeavoured to be met, but it has not been fully met yet.

7761. (*Mr. Barbour.*) What I understand you to say is this, that the index numbers may show that there is pretty generally a fall in price, but they do not prove what the cause of it is?—Yes.

7762. (*Chairman.*) As I understand the earlier index numbers, the fall in price might have resulted from a certain number of commodities, so that although other commodities had risen in price still an apparent total fall of price might have been exhibited. Is that so?—Yes. I only wish to protect myself from admitting that this index number plan is satisfactory. I do not think it is.

7763. I suppose you would say, that on the reasoning which is based upon those index numbers,—that because there has been a general fall there must have been a general cause, which it is suggested is a change in currency—if the fall has not been universal, but there have been exceptional cases in which there has been no fall, those who contend that the currency is the cause, ought to be able to point to some special reason why those articles have remained steady?—Yes, certainly; and some of them have risen materially.

7764. Then you are going to give some facts with reference to the range of prices?—Yes; I should like to read you a few words from Mr. Wells' articles in the "Contemporary Review," because there are some points upon which I have not touched. I mentioned just now the case of wheat, and the remarkable fact that it had not fallen between 1879 and 1884, and suddenly fell between 1884 and 1885; whereas if it had been a gold question, it would have fallen much sooner than that, and would not have fallen with such suddenness. Now Mr. Wells refers to some curious points about the wheat question. In America it has fallen very severely too, and America is a bi-metallic country. Silver is legal tender as we all know who have been there.

7765. (*Mr. Montagu.*) How could it keep up in one country, and fall in another with international trade?—That is another question.

7766. But could you have cotton rise and wheat rise or fall, and not fall in America when it falls in the rest of the world. Is it possible with international trade?—I am not stating that you can, I argue in this way: here is a country that is a bi-metallic country, it cannot keep up the price.

7767. There is no significance in the price going down in a bi-metallic country if it is going down in a gold country, because the one market rules the other?—Of course. Here are the facts with regard to wheat which are mentioned by Mr. Wells: "The cereal production of the United States increased from 932,752,000 bushels in 1862 to 2,992,881,000 in 1884, and in acreage from 34,594,381 to 136,292,766, or in the respective ratios of 452 and 338 per cent. respectively. The average wheat production of the United States for the five years from 1881 to 1885 inclusive was 436,000,000 bushels; while for the ten years preceding—some of which supplied the heaviest demands for exportation ever experienced,—the average was only 366,000,000

bushels. According to Mr. Neumann Spallart, a German statistician of repute, the production of cereals in Europe doubled from 1869 to 1879; and in the case of Russia, her exports of wheat increased from 36,565,000 bushels in 1880, to 67,717,000 in 1884." In regard to Russia, I have it on the authority of one of the first corn merchants—that her supply this year is enormous, and the curious fact is that Russian wheat is coming more here, because of the protective duties in France and Germany; and they cannot get rid of rye, except in England, for a price that the cattle feeders will give them. "According to figures of the United States Bureau of Agriculture, the average production of wheat in Europe for the five years from 1875 to 1881 inclusive, increased some 50,000,000 bushels over the average of the ten years preceding, which included several seasons of unusually low yield in Western Europe. In 1862 the United States exported bread stuffs to the value of \$24,000,000; in 1872 the corresponding value was \$87,000,000; and in 1880, \$288,000,000; and if since this latter year there has been a decline in the value of American cereal exports, it cannot be attributed to any impairment of ability to produce and export, if sufficient inducements existed. While, therefore, it is clear that the comparative product of the heretofore great wheat-producing countries has not diminished, recent experiences are also making it evident that the world is hereafter to derive important supplies of wheat from sources which a few years ago did not exist, or were regarded as of little importance. For example, British India, which in 1880, exported only 13,896,000 bushels, and whose increase of wheat exports appears to be coincident with the increase of the railway mileage of the country, in 1885, exported 39,312,000 bushels. During the same period, Australia and New Zealand in which a rapid growth of population inevitably tends to divert agricultural industry from wool-producing to wheat growing, increased their exports from 13,999,000 bushels in 1880, to 19,466,000 in 1885; and the Argentine Republic from 5,772 bushels in 1881, to 3,986,000 in 1884. All the indications are, furthermore, that the increase of wheat supplies from new sources is likely to be continuous, and of great magnitude from India, whose internal and foreign commerce is yet only in its infancy, but is developing with extraordinary rapidity under the influence of railroad construction; from the great wheat region of Manitoba, to open which the Canadian Pacific Railroad was mainly constructed; from Algeria and Northern Africa, which, once the granaries of the Roman world, are now, for the first time for centuries, contributing something to the world's surplus of cereals; and from the South American States of the Argentine Republic and Chili, where extraordinary railroad construction is rapidly drawing an extraordinary European immigration to the finest of wheatlands, which, so recently as 1880, were practically inaccessible. Great also as is the present wheat production of the United States, Mr. Atkinson has shown that all the land at present in actual use in that whole country for growing maize or Indian corn, wheat, hay, oats, and cotton, is only 272,000 square miles, out of 1,500,000 miles of arable land embraced in its present national domain, and also that the present entire wheat crop of the United States could be grown on wheat land of the best quality selected from that part of the area of the State of Texas, by which that single State exceeds the present area of the German Empire." (Wells in Cont. Rev., October, p. 532.) Now I should like to make a few observations as to sugar, which is one of the most important articles, and about which there has been most excitement, and in which there have been most terrible losses in this country. "Sugar did not fall much between 1879 and 1884, but West India sugar fell from 16s. to 19s. per cwt., to 9s. 6d. to 12s. before January 1885, and it remains much the

Mr.
W. Fowler.
7 Nov. 1887.

Mr.
W. Fowler.
7 Nov. 1887.

" same in 1886. But in 1884, we received $7\frac{3}{4}$ million cwt. of unrefined sugar from Germany, as against $4\frac{1}{2}$ million cwt. in 1882; and the production of beetroot sugar increased from 1,393,000 tons in 1879, to 2,500,000 tons in 1885. In the same period the production of cane sugar increased slightly, but the total sugar production of the world increased more than 30 per cent. These figures account readily for the fall." Now there is another figure. Take the Clyde. "In 1858 the first 200 tons of beetroot sugar were imported, the total import of sugar for the year being 70,000 tons. Last year 241,000 tons came into the Clyde, 158,000 being beet and 83,000 cane." (*Appreciation of Gold*, p. 23, &c.) Now a very few words more on the sugar question will illustrate what is to be said on that. "Mr. Sauerbeck estimates the increase from 1872-73 to 1885-86 to have been 68 per cent. Other authorities estimate the increase from 1853 to 1884, exclusive of the product of India and China, to have been at the rate of 30 per cent. for each decade, or about 100 per cent. compounded. In the Hawaiian Islands, where a remission of duties on sugars exported to the United States, is equivalent to an export bounty of about 100 per cent., the domestic production has increased from about 12,000 in 1875 (the year before the duties were remitted to 110,000 tons in 1885), an increase in 11 years of 750 per cent. The part that beetroot sugar has played in the increase, is shown by the circumstance that while in 1860 the proportion of this variety to the whole sugar product of the world (commercially exported) was less than 20 per cent., the product for 1886-87 is estimated as in excess of 55 per cent., Germany alone having increased her product from 200,000 tons in 1876, to 594,000 tons in 1880-81, and to 1,155,000 tons in 1884-85, while the increase of the beet sugar product in the other bounty-paying states of Europe was not disproportionate." I do not think I need add anything more than to say that, "for the year 1885, 2,000,000*l.* it was claimed, would be necessary to pay the bounty, or an amount equal to the total wages paid to all workmen in all the German sugar refineries." (*Wells, ibid.*, p. 530.) I am not arguing in favour of bounties; I think that is a most insane system, but these facts will account for the fall in price. You do not want to speak of gold; it is the enormous supply from different causes. Well, now, I should refer to copper. When I was coming over from the United States in 1881, I met an American, and he said, "I do not quarrel with your copper market at all. I like 66*l.* a ton. I can put it down at Baltimore harbour at 33*l.*" I said I did not quite believe that, but it is quite certain that it has been down to 39*l.*, though it has now risen a little. It is now 44*l.* or 45*l.* Let us see the figures. Copper was about 90*l.* a ton in 1873, 57*l.* in 1879, 65*l.* in 1883, and 41*l.* in 1886, in face of a great demand, but supplies have been, and are, so large (say 47,000 tons in 1850, and 210,000 in 1884) that the fall surprises no one." The production in America, as long as we kept up our price, was something perfectly stupendous. It is rather remarkable, in reference to that, that Mr. Jevons, in one of his books, written, I think, in 1863, says, that he considers that the metals are very unlikely to fall. Well, I am not quarrelling with his authority. He is a man for whom I had the greatest regard and respect. It only shows how very little anyone can know about the course of prices.

7768. (*Mr. Barbour.*) Are you aware that Professor Cairnes wrote that he did not believe that the relative value of gold and silver could alter. His exact words are, "The reasoning assumes the possibility of a serious divergence in the relative value of gold and silver; but I now believe that such divergence is practically out of the question?—Yes, very likely; that concurs with what Professor Jevons

has said about the metals. I will not trouble you more about copper. It is one of the most remarkable instances that I know of, because the fall has been so very rapid. It is not to be accounted for in any way that I know of, except by extraordinary supplies, but it is easily accounted for by the extraordinary supplies.

7769. The cheapening of the production, I suppose, you would say?—Well, yes.

7770. (*Sir T. Farrer.*) And at the same time there has been a greatly increased demand?—There has been an enormous demand for copper wire for the electric telegraph. There is one thing I was told the other day, which is very important. I understand copper is like the precious metals in one thing; it wears out very slowly, and old copper fetches a very considerable price, just like lead.

7771. (*Mr. Barbour.*) I suppose what you would say with reference to that is that the cheapening of the cost of mining copper has proceeded at a greater rate than the cheapening of the cost of mining gold?—I say that there was no occasion to talk about gold at all in discussing the price of copper. There has been such an excessive supply, that we need not discuss it, and, speaking generally, I do not believe the price depends upon the supply of gold. I believe price depends upon other factors, and not upon the supply of gold. In the main the supply of gold is a minor and unimportant factor, as a rule.

7772. (*Sir T. Farrer.*) But, supposing gold to have been at an absolutely stationary point, there is sufficient in copper itself to account for the change?—Yes, certainly.

7773. (*Mr. Barbour.*) I do not object to that. What I say, is this, that supposing the cheapening of the mining of gold had proceeded simultaneously with the cheapening of the mining of the copper, you might have had the same price, or, at any rate, a higher price?—I doubt it very much. I do not think you could. Now, here are some very curious facts for America, which I think are worth noting: "The countries which have most notably contributed to this increased product, have been the United States, and Spain, and Portugal; the increase in the case of the former having been from 23,000 tons in 1879, to 74,053 tons in 1885; and in that of the latter from 32,677 tons, to 45,749 in the same period. As in all other like cases, the disturbing effect on the industries involved—mining and smelting—contingent on this rapid and remarkable fall in prices was very great, and in all quarters of the world. In Montana, the Montana Copper Company, with an annual product of 8,000,000 pounds of pure copper, entirely suspended operations; and the Anaconda Company, with an unusual product of 36,000,000 pounds, shut down 20 out of 28 furnaces, and discharged most of its hands at the mines. In Chili, production during the year 1885, was diminished to the extent of about 10 per cent. In Germany, the Great Mansfield mine, which reported gross profits in 1884 of 5,675,000 marks, sustained a loss in the operations of 1885 of 653,338 marks; and its managers have since sought relief by petitioning the Imperial Government for the imposition of a higher tariff on the imports of copper into the Empire." (*Wells, ibid.*, p. 540.) That is very probable. They expect the Government to do everything there. Well then, it is hardly necessary to refer to iron and coal. Iron and coal got to their maximum just about that critical year 1873—rather before 1873. In the years 1871 and 1872 they got to enormous prices. Some people, I know, made a half-a-million in one year out of their coal and iron, and it was a most exaggerated position altogether. "Scotch pig iron fell from 6*l.* 7*s.* per ton in 1873, to 2*l.* 9*s.* in 1883, and 1*l.* 18*s.* in 1886; but the production of iron was 9,392,000 tons in 1868, and 20,410,000 tons in 1883, so that a fall was inevitable sooner or latter." (*Appreciation of Gold*, p. 24.)

The witness withdrew.

Adjourned till Friday.

THIRTY-FOURTH DAY.

Friday, 11th November 1887.

PRESENT :

THE RIGHT HON. LORD HERSCHELL, the CHAIRMAN, presiding.

MR. D. M. BARBOUR, C.S.I.

MR. J. W. BIRCH.

MR. H. CHAPLIN, M.P.

SIR T. H. FARRER, Bart.

MR. C. W. FREMANTLE, C.B.

SIR JOHN LUBBOCK, Bart., M.P.

MR. S. MONTAGU, M.P., and

MR. GEO. H. MURRAY, *Secretary*.

MR. WILLIAM FOWLER recalled and examined.

7774. (*The Chairman*.) Before we proceed to any further point, have you any addition or explanation that you would like to offer with reference to the evidence you have already given?—There are one or two points that I should like to refer to. I know that there is a difference of opinion as to the importance of the evidence about the condition of the money market; and I wish to say that I think it is of the greatest importance that that point should be clearly before the Commission, because it seems to me that if gold were really scarce, it is almost impossible, through a long course of years as from 1873 onwards, we could have the condition of things to which I referred last time. I mean, that as we cannot create notes without gold, and as, if we want money, we have to raise the rate to attract the bullion, and as we have had to raise the rate less in the last 15 years than we had before, it seems to follow very clearly that, as far as the money market goes, gold has not been scarce during that period. And in order to illustrate that more clearly, I have taken out the average bank rate for the years from 1857 to 1872 inclusive, which are the 16 years previous to those I gave before. Now, I find that the average of that 16 years is 4*l.* 2*s.* 6*d.*; the average of the 14 years I gave last time is 3*l.* 6*s.* 9*d.*, and in some of the previous periods the rate got to a very high point on an average. For instance, in 1857 it was an average of 6*l.* 12*s.* 3*d.*; in 1864 it was an average of 7*l.* 10*s.*; and in 1866 an average of 7*l.* We have never had any such rates since that time during the period in which, we are told, that gold has been scarce. I mention that particularly, because I notice in Mr. Giffen's evidence he has treated it almost as a matter of course that gold is scarce, as if it were an obvious fact about which there was no doubt at all. I wish, therefore, to impress very strongly my view that those facts about which I have given evidence are of the greatest importance.

7775. (*Mr. Montagu*.) Would it not be the case, that you raise the bank rate above those of foreign countries, so that the high rate of discount in England imposed in order to bring gold would be almost entirely regulated by the value of money in the centres from which we wish to bring the gold, and that it may be just as effectual to raise the rate to 4 per cent. with the French rate at 3, as it would be to raise it to 7 with the French rate at 6, and that the discounts that you quote are merely relatively superior to those of the Continental countries at the time?—I have not examined the Continental rates of the time to find out that. I do not think that is the real cause. The real cause is, that there has been a plentiful supply of gold for all purposes since the time I speak of, 1873, and that you have supplied Germany, you have supplied Italy, you have supplied the United States, and still there is an abundant supply here; and the best test that I know of the abundance of the supply, is the average bank rate during a series of years. I say that we cannot get on here without this sufficient supply of money, that is, gold.

7776. (*The Chairman*.) But supposing the suggestion made by Mr. Montagu to be correct, it would not be inconsistent, would it, with what you have said, because the point made is that gold is scarce everywhere, not merely in this country, and if there

has been a low rate of interest everywhere, so, with a low rate of interest, you can still draw here all the gold you want. That would still be quite consistent with your argument that there was no scarcity of gold?—No; I think it is a general abundance. According Mr. Montagu's own view, there was a considerable scarcity in other countries before 1873. That was just the time when we had had the large influx from abroad, from California and Australia, and before the great movements in reduction of gold began.

7777. (*Mr. Montagu*.) Have I stated that? I do not know. I say that you cannot judge by the actual range of discount rates, because they are never raised except in a sufficient degree to attract gold, and that 4 per cent. might be as relatively high now as your quotation of 7*l.* 10*s.* in 1864?—I understood you practically to say that the reason the rates were so high before was, that you had to overtop high rates, otherwise there was nothing in your argument.

7778. Certainly! I say it?—That rather implies, as the Chairman says, that gold was scarcer before 1873 abroad than it has been since. I do not care which way you put it, I only say it as matter of fact that for the 32 years that I have been in the money market, we have had far more ease when there was a supposed scarcity of gold than we had before; and I think that is a most important fact, and easily explained, in my opinion, from what I believe to be the fact, that there has been no scarcity of gold.

7779. (*Mr. Barbour*.) Assuming that it was the abundance of gold, or the absence of scarcity of gold, in recent years, which has caused the rate of discount to be low since 1873, why was it higher before 1873?—Because, I suppose, that the demands upon the market were very great, for reasons that one cannot altogether explain. I read you from Mr. Tooke the other day a passage in which he gave the causes why rates had been very high in 1856 and 1857, owing to the Crimean War, and bad harvests, and a great inflation of credit, and so on. There was a scarcity of gold; the gold was sent away for various causes, and gold became scarce, although it was just after you had had a very large influx of gold. But I apprehend that one of the great causes has been that there has been a considerable depression of trade, and also a great accumulation of capital, so that credit has been better able to do the business of the world than it was in the previous time. I have not gone minutely into the causes of the difference, but I apprehend that is one of the causes, that credit has become even more effective than it ever was, and therefore there has been a less demand for gold than there was in the previous period. But I am only saying that, as far as the evidence of the money market goes, it tends to show that there has not been this great scarcity which is almost assumed without discussion.

7780. (*The Chairman*.) In some of those years that you have given us, the higher rate is accounted for by a great collapse of credit?—Of course it is; in 1866 it was Overend and Gurney's failure.

7781. And 1857?—It was the year of a most fearful panic in America and England.

7782. (*Sir John Lubbock*.) And other failures besides Overend and Gurney?—Yes, a great many. The panic of 1866 is called the Overend and Gurney

Mr.
W. Fowler.
11 Nov. 1887.

Mr.
W. Fowler.
11 Nov. 1887.

panic, but there were many failures besides Overend and Gurney's. And then take 1864, which is a very remarkable case. I remember perfectly well at that time there was an enormous trade with the East, and an immense demand for accommodation of every kind. If the demand for accommodation is very great, up goes the rate, and the rate of interest is sometimes very high although there is no great change in the bullion. You may have the rate very high because the demand for accommodation is very great.

7783. (*Mr. Montagu.*) But have you not accounted yourself for gold not being perceptibly scarce by stating that one reason was the depression of trade and the falling prices, and, of course, the want of enterprise, therefore, if those conditions had not arisen the quantity of gold might still be insufficient?—Yes, I must say that, as a matter of fact, in the ordinary course of business it has often struck me that the daily demand for, for instance, the discounting of bills, for whatever reason, is reduced. We had it last time with regard to the stamps. But there is a marked diminution in the demand. A great business, in the aggregate greater than ever, is done, but with less use of money even in the form of credit. That is the history of the last 15 years. There is no doubt that a great deal more business has been done, but with less demand for money, in the technical way that we use the word money, in the money market. And I agree that there has been a diminution in the demand, and that has led to a low rate of discount. But I cannot say that I see the slightest evidence from that that gold is scarcer; on the contrary, when you want the gold you get it, and you get it, on an average, at a much lower rate than you were able to get it during the previous period, when it was supposed that there was no scarcity of gold.

7784. (*The Chairman.*) I understand that all that you say is that, at all events, looking at the rates of discount during this period when the scarcity of gold is supposed to have existed, these returns form no evidence of scarcity?—No evidence of scarcity, as far as they go. If the rate of discount is an evidence either way, it goes the other way.

7785. (*Sir John Lubbock.*) When you say they get the gold at a lower rate, you mean they get the temporary use of the gold, not the absolute right to the gold?—Of course that is always the case. That does not apply to one time more than to another, but I am only speaking of two periods when the same operation is going on.

7786. (*Sir T. Farrer.*) The rate of discount is the price paid for the use of what may be called ready capital, is it not?—Yes, it is for the loan of money.

7787. Then that depends not separately upon either demand or supply, but upon the proportion of the demand to supply?—Yes.

7788. Like every other price?—Yes.

7789. Consequently you may have a very large supply, but if the demand is greater than the supply, the rate of discount will still be very high, will it not?—It might.

7790. And on the other hand, if the supply is small and the demand is small, the rate may be low?—It might be so.

7791. But if you find that for a considerable period the rate is low you may argue, may you not, that at any rate that has not been caused by a deficiency of supply?—I should say so.

7792. Because if the supply was deficient in proportion to the demand, the price would rise, would it not?—Certainly it ought to.

7793. Therefore a low rate of discount for a period of years is proof that the low rate is not due to a failure in supply?—I think so, decidedly.

7794. (*Mr. Montagu.*) Have you lost sight of another very important factor that may account for the plentifulness of gold, and that is that in your table you give the amount of silver held by the different banks—an amount of about 112,000,000*l.* in three banks alone. That is in your evidence here at question 7709: "The United States, 48,000,000*l.*;

Bank of France, 46,000,000*l.*; Bank of Germany, 18,000,000*l.*." They issue paper against this silver, and consequently freed a similar quantity of gold in those countries, or at least taking the place that might otherwise have been taken up by gold?—I think it is quite true that there has been a large amount of gold liberated.

7795. By the issue of paper?—Partly by the issue of paper. That may be so. I have not looked minutely into that, but I daresay you are quite right that there was a very large release of American gold during the war, that is, in the previous period. But I tell you where I think there was a very large amount of gold released, and that was after the Franco-German war. There was a very large amount of gold went from France to Germany, taken from French hoards.

7796. But have you any authority for it being French hoards?—There is no doubt there was an enormous increase of the Bank of France notes at that time.

7797. But are you aware that the French, of all other people, hold the largest quantity of small railway obligations and small bonds, and that they are about the last people to hoard gold?—I have no personal knowledge. I have only seen that stated over and over again.

7798. (*The Chairman.*) But with regard to what Mr. Montagu has said, that would not be inconsistent with your view as to gold. If by reason of the use of silver in the place of gold, or its answering the purposes of gold, people are ready to part with their gold, and it is liberated, that would show that it has not appreciated by reason of scarcity?—Exactly. And with regard to the French question, I think it is matter of observation, as I understand the figures, that the circulation of notes by the Bank of France over the amount of bullion held, increased by 91,000,000*l.* from January 1870 to November 1873. I apprehend that was in order to liberate gold.

7799. (*Mr. Montagu.*) I think you will find that the indemnity was paid to Germany by means largely of silver or silver bills, bills on Germany itself and on Holland and Belgium payable in silver, and therefore it is no guide as far as the transfer of gold from France to Germany. I do not think you can draw much argument from it?—I do not wish to press that at all because I have no minute information, and I do not want to speak of what I do not know, but I certainly do think that as far as the evidence of the money market goes, it has not shown a scarcity of gold within the last 15 years. I think it is right to mention the story of the circulation within the last 30 years in our own country, because it illustrates the point that I was referring to, very strongly. If you take the circulation in 1845, 1847, 1854, and 1885, the Bank of England circulation in 1845 was 21·73 millions, the country 7·7, Scotland 3·29, Ireland 6·95, making a total of 39·67; in 1847 the figures were Bank of England 20·11, country 7·6, Scotland 3·55, Ireland 6·01, total 37·30; 1854, Bank of England 21·83, country 6·80, Scotland 4·15, Ireland 6·29, total 38·97; and in 1885, Bank of England 25·2, country 3·0, Scotland 6·2, Ireland 7·0, total 41·40. In 1885 the total is 41 millions against 39 millions in 1845, an increase of only two millions, although we have had such an enormous increase in the business of the country. I think that strongly illustrates the point that the business is actually done, I was going to say, without money.

7800. (*Mr. Birch.*) By instruments of credit?—By instruments of credit. It is one of the most remarkable set of figures that you could possibly have before you in discussing this question. I want to add one word with regard to M. Cernuschi. Mr. Montagu expressed some doubt as to what M. Cernuschi had said as to the scarcity of gold. In the *Economist* of 24th April 1886 he wrote as follows: "The fall in prices which is complained of is not due to what has been called a scarcity of gold, which is purely imaginary. If by an

" enchanter's wand all the silver francs, all the silver marks, all the silver dollars were converted into gold francs, gold marks, gold dollars, the European and American prices would remain unchanged."

7801. (*Mr. Montagu.*) Excuse me, I do not think you will find that I maintain that gold is scarce, and M. Cernuschi's remarks apply more to this, that whereas silver now is a large portion of the circulating medium, if you change that silver into gold you would still have the same circulating medium, it would not affect it in any way?—I only quoted that because you disputed the other day whether he had said that or not. Then Lord Herschell asked me last time whether there was any new evidence as regards the extension of cheques and so on in the country. I have obtained some very interesting figures from Messrs. Barclay, who permitted me to use their name. The one set of figures is their country clearing for the months of November 1882, 1883, 1884, 1885, and 1886, and the result is summed up in a letter from one of the firm in this way: "They show an increase in the number of articles of 16 per cent., a decrease in the aggregate amount of 2 per cent., and a decrease in the average amount per article of 17 per cent."

7802. (*The Chairman.*) Between what dates are those?—That is between 1882 and 1886. Now I say that shows manifestly that the cheques are going lower down, that the class of people who are using cheques is becoming smaller and smaller in one sense, but it is larger and larger in another, that there are more people of what I may call the humbler class of traders beginning to use banking facilities. And I find from inquiry that that is the impression very strongly of country bankers. The figures are as follows:—

COUNTRY CLEARING.

"In-paid."

Another set of figures I thought might interest you is as follows:—This is the receipt at the bank in Lombard Street on the 11th November 1886: "Coin '65, bank notes 1'65, country notes '18, cheques and bills 97'52 = 100'00." There is only one other remark I wish to make. With regard to the index numbers I wish to say that I omitted to refer to the fact that in the index numbers all reference to the cost of wages and living and so on is omitted, and I thought it would be interesting to refer to a paragraph in Mr. Strachey's pamphlet, page 9, in which he gives the results of the cost of living in the Hamburg hospital, and it comes to this, that if the years 1847 to 1850 be taken as 100, the cost of living has risen to 232, which is certainly a most surprising result; and that as to the rent of houses in Hamburg if the year 1850 be taken as 100, the year 1885 comes to 208, which is also I think a very remarkable result.

7803. (*Mr. Barbour.*) Does he say whether there is any improvement?—There is an improvement, but he thinks that the administration has always been "scrupulously economical," and during the period taken the same system of purchasing and doing business has been observed.

7804. But the patients may be better treated?—They may, but it is an enormous difference of the cost. I think I mentioned that I thought the *Economist* figures were much injured by there being two cotton figures in the index number, but really there are four. I should particularly ask the attention of the Commission to pages 11, 12, and 13 of Mr. Forssell's book on the question of the index number. "If, with this reservation, the table of prices of the *Economist* is closely examined, it is found that the prices in the twenty-two columns there represented during the periods in question, as compared with the same prices during the period 1845–50, which are taken as 100, give the following proportional figures:—

1851–60. 1861–70. 1871–5. 1876–80. 1881–85.
 " 114 141.₃ 127.₆ 115.₅ 104.₃
 " These averages, as well as the yearly prices quoted above, seem at first sight to prove that prices have considerably declined during the last 10 years, not only when compared with the speculative era 1871–75, but still more in comparison with the previous

Mr.
W. Fowler.
11 Nov. 1887.

Mr.
W. Fowler.
11 Nov. 1887.

" period of 1861-70. What, then, is more probable, than that the increased supply of gold during the 1850 period was the principal factor in the rise, that affected all prices in the following decade, or that the declining production of gold since 1870 has caused a change in other directions, and from 1880-85 has exercised its full influence in depressing prices? Visibly, the gold is depreciated when its production increases; again, it is appreciated when its production decreases. The *post hoc* is almost irresistibly converted into a *propter hoc*. The truth about these phenomena presents itself as plain and palpable as any complicated economical process can be, and may be demonstrated by means of statistical average-curves or figures. But beware of statistical averages! How treacherous they may be, in all their attractive simplicity, it will be particularly easy to show in the present case. Thus, for instance, it is only necessary to remove *one* link from the chain, in order entirely to destroy the evidence obtained from the above series of figures. The article *Cotton* plays a most important part in the *Economist* price-tables. It represents as many as four numbers out of the 22, that is, more than a sixth part of the total. But the price of cotton and cotton goods rose 100 to 300 % in consequence of the American war, and not through any superabundance of gold. If, therefore, we only exclude these four articles, our figures undergo the following change:—

1851-60. 1861-70. 1871-75. 1876-80. 1881-85.
114·0 125·3 128·4 119·5 107·0

" If we also exclude tobacco, which rose to thrice its former value during, and in consequence of, the American war, the proportional total index number for 1861-70 sinks to 119. By such slight changes the enormous rise in prices, which seemed to distinguish the years 1861-70 wholly disappears. In its place the period 1871-75 is coming up as the highest point of the series. From this point the fall in prices during 1880-85 is nevertheless yet very considerable."

7805. (*The Chairman*.) When the Commission adjourned on the last occasion you were giving some facts with reference to the fall in value of various articles contained in the index and other lists, as explained by circumstances affecting the particular articles. I think the last one you had dealt with was copper?—Yes. It seems almost needless to refer to iron and coal. The rise in 1873 was so extraordinary and abnormal that hardly anyone would expect that the then price would continue, or anything like that price, or that it was necessary to suppose that any question of money would enter into the price. But the figures given in Mr. Wells' article are very extraordinary. I will read one or two: The production in the United States for instance increased in one year from 1885 to 1886 by 1,638,803 tons, or 40 per cent., and in our own country the increase has been very great indeed in the amount of iron in the last few years. In 1870 Sir L. Bell told the Royal Commission that the world's production was 11,505,000 tons, which increased to 14,345,000 tons in 1872. "From that date the production continued almost stationary until 1879, when it was 14,048,000 tons. After 1879 an extraordinary change became apparent in the volume of the make, for during the ensuing five years the average make was 18,000,000 tons, and in 1883 it rose to 21,063,000, or nearly 50 per cent. more than it was in 1879." It is rather difficult to avoid mixing actual facts as to the fall with the causes of the fall, but I have referred later on to some figures as to iron which perhaps it might be convenient to bring in here. Sir Lowthian Bell's figures are very interesting, and he says that he thinks nothing has contributed so much to the fall in iron as the discovery of new and cheaply-worked supplies of iron ore, both here and abroad. I would only mention a few; in the north-eastern district the tons of ore were, in 1860, 1,483,000; in 1884, 6,103,000. In Scotland they had slowly fallen off between 1860 and 1884; in

Wales they had fallen off; in Staffordshire they had increased by 300,000 tons; in Cumberland they had increased by a million and a half; in Lincolnshire they had increased from 112,000 to 2,628,000; and the imported ores had increased from 23,000 in 1860 to 3,153,000 in 1884. But the total consumption by foreign countries is a very curious point. Sir Lowthian Bell considers that in 1870 there were received from the United Kingdom by foreign countries, 3,472,000 tons of iron; in 1884, 4,308,000; but the make of foreign nations had increased from 5,602,000, in 1870, to 12,469,000 in 1884; therefore, the total consumption by foreign nations, including their own make, and what we sent them, had increased from 9,074,000, in 1870, to 16,777,000 tons in 1884. And it is not, perhaps, very satisfactory to find that we are rather falling back as regards our proportion of the make of iron, but I do not think we can be surprised at that. I do not want to dwell on those figures, excepting to say that I think they show an enormous fall in the value of the article, without any money question whatever. The same remark applies to coal. Of course, coal has fallen greatly, but the production of coal has quadrupled since 1850, and the price of course has fallen since 1870-72 very rapidly.

7806. (*Mr. Birch*.) Do you not consider that that enormous rise in 1872 opened out a great number of new mines all over the world?—Yes, a great number in our own country and in other parts of the world.

7807. For instance, great mines in Spain, in the United States, and elsewhere that were known to exist, but would not pay to work, were then opened up?—Yes. Mr. Wells says that, "The increase in the product of the five chief coal-producing countries of the world, Great Britain, the United States, Germany, France, and Belgium, from 1870 to 1886 inclusive, has been in excess of 80 per cent.; Great Britain increasing her product from 109,000,000 tons in 1870 to 159,351,000 in 1885; and the United States from 38,468,000 in 1870 to 112,743,000 short tons in 1886. On the other hand, the amount of coal displaced from use in the United States in 1886 by the introduction and use of natural gas is estimated by the United States Geological Survey at 6,353,000 tons, valued at 9,847,000 dollars. In Germany the increase reported was from 36,041,000 tons in 1873 to 55,000,000 tons in 1883." I think those figures also prove distinctly that the cause is one of the simplest in the world.

7808. (*Mr. Barbour*.) I suppose there must have been a great increase in the demand for coal simultaneously with the increase of the production?—There has no doubt been a great increase in the demand, but the fall was so rapid that it is impossible to believe that it could have anything to do with money. The capital was poured in. I remember myself being told by various people at the time, 1872, 1873, of the great fortunes they were making out of their coal, but in about three or four years we heard no more about it. One man told me in our own office in Lombard Street that he had sold the whole of his make to a gas company at 2*l.* a ton for a twelvemonth.

7809. (*Sir T. Farrer*.) And there also have been great economies in the use of coal?—Very great indeed.

7810. And very great economies indeed of iron in the use of steel?—Yes.

7811. (*The Chairman*.) Then what is the next article?—The article of wool is perhaps the next article. I do not know that it is necessary to refer to it minutely, but there has been there an immense increase. According to Mr. Wells the increase in the world's supply of raw wools from 1860 to 1885 was about 100 per cent. I think if that figure be correct, there can be no doubt whatever about the cause of the fall. I remember Messrs. Windeler and Bowes, who are a very great authority in this trade, gave some remarkable figures, which I think I have quoted, as to the state of the wool trade. Mr. Wells says that "the wool clip of the United States increased from

"264,000,000 pounds in 1880 to 329,000,000 in "1885." There has, of course, been a great demand for wool, but there has also been an excessive supply. Formerly, I remember we used to discount a great number of bills for Americans who came here to buy wool. They used to get credits and bring them here to discount, and then buy the wool in the English market. Latterly we have seen much fewer of those. I suppose America is getting to be more self-supporting in the matter of wool than she was.

7812. (*Mr. Birch.*) You are probably aware that an enormous amount of wool now goes direct which formerly used to come through this country, goes direct from Australia?—I notice a great falling off.

7813. A very important change has taken place in the wool business?—There is another interesting trade that I would like to refer to for a moment, that is, paper. Both in America and in England, the falling off in the value of paper is astonishing.

7814. (*Sir John Lubbock.*) You mean the price of paper, do you not?—The price of paper has fallen so much. Mr. Wells considers that paper has declined, since 1872, to the extent of fully 50 per cent. There are great complaints, in this country as well as in America, of the falling off in the value of paper. One great cause, of course, has been that new materials have been brought to bear. Then, in the glass trade, window glass is another illustration. Now, of course, that is a very important article, and there has been an extraordinary fall in the value, but it has arisen from the great improvement in the mode of making the glass. I inquired of a maker of fine glass in reference to the best glass, and he said there was very little change in the price of the best glass, but that the ordinary glass had gone down. I remember quoting the *Times* as regards the falling off in the value of glass in Charleroi, where the result was that there was a sort of revolution from the change in the supply, and that was in consequence of a most extraordinary invention which is there described. I do not want to go more minutely into other articles. It seems to me that when you go through the list you find the same everywhere, that there have been ample causes for the fall throughout the whole list of articles, one after the other. As you examine them, you find special reasons why they have fallen, and where there are no special reasons, sometimes you find even an advance, and sometimes the article is stationary. I mentioned the other day the case of cotton. That has been remarkably stationary in price since we got rid of the effect of the American war upon the cotton trade, and, as the Commission have heard from others, there are other articles which not only have not fallen, but which have a tendency to rise during the very period when we are told that gold has been scarce, and that in consequence of that scarcity there has been a great fall of prices. Well, of course, if the fall in prices was caused by a scarcity of gold, the effect should be, practically, on all articles, not merely on certain articles out of the list, but on all important articles, and you do not find that to be the case.

7815. (*Mr. Chaplin.*) You said just now that there was sufficient reason to account for the fall in price in almost every commodity?—So far as I am aware.

7816. And apart altogether from any scarcity of money?—I am only speaking about the scarcity of gold. What I meant was, the more you examined into each article which has fallen, the more clear it becomes that there are other causes which have led to the fall, and that there is no occasion to go to money in order to account for the fall.

7817. Among those causes you include the rate of exchange?—Yes, I think there are cases where the rate of exchange has had the effect of increasing supply.

7818. (*The Chairman.*) You come now to exceptional cases where the prices have not fallen?—Yes, but I should like to refer to what Mr. Tooke has said with respect to former cases of great fluctuation of prices. I cannot expect the Commission to read

Mr. Tooke's history of prices; it is much too long a book, but there are passages in his work in which he analyses the causes of fluctuation at previous periods, which I think are well worthy the attention of those who have such an important question before them. They show most clearly that there were in former times, before this question arose at all, most extraordinary fluctuations of price, far more wonderful than those which we see now.

7819. You mean at the time that there were no monetary changes?—Well, when the monetary changes were unimportant at any rate, but when there were extraordinary fluctuations owing to war, and various changes of that kind. I will mention one or two.

7820. (*Sir T. Farrer.*) And seasons especially?—Seasons. In regard to corn that was what he laid great stress upon throughout his book. Of course the condition of things at the end of last century was peculiar. At this time people seem to think fluctuations are very bad, but what we should have done at the time of our forefathers I cannot think. To quote my own words, p. 33, note, "It can hardly be disputed that fluctuations of price were more severe in former than in recent times, the influence of modern discovery tending towards far greater uniformity of supply in different parts of the world. At any rate, fluctuations were formerly excessively rapid and violent, as may be seen throughout Tooke's great work. If supplies fell off, they could not easily be filled up before the days of steam and telegraph, nor could a superabundance be easily removed. So, in the early days of the century, a good harvest would cause a terrible fall in corn, and a bad year would be followed by famine prices. The history of British India is full of illustrations of an excessive diversity of price under one Government, and there can be no doubt that the railway, the steamer, and the telegraph have done more to prevent local famines than any action of Governments." Now take these few figures:—Cotton, in 1782, was from 2s. to 3s. 6d. a pound; in 1800, 2s. 3d.; in 1810, 2s.; and in 1822 it fell to 11d. Copper was 84s. a cwt. in 1782; 140s. in 1800; 160s. in 1810; and 100s. in 1822. Iron was 6l. a ton in 1782; 5l. 10s. in 1800; 8l. in 1810; and 6l. in 1822; but it rose to 12l. in 1825. Rice was 25s. a cwt. in 1782, with a duty of 7s. 4d.; 40s. in 1800, when it was free; 30s. in 1810; and 20s. in 1822. Sugar was 50s. a cwt. in 1782, with a duty of 12s. 3d.; 35s. in 1800, with a duty of 20s.; 40s. in 1810, with a duty of 29s.; and 30s. in 1822, with a duty of 27s. Tea was 5s. a pound in 1782; 5s. in 1800; 3s. 6d. in 1810, with a 96 per cent. duty; and 3s. in 1822, with a 100 per cent. duty; and wheat was 50s. in 1782; 100s. in 1800; 90s. in 1810; and 40s. in 1822. And then there was a very great outcry in regard to the ruin that was coming upon everybody, and very shortly after that there came a bad harvest, and everything was put on its legs again, as far as the condition of the agricultural world was concerned.

7821. (*Sir T. Farrer.*) A bad harvest was at that time good for the agriculturist, a good harvest good for other people?—Mr. Tooke goes through many cases where he gives the number of millions added to the agricultural interest by the rise in prices. And some of us can recollect when wheat was 90s. a quarter and upwards, and how great were the changes in our own times. And no one will suggest that these fluctuations were caused by anything but ordinary commercial or political causes. I say that from a careful analysis of the prices that I have made, it seems that in all these cases, without an exception, one can find ample causes for the fall in price, without going to the question of money at all. With regard to articles that have risen or tended to rise, there is no doubt, till a very recent period, meat for instance was very high, and I think Mr. Chaplin will bear me out, that up to 1883 meat was very high indeed, and the price of stock was very high.

7822. (*The Chairman.*) At all events you say as high as it was in the period prior to 1873?—Yes, and a great deal higher than I can recollect. But what I

Mr.
W. Fowler.
11 Nov. 1887.

Mr.
W. Fowler.
11 Nov. 1887.

mean is that beef is a first-rate article, and if gold was scarce, and was to drive everything down, beef ought to have fallen. When I first began housekeeping I paid 6d. a pound for my beef.

7823. (*Mr. Chaplin.*) It has fallen very much now?—That has been a sudden fall. Everybody was complaining of dear meat for a long time.

7824. A gradual fall. Sellers are all complaining of low prices of stock?—That may be. I think up to 1883 stock sold well and meat was very dear. Mr. Chaplin says a gradual fall, but a very decided fall has taken place in a short time both in the value of stock and meat. I should just like to read this list of articles, the comparison of 1854 and 1884, in all of which cases there was a tendency to rise:—Bacon, beef, brandy, butter, cheese, cocoa, coffee, cotton, currants, eggs, hides, oats, oxen, pepper, potatoes, raisins, sheep. It is a very curious list, but I take it as I find it. Those are imports into the United Kingdom. And then there is another list:—Beer, cloth, fire-arms, fish, horses, leather, salt, silks, spirits, yarn (cotton), yarn (linen). Those are exports which between 1854 and 1884 tended upwards, the same date as the others. Now all I say is without pledging myself to every one of those cases as very important, they seem to me to destroy the theory that you have a cause which is always tending to depress prices all round. If it was so, it seems to me that such a number of articles, in the absence of some very extraordinary causes in each particular case, would have tended downwards with the others. Why they have not tended downwards with the others is easily explained, I believe, by the fact that there has been a very large demand for many of these articles.

7825. (*The Chairman.*) And no such increase of the production as to necessitate a fall?—In the cases that I have referred to before there has been an immense supply which has driven the article down, but as I said, if it was some overwhelming cause like the scarcity of money, surely it would be universal and obvious in its effect.

7826. (*Mr. Chaplin.*) You tell us that these imported commodities that you name have risen between 1854 and 1884. Are you in possession of figures to enable you to tell us what they have done between 1873 and 1884?—I have not those figures at hand at the moment. I could easily procure them.

7827. You do not know whether they have risen since 1873, or whether they have fallen?—Some of them have certainly not fallen materially.

7828. Some of them may have fallen?—Some of them may have fallen, but I cannot tell you exactly how that is.

7829. Then you cannot tell us what really has happened to these commodities since the time when silver was demonetized?—I am very sorry it did not occur to me to do that. I would have done so with pleasure. But as regards many of these articles it is notorious that they are still high, some of them, I apprehend, not so high as they were in 1884.

7830. But still what I want to get at quite clearly is this, that as regards these commodities which, you tell us, have all risen between 1854 and 1884, as between 1873, when silver was demonetized, and the present time, you are not able to tell us whether some of them have not actually fallen?—I have not got the figures before me at the moment which tell you that, but I could easily procure them for you.

7831. (*The Chairman.*) Is there any other specific article to which you wish to call attention?—I do not know that there is any special article that I wish to mention particularly. I only mention this fact, that some articles have risen as not to be lost sight of in the question of prices, but I must say I give much more importance to the fact that the great fall can be explained in each case without reference to the question of money.

7832. In your judgment what have been the causes, speaking generally, of the recent fall in prices that are not related to the scarcity or plentifulness of money?—Well, I think one considerable cause has

been that we have now, since 1873, come into the full effect of competition with other countries. I think before that time the condition of Europe and various circumstances had tended to this result, that we did not know the full effect of the competition to which we were exposed as a nation, and of the inventions and discoveries which, even up to that time, had been made, and, of course, there have been many inventions and discoveries made since 1873. But I think since the Franco-German war was concluded, during the long peace, we have realised, as it were, our position, and the competition between one nation and another has become intensified to an extent unknown in former periods in the history of commerce, and that is one cause which has led to a great fall in prices in some of the greatest articles of consumption. Then the second cause, which to my mind is the important cause, are the inventions, and above all things, of course, the inventions arising out of the use of steam and the telegraph. I sometimes think that we hardly realise, until we examine into it, how prodigious has been the change in the times in which we have lived as regards the supply of articles.

7833. That, it would be said, had occurred prior to 1873?—I should like, if this is the right time, to refer to that remark. It is quite true that some inventions had been made before 1873, but I do not think that they had come to their full bearing till after 1873. I should like to read a general observation made by Mr. Laughlin in his remarkable essay in *The Quarterly Journal of Economics* of Boston on that question (April 1887, p. 339). He says:—"Surely no one will contend for a moment that improved processes in particular industries will not lower the value of commodities relatively to gold, if gold has remained unchanged in its conditions of production. This would lead one to suppose that the prices of many articles before 1873 must have shown a fall, had it not been for the vast extension of speculation and overtrading and the influences of the new gold. But now that the inflation and abnormal conditions of the previous period have been left behind, the effect of improvements has become more clearly apparent. In fact, when one considers that, with all the unparalleled development of cheapening processes since 1850 in almost every industry which ministers to human wants, prices are no lower or, by the Hamburg figures, even 10 per cent. above the level of prices in 1847-50, one is penetrated by the conviction that prices are still buoyed up by the high tide of an abundant gold supply. Else why should prices not be much lower than in 1850? 'If, under such circumstances,' says Cairnes, 'prices did not fall, that could only be because money had not remained the same, but had fallen in value.' Or it would be more correct to say that the cost of producing money had fallen; for, if prices are now nearly the same as in 1850, in reality the cost of productions of both commodities and money has fallen, leaving them relatively to each other in very much the same position as in the beginning. When we once fully apprehend the influences of the progress of society on prices we cannot admit that a fall of prices is connected in any necessary way with a scarcity of gold." I do not know whether it is necessary to go with much minuteness into what is so clear, but I think some things mentioned by Mr. Wells, as referring to the railways, are very interesting. I referred to several of the facts in my paper, but I prefer to give another authority rather than my own. He says, speaking of the reduction of the cost of transportation: "The investigations of Mr. Atkinson show that, 'had the actual quantity of merchandise moved by the railways of the United States in 1880 been subjected to the average rate per ton per mile which was charged from 1866 to 1869, the difference would have amounted to at least 100,000,000*l.*, and perhaps 160,000,000*l.* more than the actual charge of 1880. Comparing 1865 with 1885, Mr. Atkinson further shows that, taking a given weight of goods to be moved from Chicago to New York, 1,000 miles by the New York Central Railroad, 58 per cent. of

" the original value was absorbed in transportation and depreciation of the currency in the former year, while in 1885 only 20 per cent. was so absorbed, the charge per ton per mile having fallen from 3.45 cents in 1865 to .68 of a cent in 1885. The fall in price for the carriage of commodities by sea has also been as remarkable as the decline in the cost of carriage by land. Freight, on the average, between Calcutta and England had experienced a decline of about 50 per cent. in 1885 as compared with 1875. In the case of Indian wheat transported to England *via* the Suez Canal, the decline in freights was from 71s. 3d. per ton in October 1881 to 27s. in October 1885, or more than 63 per cent. Between 1873 and 1885 the tolls and pilotage on the Suez Canal were reduced to the extent of about 33 per cent.; but this, it should be mentioned, is an element included in and not additional to the decline in freights. Freights from New York to Liverpool declined from 1880 to 1886 as follows (maximum and minimum): On grain, from 9½d. to 1d. per bushel; on flour, from 25s. to 7s. 6d. per ton; on cheese, from 50s. to 15s. per ton; on cotton, from ¾d. to ¼d. per pound; and on bacon and lard, from 45s. to 7s. 6d. per ton. Subsequently, prices recovered somewhat, but by no means to the extent of the rates current in 1880 and preceding years." I do not think it is necessary to dwell very minutely upon that excepting to this extent, that it is a fact which is of the very first importance; I think it is perfectly clear that but for the railways, the wheat from the western states of America could never have come here, and but for the cheap freight by sea probably it would never have come here. And so with India. Indian wheat would never have come here but for the low rates by railways in India and the low freights of steamers. I know it will be said those would not have been brought here but for the exchange. I am not to discuss that for the moment, but it is obvious that no fall in the exchange would have brought the Indian wheat if there had not been also this extraordinary reduction of charge for carriage both by land and by sea.

7834. (*Mr. Chaplin.*) You have told us of the fall in the cost of transport in the case of Indian wheat, could you tell us what proportion the fall in transports bears to the value of the article imported, that is to say, what was the original cost of transport and the value of the article?—I cannot tell you that; but I was talking in Manchester the other day to a gentleman largely engaged in the cotton trade with India, and he told me that the reduction in the rate of freight by railway in the last few years had, in many cases, been as much as 50 per cent. as compared with the old rate by railway.

7835. (*The Chairman.*) Yes, but Mr. Chaplin asks if you can say what proportion the rate bore to the cost of the article?—I cannot off-hand say, but I could easily discover that for you by inquiry.

7836. (*Sir John Lubbock.*) You have spoken of exchange several times; do you mean exchange strictly so called, or are you alluding to the fall in silver?—I was alluding to the fall in silver affecting the Indian exchange; I was not referring to anything else but that, and also according to Mr. Gibbs' view, affecting the shipments from Chili and Russia.

7837. A fall in exchange, strictly speaking, is quite a different matter, is it not?—Yes. Now I mention some figures with regard to the shipping. I looked at the Joint Stock Returns for 1883, and I found that there were three millions and a half paid up by shareholders in one year in limited shipping companies, besides bogus companies, and Mr. Williamson, whose testimony I am very glad to take, because he is opposed to me on this question, says:—"That the combined capacity of our sailing and steamships was in 1875, 9,975,000 tons, and in 1883, 14,646,000 tons," an increase altogether "wild and unjustifiable," and that of course has led to an immense reduction on freights. It may be interesting to give the figure of 1874 and of later years as regards

the net tonnage of the United Kingdom in the Eastern trade.

REGISTERED NET TONNAGE sailed from the United Kingdom to India, China, and other Eastern Ports, and the Australian Colonies.

		Sailing Ships.	Steamers.
		Net Tons.	Net Tons.
During the year	1874 - -	1,626,792	654,498

And then of course everybody knows there is an extraordinary economy, so that one steamer will probably take as much stuff, with the same labour, as two would have done a few years ago. All these things, combined as they are with a great saving of capital through the mode of doing business by telegraph, have led to a complete revolution of business, a change so great that one often wonders that the disasters have not been greater in the commercial world.

7838. (*Sir T. Farrer.*) You are now speaking, are you not, of changes that have taken place since 1873. I mean you are rather addressing yourself to that point?—Well, I say since 1873, and also the result of inventions that took place before 1873, which have developed especially since 1873. It is absolutely impossible to draw a line and say that these things only began to operate in 1873. I do not think anything of the kind; they have been freely going on, gradually developing, and I think the full effect of the inventions is now being felt in a way it never was before.

7839. (*Mr. Chaplin.*) Do I understand you to say that in your opinion the effect of the great changes in the inventions of science is felt and has been felt more since 1873 than it was before?—I think decidedly more for one reason if for no other, namely, that Germany has developed in an extraordinary degree since the Franco-German war. That alone has been a continual cause of anxiety to English merchants; I mean the great development of German industry and enterprise. France is also active in certain respects; all these countries are competing with us.

7840. And you hold it is only since 1873 that their full effect has been felt?—I think their effect was decidedly felt before, but it has been felt more since; and I attribute that a great deal to the comparative quiet that we have had, and the removal of the chances of war from the German mind.

7841. (*Mr. Barbour.*) But would not the great burden of the French and German military system affect them in their competition with England?—Undoubtedly it does. I do not know what the power of Germany would be but for that.

7842. And France has suffered from that cause?—France is suffering terribly, no doubt. I think the competition with England, if Germany and France were like the United States, would be far more intense than it is now. With regard to the telegraph, I should like to mention an anecdote which is of some interest, I think. In the year 1877 I met at Pitlochry, in Scotland, a partner in one of the first houses in the Eastern trade, and in the American trade, and he said to me:—"I can do my Eastern business with one-fifth of the capital I used to do it with." I said, "How is that?" "Oh," he said, "everything is done by telegraph, and there is no necessity to keep the stocks

Mr.
W. Fowler.
11 Nov. 1887.

Mr.
W. Fowler.
11 Nov. 1887.

" of goods that used to be kept, and I do my business " with comparatively little money. I bring the money " home." About the year 1882 I mentioned this remark to his brother, who was a member of the House of Commons, and he said:—"Yes, it is quite true, " but the difference now is that our function is " gone, nobody needs us at all; a great deal of our " business has gone away, and a small man in Manchester telegraphs to a small man in Calcutta, and " the business is done without the intermediary " of the great merchant at all, and practically with " hardly any capital except the capital of a bank " advancing money on documents, or something " of that kind." So that the change in the trade, especially with the East, is great. I suppose the same thing would apply in the American trade. I remember Mr. Morgan saying to me, some years ago, that he did not believe in the American trade, that there was one-third of the bills running that there used to be in the old days for a given amount of business, so much of the payment and so much of the work being done by telegraph. I suppose you must consider that a great advantage to the world, but it produces great inconvenience and loss to individuals.

7843. (*Mr. Birch.*) I do not exactly see that; will you explain where the loss to individuals would occur?—Well, where a merchant loses his business, I mean.

7844. (*Mr. Montagu.*) Two small merchants would get it perhaps?—Yes, but the big merchant loses the business, does he not?

7845. (*Chairman.*) Is there any other point on this appreciation of gold which you wish to observe upon?—There is only one thing. I have heard it said, "We do not want to raise the prices by making this change."

7846. Is not that coming rather into the question of bimetallism?—No, I think not, except that they are so closely mixed up together. I only want to make one observation. It was said to me one day by a very intelligent man, "I do not care about raising prices, but " what I do want is to prevent a further fall." Well, if the description I have given and the description which is elaborated in these papers of Mr. Wells is true, I cannot imagine how any such change as is proposed could prevent such falls as we have seen in prices through the causes which have been mentioned. I do not think, supposing we wanted to check a fall of prices, that we could depend upon effecting any such change through altering money in any way. If prices do not depend upon the condition of money but upon the condition of credit, on supply and demand, on rapidity of production, and on rapidity and cheapness of distribution, then to alter the value of money in any way would not prevent a fall, and would not have prevented a fall, so that really we come back to the great question, about which I am anxious to bring out the view that I have taken, namely, that price does not depend mainly, and depends only exceptionally on merely monetary questions.

7847. (*Mr. Chaplin.*) Do you hold, for instance, that the suspension of the Bland Bill in America would have no effect upon the prices of commodities?—I am not prepared to say it would not have a temporary effect in this way, that if you repeal the Bland Bill you might put upon the market a great amount of silver. What the effect of putting on the market a great mass of silver would be, I cannot say. I think it very likely that it would depreciate silver even more, and might for a time cause great disturbance. I have never said changes of money would not cause temporary disturbances; what I say is that the permanent changes of prices are dependent not upon money, but upon supply and demand.

7848. I gather from your evidence that, except in a very small degree, you do not attribute the fall in prices in any way to the scarcity in gold?—No, because I began by saying that I do not think there has been a scarcity of gold, and that it is begging the whole question to say that the fall of prices is caused by the scarcity of gold.

7849. (*Mr. Barbour.*) Would you also say that if there had been a scarcity of gold it would not have had much effect upon prices?—Well, I should imagine cases where it might have great effect if it produced discredit in a country.

7850. A temporary effect?—A temporary effect, and a very important effect. We have seen a very large fall in prices in 1857 when gold was very plentiful.

7851. It was recovered from?—It was recovered from.

7852. But you think that scarcity of gold would not have an effect upon prices?—I do not think it would permanently.

7853. (*Chairman.*) If it were large enough to support the credit which it now supports, or any increased amount of credit which increased business might demand?—Yes. It might be interesting to the Commission if I mentioned that when I first came to Lombard Street it was a common thing to have the bank reserve down to 4,000,000*l.* or 5,000,000*l.* for weeks and weeks together. We got accustomed to it, and the rate of interest was six and seven per cent. for a long time; but by degrees people have got afraid of that state of things, and now we consider it a bad thing if we have less than 10,000,000*l.* of reserve. I mention that only as showing that I do not deny that gold has an important effect as a maintainer of credit.

7854. (*Mr. Chaplin.*) Then I understand you to hold this opinion, that an addition to the monetary mass of gold in the world would have but very little effect upon the prices of commodities in general?—Yes, but you must bear in mind there is this qualification. Take, for instance, the Australian discoveries. You have a sudden influx of precious metals. You may have a great demand for commodities, and that may cause a very active business to arise, as did happen after the discovery of gold, but it did not in my opinion permanently affect prices, except indirectly, by causing great demand for commodities. It was not the quantity of gold *quâ* gold, but it was the excitement of business, the speculation that it caused, and the demand caused by the enormous consumption of the miners and other people connected with the discoveries.

7855. But then you do admit this much, at all events, that a large addition to the monetary mass of the world would, even though only indirectly, probably create some rise in prices?—I think it did create a rise in prices.

7856. You admit that the discoveries of gold in California undoubtedly produced a rise?—But I dare say you are aware that it was nearly 100 years before the Spanish American discoveries in the middle ages had any effect whatever on the prices in Europe. That is what I think is laid down by Adam Smith.

7857. (*Sir T. Farrer.*) And that at a time when there was no such development of credit as there is now?—It would be much quicker now than it was then, because with the communication of the world the whole thing would operate much more quickly.

7858. And be more quickly exhausted?—That may be.

7859. (*Chairman.*) On the point Mr. Chaplin just asked you about, if the increase in the production of gold simply arose from an increased supply from existing mines now in process of being worked, so that the supply was, we will say, doubled in that way, I understand you in that case to think that no material effect would be produced on prices?—I think if you had a very rapid and constant production of gold leading to excessive demand for all kinds of commodities, it would affect prices.

7860. Supposing the supply were doubled, and rose from 20,000,000*l.* to 40,000,000*l.*, the world's supply now, but got from the same mines simply by an increased production, that might create perhaps 20,000,000*l.* additional demand for commodities, but that 20,000,000*l.* would form but a very small proportion of the total demands spread over all commodities all over the world, and might not, you

think, produce any sensible effect?—It might produce no great effect now, because the total amount of gold now is so far greater. I think I proved to you from Tooke, as far as I could prove anything from quotation, that adding 174,000,000*l.* between 1848 and 1856 had no sensible effect on prices whatever, and that upon a total stock of gold of 560,000,000*l.* in the world. Now you are far above that; therefore, an addition of 20,000,000*l.* is a much smaller per-centage, and would not produce, I think, any material effect upon the condition of prices.

7861. But would you compare as to its effect the 20,000,000*l.* with even the existing stock of gold; would you not have to some extent to compare it also with the credit which is supported?—Oh, certainly. I should have said that as regards the influences upon prices. If I am right in my view about the causes which influence prices, the total that you have to deal with is so enormous that it is very difficult to calculate; because the credit which is floating about in this country, for instance, is an aggregate, in comparison with which the bullion that we possess is a mere nothing.

7862. (*Mr. Chaplin.*) What you mean, I understand, is this, that the mass of actual legal money as compared with the commodities of the world is trifling?—That is quite true; but then I think I explained last time that what you have to consider is not merely the strict money, the bank notes and the gold, but you have to consider the cheques and the bills, and the credit which does the business of the world. Now we have had in our own country hardly any increase in the bullion held by banks in the last 40 years.

7863. But although the bullion, as you term it, is comparatively small, I yet gather from you that any large addition to the gold of the world, any large fresh discoveries of gold either in existing or new mines, would indirectly have a certain effect on the price of commodities?—I think it might. I do not prophesy that 20,000,000*l.* might have any sensible effect, but it might have some effect, judging from what happened in Australia and California.

7864. Judging from what happened in Australia and California, you think it might have some effect on prices in the future, though not a large one?—I think I explained where I think we have gone wrong in our views about prices is this, that we dwell upon the quantity of money as the great factor, I do not believe that it is the great factor.

7865. Supposing that instead of large new discoveries of gold the silver which has been demonetized was to be remonetized by law, would that have the same sort of effect as you think that large new discoveries of gold might have?—I should think it excessively difficult for any man to prophesy what the effect would be. I think, if I am not anticipating what is coming afterwards, that one effect might very likely be that we shall lose all our gold.

7866. I will put it in this way to make it clear. If by fresh legislation you restore to silver the same legal financial position that is now occupied by gold at a given ratio between the two, would that have anything like the same effect as large discoveries of gold?—No, I do not think it would, because I do not think that as far as I can make it out there is any such large amount of silver as would have any important effect.

7867. I am not limiting myself at all to the silver that is already coined or in circulation, but I am speaking also of the silver in the mines as well. I want to know whether, if the silver in the mines and the silver in circulation was all given by legislation the same position as that which is now occupied by gold, would not the effect be the same as large fresh discoveries of gold?—The last output of silver that I have a record of was, I think, about 20,000,000*l.*, rather more than 20,000,000*l.* I cannot pretend to prophesy what the effect of that would be upon prices. I do not know.

7868. At all events, you are not prepared to say that it would not affect prices?—No, I would not like

to say it would have no effect, provided it did this: if it produced a great additional demand for commodities. The mere addition of so much money without the result of an extra demand for commodities would not, I believe, affect prices much.

7869. But you think that the addition of a large sum of gold indirectly would have a certain effect upon prices, and now I understand you to say that if silver was made a legal money in the same way as gold that that would have the same effect?—I think it is extremely difficult to say, because I say that, taking by far the most careful analysis ever made of the first discoveries of gold, which were enormous between 1848 and 1856, Mr. Tooke says that though gold was of course money at once, it had no effect upon prices. Now that being so, I am not going to pledge myself to say that even the remonetization of silver, of the new silver, would have a serious effect upon prices; I am not at all sure that it would.

7870. (*Chairman.*) But supposing you remonetize silver at the existing ratio—say 20 to 1, would you explain how that could have any effect in raising prices?—You would have so much more money of course, I suppose, to work with; that would be the only way in which it would operate.

7871. How could it operate, because now the man who has the silver could turn it into gold or get credit for it at the ratio of 20 to 1; how could your remonetizing it at the ratio of 20 to 1 have any effect upon prices?—I am not at all sure that it would. I cannot see how silver turned into money would be different to silver as it is now. Take a miner at the present moment. He sells his silver, he gets money for it, he gets the power of buying other things as it is now; would he be in any different position if you called it money? I apprehend all that would occur would be this, the man would get rather more for his silver than he would get now.

7872. (*Mr. Chaplin.*) What does gold derive its value from now, its legal status or its intrinsic value?—You raise there a question of extreme difficulty, that would be a very large question to enter upon.

7873. But it is the question that you have been arguing. What I understand you to say is this, that if you gave silver the same legal status as gold occupies in this country just now, that its value would not be increased?—Well it would be increased to a certain extent of course, because the man would get more at the mine than he does now.

7874. (*Chairman.*) Would he if you monetise it at its present ratio? My question was if you monetise it at its present ratio could that have any possible effect upon prices?—I do not see how if you put it that way he could get more than he does now for his silver.

7875. (*Mr. Chaplin.*) You admit that large discoveries of gold, either in fresh mines or in existing mines, would probably add something, though not much, to the prices of commodities?—For a short time they might, judging from the effect of the Australian discoveries, where I am told that they had, at first, some effect. But I wish you clearly to understand that in 1856 it was the opinion of the best authorities that it had no permanent effect on prices whatever.

7876. Well, then, I will ask you this; in your opinion would the adoption of what is known as the bimetallic theory have the same effect, whatever that effect may be?—Well, my reply must be this, that I do not believe that an increase of the amount of money in the strict sense of bullion or coin would have a permanent effect upon prices. It might, judging from the effect in Australia and California, have an effect for a short time, but having regard to the very slight effect, if any, which was caused by the immense discoveries of gold between 1848 and 1856, I do not believe that the change proposed, though it might cause immense inconvenience and confusion of all kinds, can be depended upon to materially raise prices.

7877. Then it might raise prices temporarily?—I cannot make a prophecy as to what would happen,

*Mr.
W. Fowler.*
11 Nov. 1887.

Mr.
W. Fowler.
11 Nov. 1887.

but I think it is conceivable that such a great change might cause, at first, a great speculative feeling. I believe the price of stocks and shares, for instance, might be materially affected. Suppose the immediate effect was to cause a large addition to the banking reserve of the Bank, for a time it might cause an idea that we were going to have very abundant money for a considerable period, and that might raise stocks and shares very much, but I greatly doubt whether it would have much effect upon the price of commodities.

7878. And I suppose might produce speculation which might affect the price of some commodities at all events for a time?—Yes, but a violent speculation would be certain to be followed by a violent relapse, which would cause a great fall.

7879. But whatever the effect was or whatever it was caused by, you think that the adoption of the bimetallic system would have the same effects as large discoveries of gold?—I am not prepared offhand to say that it would, but I think it is possible that it might have a considerable effect, and that is one of the things of which I have been fearful lest it should have the effect of inflation, causing the idea that we were going to have a new supply of money in the money market; and we know very well that if once that idea got abroad, stocks and shares would be affected, though I apprehend that the price of stocks and shares is very different to the price of commodities, as being much more influenced by other causes than are commodities, and I believe that in the end the real price of articles would be settled by supply and demand, and not by any alterations in the standard.

7880. That is permanently?—That is permanently.

7881. But temporarily they would be affected?—I can conceive a change temporarily taking place, and I think any man would be very foolish to attempt to prophesy what the exact consequence of such a change would be.

7882. (*Mr. Barbour.*) When you say it would cause great variations do you refer to bimetallicism at 1 to 15½ or at the ratio of to-day?—I mean anything which would give the idea that we were going to have a new supply of money, that is, stuff on which the Bank of England must issue notes; anything which gave that idea in the monetary world would in my opinion tend to cause inflation and speculation.

7883. But do you think that if the market ratio of to-day were adopted that there would be any such impression as that?—I cannot tell you. I think very likely there would. That is one of those things as to which it is very difficult to prophesy what the consequences would be. I am very much inclined to agree with Mr. Montagu, that the consequences might be much less than you suppose in that way, but they might on the other hand be very serious, because you would have an addition of 20,000,000*l.* yearly as I understand it. The silver from the mines would have a different position in this country to what it had before.

7884. (*Sir John Lubbock.*) You expressed the opinion the other day, at question 7722, that the public have a most exaggerated idea of the effect of the quantity of money on prices. "I believe, speaking generally, that the quantity of money has remarkably little to do with it, except so far as it affects credit, and that the great factors in all prices are the supply and demand of the article you are going to deal with." And you have expressed the same opinion to-day, I think, several times; but would you not admit that the price of, say cotton in gold, depends on the supply of and demand for cotton on the one hand, and gold on the other, so that the relation between the two would depend on changes in the supply of and the demand for cotton on the one hand and gold on the other?—No; I doubt it.

7885. Why should you think that the relation between the value of gold and of cotton would depend upon the changes in the supply of and the demand for the cotton, and not on the supply of and the demand for the gold?—Well, I consider that the prices are

affected far more by the condition of credit; far more than they are by gold.

7886. That I grant. I quite admit that the supply of and the demand for the cotton would be much more fluctuating than that for gold, but as there must be fluctuations in the supply and demand for gold as well as the supply and demand for the cotton, although in much less degree, I fail to see why you should consider that the relation between the two was affected by the change in the supply or demand for the cotton, and was not affected by the change in the supply or demand for the gold?—It is clear that any one year's supply of gold compared with the total gold floating is very small, but the supply of cotton being used up every year, any addition to the new supply is of great importance.

7887. Granted; and that is the reason why, as I admit, the supply and demand for cotton would have a much greater effect upon price than the supply and demand for the gold, because in the one case the supply makes so very much less difference upon the stock, but still, so far as it goes, would you not admit that the supply of and demand for the gold must also affect the price?—I cannot connect the two things. The price of cotton depends on the supply and demand in the cotton market. No man asks about the gold when he goes to buy cotton.

7888. Then I may take it that you are prepared to affirm that although the relation between cotton and gold does depend upon the supply of and demand for the cotton, it does not depend in any way upon the supply of and demand for gold?—I do not think it depends in any way on the supply and demand for gold, excepting when that supply and demand affects credit, and the condition of the money market, so that a man, for instance, going to buy cotton is afraid to buy. That has arisen before now, everybody wanting to sell and nobody wanting to buy because the Bank of England is in trouble, that is to say, the reserve in the Bank of England is too low, everybody is frightened, business is affected, credit is bad, and so the market is affected; but as to any direct connexion between the quantity of gold and the quantity of cotton I, judging with the greatest care possible, and upsetting all my own old theories, fail to see it.

7889. You contend, if I understand you rightly, that the low rate of interest which has prevailed of late years, disproves the view that there has been any appreciation of gold?—I say that it points very strongly in that direction. I do not know that I used the word that it disproved it. I certainly think that, judging from a very constant watching of the money market, the evidence goes to show that there has not been any scarcity, seeing that ours is a bullion market, and that if we want bullion we have to raise the rate of interest to get it; and we have had to raise it less within the last 13 years than we had in the 16 years previous.

7890. And you think you cannot have an appreciation of gold and a low rate of interest?—I did not say that.

7891. I rather understood you to think that the low rate of interest was an argument against there being any appreciation of gold?—I think it is, so far as it goes, that it tends to show as a matter of fact that there has been no scarcity, and I understand the appreciation to mean that it is scarce. I think that the low rate of interest tends to show that there has been a sufficient supply.

7892. (*Sir T. Farrer.*) Sufficient in proportion to the demand?—Yes.

7893. (*Sir John Lubbock.*) Let me put this case to you; you do not deny the possibility of an appreciation, but you think that the evidence is against it; that is what I understand?—Yes.

7894. Well, the rate of interest between two contiguous countries, such as England and France, we will say, would generally bear a definite relation to one another, would it not?—Well, I have often thought they did not.

7895. Could there be permanently any great difference between the rate of interest in two first-class countries?—Yes; I have known the time when we have had money dear in London and cheap in France.

7896. Just for a time?—For weeks and weeks together.

7897. Not for years?—I think for a long period about 1864 and 1865 the bank rate in France was below ours. There was, I think, a difference of three per cent.

7898. That was a very exceptional period, but as a general rule and for best bills does not the rate approximate?—I suppose the tendency must be that way, because the French will buy our bills if they get a profit on them; they do buy them.

7899. Well, supposing our gold currency remaining at the same value, supposing the French have a silver currency falling in value, would you consider that their rate of interest would fall in such a case, and ours would remain stationary?—Well, you see, the rate of interest depends on the demand for capital and the supply of capital in the money market, but that does not absolutely depend, does it, upon the character of the metal?

7900. That is just what I wanted to ascertain your view about, because I had rather thought that you had been arguing that the gold had not risen in value because the rate of interest had been so low. Then I put to you the case of two contiguous countries in which the rate of interest would be generally approximately the same, and I suppose that one of them has a gold currency which remains stationary, steady in value, the other a silver currency which falls 20 per cent. in value. I ask you then whether, in your opinion, the rate of interest would remain stationary in the one case and fall in the other?—You see the two things are not absolutely connected, because you may have the supply and demand for capital in this country, say, pretty even, and without any very great demand, and in the other country the same, though with different metals. The assumption is that prices rise in France, and in this country there is no change. Well, if prices rise very much in France, I suppose the effect would be that the French would buy goods here, would it not? I do not quite understand how you wish to put it to me. I am not quite clear what the connexion would be, because you might mean that the supply and demand for capital in the money market have not affected the rate of interest materially for a long time after you had got a depreciation of the silver. That would cause a rise in prices, and in the end might affect the money market, but exactly how it would affect the money market is not easy to trace out in the first instance without more consideration.

7901. Then in that case the rate of interest would depend more upon the amount of capital than the actual value of the currency?—I think it does; and all I said was this. I said I did not see any evidence in our money market of a scarcity of bullion, seeing that ours is a bullion market, and if we want bullion we have got to pay for it. That is all I said. I did not say that the condition of the money market was an absolute evidence that there might be no change in prices. I did not go into that question. I merely said that as far as I could see there was no evidence from the money market of any scarcity of gold. You know, of course, we cannot issue a single bank note without gold, and therefore we have to attract gold if we want the money.

7902. And therefore, whatever may be the case temporarily, the permanent rate of interest depends more upon the amount of capital than it does on the actual value of the metal of which the currency consists?—Yes, and of course it might happen that the metal might be changed. We have seen it ourselves; prices very high and a great demand for bullion, and we have seen prices very low and no demand for bullion.

7903. (*Mr. Montagu.*) At pages 7 and 8 and at the commencement of your book you state your surprise that there was no advance in silver from 1852 to 1857. I would ask you how could silver rise when France had enormous quantities of five-franc pieces available for the exchange of gold?—Well, I merely mentioned that as an illustration of the extraordinary way in which you may have a great addition to the quantity of gold, and yet no apparent change in the value of silver.

7904. But if you have a country with 100,000,000 fr. of silver available for the exchange, silver cannot rise above the price of that currency until that currency is exhausted?—Well, I know. What the operation was I am perfectly aware. I merely mentioned it as a curious illustration of how little the mere quantity of gold had to do with the price, even of silver.

7905. Then you quote Tooke, and you have said this, that the Australian gold discoveries had very little permanent effect on prices. Now are you aware that almost all the surplus gold from Australia and California went to France and to other parts of Europe in exchange for silver, and that silver was used up for exportation to the East, on account of the cotton famine, and therefore you might consider that the Australian gold actually disappeared in the shape of silver into India and China?—I do not quite understand what you ask.

7906. You adduce a statement of Tooke's to confirm the view that the Australian gold had no permanent effect upon prices in this country, but you lost sight, I believe, of the fact that the Australian gold filled the void created by the demand for silver, and consequently, could not have a permanent effect as it disappeared?—You do not mean the 126,000,000*l.* went in those years.

7907. I should think quite 100,000,000*l.*?—It may be so. I think it is a stronger illustration still of the great danger there would be in assuming that a sudden increase of gold would make an enormous increase in price, because the course of commerce is such that you do not know what the effect would be.

7908. But would it not be the case if a larger amount of gold were discovered that it would affect prices, providing that circumstances which affected the gold supply from Australia and California did not renew themselves?—I have great doubts about it for the reasons I have given.

7909. Now, you have constantly stated that there was no scarcity of gold. Would not that rather imply that there was no scarcity of currency, than that the actual metal gold was scarce?—There never is any scarcity of currency if you have credit.

7910. But I mean in the world. I suppose you infer that there was no scarcity of gold generally in the world?—I gave as an illustration the enormous increase in the reserves in the banks.

7911. Well, I am coming to that, but is it not the fact that, say, 180,000,000*l.* sterling of silver deposited in the various banks serves as the basis of the issue of paper money in those countries, and consequently renders available silver in the same way as gold, and frees gold to that extent?—It is quite true that if you were suddenly to say that no notes should be issued upon that silver it would of course cause considerable difficulty, but it does not follow upon that that gold is scarce.

7912. But supposing that from so-called natural causes silver was becoming so depreciated that it became generally discredited, the 180,000,000*l.* disappearing from all those banks as the basis of paper, would not that cause a great scarcity of gold?—Well, you are assuming that there is to be this prodigious supply of silver which is to upset everything.

7913. Not supply, destruction?—I have never advocated any destruction.

7914. Supposing silver was to cease to be the basis of bank notes?—I have never suggested that it should.

7915. I am not saying you have suggested that it should, but if no arrangement should be made

*Mr.
W. Fowler.*
11 Nov. 1887.

Mr.
W. Fowler.

11 Nov. 1887.

internationally that might arise, you would then admit that there would be a great scarcity of gold?—If you demonetize 180,000,000*l.* of silver for any reason it might have a serious influence on gold, I quite admit, that is quite possible.

7916. You state also in pages 11 and 12 that the new demand for gold which arose in America, Germany, and Italy was not an absorption of gold, and did not affect the supply of gold in other countries or tend to lower prices?—I say it is not an absorption in this sense that the money went into the reserves of the banks and therefore is useful as money.

7917. But is this quite correct. Does not an increase in area or in the number of people using gold affect the supply of gold?—It may or it may not. Now in our own country it would have very little effect, because credit does the work, and we are told there is a vast increase of credit, both in France and Germany.

7918. But surely if we are accustomed to carrying sovereigns in our pockets and the number of people wanting sovereigns was increased very materially, the demand for gold would be increased?—It is not in this country. I have shown that we are going on very comfortably, and the obvious increase of gold has been as nothing in this country for the last 40 years, and look at the population and wealth.

7919. You gave in your evidence a statement in regard to the large reserves of gold in the State banks of France, Germany, and Italy. Are you not aware that those banks will not part with their gold freely?—I am quite aware of that.

7920. And Germany will put a banker in the black list if he wants to export gold?—I know it.

7921. And that in Italy you cannot get any gold at all?—I have been told so.

7922. Would you then consider these reserves of gold in these different State banks as available as if they had been in this country or in other countries where they would be available?—It is not the same as it is in this country, but they issue notes against it, I understand.

7923. (*Chairman.*) Is it not as much in circulation as if it were gold and silver that was in circulation?—It is; but you cannot get at it for international purposes.

7924. (*Mr. Montagu.*) We are not speaking of circulation but actual gold. You maintain that gold, having been sent to Germany, Italy, and America, was not “absorbed.” Now Germany issued about the same number of notes against silver in those days and therefore would it not be the fact that gold was absorbed in the sense of being rendered less available?—It is less available for international purposes than it would have been if it had been here.

7925. Or than it would have been if it had been in France, say, where they part with it at a price?—Certainly; still it has not gone out of the world.

7926. (*Mr. Fremantle.*) It would be a domestic regulation?—Yes, it would be less available for international purposes, because they will not let you have it if you want to buy it.

7927. (*Chairman.*) But suppose they issue notes to its full value, it would not matter what country it was in?—Not internally in the least, the money will be just as available for the purpose of the commerce of the country as if it was in circulation; and I maintain that gold against which notes are issued in that way is not absorbed in the sense of being put under the earth.

7928. But for international purposes would not a man take a note, for example, of the Bank of Germany in this country, which was issued against gold there?—Certainly; and he could sell that note.

7929. (*Mr. Montagu.*) What I want Mr. Fowler to tell us, is whether the effect of the resumption of specie payments on gold by Germany, and Italy, and America, and if it should be also the case with Austria and Russia, would render less available the existing stock of gold if we wanted it?—I think that for international purposes these countries have taken a very benighted course, and have tried to keep their gold

to themselves more than we should, or more than France would, if that is what you mean; but I do not think it is absorbed in the sense of being gone out of the money of the world.

7930. But you say it has lessened the available supply which this country might look forward to. For instance, it might be the case, might it not, that if Germany, and France, and Italy wanted gold, we might raise our rate to a very high figure without attracting the gold from those countries?—I have been told it is so; that the German Bank will not discount bills for a banker who takes gold away, and of course, however foolish that policy may be, it is a fact; I believe it is a fact, and in that sense of course the gold has got an infirmity with it when it once gets into those banks, but I do say that the gold is not absorbed in the sense of being gone out of the circulation of the world.

7931. Then you mentioned that people were alarmed at the withdrawal of a million of gold from the bank; that you consider it desirable that the Bank of England should have a much bigger reserve of gold, and that it might pay the country to enable the Bank to have a larger reserve of gold; would it be possible, under the circumstances that I have stated, largely to increase the reserve of the Bank?—It is all a question of paying for it, in my opinion. I only made that as a casual remark, that I thought that our system was worked rather close sometimes, and that I have known the time when a million of money going from the bank caused interest to be raised and a great deal of disturbance and loss, and that I had made a remark casually many years ago, I think it was to Baron Rothschild, that I really thought it would pay the country to pay the Bank of England to keep a bigger reserve. I do not use it more than as an illustration.

7932. Is it not the fact that the withdrawal from the bank or adding to the reserve of the bank of two or three millions of gold, changes the money market completely? In your experience in later years have you not found that the withdrawal of two or three millions of gold from this country will tighten the money market, and raise the rate to a very high point in the endeavour to keep it?—There is no doubt that that has been so occasionally, but I must say nothing like so much as it was when I first came to Lombard Street. In those days, when the reserve, as I said just now, was kept at say 4,000,000*l.*, 5,000,000*l.*, or 6,000,000*l.*, a very slight export of gold caused a complete disturbance. At the present moment the reserve of the bank is very rarely under 10,000,000*l.*, and the consequence is that we retain a far more steady money market than in those days.

7933. I asked you last Monday if you could estimate the burden cast on trade by a rise in the bank rate of one or two per cent. Have you been able to arrive at any conclusion?—I have not. It is very difficult to say how many bills are going at any particular moment, I mean to say in the market, how many bills are waiting for discount, how many bills are discounted each day. You would have to calculate that, and then the currency of the bills would have to be considered. I think it would be an enormously difficult calculation.

7934. And besides that of course there would be the additional charge on all loans on the stock exchange, and the loans made by them to their customers?—The total additional charge to commerce of one per cent. upon the bank rate in certain states of the market must be a very large amount of money undoubtedly, but you are perfectly well aware that there are other states of the market where the Bank of England is almost powerless, and even if it raises its rate one per cent., the rate upon bills is hardly altered at all.

7935. Do you not think that with that burden thrown upon trade gold is purchased somewhat dearly, I mean the one, or two, or three millions that we endeavour to attract here?—I perfectly agree with you there. Ever since I have had to do with the money market,

I have said that I thought we kept our reserves much too low.

7936. And the recent rise in the bank rate from two to four, has it attracted any gold materially?—It has attracted all that was wanted, I suppose.

7937. It has not attracted half a million, I think?—I thought more than that, at any rate the money market from being tight has become quite comfortable.

7938. That rise has had the effect of increasing the bank reserve materially?—Increasing the bank reserve, certainly.

7939. (*Chairman.*) I suppose that might arise from the efflux ceasing and a small flow really taking place?—I will tell you, the real cause is that we are getting quiet about the American proceedings. We were afraid of a great demand from America. That fear has somewhat ceased by reason of the action of the Treasury of the United States.

7940. (*Mr. Montagu.*) Then you stated that you thought low prices advantageous. Do you not think that the state of transition, of declining prices, stops enterprise?—I have no doubt that declining prices are very unpleasant to those who have to produce, and that it does tend to diminish enterprise. But if what I have been saying is true, declining prices of later years have been inevitable.

7941. And the diminished enterprise and the smaller stocks of goods held, and the shrinkage of values generally, would account in a great measure for the decrease of bills of exchange, and the increase in the circulation?—I do not know. It has something to do with it, but I think, as I said on the last occasion, there is a vast increase in the amount of business done by cash.

7942. Then you spoke of the export of oats from Russia, owing to the paper exchange. Is not that of the same nature as what is complained of in the Indian exchange, and is it not the fact that the Russian rouble is maintained in value because the Government has been latterly reducing the quantity of notes in circulation?—You call it maintained; it is very low now.

7943. Supposing an international arrangement were made, say, for 20 years with the other great powers, establishing a ratio of, say, 20 to 1, that is what you allowed to be equal to 47*d.* per ounce, with identical mint arrangements, charging a seignorage of 1 per cent. on bar silver presented for coinage, directing the State banks to buy bar silver, say, at 46½*d.*, and to sell it at 46⅔*d.*, issuing notes against bar or coined silver held; do you see any objection to this plan?—I really must read that over carefully before I can answer it.

7944. (*Sir T. Farrer.*) You have been asked about the absorption of gold by Germany. I find in Neuman Spallart, a statistician of great authority, that the German clearing system, which only got into operation in 1884, had got so far in 1886 as to clear 600,000,000*l.* If this is so, does it not show that great economies of gold are in progress in Germany, and that there is probably room for much further progress?—I have no doubt that as the credit

system develops both in Germany and France, there will be a great economy of gold.

7945. And there is great room for that development in Germany and France?—Certainly. Now I will give you an illustration from what happened to myself when I was at Cannes two years ago. I was in a very large hotel,—the man was worth, perhaps, 60,000*l.* or 80,000*l.*, the whole hotel belonged to himself,—and I was talking to him one day about paying my bill, and I said, "Who is your banker?" "That is my banker," he replied, pointing to a big chest in the corner of the room. I said, "Do you not keep your money in the bank?" He said, "I lost 400*l.* by a banker who failed, and I will not keep a banking account. All my money I have here." I believe we have no conception of the extent to which that is carried on in France, the number of people who do not keep any banking account, and to whom the credit system is practically unknown.

7946. (*Mr. Birch.*) Surely the value of the currency has in a general way nothing whatever to do with the rate of discount in a country?—No.

7947. Suppose in Paris there was a depreciated currency and a full value currency in this country, would there necessarily be any difference in the rate of discount in the different countries?—They have nothing to do with each other. The discount is the price paid for a loan of capital, and its rate depends on the supply of and demand for loanable capital. Supposing there was a great scarcity of such capital in this country or in France, then the rate would be affected. What I think is if prices rose very much in France it might affect the commercial relations between this country and France if prices did not change here.

7948. A depreciated currency in France would affect the exchange with other countries, and this would be shown immediately in the exchange with England; but the rate of discount in either country need not be affected?—My answer to you would be this, that you might have a depreciated currency and yet you might have very little demand for loanable capital. You might have also prices falling and very little demand for capital, and therefore a low rate of discount, and you might have prices rising and a depreciated currency, and a great demand for capital. We have seen something like it since I can recollect in Lombard Street.

7949. Then again with regard to the relation between gold and cotton, the reason is very clear that one is the standard of value, and is an established quantity; whereas the other, the cotton, is always varying in supply. It varies year by year enormously. Day by day the price varies from an infinity of causes, but the sovereign, unless for some extraordinary reason, a large amount of gold being taken away, or a very large amount of gold coming in, would not affect the price of cotton at all?—My only objection to your statement is that I would rather call it the measure of value than the standard of value.

The witness withdrew.

Adjourned till Monday.

*Mr.
W. Fowler.*
11 Nov. 1887.

THIRTY-FIFTH DAY.

Monday, 14th November 1887.

PRESENT :

THE RIGHT HON. LORD HERSCHELL, the CHAIRMAN, presiding.

MR. D. M. BARBOUR, C.S.I.
MR. H. CHAPLIN, M.P.
SIR T. H. FARRER, Bart.

MR. C. W. FREMANTLE, C.B.
SIR W. H. HOULDSWORTH, Bart., M.P.
MR. S. MONTAGU, M.P., and

MR. GEO. H. MURRAY, *Secretary*.

Mr.
J. C. Fielden.
14 Nov. 1887.

Mr. J. C. FIELDEN recalled and re-examined.

7950. (*Chairman*.) There is one question I should like to ask you with reference to the evidence which you gave on the last occasion. You have given with reference to several trades the number of unemployed now as compared with a previous period; are you able at all to give the number of those in employment as compared with the same period?—I am not; but I wish to say that since I was last before the Commission I have prepared a table which summarizes the number of people that are members of societies, and the number of unemployed at each of the periods, with the growth of the societies at the same time, and the average annual amount expended in the relief of unemployed members in the years 1871 to 1875 inclusive and 1882 to 1886, and I think it is a very instructive return.

7951. Would the growth of the society in numbers, do you think, be a rough indication of the growth of the number of employed?—I think it would be rather a greater growth than the growth of employment in the country. It would be a greater growth because there is a tendency on the part of the skilled artisans more and more to join the societies, because of the protection it affords them during periods when they are out of work.

7952. But in the case of one of the societies, for example, though the number of unemployed has increased from a few hundred to upwards of 3,000, yet the number belonging to the society has increased by 20,000?—I have given the increases in this table in the societies' membership as well as the increases in the unemployed and the increased demands of the unemployed, and I have taken every society that has data that extend as far back as 1871. There are many of the societies that have not those data, and I may say that this return is absolutely corroborated by Mr. Burnett's return. Mr. Burnett is now the assistant at the Board of Trade for the Labour Department.

7953. Yes, but what I rather wanted to see was what your figures pointed to. It would be consistent with this that the total number unemployed is greater than it was, and considerably greater, though the number of employed is also greater?—If I were to summarize this return in a few words it would give you perhaps what you desire to know. This return covers 10 societies. In 1871–75 the average membership of those societies was 98,640. Now in 1882–86 the membership of those 10 societies averaged 139,338, so there was an increase in membership of 47 per cent. Now during the same periods exactly the per-centage of unemployed from 1871 to 1875 was 2·18. In the years 1882–86 the average number of members unemployed was 7·22 per cent. so there had been a rise in unemployed over the whole of the area of these 10 societies of over 5 per cent.

7954. Yes, but that would be consistent with the total number of employed being much greater in the later period than the earlier?—I can give you some

details to show that employment is not growing very rapidly.

7955. (*Mr. Chaplin*.) I think you said last time that the population was growing four times as fast as employment?—In Lancashire, in the cotton districts.

7956. (*Chairman*.) The growth of the employment has to some extent diminished, has it not, in recent years by vastly increased economy of production?—There are always such tendencies. For instance, in a bad time the tendency is to increase the speed of machinery and to improve machinery. As profits diminish and vanish this tendency becomes greater.

7957. And that has been the tendency of late years more than in the earlier periods?—It has been the tendency for 50 years, but it has been intensified of late. I could summarize almost in one word what would show the position of the cotton districts. The machinery engaged in the cotton trade in the cotton districts has increased 18 per cent. since 1874, but the employment has only increased about 5 per cent.

7958. (*Sir T. Farrer*.) Do you mean by machinery the number of spindles and the number of looms?—The number of spindles and looms has increased 18 per cent. Looms have increased 21 per cent. and spindles 14; so that, taking the average, the spindles and looms have increased 18 per cent., but the employment has only increased a little over 5 per cent. That is, the number of workpeople engaged in the mills is only 5 per cent. more than it was in 1874.

7959. (*Sir W. H. Houldsworth*.) Dealing with your question with regard to the numbers employed for the same work, that would tend to lessen the cost of producing the article?—Undoubtedly.

7960. And would not the natural tendency of that be to increase generally the consumption of the article, so that those who were thrown out of employment by this improvement of machinery would naturally, if matters were in a healthy state, be taken up again by the greater development of the trade?—If there was nothing to stop the legitimate development of our trade, there is no doubt a cheapening process would tend to extend our trade. I mean we have always found in the cotton trade that anything that cheapened largely the cost of production began also to extend the area of consumption and thereby give increased employment.

7961. (*Chairman*.) But is it not conceivable, without any other cause to account for it, that you might have an increase of population and the increased economy in production proceeding so rapidly as to outstrip the increase of the number required for employment?—I can quite conceive that we are tending in that direction, and even if we have the most ample facilities for our trade, population is increasing so rapidly as to outstrip the possibility of employment; that is the natural tendency. On the other hand the question arises, whether anything has come over our business that has distinctly arrested its usual develop-

ment? Now we can see a continuous development up to a certain period, but then we can also see quite a decided stoppage in 1874.

7962. I do not quite understand the sense in which you mean a distinct stoppage, because you tell us that since that time the amount of machinery has increased by 18 per cent., and that the total amount of machinery did, at all events, a greater amount of work than was formerly done?—Certainly.

7963. I do not quite understand how that shows that the development has abated?—I ought to have said a distinct falling off in the rate of increase. That, perhaps, would be a better expression.

7964. Of course you are aware that, quite apart from any currency questions, there are other causes which it is suggested may have contributed to that, such as increase of industrial activity in Germany, and of late years greatly increased activity in America, too, and consequently more competition?—Well I have paid a very great amount of attention to foreign competition, and I may say this, that we have never had a successful competitor in a neutral market for the cotton trade before this silver difficulty. Germany may manufacture under her tariffs, the United States may manufacture under their tariffs, that is the point to consider. The United States, like India, grow their own cotton, but they are obliged to protect themselves by a 35 per cent. duty against our goods or else we should invade them completely.

7965. Yes; but I am not referring only to competition in neutral markets; but did we not formerly send goods to markets which did not manufacture themselves?—For instance, if you take from 1861 to 1885, the growth of the Continent of Europe in the consumption of English cotton goods is 70 per cent.

7966. What is the evidence, then, that the growth of trade has been checked?—My evidence is to this effect: that if you take from 1861 to 1874, we have a considerable growth, but from 1874 that growth diminishes.

7967. Can you tell me how much the machinery had increased from 1861 to 1874?—I cannot tell the machinery, but I can tell you the consumption of cotton, and that means the employment of the machinery.

7968. (*Mr. Montagu.*) You say unemployment has increased from 2 per cent. to 7 per cent. odd. That 5 per cent means that the number of unemployed has trebled?—That is so; there is no doubt that is so.

7969. Therefore it is not a rise of 5 per cent., according to you it is 200 per cent.?—Well, of course it is 5 per cent. on the number employed.

7970. It is three times the number of unemployed?—Yes.

7971. (*Chairman.*) The other is the more accurate way, the per-centage is more important; for instance, if you have three unemployed and nine employed the number is trebled, and yet it is not a very important matter. But do the pauper returns indicate what amount of skilled labour is out of employment?—The pauper returns, to a very great extent, are only the returns affected where every member of the family is out of work. For instance, it is a well-known fact that rather over two persons in every working family are employed in this kingdom. The average number of workers is a little over two per family. Now it is quite clear that if one member of the family is out of work that the other member or members would still obtain sufficient earnings to keep the family above the rate per head under which they are admitted upon the pauper returns, and that is why the pauper returns form no real index to the state of affairs as to the number of unemployed.

7972. (*Sir T. Farrer.*) You said that the consumption of cotton shows a diminution since 1874 that it did not show before. I have here the net quantity of cotton imported into the United Kingdom as given in the Report of the Depression of Trade Commission. These are the figures for the different periods of five years:

NET IMPORTS OF RAW COTTON.

		Annual Average.	Per Head of Population.
		Million Cwts.	Lbs.
1865-9	-	8.1	29.8
1870-4	-	11.2	39.3
1875-9	-	11.0	36.6
1880-4	-	13.2	41.8

7972a. Do those figures bear out your statement?—I have only taken the last 20 years. From 1866 to 1870 is my first period of five years, and I go up to 1881-5, which completes my last period of five years. The total quantity of cotton retained for home use—that excludes cotton which simply comes to the ports and is sent out again—in the period 1866 to 1870 was 4,955 millions of lbs. The next period 1871-5 was 6,396 millions of lbs., showing an increase of 1,441 millions of lbs. Now we come to 1876-80, and we have 6,348 millions of lbs., being an absolute decrease of 48 million lbs. as compared with the previous five years. And 1881-85 7,178 millions of lbs., being an increase over the former period of 830 millions of lbs. Now these figures show a distinct falling off in the rate of growth.

7973. But do you not think that as regards the growth between the first two periods the fact that the first period had just been preceded by the cotton famine may have had something to do with the great increase in the second period?—I do not think so, because the normal condition of the cotton trade was restored before 1870.

7974. Was it completely restored by 1866?—Probably the first year only of that period would be a deficient year so far as cotton supply.*

7975. A comparison between 1866-70 and your next period is hardly a fair average as representing the normal rate of increase?—I think it is quite likely that the year 1866, out of the five years in the first period, was the only year in which there was any limitation of cotton for use, by the fact that they had not restored the growth of cotton after the American Civil War, but all the rest of the period was a very busy period, with the machinery fully employed.

7976. Yes, but would it not be an extra busy period, even on account of the previous lack of the material?—Well, I think myself that there is all the forces at work now for a very much larger trade if we had had an opportunity of doing it without exchange fluctuations.

7977. (*Chairman.*) Is your view that if you found, between any two successive periods of four years, an increase in the production of 30 per cent., you ought to expect to find, notwithstanding improvements in machinery, or economy of production, a growth of 30 per cent. going on in every succeeding period?—I do not absolutely say that the cotton trade must of necessity increase 30 per cent. in any given time, but what I say is this, that in the period antecedent to the separation of the standards you had a certain growth which is here clearly shown. Now since that period you have had nothing like the same growth; that is my only contention.

7978. You take that date because you find a different state of things before and after the date when the change in the standards took place. Now have you looked at the last poor law returns? Are you aware that the date when the change of the standards took place is the date fixed for comparing pauperism, because up to that time, in every year from 1858 to 1873 it was greater than in any year from 1873 down to January last?—Will you allow me to say once for all with regard to my figures that I never pick figures to illustrate an argument. These figures are the natural periods; they are not picked at all.

7979. I was not suggesting that you had picked them, but you were assuming that because you found a state of things before 1873, and another state of things

* I have since examined the figures for the period 1866-70, and I find 1866 was a full average year without a scarcity of raw cotton.

Mr.
J. C. Fielden.

after 1873, that it was in consequence of a monetary change made in 1873. I was only pointing out to you that that argument would go to prove that the monetary change in 1873 had diminished pauperism for many years subsequently?—With all due respect, at present I only say that my facts are concurrent with that change. By-and-by, if necessary, I will show the connexion. With regard to the question of pauperism, I hold that the pauper returns are no index of the state of employment in this country. There are many reasons why. I have already explained one. I say that the poor law returns are a measure of absolute destitution, and that there are an enormous number of agencies at work to prevent a real, genuine, respectable operative reaching the parish.

7980. (*Chairman.*) That is just what I was suggesting to you, that the pauperism returns would not be an indication of the amount of skilled labour out of employ particularly, because they have their funds and a variety of other resources, and do not come upon the parish readily?—There never was a time, probably, when I should say there were more agencies at work to assist the people. As a matter of fact people's hearts have expanded. I am speaking now from a very large acquaintance with the people, and also with people in good circumstances, so that the pauper returns can only be regarded as a measure of relief to those operatives who when out of work have no friends and no members of their family in work, in fact the friendless and only those in absolute destitution. Now in regard to the imports and exports, in considering these I noticed one reply of Mr. Giffen before the Commission on the Depression of Trade which is calculated to create a most mistaken notion, and that is that the growth of imports and exports indicates the growth of employment. He wished the Commission to understand that the growth of population in this country is about one per cent. per annum, and then he proceeds to show between 1865 and 1885 a growth in the consumption of raw cotton of 60 per cent. Well, bearing in mind the previous remark of one per cent. of increase of population it looked as if population had only grown 20 per cent., while the consumption of cotton had grown 60, and therefore that there must be abundant employment in these districts. Now, as matter of fact, the error in that is that first he takes a special trade, and in taking that special trade, which is localised, he should have taken the population growth in that particular district, which is 45 per cent. during that 20 years instead of 20; and then, in the next place, you have to take into consideration the constantly improving machinery that tends to a bigger output without giving additional employment, and thus you get an entirely different conclusion.

7981. Have the economies in the production, changes in machinery, and so on, which have diminished the number of persons employed for a given production effected any economy in the amount of the material employed?—Well, I should think that is another point which would also show as against the employment of the people. During very high prices of the raw material every cloth is skimmed and cut down; with cheap prices you get better articles made, because more people can afford to buy them; with cheap raw material you get a better cloth, and more cotton is used for a given amount of employment, therefore the growth of the use of cotton would not indicate an equivalent growth in the employment on this head alone, because it is a fact beyond all doubt that cotton goods are now made with more cotton in for a given yardage than in the same yardage before 1874.

7982. You have given us, I think, now all the figures that you were prepared to lay before the Commission?—I desire to put in this summarized statement of the 10 trades, and it is only limited to 10 leading societies, because I could not get similar data for more, showing the growth of membership, the want of employment, and the actual amount paid in relief per annum by these respective societies at the same periods. (*See Appendix.*) And I desire to say

in the first place that I have only given 10 because there are no more than 10 to be had, not because they are selected; and in the next place I desire to say that in my opinion these 10 represent the skilled artisans of the country, and that the state of employment is worse outside the trades unions than in them.

7983. These do not cover the whole of the trades of the country, do they?—Not at all.

7984. You have not any of the woollen trades, I think?—There is not. The cotton trade is not included in this at all. There is not a single society in the cotton trade of what you may call a trades-union character in the ordinary sense of the word. They do not give relief to those out of employment, with the exception of the spinners, the weavers not having a single organisation where they can relieve those out of employment, unless it be through a breakdown or a calamity. Then the society bears the payment until the place is repaired, that is all. These are miscellaneous societies of different occupations covering a pretty large amount of ground, and based upon this return it would indicate that we have about 700,000 people out of work in this country.

7985. That is estimating that all other trades are as bad as these?—It is assuming that this is a representative case, and taking the number of people unemployed and comparing it with the people employed.

7986. (*Mr. Chaplin.*) Can you give us any estimate as to the number of men that are in employ?—Yes, about 9,000,000, excluding domestic servants. I could give you, if you like, the employments as they are classified in 1881 by the census. I have taken my data from the census as far as employment is concerned.

7987. (*Sir T. Farrer.*) Employed at what?—Oh, all kinds of artisans, skilled and unskilled, engaged in agriculture and all our other trades, and I think agriculture is a little worse off than our cotton trade. The total number is 9,000,000 of men, women, and children that are employed in the country earning wages, and the 700,000 is the estimate based upon those. I venture to say that those societies are more than a fair representation of the case. They take a great deal more care in getting the unemployed members off their books by finding them work than is possible for the people that are outside the unions.

7988. (*Chairman.*) Yes, but take the woollen trade, is that in as unprosperous a condition as any of the trades you have mentioned?—I know a little of Bradford only; at times Bradford has been in a very bad state during the last 10 years.

7989. Yes, and at times in a very prosperous state?—Certainly. They are bad now, I take it, because last week they passed a fair trade resolution. I am a thorough free trader. I have only to say with regard to the completion of the employment question that I put in a Table, which shows the growth of quantities of raw cotton retained for consumption in our factories for 20 years in periods of five years, the growth of the population of Lancashire, and all the comparative statistics of the cotton trade with regard to population, spindles, looms, operatives, &c. (*See Appendix.*)

7990. (*Sir W. H. Houldsworth.*) I think the bearing of your evidence on the examination we are making here is with regard to whether wages have all fallen since 1874. Now you have given us evidence that there is a very much larger amount of want of employment than there was before 1874. Would that, in your opinion, mean that though the wages rate were exactly the same, there is an increased want of employment, and that really wages have fallen?—Wages necessarily fall through an increase of want of employment, that is one of the conditions precedent.

7991. And we may take it from you that though the lists that we have access to and the rates that we have access to may not appear to have fallen, still the fact in Lancashire is that the wages received by the working classes have considerably fallen by the want of employment?—I gave an estimate in the previous examination covering the whole of the cotton trade,

and based upon the most accurate data, that the fall in wages in Lancashire was 15 per cent. in the cotton trade, and that the fall had been mitigated by increased earnings through speed of machinery, and improved machinery, to $7\frac{1}{2}$ per cent., so that it had been practically divided. And then I also stated in my own estimate that the average loss through want of employment in the cotton trade was 5 per cent. Mr. Andrews, who is perhaps the best authority upon the spinning trade in Lancashire, the secretary to the Employers' Association, estimates that at $8\frac{1}{2}$ per cent. I only estimate it at 5, so that the only estimate besides my own is a very much larger one than my own; so that really I estimate the loss to the cotton trade operatives, taking irregularity of employment, and taking the fall of wages, at $12\frac{1}{2}$ per cent.

7992. (*Chairman.*) That is taking into account that it is $12\frac{1}{2}$ per cent. less to the increased number who would or might now be employed. In arriving at that per-centage you take into account the increase of population?—I do not take into account the fact that there is a very large increase of people who cannot get work. It is simply the loss to those who are in employment from irregularity of employment and the fall in wages. You know in the cotton trade you can have very great irregularity of employment and still have the factory running full time.

7993. Yes, but I mean the number upon which you arrive at your basis is larger than the number in the earlier period?—21,000 larger. It was about 483,000 the number of persons engaged in the cotton trade and it is now 504,000. It has taken 12 years to grow employment for 21,000 people in the mills.

7994. (*Sir W. H. Houldsworth.*) But may I take it that what you mean to convey to us is that through the want of employment, although the list rate remains the same, that effect has been produced which would be equivalent to the rate being reduced $12\frac{1}{2}$ per cent.?—I wish to say on that, that the list rate is absolutely reduced 15 per cent.; it is an established reduction upon the list of 15 per cent.

7995. (*Chairman.*) I observe something in your table which does not altogether accord with an answer you previously gave. You put here the period 1861 to 1871 as that of the cotton famine. Now I understood you to say a little while ago that the effects of the cotton famine had entirely ceased after 1866?—In this table I have simply given the population of Lancashire for 80 years, in ten year periods, and I have explained that the period 1861 to 1871 was that of the cotton famine, showing that there was a less increase of population during that period of ten years and that the reason that accounted for it was the cotton famine.

7996. Now I should like to ask in your view does that increase, taking the last ten years, 1871 to 1881, entirely arise from population, owing to the birth rate exceeding the death rate, or does it result from migration into Lancashire?—It results also from the fact that agricultural employment is constantly diminishing, and we keep absorbing the surplus from farming districts. You have a diminution in the number of people supported by agriculture from 1851 to 1881 of from 4,000,000 down to 3,000,000, so that country people who cannot find work mainly come into the textile districts of Lancashire and Yorkshire, and we have a constant migration, and we cannot stand it unless we have our trade perfectly free.

7997. (*Sir T. Farrer.*) With regard to those figures, are they from the census, the 4,000,000 and the 3,000,000?—Well, I cannot just state for the moment, but I think you may take it that I have based it on the census.

7998. (*Mr. Chaplin.*) To summarize what you said upon the question of employment, I think your evidence comes to this, that the loss in real wages to the workmen employed in the cotton trade amounts to $12\frac{1}{2}$ per cent.?—That is so.

7999. And that holds good with regard to the various other trades that you mentioned?—I think much more, because those that are engaged in

mining and in some of the midland counties, such as the Potteries down to Birmingham, are in a more distressed condition.

8000. So that in some of the other trades the loss is even considerably greater than that?—As to the building trades, I have put in Mr. Neill's statement, and he says the loss in the building trades is 1*d.* per hour, that is 14 per cent.

8001. And concurrently with this loss in wages I understand you to say that there is a great and growing number of people out of employment altogether?—Concurrently with this loss of wages, employment has not grown in its usual proportions, while population has, and therefore that there has been an increased pressure among the working classes.

8002. What I mean to ask is this, that besides the loss in wages to those people who are in work there is a vast number of people out of work altogether?—Yes; there is not the growth of trade, and consequently there is not the same opportunities of getting work; there is a larger number of people necessarily kept out, seeing that the population increase is constant.

8003. Amounting, I think you said, to 700,000 or 900,000 unemployed out of 9,000,000 employed altogether?—My estimate of 700,000 is based on the strict proportion of the 10 societies put in; but at the Trades' Conference at Wolverhampton the delegates representing all the principal trades estimated those out of work at 900,000, and I think they are very much nearer right than I am.

8004. Well now you speak with very great knowledge and an intimate experience of the condition of the working classes, and I understand you to say that it is an entire delusion to suppose that the working classes have been gainers by the fall in prices since 1874?—What I say is that there is a certain section of economists who believe that the working classes have suffered nothing practically from the changes that have taken place. Supposing for a moment that we attribute the fall in prices to the fall in silver or to the fall between gold and silver, these economists think that they have before them a period when the working classes are open to be cut down in wages, their working hours extended, and a lot of changes that will enable them to fight the battle of foreign competition and restore profits. And I say that has already taken place, that this loss has already fallen upon them. In the case of commodities the wholesale fall does not represent the retail benefit, and I say also that upon a large proportion of the expenditure there has been no economy whatever, and that therefore the actual reductions and loss in wages that have taken place are fully equivalent to any cheapening of commodities to them. That is my case as far as the working men are concerned.

8005. It practically comes to this, that on the balance you think the working classes are the losers?—I think on balance they are the losers, and I think, to show this clearly, that on considering the question for the working classes, whenever you consider cheapness, which is a very important thing, you must also consider that employment is much more important. Cheapness is a very important thing, but employment is more important.

8006. I understand your view to be that, as regards the cotton trade, the injury which it has sustained in some respects arises from the competition of India, which has become possible owing, in your view, to the depreciation of silver?—Yes, that is one cause, and then another is owing to the fact that all the free markets that we have in the world are silver-using countries. All the gold countries are quietly yet firmly protected against us. Now, as matter of fact, the cotton trade has 900,000,000 of people to serve in silver-using countries, and the chief portion of our trade has to go there. Now it is quite certain that their money will not buy as much. For instance, you have depreciated the actual silver in India 70,000,000*l.* sterling through this action of the separation of the

Mr.
J. C. Fielden.
14 Nov. 1887.

Mr.
J. C. Fielden.
14 Nov. 1887.

standards. The currency that is circulating in India has gone down 70,000,000*l.* in relation to gold.

8007. What do you include in the silver-using countries?—China, India, Japan, some of the portions of South America; Egypt is partly silver and partly gold; down the Persian Gulf there are also silver-using countries. I have not got the figures, but that is roundly the figure according to the best authority.

8008. (*Sir T. Farrer.*) Is not a good deal of South America silver?—Yes; I am not much acquainted with South America, but I am extremely well acquainted with the trade to the East and Eastern Asia. I am well acquainted with all the trades in the further East known as Hither Asia.

8009. (*Chairman.*) Has Indian cotton gone down in the same way as the rupee has?—Oh, yes; in fact Jevons, when writing on money in 1875, says distinctly that if either of the precious metals goes down commodities will follow the falling metal. Well, it is quite certain that commodities have followed the falling metal, therefore the rupee for all purposes inside India is practically the same in value, and from this arises the power of India to compete against Lancashire in the markets of silver-standard countries.

8010. At present the competition of India is limited to the coarser cottons?—That is so, but it is only a question of time. They may begin to import American cotton and use it to the same advantage, or Egyptian, because, as matter of fact, the rupee question tells as distinctly on other makes as well as coarse makes, and it is only a question of time what part of our trade they will take away unless we act and secure rated money.

8011. I do not quite follow the reason why the depreciation of the rupee should enable them to import the American cotton and compete with us better than they could before?—It is because the depreciation in the rupee has cheapened everything they produce when they came to the exportation of it to a neutral market; it has cheapened all their labour in a comparison with our labour.

8012. But they would have to give more for labour in the United States?—They would have to give more rupees; then they would get more rupees back for the raw material when it is sent out in the form of the finished article.

8013. You attribute the competition of the Indian cotton mills to the change arising from the depreciation of silver; and you have also pointed out that in your view the depreciation of silver prevented consumers in India and China from giving so high a price for our cotton goods as they otherwise would. Will you now give us what you say as to the cost of production here, and then, with your authorities, what you say as to India?—The first statement that I have to put in with regard to the cost of production is for India. It is the statement of A. T. Whittle, Esq., who is himself a cotton spinner and manufacturer in India, and has carried on business there for six and twenty years—his own concern. He went out to India to establish a business there. I have the most distinct corroboration of his labour costs from other sources that have never either seen him and never known him at all. The total cost of producing 20's cotton yarn is 28·61 pies; a pie being one-twelfth part of an anna. Well, that is translated into English money about 3 $\frac{2}{3}$ *d.* a lb. for the production of 20's yarn.

8014. What do you take the exchange at to arrive at that?—That is taking the rupee at 2*s.* That includes the cost of fuel, wages, stores, interest, insurance, depreciation and loss in waste in the process of working. Every item is separated, and Mr. Whittle has given me this copied absolutely from his own books. He does not know that I am going to use it for this purpose at all. Well, in Lancashire we can produce that yarn for 2*d.*—2 $\frac{1}{2}$ *d.* at the outside.

8015. It does not include the cost of the raw material?—Oh, no; everything but the cost of the raw material. It is the manipulation. For the raw material we are on equal lines; there is no doubt

about that. For instance, if we buy our cotton in Bombay and bring it to England we get so much more for our gold in buying cotton; that is, our gold goes farther. What we gain in buying goes back in the loss on the exchange when selling.

8016. Have you not some cost beyond what they have in respect of freight and insurance?—I simply wish to say that there are just two points in which England is supposed to be at a disadvantage. One is that they grow their own cotton, and the second is that they are supposed to have cheaper labour. Now I shall show you that the outlook of our trade is very serious indeed so far as India is concerned.

8017. I think we had better keep to the question of comparison apart from loss to trade?—Now with regard to the growth of cotton and the transit from India to Lancashire, including all charges, insurance, and freight, the transit charges on the railway to the mills, the sending of the yarn back again and the selling of it, either in India or in Japan or in China, I have got the most careful estimates made in Manchester by merchants who are engaged in the trade, and you can put all that down at $\frac{3}{4}$ *d.* per lb. That is, we have got $\frac{3}{4}$ *d.* per lb. to pay for transit that they have not got to pay.

8018. (*Mr. Fremantle.*) That is, taking the rupee at 2*s.*?—Taking the rupee at 2*s.*

8019. (*Chairman.*) But are you aware that the rupee was only 2*s.* for a very brief period for the last 30 years?—I will take the rupee at the average price, 1*s.* 10*d.* or 1*s.* 10 $\frac{1}{2}$ *d.*

8020. (*Mr. Chaplin.*) They have a gain of $\frac{3}{4}$ *d.*, you say, in transit?—There is a natural protection to the Indian manufacturer of $\frac{3}{4}$ *d.* by the fact that he has his cotton there and his products in his market, so that there is always that natural protection. This is Mr. Andrews' return of the cost of spinning the same yarn in Oldham. Mr. Andrews says the whole cost of production (that is inside of the mill) would be from 2*d.* to 2 $\frac{3}{8}$ *d.* per lb. Now I state it at 2 $\frac{1}{2}$ *d.*, so I exceed Mr. Andrews' estimate. Now there is a very important item in Mr. Andrews' return. He says that the cost in wages would be $\frac{1}{10}$ of 1*d.*, that is the wages in a factory in Oldham. Now I have a letter here; it is from a gentleman connected with a very old and highly esteemed Manchester firm, and who has spent many years in Bombay. I am not at liberty to use the name, but I will hand in the letter. "My figures for the mills are in Manchester and I cannot give you the exact cost of wages per lb. of yarn, but approximately the cost for an average count of 15's is 7 pies per lb.; this includes the wages of reeling, bundling, and baling. 7 pies at 1*s.* 5*d.* exchange is $\frac{5}{8}$ of a penny. Learners begin at 1*s.* per week, and an experienced hand will get about 3*s.* per week. This last is 50 per cent. more than labourers and domestic servants can earn in towns, and 100 to 120 per cent. more than the pay of agricultural labourers, so that the work, owing to the system of shift, is relatively easy; it is evident that the introduction of factories into Bengal has been an immense boon to the natives. Instead of being oppressed, overworked, and underpaid, they have easy times, splendid airy rooms to work in, and much higher wages than they can get outside. This applies to Bengal. In Bombay they work with a single shift." Taking the rupee at 17*d.*, it absolutely costs $\frac{1}{10}$ of 1*d.* to produce a lb. of 15's in India. The letters I have handed in show distinctly the cost with the exchange at 17*d.* to be $\frac{6}{10}$ of 1*d.* for labour. Now we are $\frac{4}{10}$ of 1*d.*, so that, as matter of fact, you may take it with the exchange at 17*d.*, we are quite as cheap for labour because ours is given for 20's yarn whilst this is given for 15's in Bombay.

8021. (*Chairman.*) But is that included in your 3 $\frac{5}{8}$?—Certainly. I wish to say that the common delusion of all authorities upon the Indian mill question is this, that they think that there is very cheap labour in India. It is a fact that there is a small number of rupees paid for a week's or a month's work,

but it takes five times the number of persons in India to tent the same amount of machinery that is tented by a number in Lancashire. I am not basing this upon a single factory, but I take it upon the whole of India. Every spindle and loom they have got we could tend with 15,000 people, and it takes them 77,000. I only want to establish this position, that labour is not cheaper there and that it is not the cheap labour of India that is beating Lancashire.

8022. (*Mr. Chaplin.*) But how do you account for the necessity of employing so many more there?—Well, I apprehend that the cause to a very great extent is the long training and education we have had in this country and the better stamina of our workers. We have had 100 years of it in Lancashire, and, as I stated when I was last here, the operatives are apt and naturally very fit for the work.

8023. (*Sir W. H. Houldsworth.*) Is it not a fact that there is a smaller number in the cotton trade in Lancashire employed to produce a certain quantity of either yarn or cloth than in any other country in the world?—Certainly.

8024. The same remark applies to America as well as India?—Yes; the Indian cotton trade, growing out of monetary dislocation, which is of the same character as protection; it is attempting the growing of oranges on icebergs; it will go out whenever this currency question is settled.

8025. (*Chairman.*) The result is to show, if you are correct, that it costs something like $\frac{1}{4}d.$ a lb. less to make it in England, even with the disadvantage of having to import the cotton, than in Bombay?—If you take the rupee at its old value—2s., for which it is practically current in India—there is no doubt that we are fully $\frac{1}{4}d.$ a lb. cheaper.

8026. You always insist on taking the rupee at 2s. Is it your idea that in order to produce this financial result we must put back the rupee to a price which was only maintained for a brief period?—So far as putting back the rupee to any given price is concerned, I may say that as at all being supposed to represent Lancashire opinion either amongst the capitalists or the working men, Lancashire does not want to survive by protection in any way or shape, not the slightest. We are quite prepared to fight our battle if we have fair play.

8027. Would it not be better for the purpose of comparison to take the rupee at that which was its general rate for many years prior to the demonetization of silver, rather than at the exceptional rate which it attained then?—Well, suppose we take it at 1s. 10d., then the advantage between Lancashire and India would be $\frac{2}{3}$ of a 1d. We should still be that cheaper; and I wish to state the reasons why in a few words. We run a mill of 34,000 spindles at a cost of 800l. for coals. I have the balance sheet of one mill in India where the cost of coal for precisely the same number of spindles is 3,400l. They pay 25s. a ton for coals in Bombay, or about four times the price that we are paying for them in Lancashire.

8028. (*Mr. Barbour.*) They use English coal in Bombay now?—Well, I think so, but I have never been in India; I have to depend upon the best authorities I could get.

8029. (*Mr. Montagu.*) You say that the cost of labour in India is not the difficulty; but what is the difficulty?—The exchange.

8030. No; but you say the exchange even at 1s. 5d. only brings the labour to the same; what is it besides the labour that makes the difference?—Because, you see, when we send our goods into China or Japan or India the exchange affects not only labour, but it affects the running of your factory, it affects everything that enters into the cost of production. I only mentioned labour because there is a strong impression among those who look casually at the case—that, whilst America with its cotton could never beat us, India has got both cotton on the spot and cheap labour also, and it is from these two factors that they think

India is able to do what America cannot do, take possession of one of our markets. Therefore I want to show you that they have not cheap labour; that, taking effective production, the actual quantity put out, spread over the wages of a mill they are not as cheap as us to-day. Even with the rupee at 1s. 5d. they are barely as cheap as us.

8031. Could you give us the figures that enter into your calculation for the cheaper production of India irrespective of silver?—There are only two factors in the whole of the production in which India has any advantage, or appears to have any advantage, on the face of it. The first factor I admit at once shows $\frac{3}{4}d.$ a lb. of advantage of position; India saves that in transit communications. The second—labour—I dispute, and say that labour still is as dear in India, even with the rupee at 1s. 5d. Now in every other thing that goes to make up the cost of production India is very much dearer than we are. For instance, you build a mill, and the interest of capital and depreciation of the machinery constitutes a large item of annual charges. Well, it costs two and a half times as much money to build a mill and fill it with machinery in India than it does in Oldham. Taking the present position, even buying with all the advantage or disadvantage to-day, whatever it may be just as it is looked at. At the present time the cost of a mill in India is from 30 to 32 rupees per spindle. Now if you take the 32 rupees at 1s. 5d. it is about 46s. We can build a mill and equip it thoroughly to-day in Lancashire for about 21s. per spindle. The average cost of the mills in India has been about 3l. per spindle. With us the average is about 22s. to 25s. according to the character of the work they have to perform. Now the annual depreciation is a very serious item and the interest also that we have to charge. So far as the cost of stores, the cost of coal, the cost of the original buildings, the cost of the machinery, we have a decided advantage over any country in the world in these points and particularly over India. The only two factors in the dispute are those that I have drawn attention to besides exchange. Now I can show you what the effect of exchange is because I have prepared three examples which show you what the effect of lowering exchange has been upon the Oldham spinner.

At the end of the year 1885 good Dhollera cotton was selling in the Bombay market at 180 rupees per candy of 784 lbs. At the same time 20's yarn was selling in Bombay at 6 $\frac{3}{4}$ annas per lb. Allowing 116 lbs. of cotton to spin 100 lbs. of yarn, we have the following results:—

With Exchange at 2s. per Rupee.

	Rs.	s.	d.
100 lbs. yarn sold for	-	39·84	or 79 8 $\frac{1}{4}$
116 lbs. cotton cost	-	26·63	or 53 3 $\frac{1}{4}$
Margin for cost of spinning	-	13·21	or 26 5

or 26s. 5d. = 3·17d. per lb., out of which the Lancashire spinner has to pay the freight and charges both ways, placing him at a natural disadvantage.

With Exchange at 1s. 6d. per Rupee.

	Rs.	s.	d.
100 lbs. yarn sold for	-	39·84	or 79 9 $\frac{1}{4}$
116 lbs. cotton cost	-	26·63	or 53 11 $\frac{1}{2}$
Margin for cost of spinning	-	13·21	or 19 9 $\frac{3}{4}$

19s. 9 $\frac{3}{4}$ d. = 2·47d., out of which the Lancashire spinner has to pay transit charges as before, whilst Bombay is unaffected by the change, and has a margin of 13·21 rupees as in the first transaction. Supposing, however, the rupee appreciated to 2s. 6d., we should then find that an advantage accrued to the Lancashire spinner, thus:—

*Mr.
J. C. Fielden.*
14 Nov. 1887.

Mr.
J. C. Fielden.
14 Nov. 1887.

With Exchange at 2s. 6d. per Rupee.

		Rs.	s.	d.
100 lbs. yarn sold for	-	39·84	or	97 7
116 lbs. cotton cost -	-	26·63	or	66 8
Margin for cost of spinning -		13·21	or	30 11

30s. 11d. = 3·71d. for the Lancashire spinner, out of which are payable transit charges as before.

With the rupee at 1s. 6d. the Bombay spinner has a margin of	-	3·17
With the rupee at 2s. he has	-	3·17
„ „ at 2s. 6d. „	-	3·17
With the rupee at 1s. 6d. the Lancashire spinner has a margin of	-	2·48*
With the rupee at 2s. he has	-	3·17*
„ „ at 2s. 6d. „	-	3·71*

The fact remains that the variations between the lowest and highest points are equal to nearly one penny farthing per lb.

A mill of 34,000 spindles of the most modern construction would easily produce $2\frac{1}{2}$ million lbs. weight in the course of a year of 20's yarn, therefore a variation of one farthing per lb. is equal to over 2,500l. per annum.

The cost of a mill of the productive capacity named would be 40,000l.; the effect of the depreciation of the rupee from 2s. to 1s. 5d. is equivalent to a loss of 9,000l. per annum to a concern.

I have given the cost of cotton absolutely as purchased in the market, and I have taken 116 lbs. of cotton to spin 100 lbs. of yarn. Every one of the details is worked out precisely upon that figure, that 100 lbs. of yarn is spun from 116 lbs. of cotton, and based upon $6\frac{3}{8}$ annas per lb., the price at which yarn was selling in the Indian market at the time. The Lancashire spinner and the Bombay spinner would each have $3\frac{1}{8}$ d. for spinning 20's weft besides the waste, so that practically it would be a profitable trade. It would just cover cost in India, and it would be a very profitable trade to Oldham, a margin of 3d. They would make $\frac{1}{4}$ d. a lb. out of 3d., and a profit of $\frac{1}{4}$ d. a lb. besides the waste upon such a concern would mean a very large dividend. Now with the exchange at 1s. 6d. (and it is now 1s. 5d.), the margin of the Lancashire spinner drops down to $2\frac{1}{8}$ d., rather less than $2\frac{1}{2}$ d. With exchange at 1s. 6d. he gets back $2\frac{1}{2}$ d. of a margin to meet all his costs. Now out of that $2\frac{1}{2}$ d. he has got to pay $\frac{3}{4}$ d., the cost of transshipment backwards and forwards, so that really this brings the amount available for the mill down to $1\frac{3}{4}$ d. Now Mr. Andrews tells you he cannot produce it under 2d. or $2\frac{1}{2}$ d., so that the change from 2s. to 1s. 5d. has not only knocked the profit of $\frac{1}{4}$ d. a lb. down, but it has introduced more than $\frac{3}{8}$ d. of a loss. Whereas a $\frac{1}{4}$ d. was a considerable profit, $\frac{3}{8}$ d. is a frightful loss.

8032. That is, supposing you would get with the rupee at 2s. the same amount as you would get for the rupee at 1s. 5d. ?—Exactly the same price of cotton; it is simply showing the rate of exchange, and it is proved on all hands that commodities have fallen with silver. Now if you had the other change, and there was demonetization of gold instead of demonetization of silver, I should like to know where the Bombay men would be, because then the advantage would go just the other way about, and we should then be in a position to get about $3\frac{1}{4}$ d. of a margin, whilst theirs would be growing less.

8033. (Chairman.) I am not quite sure that I understand now how the Bombay manufacturer gets the profit ?—It matters not what the fluctuation is, he buys his cotton in rupees, he pays his wages in rupees, and he goes on year in and year out and does not care a flick for the exchanges.

8034. He would not be able to buy everything in India, would he, at the same rupee price? All things imported from England he would have to give more

rupees for, would he not ?—He would be a little bit affected; he would be affected somewhat in his coal and in some of his stores. As a matter of fact, I may say this, that I think it may be taken that for buying purposes the rupee is quite as effective, and in some cases a little more effective in everything but the construction of the mill. For instance, he would have to pay more rupees for his machinery. If he came to England to buy his machinery I do not think he could buy his machinery and start his mill as cheaply as he could have done under the old rupee price, but in stores he would be about the same cost. I think that, as matter of fact, silver has retained its purchasing power and has not fallen in value, but that commodities have fallen more than silver. That is, that the fall in commodities has been rather greater than the fall in silver in relation to gold. It may be taken that these changes are upon the margins for cost of production. The purchase of the cotton is not affected at all. We buy our cotton and we get the advantage of the increased price of gold, and then we sell and we lose it again, so that on the raw material there is no change and it need not be taken into account; it is simply the costs in the factory and in transit which have to be taken into account.

8035. This is supposing the yarn to be sold in Bombay ?—Yes, and the same exactly transpires when it is a question of Japan or China. They retain their remittances if they send out to China, the 4s. dollar is equal to two rupees. There is a very small variation in exchange. When the dollar comes back to us it comes back 30 per cent. off. In fact our firm are abandoning the Indian trade and getting out of it as quickly as we can. I would not undertake to work for India absolutely free of all rentcharge the best and cheapest mill in Lancashire if this exchange difficulty is to continue. I would not undertake to work it, and I know the trade well, and was brought up in the Indian trade for our cotton goods.

8035a. (Mr. Montagu.) Is not the advantage to India diminished with regard to neutral markets as against their own market. Is the freight quite so high from here to China as it would be from here to India, and then from India to China ?—They have to pay some little charge between Bombay and their other markets, so that they can command their own market easier than they can command the other markets.

8036. Then you would want a less alteration in the exchange to maintain our supremacy in the neutral markets than you would in the Indian home market ?—Quite so. But then the next point I have to show is how far they have dispossessed us, and it is a most important dispossession. I have a table here which shows the growth of the two trades, the growth of the spinning trade in England in 20 years, and the growth of the spinning trade in India since 1876. (See Appendix.) Of course I have taken from 1876 in India, because it was a very small factor before then. The table gives all particulars, but I may summarize it in this way, that taking all the markets in the world we, with 20 times the number of spindles in this country as against India, are only growing at the rate of 6,000,000 lbs. per annum in yarn exports to all the markets of the world, and India with one twentieth of the spindles is growing at the rate of 7,000,000 lbs. She is actually growing in export of cotton yarns now far quicker than we are and with only one twentieth of the machinery. Now it has taken us 30 years to extend our export trade from 150,000,000 lbs. annually of yarn to 250,000,000 lbs., and India has grown 100,000,000 lbs. of trade out of her 2,000,000 spindles in 10 years. That is the position, and I think the conclusion is that if China and these Eastern markets are to remain to us to trade with we must be put upon reasonable lines whereby our money can be reasonably put in harmony with our customers' money.

8037. (Chairman.) You would advocate some change that would send up the value of the rupee. To what point would you propose? Of course that, you foresee, would seriously injure India ?—Oh, not at all.

* From all these have to be deducted transit charges, $\frac{3}{4}$ d. per lb.

8038. It would according to you destroy that trade?—That is a very small affair when it comes to be considered besides other more important things which you can do for India. To develop a small trade miserably depending upon a question of monetary currency is one thing, but to let capital go into India to develop railways and her soil, and all her various productions, is a very different matter, and this very difficulty is stopping the flow of capital into India.

8039. Is it not conceivable that if capital flowed into India in that very way, and developed her to the extent that you suppose, you might soon have these checks upon the natural advantages of India destroyed, and consequently India become even a more formidable competitor than she is at present?—I care nothing about competition if it comes about on fair lines, and if you relegate each producer to his own natural capacity and the position and power he naturally possesses, but do not let us be destroyed by monetary complications and dislocations. That is the position we complain about.

8040. (*Mr. Barbour.*) Do you think Indian mills would lose this advantage if the exchange continued steady at what it now is for a very long period?—Well, I think it is quite possible that we should take again a part of this trade. I think that we should put Lancashire under a great squeeze, and that we should very likely have to put the operatives under a bigger squeeze than we have done. The population is growing very fast, and I have no doubt there would be a good deal of trouble before we got down our wage-rate, but we must beat Bombay, and we could only do this after serious complications.

8041. (*Chairman.*) But to what point do you think it necessary to put up the rupee in order to create what you consider the natural state of things?—I think the disadvantage in considering any other point than the old ratio is the fact that Indian coinage and all our silver coinage and other matters are adjusted to the old rate. Of course I have read a good deal upon the Indian question years ago before I knew anything or had read about the silver question. I have read Sir John Strachey's book and many other works connected with the development of India, and there is no doubt at all about it that India is starving for capital and that she cannot get it now because of this silver difficulty.

8042. (*Sir T. Farrer.*) The capital goes to these cotton mills? It goes there because they get enormous profits through this silver question; but what about extending railways, and entering into monetary operations for the Indian Government?—I contend that India is a thinly-populated country; there is plenty of room for India to develop. Lancashire is six times as thickly populated as India to the square mile. There is plenty of room for improvement by irrigation and railways. This difficulty is starving her, for the one thing she mainly wants is capital for her true development.

8043. (*Mr. Montagu.*) You have stated that the Lancashire cotton industry is seriously threatened and is in a critical state. Is that occasioned by the present price of silver or by apprehensions of a further fall?—Of course, in the first place, we know this, with the present rupee price of silver it is only a question how much capital is put into India for developing cotton mills and taking away a considerable portion of our trade, but if by reducing wages and other economies we restored our supremacy, we cannot gauge the future of silver. We have no security until we have rated money, and then we can tell what to do.

8044. (*Chairman.*) Does that conclude what you have to say on the Indian question?—The summary of what I have to say on the Indian question is this, that, in the first place, what are the advantages of India are limited purely to the question of carriage and transit charges in the cotton trade. She has no advantage over us in labour, even with the rupee at 17d.; in all other respects her mills are dearer and cost more money to produce a given weight of yarn. I have further to say that every change that

takes place that has any relation with silver to gold adverse to silver makes the position worse for the Lancashire producer; and I have also to say that, on balance, my opinion is most decided as to the fact that India is a sufferer by this very cause, notwithstanding the gain of this as yet little portion of our cotton trade; that she is a sufferer in many other respects; that what all her exports come to of cotton goods is swallowed up by the excessive remittances of rupees that they have to make merely to pay Government charges at home, so that the trade that has been developed in connexion with cotton disappears at once, as far as the benefit to India is concerned, by the fact that her home charges would grow less with the improvement of the rupee.

8045. It has been suggested by some witnesses, that she has benefited by a great stimulation of her agricultural industry?—My own opinion is this, that an alteration of the rupee would place India upon the correct line of competition with England and other countries in agriculture. She will retain her position in supplying wheat to this market. I have gone into the Indian wheat question most carefully. India is the cheapest wheat-producing country in the world, with the rupee at 2s. The only thing that the agriculturists would gain in this country is precisely what we would gain, that India would have no competitive advantage out of money dislocation. We want to put India precisely on her natural advantages; and, of course, I maintain that the greatest obstacle to the development of India, both in the employment and in the development of her resources, which are immense, is the want of capital, and that as long as you have no fixed relation between silver and gold you will never get a big flow of capital into India for public works, such as railways, irrigation, &c. I have nothing further to say upon the Indian question.

8046. What further observations have you to make?—Well, there are one or two points that I think it is worth while drawing your attention to. Jevons, who is supposed to have been a mono-metallist, is strongly of opinion that the world must tend to one system of money. It is quite clear that the present system is like a narrow-gauge railway and a broad gauge. Every time you come to the terminals there is a lot of expense heaped up. You have got an exchange banker who is now required, and we know perfectly well what that means. An exchange banker will cover your exchange when it suits his convenience and his interest, and then it is generally not our interest to be covered. When he thinks exchange is going in the right direction for him he will sell exchange. When he thinks it is going the other way he will not sell. Now I have seen in our own business, the Eastern Trading Company, six months' profits swept away (every order having been duly placed by telegraph with the manufacturers), and all expenses gone as well, by the fall in exchange in those six months from the impossibility of covering. I do not, of course, mean that money could be all gold or all silver, but it can be rated and made one standard, as it was up to 1874. And it ought to be fully considered that we grew our foreign trade under rated money. Now we have never been right since the separation of the precious metals; we have gone from bad to worse, and although we have had little temporary fluctuations they are like the flickering of a candle with regard to industry in general.

8047. There were many times before that we were very bad, when we had, as you know, what is called the rated money existing. The rated money existed till 1873, but there were many times before 1873 during this century when our trade was very bad indeed?—Well, I have paid great attention to that question as to the number of panics and depressions we have had and this is altogether a novel experience. We have had bad times, when we have been perhaps worse than at any point, during this depression, but we have generally recovered in a year or two; but we have been going on for 12 years, and we are just about as bad as ever, and likely to continue so.

Mr.
J. C. Fielden.
14 Nov. 1887.

Mr.
J. C. Fielden.
14 Nov. 1887.

8048. (*Sir T. Farrer.*) But we have had to deal with countries with paper money, which makes a greater difference in the exchange than silver?—Well, I am not very well acquainted with paper money, but I thought that the use of such money would be confined purely to the country in which it was issued. I do not suppose it would affect a country to which goods were sold. In this case it is like a paper money all round amongst the silver nations to a certain extent.

8049. (*Chairman.*) What was put to you was this, that the same sort of difficulty that had arisen in recent years commercially by reason of the depreciation of silver and the consequent difficulty of trading with people using silver, had existed in trade by reason of some nations with whom we traded having paper, which would produce an effect of precisely the same nature, though perhaps in an aggravated degree?—Well, I am rather a manufacturer than a banker or a financier, and I have studied this question from the point of view of a producer engaged in one of the biggest trades in this country. I know the other industries that I have examined are precisely in the same position, and the conclusion I have come to is this, and from a careful examination of the question, that if the countries of the world are to continue upon two different metals one group of countries having silver as the standard of their money and the other group having gold as the standard of their money, then you will see trade grow between those countries that have a similar standard to the disadvantage of those countries that have a gold standard, and to the general interchange of commodities which should be free and universal.

8050. (*Mr. Montagu.*) There is one contradiction in your evidence. You say in one part that you think $15\frac{1}{2}$ to 1 would be the proper legal ratio, and you have just now admitted that if the rupee were at 1s. 8d. the supremacy of Lancashire would be maintained; 1s. 8d. would be equal to about 18 to 1?—Yes; but I was simply asked what would restore our position as competitors for certain trade. My own opinion as to the convenience of going back to rated money is that you have all the silver coinage of the world practically based on $15\frac{1}{2}$ to 1, and any other ratio would lead to a very great amount of confusion. That is a totally different question.

8051. (*Chairman.*) Have you considered the special disadvantages to us first as compared with other nations in taking $15\frac{1}{2}$ to 1 as the standard? You have put the convenience to be derived from its being the ratio fixed by certain nations and the difficulty of re-coinage, but have you considered the special disadvantages to this nation by fixing that as the standard, supposing you had determined upon a ratio?—Well, I have considered this important point. I think that it is the point that so many people are frightened about, that there is to be a big lot of silver flooding the market, and that it would be giving to silver an undue price. I think it is a myth.

8052. But if you fixed the ratio at $15\frac{1}{2}$ to 1 would you not very considerably benefit those people who have a large stock of silver, and who have bought it at nothing like $15\frac{1}{2}$ to 1?—Undoubtedly, on the other hand we have India, which has more silver than any other country, even the United States with its supposed stocks of silver, and I take India to be one of our possessions, and anything that affects India affects us. We have to look to India and the far East for the future improvement of our trade. I wish to draw particular attention to this part, perhaps the very last I will have to trouble you with upon the production of silver. I think beyond all question that silver has gone down through demonetization and not through production of the mines, that is beyond all doubt.

8053. (*Mr. Montagu.*) But still there is no doubt that an advance of 25 per cent. or more in silver, supposing it were tried, would be sure to produce sudden and great changes. But is your objection to $15\frac{1}{2}$ to 1 only founded upon what other nations would have to say; if they agreed, say, to 20 to 1 or 18 to 1, then your

objection would cease, providing the rupee were raised to 1s. 8d. or near that?—My own opinion is this: first, that it is absolutely necessary at some point to have a fixity of value between silver and gold. And I would next say that that fixity would be brought about, as I apprehend that it would, by common agreement between the greatest trading Powers of the world, and that they will have a very much better judgment to what point to put it than I could suggest myself but my own idea is that the convenience of the whole world would be consulted by the $15\frac{1}{2}$ to 1 ratio because of the existing coinage, and because of existing conventional charges and prices.

8054. (*Chairman.*) America would have to recoin the whole of hers, as it is at 16 to 1?—Well, that is, of course, really a question for that conference, but I do not apprehend any serious disturbance in values arising suddenly out of a settlement of this question; whilst I attribute the fall largely to the silver question, and that consequently there would be a rise in commodities as the result of rated money again, because it would increase the available money of the world. It is very easy to understand if you have the money of the world in one scale and the commodities of the world in the other, if you take a heap of money and put it in the scale along with the commodities, up goes gold, down goes commodities. It is as plain as possible, and this is practically what has been done with silver.

8055. Is it perfectly clear that there is less money in the world now by a thaler, or a shilling, or a sovereign, than before silver was demonetized?—It is not a question of there being less money, that you have had any less money for use, but that you have got the money of Europe and the money of Asia dislocated; you have not through traffic, and consequently less effective money, and we want a common standard around which all commodities, labour, and service should find their level; this I should strongly urge independent of any of my previously stated facts.

8056. (*Sir W. H. Houldsworth.*) As I understand you, you consider a ratio of 1 to 18 would meet the practical difficulties that you have laid before us?—I believe that a ratio of 1 to 18 would be a ratio that would enable us to carry on our business and would probably not much disturb any industries that have been recently developed in India. On the other hand, it would be a very great inconvenience, I think, so far as regards re-coinage, all over the world, and having to get to and understand the fresh value of silver would lead to much confusion.

8057. (*Mr. Montagu.*) It would not be necessary probably to re-coin any of the currencies?—For instance, we have the old ratio here. You have the shilling interchangeable in every retail transaction at home, but the minute we begin to deal in our foreign business you refuse us the same advantage. Bimetallism does exist in England throughout your internal trade.

8058. 14 to 1, I think, is the ratio of our silver?—At any rate it is a rate that we well understand. If you get a different rate you alter the 1s. You may add to or diminish the rate, but I prefer to keep the relative proportions the same.

8059. Supposing the nations agreed and there was no necessity for re-coinage their currencies, then 18 to 1, or 1s. 8d. the rupee, would be quite sufficient, providing all other obstacles were overcome?—Certainly. I do not think that the great point of the question is so much the point at which it is rated as to get it fixed definitely.

8060. (*Sir W. H. Houldsworth.*) You are a merchant, and you have explained to us that the action of the exchange banks, which we have heard a good deal about in previous evidence, is not satisfactory to your mind. Now what I wanted to ask you was this, how it comes that some witnesses engaged in exactly the same trade seem perfectly satisfied with the exchange bank arrangement?—I can explain that; I will take a Manchester firm doing a business of millions a year. They can command it because of the

enormous character of their business. It pays the bank to do their business at all times. But take a small firm like ourselves, they will refuse us or not, just as it suits their convenience, but they will take all the business of a large firm, although in some instances it may yield little or no profit, for the sake of keeping up the connexion, and there is besides the very important fact that it adds a new charge for middlemen.

8061. Then you have a difficulty in making these arrangements, which the larger firms can easily do?—Yes, certainly.

8062. And you probably pay more for it than the larger concerns?—It is no problematical case. I am not dealing with the business which I manage, which is a large business; I am speaking of my position in connexion with the Eastern Trading Company, of which I am a director. It is a small company, and we are very much bothered with this exchange difficulty.

8063. (*Sir T. Farrer.*) Exchange with India and China?—Well we do with Shanghai, Penang, Rangoon, Bombay, Madras, and Calcutta, and with all these markets we have great trouble through silver fluctuations.

8064. Have you any greater difficulty with China than with India? We have been told by some witnesses that the regularity of business with India makes it more easy to deal with exchange?—Our losses have mainly arisen with Penang, but I do not think we do a very large business with China; only a little with Shanghai. I have seen the profits supposed to be secured absolutely showing a clear percentage on each transaction, week after week, and then there would take place a fall in exchange, and when we get our money we have positively got a loss and I have seen six months' profits (every transaction entered into at a profit) swept away.

8065. Is that in trading or in manufacturing?—In trading, buying and selling; this is not manufacturing. I wish to be understood. A buyer telegraphs to us, "Will you send us out a certain class of goods at such a price?" We reply, "We will take it." We then get an order for so many cases. We go into the market and place that order. We have ascertained what the price will be and we fix it up. All this is done by wire the same day. We never put down a transaction under 4 per cent. in white goods. That is considered the lowest profit we will take on white goods; on grey goods we will take 1½. I have seen us have 7 per cent. on a transaction distinctly fixed with both the manufacturer and the purchaser, and I have seen that transaction bring a loss, through nothing but exchange, in less than three months; meantime we have been refused exchange cover.

8066. Then what you complain of is not so much the fall in the exchange as the fluctuations in the exchange?—I complain of the fall in exchange having so changed the relative positions of certain sections of producers as to become a very great disadvantage to the sections of producers who are under a gold currency.

8067. But supposing that the fall went no further and that the exchange remained at what it is at present, matters would adjust themselves, would they not?—They would adjust themselves over the next eight or ten years. You would have another eight or ten years of painful experience and of gradual adjustment.

8068. Adjustment of expenses to prices?—Expenses and wages to prices. It would be by considerable suffering. It has been by considerable suffering that we have adjusted somewhat to the present ratio.

8069. It is the process of adjustment which does the mischief?—Yes, and I think I have shown that many fixed charges and conventional prices do not so adjust themselves.

8070. Then I want to ask you whether you know anything about the cotton mills in North America—in the United States?—Yes.

8071. Well, they, I believe, have been losing their business in coarse goods?—No, it has very greatly increased.

8072. But I am told they are losing their business to the Southern mills?—Well, that is practically the same, the South and the North are practically one.

8073. Where there is no silver question intervening?—It is simply this, that a man builds a mill in another part of the country, and he is a bit nearer to the cotton.

8074. Yes, and he has the negro labour?—The cotton trade with the negro labour in the South is just a mere bagatelle as compared with the cotton trade with the white labour in the North. I do not suppose they have 2 per cent.

8075. Just as the Indian trade in the coarse goods is growing, so the trade in the South in coarse goods is growing?—America cannot make fine goods yet, and the mills in the South do not increase as in the North.

8076. The coarser goods at any rate?—The great advantage that we have in this country over all the world is this, that we take the raw cottons of all the world into our free ports, mixing the good cottons and assorting the cottons to suit our various threads and fabrics.

8077-8. But you have not paid any attention to those changes in the American trade?—Oh, certainly, I know the exact position. There is an enormous growth taken place in the cotton trade of America for the supply of their own common wants, but it is in heavy fabrics, both in the north and in the south. They never make anything like the fine goods that we make.

8079. (*Mr. Barbour.*) How is it that with such a reduction of employment wages have not fallen more than they have done, say, in the cotton trade?—Well, in the first place, as far as the cotton trade is concerned, the operatives for 20 years, from 1853 to 1873, have practically remained stationary in wages during a long period of the good times. The manufacturers are naturally reluctant to touch the wages of their workpeople. I am an employer in the cotton trade myself, and I have a very great amount of sympathy with the operatives. I think that factory wages would be the last thing I should touch; they work hard and their comforts are not many or excessive.

8080. And, besides that, I suppose the operatives resist, so far as they can, any attempt to lower their money wages?—I may say that there is such tenacity and such an amount of the fighting element amongst the working men with regard to any further reductions that they will fight, and fight hard, sooner than stand any more reductions. It would be a very disastrous process. You think you are to get out of this difficulty by adjustment. Any adjustment which would be attended with any further loss of wages and employment and pressure on the population will be fought very tenaciously. Now I am not an alarmist at all; I am rather a sanguine man. I believe that Lancashire can beat the world on fair lines, and no matter for charges on import or export, no matter for the ¾d. or 1d. a lb., we can beat the world in cotton goods with equal monetary conditions. We have beaten America. For 60 years America has been engaged in the cotton trade, and she cannot take a market from us. Why is it that India, with inferior labour to America, can come and take a big market from us? It is nothing but the exchange.

8081. Then your evidence is that when a fall in price takes place wages do not automatically and without any trouble adjust themselves to that fall in price?—Certainly; and I have shown that commodities do not adjust themselves to the fall. A wholesale fall of price never means more than half that fall to the retail consumer. When the retail customer comes into the shop if you had a fall of 30 per cent. all round wholesale, you have the expense of distribution the same practically for a long time, so that it takes a very long time to adjust everything, and there are many things

*Mr.
J. C. Fielden.*
14 Nov. 1887.

Mr.
J. C. Fielden.
14 Nov. 1887.

that are never so adjusted. For instance, take the rent of my mill. I am paying precisely the same money as I paid ten years ago, 500*l.* a year for my mill. I am just in the same position in regard to my railway carriage. My railway carriage comes to about 400*l.* a year. How can you adjust railway charges considering the enormous cost of construction?

8082. Then you would say that, as all the charges do not immediately adjust themselves to any change in the relative value of the two standards, it is very desirable as far as may be possible to preserve fixity of value between the gold and silver standards?—Stability of value in the standard is of the highest importance to traders. Prices adjust themselves to stability, but they never adjust themselves to unstable standards. A man gives a certain amount of labour or a commodity and he wants it put into a coin with which he will get a similar thing back or an equivalent for the supply of his needs, but you never can have that throughout the world with two fluctuating standards.

8083. (*Chairman.*) One question I want to ask you as to the statistics you have put in, the number of the unemployed. Is that the number at a particular date, or is it the total number who have received assistance during the year or some definite period?—It is the average number during the year on their books.

8084. (*Mr. Chaplin.*) You have given us some further remarkable information as to the rapid advance that has been made in the cotton trade in India. I understand that you think that if that continues to develop it would place the cotton trade in this country in a very serious position?—Yes.

8085. And that you attribute to the advantages which they derive from the rate of exchange?—That is so.

8086. In the remedies you suggest I understand that you have two main objects in view; one is to get rid of the difficulties of exchange and the other is to establish stability in the standard for the future?—Yes.

8087. And this you say can be done in your opinion by the adoption of a double instead of a single standard?—It has been done, and we as distinctly lived under bimetalism in this country, without knowing it, as our forefathers lived under the law of gravitation without knowing anything about it up to the time of Newton. It is simply this: there was a monetary convention that did the work though we were practically outside of it. Now I have taken the price of silver in London for 70 years, and it has not varied a half per cent. taking the averages year by year, and the price has averaged within a half to 1 per cent. of the French ratio of 15½ to 1, showing plainly that France almost alone was capable of maintaining the bimetallic law for such a period when the production of silver was twice as large in proportion to gold as it is at the present time.

8088. And I gather from what you have said that you are of opinion that the agricultural industry of this country is suffering in a similar way to the cotton industry in Lancashire, and from precisely the same cause?—Precisely.

8089. You were asked by the Chairman what you would like to see the rate raised to. I suppose you would be satisfied if you could revert to the position prior to 1874?—My own opinion is that the natural rate, looking to all the circumstances, would be to go back to the old standard, because there are many very oppressive charges arising from the change then made. For instance, a man has mortgage money borrowed on property, and there is a large class in Lancashire of small men, the best portion of the working classes, who hold property in this way, but they have been almost cleaned out wherever they have built a bit of property for themselves, and borrowed part of the money.

8090. The ratio at that time, before 1874, was 15½ to 1?—15½ to 1 and in America 16 to 1.

8091. And it is 15½ to 1 that you would prefer if you had your choice?—Personally, as far as my

investigation is concerned, I think, in justice to the country, and to every pre-existing contract that that ratio should be adopted.

8092. (*Chairman.*) But what do you say as to contracts entered into since this change took place?—As contracts they would undoubtedly gain. The people that had borrowed or bought since that time, especially after the fall became considerable, would be gainers, but this is small compared with all continuing charges existing from and after 1873 or 1874.

8093. Therefore, you must interfere with one or other: you would interfere if you put it back to the former state of things with all contracts made since?—I think it is very much better to give restitution to those who have suffered and even sacrifice a little advantage to those who have traded in the meantime. You must bear in mind that the class of people who had borrowed and entered into mortgages or loans or fixed charges, such as ground rents, dead rents of collieries, royalties, &c., have been very large sufferers, and that they have paid annual charges based on prices before the standard was touched.

8094. But if they have both acted under economical conditions, with which legislation has had nothing to do in this country, would it not be rather a strong thing to legislate to the disadvantage of one class in order that you might restore, as you say, something to another. It is a different set of people who get the benefit to those who suffered the disadvantage?—For instance, supposing we take it in this way, that there was a very large number of rents, fixed through rent courts, say, and they are being revised, there is no doubt that to go back to the 15½ to 1 would be a very hard thing on the landowners, but I do not see how any very great improvement in regard to our monetary relations with the rest of the world can take place if we are never to enter upon a policy of fixing the rate through fear of dealing unequally with somebody.

8095. Yes, but might not this answer be given (I am not putting it as expressing an opinion), that the advantage or the disadvantage which has arisen has arisen from economical conditions in the relations of gold and silver independent of any legislation, and that it is a different thing fixing a ratio which is to prevail for the future and fixing a ratio at such a rate as by that legislation actually to affect the contracts that people have entered into?—Well, as I stated before, it is not exactly my province to fix a ratio. Knowing that no such ratio can be fixed without very important negotiations with the United States, France, Germany, and this country, and I do not suppose any attempt would be made to fix a ratio without the common concurrence of the great nations of the world, so that I fancy they would find a rate very much better than I could suggest. My own leanings are decidedly in favour of the old rate, because I believe restoration to the class of sufferers through that period is a much more moral act so far as we are concerned than any little disadvantage that may occur through the change.

8096. (*Mr. Chaplin.*) In reference to what the Chairman has just said, your reply in fact would be this: I understand that you would cause no greater interference with contracts now by the establishment of a double standard of 15½ to 1 than was caused by the demonetisation of silver in 1874?—Precisely, and the only difference is this, that whereas the cause of all this trouble was the demonetization of silver by Germany and the other States and by the dissolution of the Latin Union which had maintained the rate, in which we had no part; now we are the only people who are standing in the way of repairing these errors. Those countries begin to see they have made a great mistake in their monetary changes.

8097. Do not you think it does make a little difference that the one arises from something in which neither creditor nor debtor had a voice, and the other arises from the direct act in which both debtor and creditor had a voice, but the one has the voice which prevails?—Well, although I say that I appear here as representing the working-class element, I have stated

that I have been an employer for a long period, and I venture to say that if I had drawn a picture of the ruin that has come over the capitalist class it would have been very much blacker by far than that I drew of the working classes; the ruin through fixed charges and the changed valuations has been something awful to the capitalist class who are engaged in industrial and mercantile operations. Now I do think that if you determine on a policy you will get quite enough of evidence from the capitalist and other classes to direct your views as to what point ought to be determined upon. But I am certain that you need not fear a rapid change, because if we went back to the old prices they would go back very gradually. For instance, supposing this Commission reported favourably upon having a rated money, that would send silver up a penny or twopence an ounce immediately. Well before our Government took action, the determining on having a conference would send up silver another step. In fact the natural steps that would have to be taken before we could get to a common agreement with the other countries named, would bring back silver before you rated it.

8098. And to what ratio would it bring it back?—Very nearly to the old ratio.

8099. At the same time you hold that as a matter to be settled by a conference of the nations?—Yes.

8100. You are then distinctly of opinion that the adoption of a double standard or this ratio, although it might injure one or two individual trades in India, would be a great benefit to India as a whole?—Most distinctly an enormous benefit.

8101. It was suggested to you just now that the process of adjustment, say, would cause a real injury and a real difficulty, and that when that was over the difficulties would subside. But supposing that was so there is no guarantee, is there, whatever against a further fall in silver at some future time?—Certainly not, that is the difficulty, it is a never ending process.

8102. In which case the whole process of adjustment would have to be gone over again?—If you fix a rate the process of adjustment would determine the question, but I have to submit that there cannot be an adjustment with fluctuating standards. You never know where they will fluctuate to. Silver might be much depreciated at one time and gold might be much depreciated at another, through either the output of the mines or further action of Governments, and you have the whole commerce of the world playing at see-saw.

8103. (*Sir T. Farrer.*) I understand how the change your propose will operate to the benefit of the Indian trade, possibly also to increase the price of wheat and so improve the position of the English agriculturist; but I do not quite understand how this alteration that you propose will benefit all the other trades?—Well, I apprehend that England is really supported by five trades. There is agriculture; there are the textile trades; there is the mining industry; there is engineering, including all mechanical industry, and the shipping industry. Now those are the five big trades that support the prosperity of this country. Anything that destroys one is a very serious matter. Now two trades are seriously interfered with—I refer to agriculture and the cotton trade—and the others are in a bad way.

8104. But with regard to agriculture you said that the Indian wheat would still keep the market against the English wheat?—I never said so. It will keep the market as against American and other foreign wheat, that is supposing wheat went up. I think it would go up 8s. or 10s. as the result of readjustment.

8105. Do you mean the American wheat would rise 8s.?—Indian wheat, American wheat, all wheat would rise 8s.

8106. But you think Indian wheat rules the market?—Undoubtedly.

8107. (*Chairman.*) Why do you say 8s.?—Because the fall has been within the last few years very much greater than the fall in silver. Well, if you take the

fall in silver and you take the rupee at 1s. 10d., and it is now down at 1s. 5d., the fall would be about 24 per cent. Supposing that Indian wheat now is selling in this market, say, at 30s. or 32s., 33 per cent. would bring it up to 41s., so that practically 8s. or 10s. would be the change supposing it went back to the full point with money. But there are other processes of cheapening; there are the improved communications, that have been one of the elements of cheapening in the supply of wheat as well as in all our other foreign trade. I expect that it might send up the price of wheat 7s. or 8s.

8108. (*Sir T. Farrer.*) Now how do you suppose it would do that? Suppose that the price of Indian wheat were raised to-morrow by your action and that the Indian wheat were kept out of the market, do you suppose that other wheat would all rise to that extent?—Certainly.

8109. Now at this moment I am told that the wheat which rules the market, and which is at the lowest price, is Russian wheat, and that the quantity of Indian wheat coming is diminishing and the quantity of Russian wheat is increasing?—I should presume if Russian wheat is ruling the market it is because they are offering it cheaper in the market, because it is a fact that whenever you have a full supply of any article the producer who offers the cheapest, taking qualities to be equal, is the man who rules the market.

8110. Of course he is. How would restoring silver affect the price of Russian wheat?—I suppose Russia has roubles.

8111. It has paper, no silver?—Well I cannot say. As I said before, that is one point to which I have paid little or no attention, the question of paper money. I do not understand how it affects this question, nor do I think it does.

8112. And you never examined as to what have been the causes of the fall in the price of Canadian and American wheat so far as regards competition with Indian wheat?—Well, I examined them in this respect. As a manufacturer having to do with daily productions and in selling cloth I know that when the market is pretty well stocked the man who offers the cheapest article fixes the price. If the market was not stocked he might not, he would not; but with the market overstocked the man who offers the goods at the lowest price fixes the price.

8113. And a very small excess lowers the price?—I know it from experience.

8114. You mentioned a great number of trades as being in a very bad condition. It is impossible to go through them all, but I do happen to know something of one of the trades that you mentioned and that you have referred to to-day, and that is the pottery trade. I have the following statement from one of the first manufacturers in the Potteries:—“Josiah Wedgwood and Sons, Etruria, have paid 44 per cent. more wages in 1887 than they did in 1877, and have sold 57 per cent. more goods, the class of goods being more ornamental will account for the greater increased per-centage of goods sold over wages paid. I believe there is more ware made to-day in the Potteries than ever was made before, and in this belief I am confirmed by the opinion of other manufacturers. One Longton manufacturer told me that last week was the largest get-off of ware from Longton Station they had ever had. Another told me that though certain works were on short time the aggregate amount produced was largely in excess of what it was ten years ago, as they had so many new works since that date in operation. The manager of the Manchester and Liverpool District Bank, speaking without reference to books, thought there was no doubt that more money was paid in wages now than 10 years ago. Some works are making short time, and some branches of the business are working short while others are working full time. This will always be the case from various causes, change of fashion, of the character of trade, the introduction of machinery, &c. Thus, although we are working full time generally and are paying

Mr.
J. C. Fielden.
14 Nov. 1887.

Mr.
J. C. Fielden.
14 Nov. 1887.

" so much more wages than we did ten years ago, certain branches, as the plate makers and earthenware potters, are only working four works a week. That is due partly to change of markets, but chiefly to the introduction of machinery enabling one man, or in some cases one woman, to do the work of three formerly. Three fourths of the wages paid are piece-work. In 1873 there was a general rise of 5 per cent. all round amongst potters' prices, other branches participating in the rise in greater or less degree, and prices reached the highest they have ever attained. In 1878 or 1879 Lord Hather-ton as arbitrator awarded a reduction of prices all round of 1d. in the shilling. This reduction has not been questioned since by the men, and obtains still though the penny is no longer deducted from the weekly wage bill, but is allowed for in the revised list of piece-work prices. So far the witness's statement is true. But the purchasing power of the reduced wages is greater now than it was in 1873. Then the 4-lb. loaf was 7½d., now it is 4d. Our foreman of potters says the men were much more discontented when the rate of piece-work prices was higher than they are to-day. Life was harder for them. They are better fed, better clothed, and better housed to-day than they were in 1873. In fact, he says 20s. to-day goes farther than 27s. did then. He says there is no excess of labour over employment now. He has only had one application for a potter's place in the last three months, and in bad times he is pestered with applications. The present state of things is much better in this regard than is usual from the men's point of view. The relieving officer for Hanley, a town of 50,000 inhabitants, tells me there is no distress in his district; indeed, the working man is, he thinks, better off than he has been for some time. The Committee of the Hanley Charity Organisation Society concur in this opinion, The Hanley Sick Visiting Society reports that they have unusually little sickness to attend to. The secretary to a large sick club in Newcastle having 500 members reports that there is no difficulty in getting their payments from the members regularly. The fines for non-payment were 96d. for the five years 1876-80, and 97d. for the five years 1881-85, since which date their code of fines has been altered and is not therefore a fair test. The following are the investments with, and drafts on, the Commissioners of the National Debt of the Pottery Central Saving Bank:—

	Investment.	Drafts.
1878	—	5,000
1879	—	5,250
1880	—	1,500
1881	—	2,500
1882	—	1,800
1882	1,700	1,700
1883	700	—
1884	500	1,000
1885	500	3,000
1886	—	2,200
1887	500	1,100

" This is a working-man's saving bank mainly, and though the sums are not large they show that the savings are larger of late years than they were 8 to 10 years ago. The Post Office Saving Bank is also doing a large business." Now that is the account I get of the Potteries, which you stated was in a very bad state. I only say that there is another side to the question?—Quite so, of course different sources of information may differ a little, it depends entirely upon the width of ground you cover. Now take the last statement, the savings banks are increasing their annual investment. It is easy to understand why the men put their money into them. It is simply because other methods of investing the money of the working—classes have become less profitable.

8115. But that is not so in the Potteries. I happen to know that the working people there invest largely in their own houses?—In nothing has the suffering been more serious than to the property of small holders. Several of the greatest building societies in this country are in liquidation. In Manchester alone the falling off on investments in such societies is over two millions per annum.

8116. I give you these facts which are given to me by an extremely good authority in the Potteries, and which are certainly not consistent with yours?—I desire to say that my principal remark about the Potteries is based on the factory inspector's report on the district. He stated distinctly in his report last year that there was deficient employment in the Potteries.

8117. I am speaking of the pottery trade, not the iron trade?—I also gave a general sample of the Potteries from a report specially prepared for me. I can only say that whatever may be the facts I have given or the conclusions that can be formed upon my evidence it has been honestly prepared, not on purpose in the slightest degree to give anything but what is fair and right.

8118. Certainly, I only mean that there are two sides to a question?—That is so.

8119. With regard to a point of argument, not of fact, you said, I think, that two fifths of the expenditure of the country was fixed, and that in respect of those items no advantage was reaped?—Yes, conventionally fixed.

8120. I should like to ask you whether persons do not benefit in respect of prices, not only by paying less but by getting more and better things for the same price?—Undoubtedly in some respects; for instance, supposing that for the same money he gets a better service, but that does not affect the man's income and spending power. He has to do a certain thing and he only has so much with which to pay for it, he must put up with the worse service rather than pay more.

8121. But supposing he pays the same price and gets better service, that is the same as if he was able to pay more?—No, it is not the same thing. Now I will take a man who has a certain sum of money to pay per week for a family of five. Well he may get a better service for a given sum of money as he might get a rather better article; but if he divides his money out, and he can only pay a certain amount for this or that, the better service is no advantage to him from a saving point of view.

8122. Yes, but if the same amount is paid and a better service is got for it he is better off?—I think not, when you consider changes in employment and wages.

8123. If you take the different items which you have mentioned, you will find that in almost all of them we get more for our money. I will not go through them in detail. But, for instance, local taxation gives better water, better police, better streets, parks, and buildings. Then you spoke of hotels and everything that was sold at publichouses. We get very much better accommodation, far better than we did when I was a young man, and probably the working man does, though he may pay the same money. Take, again, railways. I could show you by very detailed figures what an immense advantage (although the penny a mile may remain the same) the working man has got in improved quickness of service, in third-class carriages being attached to every express train, in workmen's trains, in cheap trips. The working man, although the actual rate of a penny a mile may be the same, surely gets for his penny infinitely more than he used to get?—Well, I think I could go through every one of those items and explain them precisely. If a workman has only 6d. a week to come into this city to serve his employer, so far as economy it does not matter to him whether he has a better carriage or not, the 6d. is the important point, and if he still spends that he makes no economy.

8124. I will only give you two figures; the number of third class passengers in 1873 was

455,000,000; the number of third-class passengers in 1886 was 726,000,000. Does not that show that the poorer classes have had some benefit?—Yes, but will you allow me to tell you that the natural growth of railway traffic is practically only indicated there.

8125. And all these third-class trains are far better than they used to be?—They are better served, I admit; improvement is a tendency in all these things.

8126. Then, again, as to workmen's trains, trains which actually carry the working men at a very cheap rate, some of them at about $\frac{1}{4}d.$ a mile; in 1872, there were out of London 38 workmen's trains, now there are 113, and the number of persons carried by them has more than doubled. And so I might go on?—In Lancashire the passenger traffic doubles of itself every 10 years. As matter of fact, these increases must not be put down as in particular arising from the service but from the natural growth of traffic in the country.

8127. That shows that the workmen get more facilities of communication than they did?—You see the whole of that question has to stand on this point: Given a certain amount of reduced income, can a working man effect certain economies? He may get better service, but can he effect certain economies and devote the surplus to other things?

8128. If he gets more for each $1d.$?—He does not get more, he gets the same service better rendered. I did not include in that estimate of 400,000,000 a very large item that I have thought of since, viz., the cost of recreation and amusements. They are all growing dearer and they come to a very large sum per annum.

8129. (*Mr. Fremantle.*) You said a little while ago that this country had no part in the bimetallic arrangement which was in effective operation before 1873. Is there any special reason now, do you think, why this country should join in an agreement of that sort?—The special reason is this: supposing that it be a fact that we are suffering by this dislocation of money and that the Governments of the world will not again undertake to maintain a fixed rate without England taking a share in the work. That is the special cause of delay in fixing up again rated money.

8130. But is there any reason why the other nations of the world should not join in an agreement of that kind, as they did before, without the aid of this country?—Commerce is very much larger than when that arrangement was entered into, and some people are very much frightened about the production of silver. I find the production of both metals in the United States is practically about $\frac{1}{10}$ part of the production of their commodities and no more. The international trade of the world is a much bigger factor than when France began the regime in 1803, and there is no reason why England should refuse to take her perfect and proper share of the work of getting international rated money. There is another very great

reason why England should be included, and it is this, that we have the greatest silver-using country in the world under our Empire, and other nations are very much afraid if they build up the rate again that we might make some change in the currency of India that would be very disadvantageous, in fact, as Germany broke down the Latin Union in 1873. I believe at the Monetary Conference in 1881 they would have agreed if England, being out of the arrangement, would have given a pledge that for 20 years she would not interfere with the standard of India. I believe the nations would have rated money without England.

8131. But are you aware that at that Conference England gave the pledge that the mints of India should be open to silver coinage?—I am aware that she declined to pledge the future. It is not a matter of whether the mints of India are open to-day or to-morrow, it is a question of 20 years. They, the nations, must have no great flood of silver thrown on the market through another demonetization.

8132. I think I am right in saying that no question was raised about the change of standard in India at that time, nor was any apprehension expressed that such a change would be made?—The impression remains on my mind that the Powers were prepared to accept the responsibility of rating silver, providing that this country would give an absolute guarantee not to touch the coinage of India for 20 years. However, that is a matter of small importance now.

8133. You would agree that without England, before 1873, the bimetallic arrangement was possible?—It not only was possible but absolutely carried out, and carried out during a period when twice the production of silver in relation to gold took place than is taking place now. Silver has fallen through restricting its use and not through the production of the mines.

8134. (*Mr. Montagu.*) Would there not also be a disadvantage to this country if other nations were bimetallic and we remained out, with regard to our trade with silver-using countries, because we should have to get the silver from those countries with expense or sell it again with loss, and so we should be handicapped in our trade with silver-using countries?—Quite so.

8135. That was the case, was it not, before 1873?—If we wanted silver for India we had to go abroad for it and pay the profit, and the reverse would cause a loss if we received silver, and had to sell it abroad?—Well, I am not quite acquainted with that question, but I would simply say that the greatest danger that could possibly happen to this country in regard to its trade would be if the United States were to say, "We will go on silver and we will clear England out of the whole of her Eastern trade, and, if she did, you could not help yourselves." You would have to rush to a silver standard.

*Mr.
J. C. Fielden.*
—
[14 Nov. 1887.]

The witness withdrew.

Adjourned till Friday.

THIRTY-SIXTH DAY.

Friday, 18th November 1887.

PRESENT :

THE RIGHT HON. LORD HERSCHELL, the CHAIRMAN, presiding.

MR. D. M. BARBOUR, C.S.I.
MR. HENRY CHAPLIN, M.P.
SIR T. H. FARRER, Bart.

SIR JOHN LUBBOCK, Bart., M.P.
MR. S. MONTAGU, M.P., and

MR. GEO. H. MURRAY, *Secretary*.

Mr. T. COMBER re-called and examined.

Mr.
T. Comber.

18. Nov. 1887.

8136. (*Mr. Chaplin.*) I think last time you were here, you said you regarded the question in two lights; first, as to whether the fixed ratio was possible, and secondly, if it was, whether it was desirable in the interests of India and England, that it should be re-established?—Yes, I did say so. I may mention that I understood that I came here to-day to answer certain questions about wheat; I did not understand that I was to go over the whole subject. There may be some questions that I have not materials with me for answering. I will answer them if I happen to be able to.

8137. Well, I gather that you gave a general opinion that it would be impossible to fix the ratio permanently?—That is my opinion.

8138. But that opinion was somewhat qualified, I think, by various answers that you gave. In Question 6335, you laid down that it would be “impossible to permanently maintain a double standard, even when established over a certain area, by international agreement.” But you do not deny that the fixed ratio has had some effect in keeping the standard steady?—Not at all; certainly it had some effect.

8139. And you limit your observation to this: that you do not think, permanently, a fixed ratio could be maintained?—Yes, on the ground which I tried to explain.

8140. Well, then you spoke of India, and I think you said that the disadvantages to India, arising under the present system, were more than counter-balanced by the advantages to India as a whole?—Yes.

8141. Then I suppose you would disagree altogether with the evidence given by Sir Evelyn Baring upon this question. At Question 7109 of his evidence, he was asked this: “I think you admitted that the fall in silver has, to some extent, been advantageous to producers in India?—Yes, I think it has. It has sent home more produce than otherwise would have been sent.” Then the next question that he was asked is this: “But it does not in any way compensate for the general mischief?—I think certainly not.”—I disagree with him entirely; I think it more than compensates.

8142. And that would not modify your opinion in any way?—I arrived at my opinion quite independently.

8143. You consider that India gets the advantages which you spoke of. Do you think that the rate of exchange has a tendency to develop trade?—The answers to Questions 6375 and the following ones, give my views as fully as I could venture to give them. “I think it is beneficial to a certain extent in India, because India is entirely differently situated” and again, “India is a producing country; she produces and exports sufficient to pay for her imports, for what has been termed the Government tribute, by which I mean the liabilities of the Indian Govern-

ment in London, and to receive a balance in “treasure, largely composed of silver from her debtors, namely, the recipients of her exported “produce.” Speaking broadly that her producers, in competition with the producers of other countries are at a considerable advantage.

8144. And you do not think it is counter-balanced at all by the fact that she has to pay a very large interest on her gold debt to England?—I think when things finally adjust themselves, the increase of the revenue of India, from the increased assessments for the land tax, will pay the increased charge for interest.

8145. But at the present time?—At the present time I think that the advantage to the cultivator compensates for any disadvantage.

8146. In respect of the large debt that she has to pay to England?—That is only one item in her balance of trade, which is more than counterbalanced by other items; so that the balance of trade is in her favour.

8147. You were asked some questions by the Chairman, as to the alleged depression of trade and agriculture in this country, owing to the suggested appreciation of gold, and you said that, as regards trade, you thought it was much more largely due to other circumstances; and then you took the cost of wheat, and you were kind enough to give us some figures compiled by a neighbour of yours; the general result of which was to show that the fall in the price of wheat was very nearly accounted for by the diminished cost of transport?—That it was largely accounted for by that.

8148. And you suggested, I think, that the years taken were not fairly representative years?—Yes, I questioned the taking of the year 1875.

8149. Do you know why 1875 was taken?—I could not tell you then, and I cannot tell you now, except that my friend Mr. Nixon did take those years; but I want to put before you, if you please, a statement, which I have prepared myself for every year from 1873 up to the first half of 1887, and that shows it year by year (*see Appendix*). It has been made up by myself, and I will be responsible for it. If you will allow me to explain, the first column shows the average price of English wheat. The next columns show the cost of carriage of Indian wheat, the inland carriage, the sea carriage, and the two together for each year; the next columns show the same from America; the last columns show the reduction from the year 1873; the reduction in the price of wheat, the reduction in the transport from India, and the reduction in the transport from America. I average the four years 1874-7; the five years 1878-82; and the four and half years ending June 1887.

8150. (*Sir T. Farrer.*) Could you give us the general result in figures?—The average price of

Mr.
T. Comber.
18 Nov. 1887.

wheat in 1873 was 58s. 8d. It was 33s. 11d., in the first half of 1887. Of course there has been a great change since then. The Californian ring has broken, and the price is now a good deal lower; but I take the average price during the first six months of the year.

8151. (*Mr. Chaplin.*) What is the present price?—The present price is about 30s.

8152. And has been about that for some time?—Yes.

8153. It has been considerably lower than that during the first part of the six months?—A little lower. I made up this table immediately after I was here before, and I took the first half of the year.

8154. I suppose 30s. would be a fair average to take as the probable price of wheat in the last six months in 1887?—I think so.

8155. I understood that there has been a fall from 1873 to 1887; to what extent?—The first half of the year 1887 the average price was 33s. 11d., that shows a fall of 24s. 9d. The fall in the cost of transport from India was 13s. 3d., and in the transport from America, 9s. 3d. I should like to explain that in one item, the inland carriage from Jubbulpore to Bombay, the reduction is partly due to the fall in silver, to the extent of 1s. 7d.

8156. You say that the fall in the transport from India to England is 13s. 3d.; how do you get the 13s. 3d. in the different items. How much is owing to land transport, and how much to sea?—The land carriage has fallen from 9s. 8d. to 4s. 11d.; that is a difference of 4s. 9d. The sea carriage from 13s. to 4s. 6d., a fall of 8s. 6d.

8157. Where is that from?—From Jubbulpore. It is the only place where I could get a return from the railway companies so far back as 1873.

8158. You have got returns as to Cawnpore at a later date than that, I suppose?—Yes, but those are not regular; I could not get them from 1873 from any place but Jubbulpore.

8159. (*Mr. Barbour.*) Have you got a statement of the amount of wheat exported in 1873; I think the trade was very small at that time?—Yes, the export was only 394,000 cwts. Of course a good deal of wheat came down to Bombay from Jubbulpore for local consumption, apart altogether from export.

8160. (*Mr. Chaplin.*) I do not think it is necessary to go through every year, but take 1877, could you give us that?—Well, I could give you the average of four years from 1874 to 1877; the average of five years from 1878 to 1882; and the average of four and half years from 1883 to the middle of 1887.

8161. You could not give us 10 years ago?—Yes, in 1877 the price of wheat was 56s. 9d., as against 58s. 8d. in 1873, showing a reduction of 1s. 11d. per quarter. The fall in transport from India was 6s. 11d. at that time.

8162. Now what I want to point out to you is, that from 1873 to 1877 the price of wheat has varied. It has sometimes fallen, and sometimes risen, but since 1881 there has been a steady and continuous fall to the present time. Now could you tell us what the price of wheat was in 1881, and what the fall in carriage between 1881 and 1887 was?—Yes. The price of wheat in 1881 was 45s. 4d., and in the first half of this year it was 33s. 11d.—that is a fall of 11s. 5d., and the fall in carriage was 6s. 1d. In 1881 freights were rather high. The average ocean carriage was then 9s. 2d., whereas two years before, it was as low as 6s. 3d.

8163. (*Chairman.*) Can you give a comparison of the price of silver in the two years 1881 and 1887?—I can give you the rate of exchange, if that will do. In 1881 the average exchange was 1s. 7½d., and in the first half of 1887 it was 1s. 5d.

8164. (*Mr. Chaplin.*) Well now, in all these calculations you have allowed for the price of wheat being 33s. 11d. for the first half of 1887?—Yes.

8165. On the assumption that the price of wheat for the second half of 1887 is only 30s. which is the average price quoted now, that would make the fall

from 1883 to the present time 11s. 8d.; whereas the fall in carriage has been only 2s. 5d. If that is so, I presume you will admit that that entirely disposes of the argument that the fall in the price of wheat has been due to the fall in the cost of carriage?—There are fluctuations in different years, but the argument that I venture to put before you, I think, holds good on the average.

8166. (*Sir T. Farrer.*) Has there been any great fall of exchange between 1886 and 1887 and the present time?—I cannot give it you for the year 1887, because the year has not closed, but in the first half of the year 1887 it was 1s. 5d. as against 1s. 5½d. last year.

8167. (*Mr. Chaplin.*) But, however, we are in the middle of the second half of 1887, and, taking the price of wheat at 30s. for the second half of 1887, and taking also the fall in the cost of transport that you have given us, we arrive at these figures, that the fall in the price of wheat has been 11s. 8d., and the decreased cost of transit has been 2s. 5d.?—If you take those two particular years, that is so. I do not agree to 11s. 8d., unless you take only the second half of the year.

8168. Since 1883 there was a heavy and continuous fall in the price of wheat?—It would depend altogether upon how you regard it. I do not think the average of this year will be lower than the average of last year, because the average of the first half of the year is 33s. 11d.—34s. in round numbers. Accepting your supposition that in the second half it will be 30s., the average for the year will be 32s., or 1s. higher than it was in 1886. I do not want to assent to your suggestion that the fall has been continuous since 1883, because in the first half of 1887, there was a considerable rise, and that must affect the average for the whole year.

8169. That, as a matter of course, can only be decided when we get the average at the close of the year, but my statement was that from 1883 to the present time there had been a continuous fall?—Not continuous so far as the beginning of this year was concerned.

8170. But, as far as the present time is concerned, November is the last month for which we have returns; for three or four months the fall has been continuous?—I do not want you to put the words "continuous decline" into my mouth.

8171. (*Sir T. Farrer.*) Has there been any great fall in exchange during the present year, comparing the exchange with prices?—There has been no very great fluctuation.

8172. (*Mr. Chaplin.*) Admitting, for the sake of argument, that your contention is right, there has been still a very great fall from 1883 to 1887?—A fall of 8s. 7d.

8173. And that fall, amounting to 11s. 7d. according to my calculation, and amounting to 8s. 7d. according to your calculation, is not nearly accounted for by the diminished cost of transport, which was only 2s. 5d.?—Partly accounted for. I have only mentioned the cost of transport as one item in the cause of the fall.

8174. Well, in your evidence the statement is this: "He has calculated the cost of carriage from Cawnpore to Liverpool, making a total of 9s. 3d.; the reduced cost of transit was very nearly as much as the reduced price for wheat?"—Yes, that is for those particular years, but, I think, if you would read several other answers which I gave, I pointed out that the cost on transport was only one of the various causes which I thought had produced the fall in prices; and that I did not deny that the fall in silver was also a contributory cause—I think so still.

8175. That was what I wanted to arrive at, that the fall in the price of wheat is not nearly accounted for by the diminished cost of transport?—I should prefer to rely on the table I lay before you which gives the whole series of years covered by the fall in silver.

Mr.
T. Comber.
18 Nov. 1887.

8176. (*Sir T. Farrer.*) I suppose the price of wheat in each particular country depends more than anything else upon the seasons in that country, and especially upon the question whether there is an abundance or scarcity there for the time?—That is the main factor.

8177. (*Chairman.*) But does it depend so much now on the seasons and those conditions in a particular country with the rapid and easy acquiring of information internationally?—Not so much as it formerly did.

8178. (*Sir T. Farrer.*) But in a particular country the supply will depend on the seasons, will it not?—The supply will depend mainly on the seasons.

8179. Have you heard that at this particular time, and during the latter period of this year, the lowest wheat in the market has been Russian wheat?—I cannot speak as to that.

8180. Do the items you have given include all the reductions in the cost of Indian production? There have been some witnesses who have told us that the price of bagging has been reduced?—The table shows the cost of transport only, railway carriage from Jubbulpore to Bombay, and steamer freight from Bombay to Liverpool. It does not include any reduction in the cost of bagging, or of handling, or the elimination of middle profits at all.

8181. (*Mr. Chaplin.*) You expressed the opinion, I think, when you were here before, that the condition of the wage-earning classes was much better now than it was 14 or 15 years ago?—I think so; yes.

8182. And do you refer to the wages of artisans or agricultural labourers, or both?—I referred principally to cotton operatives, with whose position I am better acquainted.

8183. You speak from experience of these?—I have not much personal experience with operatives, but I speak from my general knowledge of the cotton trade.

8184. You would say that the condition of those classes is better than it was 14 or 15 years ago?—That is my opinion.

8185. In what respect is it better?—I think the rate of wage has been reduced somewhat; but that has been partly compensated for by the increased out-turn of machinery; and, therefore, the weekly earnings have not decreased in proportion to the rate of wage; whilst the buying power of the weekly earnings, considering the fall in prices in the necessities of life, is greater than it was at the former period.

8186. You think then, in so many years, that their real wages have increased?—Yes.

8187. You would entirely dispute the evidence which was given before us last week, by a gentleman, who spoke, apparently, from an intimate knowledge of the working classes, and estimated the fall in their real wages at something like $7\frac{1}{2}$ or 10 per cent.?—It is so very difficult to say whether he was speaking of the rate of wage, or of the weekly earnings, because they are essentially different. For instance, supposing that the wage of a weaver has been reduced, we will say, 10 per cent., and that through improvements in machinery, one hand that used to mind, as they call it, two looms, can now mind three looms; it is very evident that her weekly earnings would be very largely increased in spite of the reduction in the rate of wage. I do not put that as an actual instance, but as showing how the weekly earnings depend upon out-turn.

8188. (*Mr. Barbour.*) I think I can give you Mr. Fielden's figures. He said the rate of payment for work done was reduced 15 per cent.; that owing to a worker being able to turn out more work, one-half of that loss was recovered, so that there is a net loss in the money wage of $7\frac{1}{2}$ per cent.?—I should not differ much from him; I think the rate of wage has been reduced about 10 per cent., and the weekly earnings about 5 per cent., and I believe that 5 per cent. less money now buys more than the larger sum did so many years ago.

8189. He also said that there had been a loss of wages owing to strikes that had taken place before the rate of wages could be reduced, and that there was

a larger number of men out of employment?—I cannot speak as to the number of men out of employment at present, I should doubt its being large, but I have no definite information.

8190. (*Mr. Chaplin.*) Then you still adhere to that opinion, that the condition of the wage-earning classes, on the whole, is better than it was?—Yes.

8191. But, at the same time, you say that you speak from no personal knowledge or any very great experience of their condition?—Not directly.

8192. And the evidence of the gentleman to whom I have referred, who speaks from direct personal and intimate knowledge, would not shake your opinion at all?—No, I think I could produce evidence from people, who are more intimately brought into contact with the operatives than I am myself, which would go quite the other way.

8193. I think you stated in the course of your examination, that one effect of the adoption of the bi-metallic theory would be to increase prices generally?—In gold countries.

8194. You said largely in time?—I think largely in time as the production of the mines comes up into the currency. I want you to bring in that condition.

8195. And, at all events, you think that the general effect of the adoption of the bi-metallic system, at the rate of $15\frac{1}{2}$ to 1, would be to increase prices at once to some extent, and largely in the future, probably?—Yes.

8196. Do you consider the increased price of commodities generally would be an evil or not?—To the country generally, I think it would be, if anything, a disadvantage.

8197. You do not hold any strong opinion about it?—It is a matter of opinion, and not of fact, although I do hold that opinion quite strongly in my own mind, I do not wish to express it in a dogmatic manner.

8198. You are aware that in the report of Lord Idlesleigh's Commission which inquired into the Depression of Trade, among the causes which had produced this prolonged depression, the fall of prices was given a very prominent place?—I have explained, I think, in my previous evidence, that the fall in prices, while it is taking place, produces loss to traders.

8199. Then so long as this fall in prices continues, you admit that it is a general disadvantage?—It produces loss to the trading community.

8200. I am speaking of the interests of the country as a whole. I want to arrive at your opinion upon that subject?—Well, I have expressed it as well as I can in my examination-in-chief, which is principally this, that the lower prices fall, the more produce this country, as a whole, draws from its debtors; and, therefore, although it may be a loss to one class of the population, and a gain to another, on the whole, taking the nation all round, the balance is of advantage to this country.

8201. Although one of the results in the fall in prices is to create a general depression of industry throughout the country?—No, excuse me, you are putting words into my mouth.

8202. I am asking if you admit that?—No, I do not admit that.

8203. Then you differ from the report of Lord Idlesleigh's Commission?—I should like to see how that was expressed in the report of the Commission.

8204. Well, I will read you one section from the report, as I am anxious to have your opinion upon it. Section 72 says as follows: "We expressed, in our Third Report, the opinion that this fall in prices, so far as it has been caused by an appreciation of the standard of value, was a matter deserving of the most serious independent inquiry, and we do not therefore think it necessary to investigate at length the causes which have brought it about." I suppose this Commission was appointed to inquire into the consequence of that. "But we desire to give it a leading place in the enumeration of the influences which have tended to produce the present depression." Well, now it seems to me, therefore,

if that report is to be taken as expressing a reliable opinion, that a fall in prices, such as it refers to, must be a disadvantage to the country at large, and that is precisely the point upon which I wanted to have your view?—After hearing that, I adhere to my previous opinion that low prices once established, are a distinct advantage to this country.

8205. Do you agree with the statement in the report that I have just read?—It depends upon the amount of the fall; I should not like to agree to it generally.

8206. You would not like to admit that the continuous fall in prices referred to has been a leading cause of depression?—No. Even while prices were falling, although the loss to the trading community may have been large, and may have contributed to the depression which existed, I think that was counterbalanced by the advantage to the working classes of the lower prices.

8207. Assuming that your opinion is right, that the working classes, on the whole, have benefited rather than the reverse?—I think so.

8208. But if it could be shown as a matter of fact, as to the condition of the working classes, that your opinion was wrong, would that alter your view as to the advantage of the fall in prices?—Of course if my facts were wrong, my opinion would change.

8209. Then if it could be shown you, or if it could be shown satisfactorily, that the condition of the working classes, instead of being benefited, has been injured by the present state of things, your opinion would change?—My opinion on that point would change.

8210. (*Chairman.*) Well, but do I understand you to mean, that if you found that there had been some suffering, or inconvenience, or loss to the working classes, that that would lead you to the conclusion that bi-metallism was a remedy which would remove it?—Not at all. This is a question of fall in prices entirely, and a fall in prices is produced by a great many other things besides mono-metallism.

8211-12. (*Sir T. Farrer.*) Supposing a fall in prices were a bad thing, and was admitted to be a bad thing, you would not think it right to try and counteract that by any violent remedies such as a change in the standard. Any legislative remedy, I should rather say, than a violent remedy?—The effect on the working classes would be only one consideration out of many, that I think should be given to the question.

8213. With respect to this question of wages, I think you said you thought that the fall in the value of silver had given some stimulus to production in India, as compared to production in England?—Yes, as regards wheat.

8214. And probably as regards cotton, but we will put that out of the question for the present. But as regards wheat, I think you said also, that that was very much because wages and fixed charges did not adjust themselves at once to prices?—And rents.

8215. Rents more particularly?—Owing to the assessment of the land tax in India.

8216. But wages do not adjust themselves so readily as prices?—No.

8217. If then, wages have fallen, as is stated in England, the adjustment has probably taken place?—Partly; I do not think it has completely.

8218. And to whatever extent it has taken place, then to that extent the stimulus given to the Indian competition is removed, and the English producer is placed so far *pro tanto* on the same footing with the Indian producer as he was before?—To the extent that the wages he pays have been reduced.

8219. In fact, the adjustment then to that extent has taken place which might have been expected?—Yes; but it is so far only a partial adjustment.

8220. Well now, going from that question, the last witness we had gave us very elaborate figures to prove that the English cotton spinner and the English weaver were much injured by Bombay competition, and that that was due almost entirely, if not entirely, to the fall in the price of silver. I think you have something to say on that point?—I quite dis-

agree with the opinion that the large development of the cotton industry in India is due entirely, or even chiefly to the fall in silver. I desire to say that on the contrary, the Indian mills derive only a trifling and temporary benefit from the changed relations between gold and silver, and that their remarkable development of late years is due chiefly to other and natural advantages which the Indian spinner enjoys over his Lancashire competitor in the production, not of all kinds of yarn, but of those descriptions which can be made from Surat cotton, that is Indian cotton. Before entering into details, I may state broadly that these advantages arise principally from the Indian spinners' proximity to the place where (1) the cotton he uses is grown, and (2) the yarn he spins is consumed. To estimate rightly the conditions under which the Indian cotton mills work and the influences which bear upon them, they should properly be compared, not with the English mills, but with other mills which enjoy similar advantages of position, yet are in no way affected by any change in the value of silver. Such mills are to be found in the Southern of the United States; for they are in, or close to the American cotton field, and they produce, as the Indian mills chiefly do, for the neighbouring population. The following comparisons show that although the recent development of the Indian mills has been very great when compared with that of English mills, it has been by no means phenomenal when compared with that of the mills in the Southern States. First as regards machinery:—

SOUTHERN COTTON MILLS.

	Spindles.	Looms.
1886-7 - - -	1,213,346	27,963
1879-80 - - -	559,320	12,329

Northern States - - -	1,727	1,710	17	1

* In thousands of bales.

It may be objected to these comparisons that the development of the cotton industry in the Southern States of America is due rather to their working under a system of protection, and that, in fact, the advantage thus conferred on the Southern mills takes the place of that conferred on the Indian mills by the fall of silver. But a comparison between the cotton delivered to the mills in the Southern States, and that delivered to those in the Northern, shows that such is not the case. As the Northern mills enjoy equally with the Southern the advantage of protective duties, and have increased during the six years to so small an extent, it is clear that the development of the Southern mills is not due to protection, but to the advantage which they possess in common with the Indian mills, viz., proximity to the areas of production of raw and consumption of manufactured cotton.

Mr.
T. Comber.

18 Nov. 1887.

Mr.
T. Comber.
18 Nov. 1887.

8221. (*Mr. Chaplin.*) What is the amount of the protective duty?—It varies a great deal with different things, but it is quite prohibitive.

8222. (*Mr. Montagu.*) Would not cheaper labour in the south than in the north affect the mills?—I do not think the labour is cheaper in the south.

8223. Do you know that they employ the free negroes at cheaper rates than the north can employ white labourers?—I know that wages in the Northern States have fallen very much, and I think that taking into consideration the quality of the work, the Southern States have certainly not the best of it. It is in the production of low counts of yarn, not of finer yarns or cloth that the Indian mills have been so successful of late years; and the cost of production of yarn is chiefly made up of items which can be grouped under the following heads.

8224. (*Sir T. Farrer.*) This coarse yarn is made from Indian cotton, is it?—In Bombay it is made from Indian cotton; in Lancashire it is made from Indian cotton and low American cotton mixed.

8225. (*Chairman.*) The Surat cotton is never used except for the low manufacture is it?—No. The heads are (1) raw cotton; (2) mill and machinery; (3) labour; (4) power; (5) stores; (6) transport to the consumer. These items vary greatly in importance. To arrive at a correct estimate of the cost of producing yarn in Lancashire and Bombay respectively, and laying it down in the East, allowance must be made (a) for the relative importance of each item; and (b) for the degree of advantage enjoyed on the one side or the other. I have prepared a statement in which I have endeavoured to show these. The first item, cotton, is by far the most important, and indeed amounts to rather over two-thirds of the whole; for owing to wastage in the process of manufacture, it takes about $1\frac{1}{4}$ lbs. of cotton to produce 1 lb. of yarn. In this principal item the Indian spinner has a great advantage, as he is saved the cost of transport, that is of bringing cotton from Bombay and laying it down in Oldham, amounting to about $14\frac{1}{2}$ per cent. on the cotton, and to produce a pound of yarn, the cotton costs the Bombay spinner only 5d. against 5·69d. to the English spinner; the extra cost to the English spinner is thus, between $\frac{3}{8}$ d. and $\frac{1}{2}$ d. per lb.

8226. I think the extra cost to the Lancashire spinner of freight and commissions, everything covered, was stated as $\frac{3}{4}$ d. Would you agree with that?—It is not quite so large as that. That covers the cost of conveying the cotton from Bombay to Oldham, including freight, cost of pressing, handling it at different places, brokerages, and commissions, which as matter of fact are paid. The second item, mill and machinery, consists really of three items (a) cost (or rent) of land; (b) cost of erecting the building; (c) cost of machinery. In the two first the Indian spinner has probably a slight advantage; in the last a considerable disadvantage; but the disadvantage is a good deal compensated for by the longer hours of working in India, 80 to 84 hours a week, against 56 hours a week in Lancashire. This materially reduces to the Indian spinner his standing expenses per pound of yarn produced.

8227. But does that necessarily diminish it unless in the 84 hours they do as much or more than would be done in 56 hours here?—Oh, but they do a good deal more. The annual out-turn of a mill of 40,000 spindles in India working 80 or 84 hours a week is very much larger than that of a similar mill in Oldham working 56 hours a week.

8228. (*Mr. Chaplin.*) How many hours do they work in India?—I can give you the particulars of the 84 hours if you like.

8229. It is not true that they work at night by petroleum light, is it?—I think they use gas when they light up. In Calcutta the hours are from daylight 6 a.m. to 8.30 p.m., or $14\frac{1}{2}$ hours for five days a week, and until 4 p.m. on Saturdays. That makes 84 hours per week; and they do not work there on Sundays. In Bombay they work on Sundays, and they work 80 hours per week.

8230. And they work the same in Bombay on Sundays?—I do not know whether the hours on Sundays are the same.

8231. (*Mr. Montagu.*) Do they not have long periods of holiday in India?—They have about two weeks in the year, corresponding to what the English spinner also has.

8232. (*Mr. Chaplin.*) These long hours, I suppose, wear out the machinery sooner?—The depreciation is found to be much the same, $7\frac{1}{2}$ per cent. per annum. The greater cost of machinery in Bombay has been of late years reduced by the fall in freights. The interest on the cost, and the depreciation of the machinery bears a much smaller proportion to the total cost of yarn, than the cost of cotton does. It is ·42 of 1d. per lb. in England, ·64 of 1d. per lb. in Bombay. In labour, conditions are about equal. In wages to the operatives, the Indian spinner has the best of it, not only in the lower rate of wage, but also in the longer hours of labour. But against this there is the greater cost of supervision, for the Indian mills are obliged to use English superintendents, who get very high wages. The hands in India are not, individually, as efficient as the English operatives; but their rate of wage is much lower, and more than compensates for their want of skill. Besides this, by longer training, the Indian hand has become more effective than formerly, and recent improvements in machinery have rendered it now so automatic, that much which formerly had to be done by hand, is now done by the machine, and this greatly diminishes the advantage conferred by the superior skill of the Lancashire "hand." In Lancashire, labour in producing 20's yarn = 1·11d. per lb., in Bombay ·99 per lb. Few mills are driven by water, and the cost of power depends almost altogether upon that of coals. It is greater to the Indian spinner; but his disadvantage in this respect is less than formerly, owing to the fall in freights. Cost of coals in England ·05 per lb. of yarn, Bombay ·16 per lb. of yarn.

8233. (*Sir T. Farrer.*) It is English coal that they use?—Yes, it is English coal.

8234. There is coal in India?—There is.

8235. (*Mr. Chaplin.*) Would it be possible to establish mills in the neighbourhood of the coal?—I do not know.

8236. (*Mr. Barbour.*) Some of the Calcutta mills are not far from the coal; do they use Indian coal?—I only know of the Bombay mills. Most stores are cheaper in England, but some, such as oils for lubricating, cost less in India. This item is again of little importance. Of the yarn produced in India, $\frac{2}{3}$ ths is consumed in the country, $\frac{1}{3}$ ths is exported chiefly to China. On the larger portion, therefore, the cost of transport which the English spinner incurs from England to an Indian port is entirely saved, viz., ·50 per lb. On the smaller portion exported, the cost of transport from Bombay to China is a great deal less than that from Manchester. Formerly this was not so much the case, for the steamship company that ran between Bombay and China, practically had a monopoly, and charged very high freights; but lately there has been competition, and several times last year, the freight from Bombay to China was as low as one rupee per ton, and the average rate at which the year's export was carried was probably five rupees. We find then that the Indian spinner has natural advantages in the most important items. Further, that in one principal item, that of cost of conveyance to China, the advantage of the Indian spinner has of late been materially increased by the reduction of freight, while the advantage of the English spinner has been diminished (a) by improvements which render machinery more automatic, (b) by the increasing skill of the Indian hands, (c) by the fall in freights which reduces the extra cost in India of machinery and coals.

8237. (*Mr. Chaplin.*) What is the advantage in the cost of freight between India and China and Manchester and China?—To carry yarn from England to China costs ·7 of 1d. per lb., and from Bombay to China ·26, including packing and other expenses;

8238. (*Chairman.*) Supposing that the rate of exchange were to rise, would not that be to some extent an advantage to the English manufacturer in his competition with India?—I am just coming to that point. In giving these details, I have endeavoured to avoid all reference to exchange, and now we come to that question. In the foregoing particulars, I have treated the various items entirely apart from the effect upon them of the change in the relative value of gold and silver. The question remains, what effect does this really exert? The fall in exchange inflicts no injury on the English spinner in his competition with the Indian mills if the loss it causes him in the realisation of his yarn in India and China is counterbalanced by a decrease to him or an increase to the Indian spinner of the various items of the cost of producing the yarn. This is, more or less, what has been the result, or will be when adjustment is complete. As regards the most important item, cotton, the cost to the English spinner is lowered by a fall in exchange exactly in the same degree as the price abroad of his yarn is lowered. As regards machinery, coals, and stores, their cost to the Bombay spinner is increased in the same degree. As regards wages, these have to a great extent, already adjusted themselves by some fall in English wages, and some advance in Indian wages; but they have probably not yet entirely done so, and the extent to which they have not done so, is the measure of the loss which the English spinner at present temporarily suffers from the fall in exchange, until the adjustment is completed. Another item hardly affected by exchange, is Government and local taxation, which has not materially altered in England or India. But wages and taxes together form a very small portion of the whole cost compared with the items in which the Indian spinner possesses natural advantages for the production of coarse yarns for eastern consumption. I find that, on the assumption that at present wages have been adjusted to the fall in exchange to only half the extent required; the natural advantage the Bombay spinner enjoys from the situation of his mill, still remains over $\frac{3}{4}d.$ per lb. of yarn produced; viz. $\cdot 71d.$ on the portion consumed in India, and $\cdot 65d.$ on that exported to China. Such an advantage is quite sufficient to prevent the trade in coarse yarns returning to Lancashire. It must be regarded as permanently lost to this country. But the manufacture of medium and finer yarns, and of cloth made from them, which constitute the great bulk of the cotton trade of Lancashire, has not been, nor is likely to be, in any way affected by Indian competition; nor is it in any degree prejudiced by the fall in exchange.

COMPARISON between Cost to English and to Bombay Spinner of producing and laying down in the East, 1 lb. of 20's Yarn.

Exchange 1s. 5d.

	Cost to		Advantage to	
	English Spinner.	Indian Spinner.	English Spinner.	Indian Spinner.
Cotton, $1\frac{1}{2}$ lbs.	$d.$ 5'69	$d.$ 5'	$d.$ —	$d.$ '69
Depreciation and interest on mill and machinery	'42	'64	'22	—
Coals	'05	'16	'11	—
Wages	1'11	'99	—	'12
Stores	'28	'46	'18	—
Sundries	'40	'25	—	'15
Cost at mill	7'95	7'50	'51	'96
Packing and carriage to Bombay	'50	—	—	'50
Delivered at Bombay	8'45	7'50	'51	1'46
		Net advantage		'95
Packing and carriage to China	'70	'26	—	'44
Delivered in China	8'65	7'76	'51	1'40
		Net advantage		1'89

8239. Is that on the question of carriage?—On the question of carriage, yes. I am taking the price of cotton in Bombay, and adding the carriage to it. This is not per pound of cotton, but per pound of yarn produced. It takes about $1\frac{1}{4}$ lbs. of cotton to produce 1 lb. of yarn. In depreciation of machinery, the English spinner has an advantage of $\cdot 22d.$; coals, $\cdot 11d.$; wages, at 1s. 5d. exchange, the Bombay spinner has an advantage of $\cdot 12$, but at 2s. exchange, on the assumption that they have only half been adjusted, the English spinner would have an advantage of about the same. In stores, the English spinner has an advantage of $\cdot 18$ of $1d.$ In sundries, including local and government taxation, fire assurance for mill, lighting mill, cost of management, and so forth, the Bombay spinner has an advantage of $\cdot 15$, and in packing and carriage of his yarn to China, the Bombay spinner has an advantage of $\cdot 44d.$, making a total balance of advantage to the Bombay spinner, on the yarn consumed in India, of $\cdot 95d.$ of a $1d.$ per pound of yarn produced, and on the portion which are exports from China, of $\cdot 89d.$ per pound of yarn produced. I have had these very carefully made out from returns made to me by cotton spinners in this country as regards the English expenses and by cotton spinners in Bombay, one of them the largest in the place, as regards Indian mills.

8240. (*Mr. Barbour.*) They are not founded on your personal experience?—No.

8241. (*Mr. Chaplin.*) They are not from personal knowledge of Bombay mills?—I have been there and I know them very well, but I have never worked them, and I have no interest in them.

8242. (*Sir T. Farrer.*) Then the result of all is supposing the exchange to alter, and the silver again to be $15\frac{1}{2}$ to 1, and the rupee to rise to 1s. 10d. or 1s. 11d., that would not have the effect of recovering for Lancashire the spinning of coarse yarns, or of preventing Bombay competing successfully with Lancashire?—I think not. The advantage to the Indian spinners would be over $\frac{5}{8}d.$ per pound of yarn produced.

8243. Do you know what the proportion of the coarse manufacture in Lancashire is, or has been, to the finer manufacture?—I should think it was about 10 per cent. of the whole.

8244. Then what is the effect upon the mills which used to spin the coarse yarn?—Most of them are out of work and some are being filled with new machinery to work finer counts.

8245. That is the process which is going on?—I think so.

8246. (*Chairman.*) I suppose you would not dispute that these adjustments of wages that become necessary by reason of any change in the rate of exchange are in themselves inconvenient, if not mischievous, and difficult to bring about without a great deal of controversy?—If they could be avoided, it would be an advantage, but I do not think they can.

8247. (*Sir T. Farrer.*) But what I rather gather from your evidence, is that you would say that though the alterations that are caused in prices and in wages, by the alterations in the exchange, have, like every other alteration, a certain mischievous effect, yet that it is small as compared with the alterations that are caused by a great number of other factors?—I quite think so. You asked me a question about the proportion of the Indian yarn exported. I promised to give it, and I will answer now if you will excuse me interpolating. The consumption of cotton by the Indian mills in the year ending 30th June 1887, was 284,000,000 lbs. That is from the return of the Indian Mill Owners' Association. Allow 20 per cent. for wastage, which is their own estimate, and it makes the yarn produced 227,624,000 lbs., the export during the year ending 31st March—the years are not quite contemporaneous—was 91,803,000 lbs.

8248. (*Mr. Barbour.*) Out of 228,000,000 lbs.?—Out of 228,000,000 lbs.; it is as nearly as possible 40 per cent., leaving 60 per cent. as used in the country.

Mr.
T. Comber.
18 Nov. 1887.

Mr.
T. Comber.
18 Nov. 1887.

8249. Can you take that as being a fair average over a long period?—I should say it was a fair average generally.

8250. The period for which you give the production of yarn as 228,000,000 lbs. is not the same period as that for which you give the exports?—There is three months difference.

8251. (*Sir T. Farrer.*) Do you know whether these Bombay mills are set up with English capital or with Indian capital, or with both?—With both.

8252. There is a good deal of English capital in them?—A good deal of English capital, I think.

8253. (*Mr. Chaplin.*) I gather from your evidence that the English capitalists are beginning to find it more profitable to invest their capital in the cotton industry in India than in Lancashire?—I think it is principally the machinery makers.

8254. I understand it is developing very fast, the cotton industry in Bombay?—Very fast.

8255. It is increasing much faster now than it is in England?—Yes.

8256. And that you say is entirely owing to natural advantages?—Chiefly owing to natural advantages.

8257. But not entirely?—No. I have given you to what extent it is due to natural advantages, and to what extent it is due to an advantage in wages from the fall in silver. I do not deny that the fall in silver has been some advantage, but not nearly so much as the natural advantages.

8258. And even suppose the advantage given by the fall in silver was done away with, that would not prevent them increasing faster?—So far as coarse yarns were concerned, the Indian spinner would still have an advantage of $\frac{3}{4}$ d. per lb. There is also a limit to the amount of cotton available for him, and the amount of yarn that he could dispose of.

8259. And then I gather from you that it would be impossible for Lancashire to hope to compete successfully with the Bombay mills in the China trade?—In the coarse yarns. A great deal of what goes to China is not coarse yarn, and that England would still supply.

8260. But as far as the coarse yarn is concerned, there is no hope?—I do not think there is any hope.

8261. Even if the rate of exchange were abandoned?—No.

8262. What effect would that have on the cotton industry of England as a whole? Must it be prepared to look forward to a very serious reverse?—As regards coarse yarns, a permanent loss, I think.

8263. Is it not the case that a committee has been appointed by the Chamber of Commerce in Manchester to inquire into all the relative advantages of cost of production between India and England?—Yes, I am looking forward with great interest to its report.

8264. (*Mr. Barbour.*) It was stated that an experiment was to be made in spinning the fine yarns in Bombay; do you know how that resulted?—It has not succeeded at all.

8264a. (*Sir T. Farrer.*) We have had a great deal of evidence from others, and you have given a good deal yourself, upon the supposed disadvantages which have arisen from the alteration in exchange, and upon the supposed advantages which would arise from doing away with these fluctuations in the future by adopting a bimetallic ratio. Now what we wish to get is a statement from some persons who hold a strong monometallic opinion upon this subject of the disadvantages which are to be expected from the adoption of a bimetallic ratio. You have given them at some length in your evidence, but do you think that you could summarise them in some distinct and short form? Supposing bimetallicism were adopted, first, at any given ratio below the market ratio, and then in the alternative at the market ratio, what evils do you expect would flow, on the whole, from such change?—It is a little difficult to put it all in a nutshell, but I will endeavour to summarise. I believe the disadvantages will be: (1.) That inseparable from a double or alternative standard, that a debtor will have the option of paying in whichever

metal may at the time be depreciated. The chance of fluctuations in the standards of value is, therefore, not shared equally between the debtor and the creditor, but must always be in favour of the debtor. This is a manifest and grave injustice to creditors, especially if their contracts were entered into on the basis of a single standard, an injustice comparable only with that which, at earlier periods of our history, was sometimes inflicted on them by the wilful debasement of the currency. (2.) The position which London has acquired as the financial centre of the world, under a single gold standard, may be endangered if that standard is altered. In both these respects it makes little or no difference whether the fixed ratio adopted be $15\frac{1}{2}$ to 1, or corresponds with the present market values of the metals. (3.) England will lose the benefit which, as a large creditor on a gold basis, she has derived from the appreciation of gold. In other words, she will, for the balance of trade in her favour, amounting to some 80 to 120 millions sterling annually, receive fewer commodities from other nations. With a fixed ratio of $15\frac{1}{2}$ to 1, this loss will be immediate. With a fixed ratio representing the present market values of the metals, there will be no immediate loss; but, when an unlimited market is secured for silver by the opening of the mints, I believe the production of the mines will largely increase, and the loss will be gradually incurred, as prices rise from the increasing volume of the currency.

8265. (*Mr. Barbour.*) Would you look upon that loss as a loss to England, or only to those particular individuals who happen to have foreign investments?—I think it is a loss to England as a whole. (4.) By the rise in prices, immediate or deferred, according to the ratio adopted, the condition of the working classes will be rendered worse, for the cost of the necessaries of life will advance more rapidly than wages.

8266. (*Chairman.*) Would that matter if the wages re-adjusted themselves again to the higher prices; would not that be merely the trouble of a second process of re-adjustment in the opposite direction?—I think that would be a disadvantage.

8267. The reverse process would go on to that which has gone on? A fall in the price of the necessaries of life produces a fall in wages, and a rise in the price of the necessaries of life, produces a rise in wages?—The wages rise more slowly than the prices of commodities.

8268. That is the real evil, whatever is the inconvenience and trouble that arises from adjustment?—Yes.

8269. (*Mr. Barbour.*) And if that adjustment, made once for all, saved you from half-a-dozen adjustments up and down, in the future, it might, on the whole, be a gain?—Yes, but my opinion is that there will be no such finality of adjustment. (5.) If a ratio of $15\frac{1}{2}$ to 1 be adopted, the fall in the silver prices of commodities in India will compel her to deliver more produce for the silver she receives. (6.) The relative advantage, which Indian cultivators at present enjoy in their competition with producers in gold countries will disappear. (7.) I have endeavoured to show, (a) that the purchasing power of gold will diminish immediately, if a ratio of $15\frac{1}{2}$ to 1 be adopted, and ultimately, even if a ratio corresponding to present market values be adopted; (b) that, if this be the case, its annual production will be checked, and is likely to fall below the annual consumption in manufactures, and the requirements of hoarders; and (c) that as the stock diminishes, its market value will rise above its legal value, and the metal disappear from circulation; so that the metallic currency of the nations which may adopt the bimetallic system, will become wholly silver. That only one metal should be left to perform the function of money, I cannot but regard as very undesirable.

8270. (*Mr. Chaplin.*) Now we have two objections; to India, the disadvantage that she would have in paying the larger amount of produce for the silver.

that she requires?—I tried, when I was examined before, to point out the advantages which India gained in respect to which there would be a loss to India from bimetallism. She would have to pay a larger amount of produce for her silver.

8271. (*Mr. Barbour.*) But if gold disappeared, and we had a sufficient supply of silver, and nothing but silver, would it not be a positive gain? We would get rid of the exchange question and all troubles connected with it. Where would the loss arise if we had nothing but silver, and there was no gold in the currency?—The stock of gold and silver together will clearly be larger than the stock of silver alone. Their value is therefore less likely to be affected by variations in production, and I believe the two metals, used as at present, afford a less fluctuating standard than silver would by itself.

8272. (*Sir John Lubbock.*) Mr. Chaplin asked you whether, assuming it is proved that a fall in prices had been injurious to the working classes, this would alter your opinion; but would you not maintain that other things remaining the same, a fall in prices must be beneficial to the working classes?—Other things remaining the same, undoubtedly it must.

8273. Then you doubt, I think, whether international arrangements would maintain unaltered the ratio of value between gold and silver?—Permanently. Temporarily, they, no doubt, could.

8274. Therefore, whether bimetallism is a good thing or a bad thing, in your opinion it would be impossible to maintain the ratio unchanged between gold and silver?—Permanently.

8275. (*Chairman.*) Why do you say that? In what way, supposing that by arrangements between all nations there was a certain ratio fixed, in what way do you suppose that a disturbance would manifest itself?—In this way. For some time past the production of gold has fallen off. It has been unprofitable, even at the recent value of gold, and I maintain, that if the buying power of gold is decreased by the adoption of a ratio of $15\frac{1}{2}$ to 1, the production will be checked and very greatly diminished, and that it will not be sufficient to supply what is used throughout the world in arts and manufactures, and what is hoarded in India and other countries; that thus the stock of gold will year by year decrease, and in the course of a reasonable length of time, will become so small, that gold will go to a premium and disappear from circulation. And when that takes place, the bimetallic ratio is broken.

8276. (*Sir John Lubbock.*) That is exactly the point on which I wished to ascertain your opinion. The annual production of gold may be taken in round numbers to be about 21,000,000*l.*, and Soetbeer estimates that the amount used in the arts is 12,000,000*l.*; therefore your allegation, as I understand, is that if the production of gold was discouraged, the amount used in the arts would become so large in relation to the total amount, that practically the value of gold would be regulated not by its use in currency, but by its use in the arts?—That is what I think will occur. I believe the production will fall off to very much below 21,000,000*l.* if the ratio of $15\frac{1}{2}$ to 1 is established.

8277. You would admit, if I understand rightly, that if the only use of gold and silver was for currency, then, theoretically, it might be possible to keep the ratio equal, but that the use in the arts being so important, practically, it would be impossible to do so permanently?—Yes, if the production of gold seriously diminish, as I think it will.

8278. (*Chairman.*) Would not, in that case, the use of it for the arts be likely to diminish?—The first effect of an adoption of a ratio of $15\frac{1}{2}$ to 1 would rather be to increase the consumption of gold, because it would reduce its price.

8279. Yes, but then as soon as that resulted in a diminished production, the natural tendency of it would be to increase in value?—As soon as you have an increase of value your ratio is broken.

8280. (*Sir John Lubbock.*) The value for monetary purposes would remain the same; the value for the arts would be increased?—When that takes place, then the bimetallic ratio has ceased to operate.

8281. The populations of the world at present using gold are now about 140,000,000, according to Mr. Seyd, and those using silver are about 800,000,000; therefore if you were to have a general bimetallic arrangement, assuming such a thing to be possible, that the whole world should use both gold and silver, you would really introduce a change under which the number of those now using silver and who would adopt gold would be much larger than that of those now using gold who would adopt silver?—I have not studied it in connexion with the amount of population using the metals at all.

8282. When you spoke of the effect of bimetallism, were you assuming that India and China were to come into such an arrangement?—I had it in my mind that India would, but not China.

8283. Well, then, if India does, the populations which now use silver and do not use gold coming into the arrangement would be far larger than those now using gold and not silver?—I cannot speak of the figures at all as regards population, because I have not considered them. I have no doubt your figures are correct, but I do not know.

8284. But assuming it to be so, that the populations using silver now and coming into the bimetallic arrangement, would be greater than the populations now using gold and coming into the arrangement, then the demand for gold would be likely to be increased by a bimetallic arrangement?—I should not like to answer you without considering it, because it depends a good deal not upon the population only, but upon the amount of trade. For instance, the population in this country and a similar population in India would be quite different.

8285. No doubt that would be so; still you would have, naturally, to take the number into consideration?—You would have to take other circumstances into consideration.

8286. Now supposing that bimetallism was adopted at the ratio of $15\frac{1}{2}$ to 1, then I understand you to allege that the present ratio between gold and silver being 20 to 1 a legislative enactment, compelling payment in silver at the ratio of $15\frac{1}{2}$ to 1, would be an arbitrary interference with existing contracts?—Decidedly.

8287. And that therefore in India those who had made contracts in silver at the present ratio, would be arbitrarily compelled to pay something like 25 per cent. more than their contracts?—I think those who are trading with India take good care not to make any such contract.

8288. Those who are trading might do so, but of course there have been a good many permanent arrangements made in India?—Of course it would be an injustice to those.

8289. That would be in your opinion a very material objection to it?—It would.

8290. (*Mr. Barbour.*) Do you think it would be a greater injustice, than the injustice of making foreign nations and British colonies, who have liabilities to us in gold pay, as you say they do, some 25 or 30 per cent. more than was contemplated at the time the contracts were made?—There is this difference which I have endeavoured to point out before, that one would be our act; the other is not our act.

8291. (*Sir John Lubbock.*) You also consider, do you not, that the confidence in the stability of our system of currency has greatly contributed to our commercial position amongst the nations of the world?—I do not think I have said so in evidence.

8292. I wish to know whether that is your opinion?—Certainly it is my opinion.

8293. (*Mr. Barbour.*) Supposing that bi-metallism were adopted by all the civilized nations at the same ratio, we will say the market ratio of the day, and supposing that in the course of time gold became so scarce that its value was controlled by its use in the

18 Nov. 1887.

arts, and that the market ratio came to differ from the legal ratio, what great evils would follow; what would be the evils supposing we adopted bimetallism at the market ratio of the day, and ultimately the ratio of gold came to differ from the legal ratio? In that case, I believe, the cheaper metal would become the standard everywhere; every country would have the same standard, and there would be a par of exchange between all countries using the metallic standard. Nobody would be obliged to take gold money at any ratio other than the legal ratio unless it suited him to do so? To me it seems a not undesirable result, because we would get rid of the difficulty of exchange and all our present currency troubles?—The evils arising from the adoption of a fixed ratio, corresponding to the present market ratio, would be less immediate than those caused by the adoption of the $15\frac{1}{2}$ to 1. Looking at the fact that while silver was declining in price from $61\frac{1}{2}d.$ per oz. in 1862 to $45\frac{3}{4}d.$ per oz. in 1886, the production in the United States rose from 900,000*l.* in the former to 10,800,000*l.* in the latter year, I cannot but feel a strong conviction that, under the circumstances you put to me, the out-put of silver mines will show a further important increase, that the metal will in time depreciate, and ultimately prove less stable as a standard than gold. Of course, its variation will be in an exactly opposite direction, and lead to an inflation instead of a contraction in prices.

8294. (*Sir John Lubbock.*) Our present system of currency is, that we use gold for the larger payments, silver for the smaller, and copper for the smallest payments, is it not?—I think the largest payments are principally made by cheque.

8295. I am not now speaking of cheques, but as regards the actual use of coins?—It is self-evident that it is so.

8296. And it is very convenient, is it not, to have three metals that we can use in that way for the payment of different amounts?—Quite so.

8297. And in France, under the old arrangements, there was generally an agio on either gold or silver as the case might be, was there not?—There was, frequently.

8298. And if gold was driven out of circulation, would that not be a great inconvenience?—I should think so.

8299. Therefore, there is a great practical convenience in everyday life in having a coinage which is partly gold, partly silver, and partly copper?—Yes.

8300. And that convenience would be interfered with if gold were driven out of circulation?—Certainly.

8301. (*Chairman.*) If we adopted the American habit of using notes, whether representing gold or silver, I suppose it would not matter then whether you had gold or silver stored in the treasury upon which those notes were founded?—Of course, metallic currency has advantages of its own.

8302. (*Mr. Chaplin.*) One question in relation to what you said in reply just now, bearing on that very point. If you made gold less valuable, you say you are afraid its production would be greatly lessened?—Yes.

8303. Well, we have been told more than once before this Commission that the production of gold does not depend at all upon its profit; and it has been stated, I think, that the whole of the gold of the world has been produced on a loss?—That is an opinion, but it is not my opinion.

8304. You think it does depend upon its being profitable?—A small portion of the gold used may be called a bye product. I have already said that I do not know anything personally about these matters; but this is the conclusion I have come to from reading. A certain proportion of the gold produced is a bye product in the production of silver. It is produced along with silver, and no doubt would continue to be produced whether at a loss or at a profit to get the profit on the silver. But the larger proportion of

gold produced comes from gold mines, and those certainly have not been worked continuously at a loss.

8305. You dispute the theory altogether, that the gold is produced by the gambling instincts of mankind, and that a large proportion of it has been produced at a loss?—I do not know what may have been the case in days gone by, but now if gold mining companies in Australia, for instance, do not pay dividends they are wound up.

8306. (*Mr. Montagu.*) You gave seven reasons why the $15\frac{1}{2}$ to 1 ratio should not be adopted; seven objections or disadvantages to the ratio $15\frac{1}{2}$ to 1. At the moment you could not point to one that would remain if 20 to 1 were adopted?—Several of them would apply to the ratio of 20 to 1, including the last one.

8307. What was that?—The production of gold would be checked.

8308. How could that be possible if you do not alter materially the existing relation between gold and silver?—The tendency will be to produce less gold, as its buying power diminishes.

8309. And also, do you not see, on the other hand, great advantage in having a stable relation between gold and silver, so that capital should find an increased outlet in silver-using countries?—I admit that a stable ratio between gold and silver is in itself an advantage. I have already stated so in my examination, but I deny that bimetallism will bring about a permanent stability of ratio.

8310. (*Chairman.*) If the view be correct that there is a tendency in the gold production to diminish, which needs to be stimulated by a rise in the value of gold, would that not tend to show an unsatisfactory condition of things, inasmuch as your standard is more or less unstable?—It would tend, of course, to some further rise.

8311. And you agree that the more unstable the standard, the less satisfactory as a standard?—I consider gold will be less unstable than silver.

8312. (*Mr. Montagu.*) Being connected with the Indian trade, you are aware that the Indian banks are very reluctant to place sterling in India or China permanently?—I have nothing to do with any of the Indian banks.

8313. That some bankers hold their capital in this country, rather than risk investing it in India?—It may be so.

8314. (*Mr. Barbour.*) Do you know that they keep the balance in the Eastern banks as low as they can?—I do not know.

8315. (*Mr. Montagu.*) You mentioned that you considered low prices advantageous to this country. You would not include in that the declining tendency of prices—the transition to lower prices?—That produces loss to the trading community while it is taking place. A shrinkage of values injures anybody who holds a stock of the article whose value shrinks.

8316. And it kills enterprise?—I do not think it kills it.

8317. Say diminishes it?—It diminishes it for the time.

8318. And therefore until prices do reach a level of some permanence it is a disadvantage, a decline to this country?—It is a disadvantage to the trading community.

8319. (*Mr. Barbour.*) Is it a disadvantage to the producer; does it check production? He gets a lower price; the wages he pays, rent, and so forth, remain the same for a time; does not this impose a check on production?—It has that tendency until rents, wages, and so forth are adjusted.

8320. (*Mr. Montagu.*) One of the disadvantages you mentioned was, that if silver advanced in price, the natives of India would have to give a larger quantity of produce for the silver; but would not, on the other hand, their enormous stores of silver be rendered more valuable and stable, and the country would be rich therefore?—A rise in the price of silver would benefit them if they were sellers of silver.

8321. You say that if silver advanced in price, it would be an evil for India to give more produce for that silver, but if the silver they receive is appreciated in value by being advanced in price and rendered available for exportation, would not that be compensation?—Yes, but India never exports silver; India has always been a receiver of silver. If she were an exporter, that argument would apply, but it does not under the circumstances which exist.

8322. But it is quite possible that she might want to export silver?—I do not think so.

8323. Then you say gold would have a tendency to disappear from circulation; are you aware of the quantity of the gold supposed to exist?—Yes.

8324. Do you remember the figures. Was it 600,000,000*l.*?—I gave them in my previous evidence.

8325. And it is estimated that the gold now produced is about 20,000,000*l.*, and that used in the arts about 12,000,000*l.*; therefore you assume, possibly, that not only will gold diminish to the extent of the production of gold below that required for the arts, but that at present in circulation will be used up?—I would prefer repeating the figures which I gave on the previous occasion.

8326. What is the figure you make it of the circulation?—“Assuming that the stock of gold now is “1,200,000,000*l.*, of which 700,000,000*l.* consists of “coin, or of bullion held by the banks, which may be “considered as good as coin.”

8327. 700,000,000*l.*; well, that is even more than I recollect. Do you assume the possibility of the production of gold, through its want of appreciation, becoming so diminished in production as to become less than the consumption for arts?—Yes, I assumed in the forecast which I ventured to give when I was here before, that the whole annual production of gold would be largely curtailed, and probably sink. It is quite conjectural to what it will sink; but I took it at 6,000,000*l.*

8328. It would sink by 6,000,000*l.*?—No, to 6,000,000*l.*, that would give 12,000,000*l.* annually to be taken out of the stock of gold for hoarding and use in arts.

8329. And do you know what quantity of gold is produced in the silver mines in America?—I do not know. I cannot tell you how much is produced in mines which principally yield silver.

8330. And you admit that that would not be affected?—Probably not at all.

8331. Therefore if there is sufficient gold found with silver, and there is a larger value of gold found in some mines in Montana, if that is more than is used in the arts, there would be no danger?—If you assume that the production of gold will continue equal to the requirements for arts and for hoarding, there will of course be no diminution in the stock.

8332. Sir John Lubbock said that in France there used to be an agio on gold and silver at different periods; is it not the case that that only arose when either was wanted for exportation, and not for internal use?—I think that gold was frequently at a premium for convenience of travellers.

8333. Yes, but never for internal use?—Yes, for the convenience of travellers in France. At a time when it was not in active circulation. I state it as a matter of history. It was before my time.

8334. Not since the Australian gold discoveries, but before then?—Before then I believe that gold was

for some time not in actual circulation in France, and a premium was paid for it.

8335. Since 1850 that has not been the case; since the Australian and Californian gold discoveries?—Since then I believe there has been no agio for internal use.

8336. For the last 30 years there has been no premium on gold and silver for internal use in France?—Only for export as far as I know.

8337. Have you any idea of the amount of gold hoarded in India?—The amount of gold in India, not the slightest. I could give you the amount for many years past that has been annually taken by India.

8338. You have no idea. And do you think if India were included in a bimetallic convention, that that would have the effect of bringing out the gold?—On the contrary, I think a great deal of what is now hoarded there in silver would be hoarded in gold.

8339. Is it not the fact that it is hoarded in gold in the form of armlets and bangles?—A portion of it.

8340. And why should it be increased by a change of the ratio?—A certain portion of it is not hoarded in the shape of ornaments, but in coin or bars, and I think the Indian hoarder is likely to prefer gold as being the better investment.

8341. Is that because gold has continually advanced in price?—Because he has known gold advance in price, and if it suddenly becomes lower in price, he would think it a good time to invest.

8342. But supposing there was no change, and that it should not continue to rise, would that not have the effect of realising gold, and letting it produce interest?—I do not think so. No, the hoarding instinct is unreasoning.

8343. I thought the natives were investing more in the rupee loans than they used to?—I think not.

8344. (*Sir John Lubbock.*) You stated just now that you were not exactly aware as to the amount of the population of countries using respectively gold and silver. Let me put to you this theoretical question. Assuming that the amount of silver in circulation in silver-using countries was equal to the amount of the gold in circulation in gold-using countries, then the adoption of bi-metallism would not necessarily tend to raise prices, would it?—Throughout the world, as a whole, no.

8345. In such countries?—It would tend to raise prices, I think, in what had previously been gold countries.

8346. That would depend upon the ratio?—Upon the ratio, certainly. With the ratio of 15½ to 1, the effect would be immediate.

8347. But if you take the ratio of 20 to 1, if you take it at the market ratio of the time, then I understand you to say that it would produce no effect on prices, and, therefore, it does not at all follow that the adoption of bi-metallism would raise prices; but whether it would raise prices or not, would depend on the terms and conditions under which bi-metallism was adopted?—The immediate effect of the adoption of a fixed ratio corresponding to the market ratio would be nil, but the ultimate effect would depend on the production of silver. If, when the silver mines are assured of their market, they pour out much larger supplies than they have done hitherto, it would have an ultimate effect upon prices.

8348. That would depend on whether it had the effect of stimulating the production of silver?—Yes.

The witness withdrew.

Adjourned till Monday.

Mr.
T. Comber.
18 Nov. 1887.

THIRTY-SEVENTH DAY.

Monday, 21st November 1887.

PRESENT :

THE RIGHT HON. LORD HERSCHELL, the CHAIRMAN, presiding.

MR. D. M. BARBOUR, C.S.I.
MR. J. W. BIRCH.
MR. HENRY CHAPLIN, M.P.
SIR THOMAS H. FARRER, Bart.

MR. C. W. FREMANTLE, C.B.
SIR JOHN LUBBOCK, Bart., M.P.
MR. S. MONTAGU, M.P., and

MR. GEO. H. MURRAY, *Secretary*.

Mr. WILLIAM FOWLER re-called and examined.

Mr.
W. Fowler.
21 Nov. 1887.

8349. (*Chairman*.) With regard to those articles which you say are the same in price, or have risen between 1854 and 1884, how would it be if you compare 1873 and 1884?—Bacon, identical prices, 1873–1884; beef the same; brandy risen about 100 per cent.; butter risen about 16s. a cwt.; but as regards butter it must be remembered that butterine has come in since that time, and notwithstanding that, it has risen about 16s. a cwt. Some estimates estimate the rise at more. Cheese may be put down as identical; cocoa has risen 20s. a cwt.; coffee has slightly fallen, but I should say that there have been great speculative changes in coffee in recent times, but they have had nothing whatever to do with any question of money; currants remain almost identical; eggs have slightly fallen; hides have fallen slightly; oats identical; oxen, I think, were mentioned, and they may be said to be identical; pepper identical. Between 1873 and 1884 there is a heavy fall in potatoes; but it really was a mistake to quote potatoes, the oscillations in price are so enormous; raisins are identical; beer has slightly risen; cloth may be said to be identical; fish identical; leather had risen about 14s. a cwt.; silk had fallen considerably; spirits had fallen slightly; cotton yarn had fallen; and linen yarn had fallen. So that, practically, it comes to this, there is no doubt if you take 1873 and 1884 there is a different result to that obtained as between 1854 and 1884, that is to say, a large part of the articles remain the same in 1884 as in 1873, and some have fallen between 1873 and 1884, and it is a remarkable thing, that in such a considerable list as that there should be even something like an uniformity of price, if, as is alleged, there is a cause operating towards a fall which ought to influence every article. That was the only way I wished to use this argument, and I do not think it is materially changed by the comparison between 1854 and 1873.

8350. (*Mr. Chaplin*.) In regard to some of these articles there has been a considerable fall, I suppose, since 1884?—There is; but I did not go into that, because I think nobody would allege that that was a money question.

8351. Since 1884 there has been a very considerable fall in beef?—Yes; I do not know exactly how much, but a considerable fall. It has fallen very heavily in America, and it has fallen here.

8352. Do you remember what has been the fall in the price of silver since 1884; has that been much larger than it was before?—No, I think in 1876 it was almost as low as it has ever been; I think the rupee was 1s. 6d. in 1876; there has been a very heavy fall once or twice.

8353. What I wanted to arrive at was this: is there any comparison in the great fall since 1884 in the price of some of these commodities that you mentioned, and the fall in the price of silver?—For instance, the great fall in wheat has taken place since 1884.

8354. (*Chairman*.) But I suppose the fall in silver from 1873 to 1884 was much greater than any fall of silver between 1884 and 1887?—Oh yes, it fell from 1s. 10½d.

8355. I have now some questions to put on that branch of our inquiry which relates to the proposed remedy, by means of what is known as bi-metallism. I believe you have given some attention to that subject?—I have. I should like, in the first place, to express my great doubt whether, as a matter of principle, it is right to attempt to fix values by Act of Parliament, or by agreement between nations. And I should like to read two passages, one from a predecessor of Mr. Fremantle's, who wrote in the year 1757, and one from my late friend Mr. Walter Bagehot. In Harris, on Money and Coins, page 46, are these words, "Silver and gold with respect to one another, are, like other commodities, variable in their value, according as the plenty of either may be increased or diminished; and an ounce of gold that is worth a given quantity of silver to-day may be worth more or less a while hence. And, therefore, it is impossible that both these metals can be a standard measure of the values of other things, at the same time; and one of them must be a mere commodity with respect to the other." Now at that time, the money of England was silver, and all through Harris's book he argues in favour of silver as the right money. Here is another passage, when gold was our money, from Mr. Walter Bagehot's collected papers on Depreciation of Silver, page 13. "The same causes which regulate the value of gold and silver as respects other things, determine, as we believe, their value relatively to each other, and, therefore, as the circumstances of production of both are constantly changing, it is contrary to principle to make or attempt to make by law a fixed equation between them."

8356. By saying that the one at different times will be worth more or less than the other, he meant, I suppose, that it will cost more or less to produce?—That is the point exactly. Of course, opinions, as to the influence on price of cost of production, have changed a great deal since Harris's time, but still, I think, that speaking generally, it is a sound idea, that if we were to have a measure of value, it should, if possible, be one article and not two. That is the question of principle, and I cannot get out of my great objection to any such arrangement; and for reasons that I shall indicate presently, I am entirely unable to anticipate the consequences of that change, which might be, in certain events, extremely serious to a country like ours.

8357. Do you think that a fixed ratio between silver and gold would be possible, either as adopted by a single nation, or by means of an international agreement?—I do not want to exaggerate for a moment on this question, and I think there has been a great deal of exaggeration on both sides. I think it is perfectly clear that if you create an extra-

ordinary demand for silver by Act of Parliament, you will tend to raise the price of silver. I think that was what was done during the arrangement of the Latin Union. There was a demand for silver as long as there was a free mintage, which was what you may call something more than a commercial demand. It was a Government demand, and, therefore tended to keep the price of silver higher than it otherwise would be. I think there is no doubt about that. I never disputed that for a moment, but what I have doubted is, whether that would be a sound arrangement for us to undertake as a new thing, we having adopted a single measure of value ever since 1816. And what has made me more doubtful, I must say, has been the extraordinary difference of opinion amongst those who advocate what is called the bi-metallic system, as to what the ratio should be between the two. I think it is very tempting to try and create what is called "one money" for the world; but I gravely doubt whether it is possible without dangers that are very serious for us in the position that we hold. And one remark, made by one of the most important of the bi-metallists has frightened me perhaps more than any other. I think in page 41 of his last pamphlet, he says it does not matter whether it is 10 or 20.

8358. (*Mr. Chaplin.*) Are you referring to M. Cernuschi?—Yes, he says it does not matter whether it is 10 or 20, "the great Powers would be just as free to stipulate the ratio of 10 as the ratio of 20. The ratio of 10, or the ratio of 20, once promulgated, nobody would be able to resist it." ("The Bi-metallic Par.")

8359. He then goes on to say something more on the choice of ratio. "But the choice of ratio should be determined after examination of the interests at stake"—Quite so; but still he says 10 would work as well as 20.

8360. No, he says the great Powers would be just as free to stipulate the ratio of 10 as the ratio of 20.

(*Chairman.*) I think he said something more than that, that if they once promulgated it?—Nobody would be able to resist it. And also very curiously he says, I would not have all the world in it. India must not come in. Well, I should be disposed to agree with him about that.

8361. (*Mr. Chaplin.*) He says, "India, and indeed, Asia, might remain silver monometallic without the least inconvenience"?—Yes, but look here; "We bi-metallists do not ask that every government in the old world and the new enact bimetallic laws. We do ask that the great metallic Powers (the United States, Great Britain, Germany, France) unite to restore to all nations what they all once had, but unwittingly lost in 1873—namely, a universal bimetallic par of exchange." (*Ibid*, p. 38.)

8362. Well, is not that, of course, the agreement of the United States, Great Britain, Germany, and France would be quite sufficient to accomplish the purpose with the others?—So he says, but I doubt that very much. But if it is such a precious thing for us, why should it not be as good a thing for India.

8363. Yes, but it is not proposed to include Russia?—"No," he says, "it is enough for bimetalism to be Atlantic; that is to say, practised visibly by the United States, Great Britain, Germany, and France. The great thing is that silver should be universal money." (*Ibid*.)

8364. But is it not the contention of M. Cernuschi, that the adoption of that principle by these four nations that he mentions would be sufficient in itself to make bimetalism universal?—Then that is a thing we do not see; that is to say, I am doubtful about that, I am jealous of entering upon such an arrangement.

8365. I should like to clear this up. What I understand from his pamphlet is this, that he does not object in any way to the inclusion of other nations, but he says that it is not necessary; that those four nations joining together would be sufficient to make bimetalism universal, and that the inclusion

of the others, although there is no objection to it, is not absolutely necessary?—In his own mind, I gather that he is very doubtful about going any further. Of course, he puts it forward as what he calls an Atlantic arrangement.

8366. (*Mr. Montagu.*) I think you will find that M. Cernuschi is quite willing for everybody to come in, but that the minimum number of contracting Powers would be the four great Powers, France, Germany, the United States, and England; the maximum might comprise the whole world, but it is not necessary?—Quite so.

8367. (*Mr. Chaplin.*) And does he not found that contention upon the experience of the past, and the fact that France and the countries of the Latin Union were effectual in making bimetalism universal before?—I think probably he did think so, but I am sometimes a good deal puzzled to know how he would have dealt with countries like Russia and South America, and those who have really no metallic currency at all, and no metal back to their currency, who have merely inconvertible paper, and yet are very large operators, like the Argentine Republic and Russia and Chili, very important commercial countries.

8368. (*Sir John Lubbock.*) If I understand aright, your contention is, that if Germany, Italy, France, and the United States, with a population of 130,000,000, could not maintain the ratio without us, that the addition of our 32,000,000 of population would not enable that to be done?—Yes; but I was going later on to mention that the past experience makes me fear that even these countries, after making a bargain, would not be bound by it, and would go off from it if it suited them, as France did in 1873, so that I hesitate, not merely because I do not like the thing on principle, but I cannot be sure that even if I got this arrangement it would last; no treaty would really bind either of the parties. Supposing there came a war or some great disturbance, even a financial disturbance.

8369. (*Mr. Montagu.*) Did France break faith in any way?—I never said that she did.

8370. But you say she broke the treaty?—Well, I mean to say she broke the arrangement for free coinage of silver.

8371. I thought it was all the Powers comprising the Latin Union that agreed?—They all agreed; but then we are told that that was the great cause of the trouble; that they all went back from their arrangement to coin silver freely. That has been the history of our past.

8372. (*Chairman.*) What I understand you to mean is, that if nations hereafter found it convenient to go back from the arrangement to coin freely both gold and silver, as France did in 1873, they would not refrain from doing it merely because they were bound by a treaty?—No, you could not depend upon their being bound. We could not let our currency depend at all upon the goodwill of another country. We must have our currency system right in principle if we can, and, as far as possible, be friendly with all other peoples, but that we should not have our whole currency system liable to be disturbed by one or two countries breaking a treaty.

8373. (*Mr. Barbour.*) When you speak of the currency system, do you mean the standard of England, or do you include the other portions of the Empire which use silver?—I mean the currency system of England.

8374. (*Mr. Chaplin.*) But if once an arrangement of this kind were come to between the countries specified, what object could any one of them have in departing from it?—I do not know. I do not know what circumstances might arise.

8375. But you cannot see that any one of them would have any object under any circumstances in departing from it?—It is really impossible to say what object they might have. They might have a great war to disturb their position immensely; who can say?

*Mr.
W. Fowler.*
21 Nov. 1887.

Mr.
W. Fowler.
21 Nov. 1887.

8376. But supposing they had a great war, or supposing commercial changes were to occur, how could they be benefited, do you think, in any way by departing from this arrangement?—I do not know; I cannot say. But, after the experience of 1873, and what occurred when Germany changed her system, I feel a great hesitation in trusting our system to the good will of any other nation.

8377. (*Chairman.*) Then, I think, you were pointing out that it was not proposed to include Russia and the South American States. In your view, so far as this bi-metallism is suggested as a remedy in respect of the impulse given to competing countries that have a silver currency, or a currency different from ours, would that apply equally to Russia and South America, notwithstanding the bi-metallic arrangement amongst the other great Powers?—The bi-metallic arrangement, I understand, would leave things with them exactly as they are. There would be no change whatever. They would not be asked to come in. They are not mentioned by M. Cernuschi, or anybody else that I am aware of; and you must not go away with the idea that their influence on commerce is unimportant. I am told by the highest authorities, that, as far as our wheat trade is concerned, for instance, we are suffering more, if we use the word suffering, from competition of Russia than from that of any other country in the world.

8378. (*Mr. Chaplin.*) Is that borne out by the returns of the imports?—So I am told.

8379. (*Mr. Montagu.*) But, in the case of Chili, the bi-metallic convention would facilitate the resumption of specie payments in silver, and so it has been urged with regard to Russia. I have never heard of anyone desiring to exclude Russia from the arrangement, as she might be willing to resume specie payments in silver when silver is available?—I wanted to mention here specially that question of the competition of these countries with our country, in certain cases, and to allude also to the case of India in connection with that. The case of Russia appears to me to be very remarkable. I have here the statement of the exports of wheat from Russia in Europe during each of the last 20 years into the United Kingdom, and I have put side by side the exchange of the year as nearly as one can tell it (*see Appendix*). I will only make this general remark, which agrees with the remark made by Mr. O'Connor, with regard to the exports of wheat. There is no obvious relation between the fall in the exchange and the export of the wheat. That is to say, you have an exchange of 23 in 1885, and an export of 12,000,000 cwts., in round figures, of wheat. But take it further back—take 1884, you have an exchange of 23 and an export of 5,400,000 cwts. With the same exchange in 1885, you have an export of 12,000,000; and with an exchange which had fallen to 20 or 21 in 1886, you had an export of 3,700,000. I inquired about the cause of the falling off in the export, and they said the falling off arose from a very bad harvest in Russia in 1886; but this year the harvest is so great in Russia that the exports are expected to come forward on a tremendous scale.

8380. Have you got the returns for this year?—I have not got the returns for this year.

8381. As matter of fact, the Board of Trade Returns for the first 10 months of the present year ending 31st October only give 983,542*l.* as the value of the wheat imported, as against 1,229,759*l.* for 1886. That does not look as if it could at all approach the amount imported in previous years?—The harvest is not very long over, and the new crop has not yet come forward largely. I mention this because a very strong point is made, that we should try to get rid of excessive competition arising from the peculiar condition of silver. Now, you would not get rid of the competition from these countries that use no silver but have merely inconvertible notes, and therefore I think it is very important that we should not exaggerate the influence of this bi-metallic

system even if it were adopted. I do not know whether this would be the right place to refer to the question of the Indian exchange. There is a very widely-spread notion that the great competition of India with us as regards wheat arises from the silver question, and that if we changed the position of silver and got the rupee back to its old point, we should at once get rid of what we may call the excessive competition with India. Now, I have read Mr. O'Connor's statement "On the effect of a low rate of exchange on the Indian export trade." I have always said that there was a bounty arising to a certain extent from the condition of silver, as regards the exporter of wheat from India in this way, that if he gets a gold price he can buy with his gold more rupees than he could formerly have bought, and to that extent he is helped in his export by the low price of silver. Mr. O'Connor says that that is not so, because prices in Calcutta of exported produce have not increased; if anything, they have fallen. And he says, "the exchange has fallen 20 per cent., which means a gain of 20 per cent. to the exporter. But prices in England have fallen 30 per cent. all round, and this means a loss of more than 20 per cent. to the exporter, allowing for the slight fall in prices in Calcutta and Bombay. The exporter, therefore, has not gained directly by the fall in exchange; he has simply been saved from a certain proportion of loss." Now, I say saving a certain proportion of loss is equivalent to a gain, and I think, therefore, that there is a slight gain—not 25 per cent. or anything of that sort which has been stated—but there is a gain to the exporter of wheat from India, and that is entirely confirmed by what Mr. Waterfield says at question 2551 and 2568. I need not repeat it, but it is in substance the same thing as Mr. O'Connor has said here. He says the causes of the stimulus to production are "the reduction of cost of transport from the field to the port of shipment, and from the port of shipment to the consuming market, by the extension of railways, by reductions in railway rates of freight, and by reductions of sea freight." With that I entirely agree, but I think there is also something to be put to the change in the exchange. But I ask you to consider whether, if there be an advantage to the exporter in India, it is right for us to endeavour to get rid of that advantage by raising the rupee, not by any ordinary commercial action, but by a special action of this country interfering with the natural course of commerce, and creating a fictitious value for silver, as I reckon it to be. The stronger the case is stated as regards the help given to the producer, the stronger it makes our action if we interfere with it. My view is, that there has been great exaggeration as regards the effect of exchange; but so far as it goes, I think it has helped the exporter and producer in India, and I do not see why we should interfere with that help or benefit, whatever we may call it.

8382. (*Chairman.*) That is to say interfere, with the object of interfering with it; but if it were expedient not for the purpose of interfering with that aid to competition, but for general currency reasons, such as making the standard more stable, and other grounds that are put forward, then, I suppose, you would not consider that there was anything wrong in doing it; though incidentally it might deprive the Indian producer of that advantage which he has gained accidentally, you may say?—I think if it was essential for the benefit of the whole empire, if it could be proved that our commerce and our position as a commercial country could be vastly benefited by altering the price of silver, India must take her chance with the rest of the country. I greatly doubt the benefit. Then I say, if it be doubtful whether there would be a great benefit to the community, it would be extremely hard upon India to take from her any advantage that she may have. Of course India is divided into two camps, as it were. The Government are greatly injured by the present price of silver and official people are greatly injured; but the community, accord-

ing to all evidence that I can find, are benefited by the present condition of things, and not injured in any way.

8383. You are arguing, as I understand, against those who put forward this advantage to India as a ground for our adopting bi-metallism, in order to counteract it?—Certainly; but I mentioned it here because I think it is interesting in connection with the cases of Russia and others in this way, that if you were to abolish this difference as regards India by altering the price of silver, you would not get rid of competition as regards Russia and those countries which have inconvertible notes. As I make it out, altering the silver in this way would not in the slightest degree diminish the competition of Russia, because she does not work with silver. Silver does not affect her, and she works with inconvertible notes, and she would have just as much benefit if we altered the value of silver as she has now, as far as I understand it. The way it operates is this: A man in Russia sells his produce to a broker in St. Petersburg, the broker sells the wheat or oats to the merchant, the merchant draws in gold upon London, and with that he gets paper roubles in St. Petersburg; and if you produce the bi-metallic par, as it is called, that operation would go on exactly as it does now; there would be no change whatever, and, therefore, you would not get rid of the competition of these note-circulating countries, if you got rid of the competition in some degree of the silver-using countries. The difference would be this, instead of taking your stuff from India, which takes an enormous quantity of our productions, and is part of our own territory, we should be taking the stuff from Russia which puts very heavy duties upon our imports, and is generally not very friendly to us; and if we compare the two arrangements, I much prefer the present arrangement.

8384. (*Mr. Chaplin.*) The bounty, in consequence of the depreciated rouble in Russia is larger even, I think, than the bounty in consequence of depreciated silver in India, is it not?—Well, you ask me there a question that it is very difficult to answer. I think it ought to be larger; I think it may be larger because there seems to be a double bounty in converting the rouble into silver and the silver into gold, but as a matter of business it is done exactly as I tell you; there is no question of silver at all; the man draws in gold upon London, and then it is turned into paper roubles.

8385. (*Chairman.*) What discount is the paper at now?—36 is the par, or 37; I am doubtful which. The actual price is slightly over 21, so that there is an immense advantage apparently to the exporter if the lowness of the exchange is a source of great advantage.

8386. So that there is a greater depreciation of the Russian paper than there is of the silver rupee?—Oh, far greater. Mr. Gibbs has pointed out, as regards Chili, the same thing in the same way. He said the producer in Chili has an immense advantage, because, as is very remarkable, in Russia and in Chili the price of articles of ordinary use measured in inconvertible paper has not changed.

8387. Are you sure of that about Chili?—Yes, I inquired specially. Mr. Gibbs has stated it distinctly; and I inquired of a Chilean merchant closely connected with Mr. Gibbs the other day, and he said, "I have made inquiry, and it is so." Very well now, what is the operation? You get a large amount of rouble notes or inconvertible notes in dollars, and the dollar is down in Chili about as much as the rouble is in Russia. If people are able to get with each paper rouble or dollar as much of ordinary necessities as ever they did, it seems to me that it must be a great advantage to those who sell under those circumstances. But what I want to lay stress upon is this, which illustrates a point I made in my first day's examination: here we see people issuing notes excessively, and yet the price of articles measured in that "money" has not changed. So we see in India silver is in plentiful

supply, but the price in silver of ordinary articles has gone down, not up.

8388. (*Sir T. Farrer.*) Does that apply to articles imported from a gold country?—No, I do not say that; I do not think it applies to those imported from gold-using countries like England, but it applies to the ordinary productions of the country. Well, I argue from that how much more the price depends upon the supply and demand of the article than any condition of money. Here you have a situation which, according to all the old theories about money, ought to raise the price in the country of ordinary articles produced in the country, but it does not raise them.

8389. (*Mr. Montagu.*) Are you not aware that there has been a great effort made by the Russian Government to resume specie payments, and that the rouble notes have been ordered to be destroyed to the extent of about 50,000,000 roubles a year?—Well, I have seen it stated, and then they make them again.

8390. They have been destroyed and the amount has been reduced from 1,200,000,000 to about 1,046,000,000?—The best answer to it is, that the exchange keeps on falling.

8391. Is it not a fact that the exchange falls not because of any excessive issue of paper, because the paper really is insufficient for the wants of the country, but it arises from the distrust of Russian finance outside of Russia. For the population, 1,046,000,000 of roubles, that is, about 85,000,000*l.* sterling, appears to be a very small circulation, according to our ideas in Europe; and there is an effort being made to resume specie payments?—I am exceedingly glad to hear it. It is the first time I ever heard it. I have seen the most extraordinary accounts of the burning of the rouble notes every year, but I have been told that they make them afterwards.

8392. I have a letter which states that they burned 30,000,000 a year between 1882–83, and 25,000,000 a year in 1884–85?—Does your information state how many new ones they printed?

8393. The issue from the Bank has been diminished. It stood at 467,000,000, and it has been diminished to 330,000,000; that is, the excess issue of 467,000,000 ordered by the Government after the war has been reduced to 330,000,000?—Your information does not at all agree with mine, that is all I can say.

8394. (*Sir T. Farrer.*) It has not raised the exchange?—The exchange has fallen; it is lower than ever it was, even during the Crimean War.

8395. (*Mr. Barbour.*) But is it lower with reference to silver?—Yes, the paper rouble is down to 21.

8396. Yes, but when you are speaking of the par being 36–37, that was when silver was at 15½ to 1?—Oh, that would not make the difference between 36 and 21.

8397. But, if you take off 25 per cent. or so, for the difference in value between silver and gold?—Nothing like it.

8398. (*Mr. Chaplin.*) May I go back for a moment on a question I wanted cleared up, the question between Russia and India which Mr. Barbour raised. You told me that the depreciation was even greater in the rouble than in the silver?—The depreciation of the paper rouble as against silver is greater than the depreciation of silver itself as against gold.

8399. And the greater the depreciation, the more the exchange, I understand you, is in favour of the exporter?—I should say so.

8400. Then, how do you account for the fact that while the wheat imports from India are steadily increasing according to all the returns, the wheat imports from Russia have been very largely falling off?—Excuse me, I do not agree with that statement. The imports this year from India are going to be very much less I am told.

*Mr.
W. Fowler.*
21 Nov. 1887.

Mr.
W. Fowler.
21 Nov. 1887.

8401. Well, but let us take the returns we have got?—I have got here the returns from India—

1882 -	8,461,000 cwt.
1883 -	11,248,000 "
1884 -	7,980,000 "
1885 -	12,170,000 "
1886 -	11,023,000 "

for 10 months to 31st October 1887, 7,647,000; there is a great falling off.

8402. Yes, but it does not compare at all with the falling off in the wheat coming from Russia?—We come back to the old story about Russia, about the facts. I certainly have heard that the amount coming from Russia is expected to be very large indeed.

8403-5. Well, I must call your attention to the official figures which are published. For the first 10 months of 1885 the returns from Russia were 3,521,000*l.* in value; for the first 10 months in 1886 they were 1,229,000*l.* in value; for the first 10 months of the present year they are given at 983,000*l.*?—I am told that the returns to October are no criterion as regards Russian wheat. The new crop has hardly come forward so early, owing to the ports being closed; but it is known in the trade what amount is coming forward in the spring, and that affects the market now almost as much as if it was here. I understand that the quantity coming forward next year is enormous.

8406. (*Mr. Montagu.*) Did you suggest that wholesale prices in Russia had not increased in paper?—What I spoke of was the ordinary price of the necessities of life as used by the ordinary people, and I am told by the Russian merchants that practically they are unchanged. I asked, for instance, had wages risen, and he said, "No, they have not risen for many years in Russia." Now, I think wages would be affected immediately, if there was any considerable rise in the price of necessities, at least wages ought to be so affected.

8407. Has not the depreciation of the rouble been for many years about the same price in the country?—Since 1876 it has been 25, 22.

8408. When was it 22, before the present year?—In 1878.

8409. (*Mr. Barbour.*) If you assume that it was gold that was rising in value, and that gold wages had fallen, or would fall, would you not get rid of the difficulty in that way? Because, if you assume that the rouble has fallen, you may expect wages to rise; but, on the other hand, if you assume that gold has risen, then you would expect rouble wages to remain the same and gold wages to fall?—It seems to me the more you look into the figures with regard to Russia, what you see is this, a great change in the supply of articles, and a great change, therefore, in the export, and a remarkable stagnation. With regard to the condition of the country, very little change indeed; but a vast change in the commercial export, resulting, as I understand it, from the immense change which the seasons produce.

8410. (*Chairman.*) Certainly, your figures would tend to show that the rouble could hardly be described as steadily falling in correspondence with the appreciation of gold, because, if you take 28, 24, 22, and up to 25 again, there are no suggested changes of gold with regard to appreciation or depreciation to parallel those?—No, no relation at all that I could see.

8411. (*Mr. Barbour.*) Is it not possible that the change might be at one time depreciation of the rouble, and at another appreciation of gold? Treating the matter from a purely theoretical point of view, might not the divergence at one time be due to depreciation of the rouble, and at another time, to an appreciation of gold, while the effect on the exchange would be the same in both cases?—Well, theoretically, I suppose it is conceivable, but I do not think there is any evidence that it is so.

8412. (*Sir John Lubbock.*) Surely the value of the rouble is greatly dependent on political circumstances, and the probability of further issues, is it not?—To

some extent, no doubt, it would be dependent upon political circumstances, but I do not know that anything extraordinary has happened within the last three or four years. In 1877, which was the time of the Turkish war, the rouble was 25, and it is now 21.

8413. I do not at all intend to deny this. But I wish to know whether it is one of the causes in your opinion?—I am not putting it too high. I cannot see the relation between the rouble and the exports of produce from Russia, but I think the condition of Russia and Chili and those other countries, does tend to show that it is very dangerous to put too much upon the question of the amount of money in that country as affecting the price of articles in the ordinary course of life. I think it is an illustration of the point which I made when I was first examined.

8414. (*Chairman.*) Supposing that a bi-metallic arrangement were arrived at, do you think there would be a danger of disturbance, if the supply of silver should be increased more rapidly than that of gold?—Yes, I have thought so. I have been a good deal affected, I must say, by the strong expressions used by Mr. Giffen, by Mr. Marshall, and by Mr. Norman on this point. It seems to me, that if silver was to be in very largely increased supply, it might happen that gold mining might be discouraged, and if the mining of silver should become exceedingly profitable from the increased value given it by this new arrangement, we might have such an excessive supply as practically to bring silver to be the metal which stops at home, and gold the metal which goes away. But there is more than that in it, I think. I hesitate very much to speak of Indian matters, not having lived in India, but it seems to me that it is notorious that there is a very large supply of silver hoarded in India, besides what circulates amongst the people. It is also stated, and I believe on good authority, that a very large amount of gold is hoarded in India, and Mr. Daniell says, in his book on "Discarded Silver," that the people prefer to hoard gold to hoarding silver, and certain it is that in 30 years we have sent 100,000,000*l.* of gold to India. I think it is very probable that if we give this very high price for silver, higher than is now the ratio between silver and gold in the Bazaars in India, as Mr. Daniell says, they would send over enormous quantities of silver here, to get gold to put into their hoards, and we might suddenly find ourselves denuded entirely of gold and going back on silver mono metallism; that is to say, that our needs would be supported only by silver bullion, and not gold. I am not prepared to say that that would be a good thing. I do not think any English merchant would like the look of it. But what Mr. Marshall, and Mr. Giffen, and Mr. Norman laid stress upon, as I understand it, is, that the profit on silver mining would be far greater than that of gold, were the proposed change made, and the result equally might be that a great flood of silver might come, so that silver being of over value would be retained, and gold would go out as merchandise. That is a speculative idea, no doubt; and that fear about India may be said to be speculative, but it is just one of those things we have to consider when we discuss the probable results of what we are about. I myself should look upon having silver monometallism as a very serious thing indeed in this country, and I will give another reason. The trouble of my commercial life has been the delicacy of the credit of the nation. We pile up credit on a very small basis of actual money. That is the system of the country. It used to be said in Lombard Street, that any man who went to bed with 10,000*l.* unlent was a fool, and I do not know whether that would not apply to everybody—I do not mean to bankers, but to anyone who was not a banker. It means that we are in the habit of using up all our money; and the whole system of our credit is to have very little money excepting what is floating in the pockets of the Queen's subjects, and to have a very high and developed system of credit. Anything, therefore, which would affect that

credit would be a most serious thing for the country, and if we found our gold rapidly passing away from us, although we had silver instead of it, I am not at all sure that the mercantile position of the country would be equally stable and comfortable. You may say that I am only agitating doubts and fears, and that they are not very precise. I admit that; but I am bound to say what strikes me, and to leave the result for your consideration.

8415. Is your view influenced by the fluctuations between gold and silver in France prior to 1873?—It has been in the way that I have already indicated. I remember the time when travelling in France as a boy, I could not get any gold without paying dearly for it. I have travelled in France since, when I could hardly get any silver; and I believe it is notorious that France was, before the celebrated gold discoveries, comparatively very short of gold, and very full of silver, and since that time she has been very full of gold and very short of silver. It may be said that she retained her position as a mercantile country notwithstanding that, and so she did; but her position and ours are totally different. Her credit system is a mere nothing compared to ours. The whole system is totally different. They never have panics in France, unless it be Stock Exchange panics. They do not know what a Commercial panic is in France, because one may say that no man trusts another by comparison. Baron Rothschild told me once that buying and selling bills of exchange, which is a vast business in London, was practically a thing unknown in Paris, except as regards, of course, bills drawn on foreign countries.

8416. (*Sir John Lubbock.*) And that agio first on gold and then on silver was, you think, an inconvenience to the country?—I should say it would be, but I do not want to say how far the inconvenience would go, but I fear that as regards our own country, with our position, and the condition of our country commercially we might be seriously affected if it were felt that we were going to be without gold at all.

8417. (*Chairman.*) Did the agio arise except in connexion with the desire for the metal for purposes outside the country; for export, I mean?—I do not know; I am not prepared to say how far that is so. Of course it is a mere nothing what happens to a traveller; it is only an indication of the state of things.

8418. (*Mr. Barbour.*) Have you ever heard of an agio on gold in any part of England. That a man had, not recently but in former years, in a remote part of the country, to pay something extra to get the particular kind of money that he wanted?—I never heard of it; it might be so.

8419. (*Mr. Birch.*) With regard to the premium on gold, have you read Baron Rothschild's evidence before the Committee on the Bank Charter Act of 1832?—I do not remember.

8420. (*Chairman.*) Supposing the relative value of gold and silver were fixed at the suggested ratio of $15\frac{1}{2}$ to 1, what do you think would be the effect?—Well, I have alluded to what I think might be one result, that there might be a very large export of silver from the East and a great loss, but I should like to refer to what Mr. Westgarth has said. He is considered to be a very intelligent and active bi-metallist, and he says, in a paper which he has issued, and which has been sent to me: "To re-open the bi-metallic mints at so great and sudden a rise in silver value as $15\frac{1}{2}$ to 1 gold from the current ratio of 19 (it is more than that now) would at once direct into these mints a tide of silver from every part of the silver-holding world, thereby loading the bi-metallic currencies with silver to be relieved only by proportionate demonetisation of their gold. Although this effect might be unimportant under any wide and general international bi-metallic agreement, it must once more severely strain the hitherto limited Convention as the practical effects would probably be not unlike those of the great German operation." Now, I mention

that as the opinion of one who seems to take a great interest in this question and has written a great deal about it; and Mr. Gibbs, on the other hand, seems to think that to restore $15\frac{1}{2}$ to 1 is the only thing that is of any use; and as I said just now, M. Cernuschi seems to think that any ratio might do.

8421. (*Mr. Chaplin.*) Have you read his pamphlet on $15\frac{1}{2}$ to 1?—Yes, I have.

8422. Does not he call it an actual necessity?—I have quoted him as regards 10 or 20. Mr. Gibbs speaks very strongly at pages 26 and 27 in favour of the $15\frac{1}{2}$ to 1 being restored; and, as I understand it, that would be essential for the benefit of the Indian Government. What I mean to say is this, so far as you make it permanently less than $15\frac{1}{2}$ to 1, you would thereby make the loss of the Indian Government permanent. I am very much puzzled. Even supposing I were a bi-metallist, I should be exceedingly puzzled to know what ratio I would adopt.

8423. (*Mr. Barbour.*) But with regard to that influx of silver, you are supposing that the ratio of $15\frac{1}{2}$ to 1 was suddenly adopted?—Of course we must.

8424. If it could be done gradually, say in 50 years, do you think the effects would be so very serious?—I think that would do very little good to anybody. We should all be dead and gone; it would not help us, and I think it would be a very serious thing. If it is so very beneficial we ought to have it done as rapidly as possible.

8425. (*Chairman.*) Now, supposing, instead of the $15\frac{1}{2}$ to 1 the market ratio at a given time were taken?—That is what Mr. Gibbs objects to so very much. He says that he thinks it would cause such a very serious loss.

8426. Yes, but do you agree that it would?—I think it would be a very serious thing for the Indian Government to fix 20 to 1 by Act of Parliament or arrangement. According to that the Indian Government loss would be a permanent loss, and the loss to the officials also would be a permanent loss. Now, it would not be so if silver were to rise again from the natural course of events. I only mention here that it is the opinion of very high authorities that this is what is going on, and that silver is going to rise, and that gold, relatively to silver, will fall; that is to say, that the mining of gold is going to overtake the mining of silver. That is Mr. Atkinson's strong opinion, and he bases it in his last paper from information from high-class people in America. And I confess that personally, although I admit the force of what Mr. Giffen and Mr. Marshall have said, it would not surprise me at all to see gold overtake silver; that is to say, that the mines of gold would become more productive than the mines of silver, so that you would have a restoration of the rupee without entering upon any agreement with anybody. Of course that is pure speculation; no man's opinion is probably worth a halfpenny about it either way, but I think the one is just as likely as the other.

8427. (*Mr. Chaplin.*) Supposing that silver in the natural course of events rose again to its old value, would that be advantageous or desirable, in your opinion?—I would not ask any question about it, I would take it.

8428. Would you like to see it; would it be an advantage?—It would be an advantage to some people; it would be a very great advantage to me.

8429. To the general community?—That, I think, it is very difficult to say. If it raised the price of corn. I think it would not. I think it would not raise the price of corn, because we should get plenty or supply.

8430. At all events, you see no objection to it?—I see no objection to it if it comes by nature. I see all the objection in the world to it if it comes by Act of Parliament. That raises a point that I want to mention. I think the loss that we get now, whatever it is, comes to various people not by the act of the Government, but by the act of the natural forces of the world and of nature.

Mr
W. Fowler.
21 Nov. 1887.

Mr.
W. Fowler.
21 Nov. 1887.

8431. You would see no objection to the restoration of 1 to 15½ if it were done by foreign Powers, without reference to England; would you put that under the category of natural events?—I should have nothing to say to it. If they choose to call it 15½ to 1, I am not quite sure that I would not be well pleased.

8432. The objection to it is, that it must not come from the act of England touching her standard?—Yes, that is my view. We do not know all the consequences, and some of them I will state presently; and I intensely dislike the idea of this leap in the dark.

8433. (*Chairman.*) To continue your statement of the evils that you think would arise from taking the market ratio. First, you have said that it would perpetuate and stereotype the loss to the Indian Government. Do you think that there would be a danger of our being reduced to a silver monometallism such as you have described?—That is a question of degree. It would be far more profitable to the silver miners to have 15½ to 1 than 20 to 1, and to that extent the 20 to 1 would not specially encourage silver mining as much as 15½ to 1 would. To that extent there would be less danger of the silver monometallism, but I think it is one of those cases where it is impossible to indicate exactly what the effect of the change even to 20 to 1 would be. Then with regard to India, I have indicated practically some of the dangers that I think would arise. If I am right, a fixed ratio would tend to discourage the exports from India, and if it discouraged the exports from India, it would lessen the power of India to purchase from us and lessen the exports from us to India.

8434. (*Mr. Montagu.*) If the ratio were 20 to 1 as the Chairman asked?—Yes, I say whatever that ratio, it would tend that way, not at once, but if other people are right in saying that silver is going lower. Now that is what some people argue. Of course fixing the ratio at 20 to 1 would tend to prevent that fall, and therefore would tend at any rate to take away part of the benefit which the exporter from India now gets.

8435. (*Mr. Barbour.*) Do you think that the fall in silver stimulates both the import and the export trade of India with gold countries?—I do believe the fall in silver has tended to help the exporter from India.

8436. And also increased the imports, because it increases the purchasing power?—No, only in this way. Mr. O'Connor lays great stress upon that point. I think he is quite right; if you increase the export you are sure to increase the import, because goods go against goods, and if you decrease the export you decrease the power of India to buy.

8437. Then you hold that it has increased both the imports and the exports?—I do not know that I can say that off-hand. I will tell you what has happened. I think silver has fallen, and goods have fallen too here, and that that has tended to send both to India, —both goods and silver; that is my view.

8438. (*Chairman.*) If you increased the exports; but the exports fetched no more than they did before; and if goods had not fallen here you would send, of course, a smaller quantity of goods from here than you did before?—Yes.

8439. If goods here have fallen in the same proportion, and exports there have increased, you send a larger quantity of goods from here than before?—Yes.

8440. (*Mr. Chaplin.*) You do not agree then with the gentleman you have so often quoted, M. Cernuschi, that the rupee at 1s. 6d. has the effect of protection against the English merchandise which reaches India, as well as a bounty for the merchandise which is exported from India?—I have said that I believe the fall in silver has had an effect in encouraging the export of produce generally from India, just as Mr. Gibbs has pointed out that it encourages the export of produce from Chili. I have pointed out that the proportionate increase of the imports into India

in five years that I have mentioned in my paper, was greater than the increase of the exports.

8441. (*Chairman.*) Do you mean in value or in quantity?—Value; and I think it is a very curious point. It has been referred to in the "Economist" of last Saturday. It has been argued that the tendency of existing arrangements is to discourage our trade with silver-using countries. I have seen that put very strongly, especially the other day in an address that was made to Mr. Goschen. The figures are very remarkable, and they confirm the view that I have taken as to the way in which our trade has expanded with India, even as regards imports into India from us, notwithstanding the fact that this fall in silver tends to discourage the import from this side to India, almost as much as it encourages the export from India; but the curious thing is, that the export of cotton piece goods has greatly increased between 1872 and 1886 to silver-using countries as against gold-using countries.

8442. (*Mr. Barbour.*) Are these fairly representative years, because I believe in 1886, at any rate, there was a very unusual export of piece goods to India?—I do not know that they are absolutely without objection; I cannot tell you. At any rate, the figures are very remarkable, and they go to show that we keep up our business with silver-using countries. Now, in our exports to Europe generally there is a considerable falling off from 456,000,000 in 1872 to 296,000,000 yards in 1886. The other figures are as follows:

	1886.	1872.
	Yards.	Yards.
Turkey - - - - -	299,706,700	280,964,350
Egypt - - - - -	139,468,700	261,105,740
West Coast of Africa (Foreign) -	37,343,900	22,744,789
United States - - - - -	45,251,200	132,947,936
Foreign West Indies - - - - -	90,238,200	93,320,461
South and Central America - -	611,100,000	493,370,800
China and Hong Kong - - - -	455,823,000	402,079,825
Japan - - - - -	34,628,500	28,447,500
Dutch Possessions in India - -	86,592,400	23,326,350
Phillipine Islands - - - - -	43,214,700	10,785,360
West Coast of Africa (British) -	28,490,100	—
British North America - - -	32,584,700	41,329,605
British West India Islands and Guiana	42,893,000	40,504,797
British Possessions in South Africa -	21,463,800	25,299,893
India - - - - -	2,118,888,200	859,705,200
Straits Settlements - - - - -	103,929,600	101,156,600
Ceylon - - - - -	14,868,200	33,234,700
Australasia - - - - -	96,756,300	45,895,482
Other Countries - - - - -	240,989,400	182,798,738
Total - - - - -	4,850,030,200	3,535,157,600

At any rate, the figures go to show that India and other silver-using countries go on dealing with us on a very large scale, and apparently as large as ever, notwithstanding the fall in the value of silver. I understand one object of the agitation is to raise prices. Well, of course, if we raise prices by what is called monetising silver we should discourage our exports by making them dearer. I think that would be a very natural result. If we make wages and all these things higher in our own country, that would tend to discourage the export to other countries, as we should not be able to work as cheaply.

8443. Would that be the case if you raised wages equally in the other countries too?—But the prices have not risen in India.

8444. Then you think the influence of the standard would be confined to one region?—The argument used in this country is that you have got prices down

very much, and you want to raise them. If you raise them you diminish our power to export to other countries.

8445. Would that be the case if you raised prices in an equal degree in those other countries?—I do not know that you could; the circumstances of each country are so different. In India the prices have not risen in cotton goods; they have gone down very much. Then there is another thing which strikes me about it. If we raise the value of silver we might discourage the export of silver to India. If we discourage the export of silver to India we certainly should lessen the supply of the metal, so if prices depend on the supply of the metal, we should lower prices in India; and if we lower prices in India, the result might be that you would have wheat coming here and competing with our agriculturists as much as ever; and I only mention this as an illustration of the complicated results that might arise which no man can foresee, so that we are bound to be very careful, lest, in order to produce what we think is a good result, we bring in other difficulties very hard to foresee; and generally I cannot help thinking that if the arguments used on this question are correct, we should be injuring India for the sake of benefiting some part of our own people. I may say here that all that I have read seems to show that the fall in silver, so far from injuring the Indian people as a whole, has been beneficial. That was Mr. Cross's opinion very strongly expressed in the speech he made in 1879 in the House of Commons, and I believe he never varied from that opinion; and it was agreed to by Mr. Goschen in the same debate; and I think it would be a very serious thing, as I have said before, for us to do anything which might injure India for the supposed benefit of our own people.

8446. (*Sir John Lubbock.*) Do you maintain that it would be for the benefit of our own people?—I do not see that it would; on the contrary, I think I have argued that we cannot foresee precisely what will occur, and I see no necessity for it, and on the whole I am inclined to think that it would be a dangerous thing for our people. But what I mean is, that it is argued as if we were going to raise certain prices, and thereby help certain classes of our people. But even if we could do it, I say it would be very doubtful whether we ought to do it for the sake of only one part of the empire.

8447. (*Chairman.*) Do you think that a bi-metallic system would add to the stability of the standard?—That is a question of great difficulty. My own impression is, judging from the past, that it is extremely doubtful whether it would be more stable. Of course there is no natural equation, as we have said, between gold and silver. There has been a great preponderance of supply of gold in the last 30 years, and I cannot see what the real relation of value is, and I do not think that anybody has ever shown that there is one. I think if we had two metals we should be liable to disturbance from any sudden change in the supply of one, unless you could absolutely depend upon this compact that is suggested being kept under all circumstances by all; and even if you could so depend, there being such a very large number of countries not in the compact, it seems to me that you might have, as I suggested before, a sudden removal of all your store of one metal, and you would be dependent upon the other metal entirely.

8448. That removal could only take place by reason of hoarding, could it, because you have your existing stock, to which after all the existing supply bears a very small proportion; and, therefore, the diminution of that supply would not be a very serious proportion, so that you could not have any sudden disturbance, could you, of your gold stock, for example?—Well, you use the word sudden; but you might have a rapid export of gold to the East from various causes, either commercial, or for hoarding, or otherwise, and if you did, as I said before, your standard would depend upon silver only.

8449. But there is no motive except that of hoarding, is there, which you would suggest that would bring about that result?—I do not know about that. That change took place in France without hoarding, so far as I know.

8450. Yes, if there are other countries to which it might still flow?—Of course what took place in France in the first instance was an enormous flow to the East; that was a commercial demand for the East.

8451. (*Mr. Barbour.*) Do you mean of silver?—Of silver. I have got the figures here, and you will see that during the years between 1856 and 1861 the flow of silver to the East was enormous, and that was a commercial demand, and also, I suppose, partly a hoarding demand. It was an Oriental demand, and that might arise again, and that makes me fear that the nominal stability would not be so real as it would appear. Of course the argument of the other side would be this, "You have only got silver, but your silver and gold have a special relation, and therefore you may be quite happy. You can issue your notes on the silver as well as the gold; it does not make any difference." But as I said a little while back, I am not at all sure that that would make no difference to us commercially, and that our position as a commercial nation would be as stable, to use your own word, as it now is.

8452. The area from which people, desiring to hoard in India, would draw would be the whole of the nations that were in this bi-metallic union?—Yes, they would be, no doubt.

8453. Would it not take a very long time before they would make a very sensible effect upon the joint stock of gold of all the nations?—Unfortunately our stock of gold is very small. A difference of 10,000,000*l.* would cause a panic during our present arrangements, and I do not know what the effect of taking 10,000,000*l.* would be, even if you had this arrangement. We are become in a sense the centre of the settlement of the commerce of the world from various causes, partly because of our situation, and partly from absence of risk of invasion. But I do not think that is the only reason why we become the centre of settlement. I think one reason is that everybody knows what the pound is; all the world knows what a pound is, and always has known what a pound is; a pound means a certain weight of gold. Now it is proposed to say that a pound either means a certain weight of gold or a certain weight of silver, not at the option of the creditor, but at the option of the payer.

8454. You do not mean to say that a pound in England has been always a certain weight of gold?—It has since 1816.

8455. But that is not always?—It has been during the period of our great commercial development.

8456. (*Mr. Montagu.*) No doubt that permanence has arisen partly from the follies of other people. Other countries have become more powerful in a monetary sense than they were because they have lived more at peace?—There is less danger than there was of disturbance, though we are frightened with a possible war about every three months. But still one cause of our position has been, I think, the mode of payment of our debts. Mr. Raphael said in his evidence that he did not think much of it, but that the important point was that we were secure from internal and external disturbance more than any other country in Europe. Well, that is a question of opinion, which is only speculative; but I think, and always have thought, that the fact that we stick to a certain mode of payment, and everybody, for the last 70 years, has known exactly what is meant by a pound, that all bills drawn upon London meant so much gold, has had an influence in confirming our commercial position.

8457. (*Sir John Lubbock.*) And would you not say further, that there might be a fear if we altered once we might alter a second time?—Well, of course, that is quite reasonable. If we once begin altering, as you

Mr.
W. Fowler.
21 Nov. 1887.

Mr
W. Fowler.
21 Nov. 1887.

say, no one knows where it will stop. But I do not want to put it too strongly. I say generally that I think it is not only a question of the stability of the standard, but it is a question of the stability of the commercial position of the nation, and I think it is a very serious thing for the Commission to consider.

8458. (*Mr. Chaplin.*) But if a certain weight of gold and a certain weight of silver meant exactly the same thing, and would purchase exactly the same commodities, what difference would it make to anybody, or what harm could it do them?—The difference is this, that there are a good many countries outside this arrangement, and the merchant sometimes wants gold.

8459. (*Mr. Montagu.*) What other countries?—Well, all the silver-using countries. According to M. Cernuschi, there are only to be five countries in the arrangement, and the other countries are to be outside.

8460. There may be none left out?—Well, if you think Russia is to resume specie payments forthwith, you are more sanguine than I am.

8461. (*Mr. Chaplin.*) The link between gold and silver would be established, and though left out, all countries would be equally affected by the arrangement?—All I maintain is this, that I cannot foresee exactly what the result would be of a merchant not being able to get any gold here; that is to say, our having no gold in this country. I do not know; I am not going to prophesy that it would do harm, this way or that way, but I say it is one of those things that I cannot see my way about, and I cannot feel satisfied that the country ought to be put in that position by any arrangement which we may make with other countries, for although you say the value of the stuff which you give whether it is silver or gold is identical, it may not be identical for the purposes of the merchant. Now, you asked me about the stability of the two metals being as great as the stability of one; but what I want to ask you is, if I may ask a question; what is the evidence of the instability of gold, and why should we attempt to introduce a possible instability of a second metal into our measure of value? It is admitted that silver and gold do not maintain always the same relation, and you say, "Oh, we will get rid of that by an agreement." Now that is coming back to the old point that I began with. I greatly doubt whether you can get rid of that difficulty by an agreement, partly because of the inherent objection to creating values of any kind by Act of Parliament or treaty, and partly because I do not believe you can depend on those people keeping to that agreement if it does not suit them, so that I think there is an additional danger from your being liable to the fluctuations of a second metal.

8462. But you cannot give us any reason, I understand, why it should not suit those other people to adhere to the arrangement, or what should induce them to depart from it?—I am not going to prophesy what is going to happen. France gave it up; at least the Latin Union gave it up because Germany took a particular line.

8463. There was a special reason for that?—Well, there might again be something of the same kind. There might be wars, and these countries would not think a bit about John Bull; they would think about themselves.

8464. (*Mr. Barbour.*) But was not the action of Germany influenced by a desire to imitate what England had done during the early part of the century? Are we really not the authors of the change?—I understand the reason why Germany made the change was that her money was in great confusion, and she saw she was to get a great indemnity from France, and she took the opportunity to improve the state of her money. It was not from any theoretic reference to what we have done. I daresay there were some people in Germany, who thought that England's supremacy was because England had a gold measure of value,

8465. (*Chairman.*) It was suggested that Germany may have thought that our commercial supremacy was in some degree due to gold, and therefore they adopted gold. Though that idea was unfounded, still the fact that the idea was entertained would seem rather to support your view as to the dangers that might arise from the change?—Precisely; I entirely agree with that.

8466. (*Mr. Barbour.*) And that would be the case unless the fact of the superior advantages of the gold standard could be conclusively disproved?—Well, if you could disprove it altogether, then the argument would fall; but I want to know, what is our motive for reverting to this bi-metallic par. If I am right we should be injuring India, and I cannot see the slightest benefit that would come to England in any way or shape. I say we do not want any more money. We have too much money; we have got a standard which has proved itself, certainly, more stable, than the silver standard has been, and I do not know why we should be asked, because of inconvenience that comes to other countries, to enter on this arrangement. If I thought that the great mass of the people of India were injured seriously, and that we should restore their prosperity by this arrangement I should think differently about it; but I do not believe it. I believe the great mass of the people of India are benefited rather than injured by the present condition of things.

8467. But whether there is sufficient ground for the change or not, I suppose you would not dispute that the constant fluctuations in the relation between the silver and gold causing fluctuations in the value of the rupee are objectionable, and a source of inconvenience to the Government of India, and probably of political danger?—They are a source of inconvenience to the Government of India. That is perfectly true. I quite admit that; but I will tell you what I think has caused much more trouble to the Government of India, and that is these horrible wars and these probable wars. If you look at the finances of India you will find they are flourishing, and if you did not make annexations, build frontier railways, and make an enormous quantity of productive works out of revenue, the finances of India would be in a very satisfactory condition. The political danger arises from expenses that need not be incurred, or at any rate of very doubtful character, and not merely from exchange.

8468. (*Mr. Chaplin.*) In continuation of what you were saying about India, if it could be shown to you that the mass of the people in this country—the artisans, for instance, and the agricultural labourers—were in a worse condition than they used to be in consequence of this state of things, would that alter your objections also?—Well, I happen to have lived in the West of England all my early life, and all I can say is, that I am so satisfied that the people are far better off than in those days, notwithstanding all the troubles we have had, that it would take a great deal to convince me that they have been injured by cheap bread.

8469. I am not limiting my question at all to cheap bread. I asked the question, because we have had very remarkable evidence here from people intimately connected with the working classes, to the effect that the artisans in particular, as well as the agricultural labourers, are very seriously injured by the existing state of things?—Yes, but they have to prove that the existing state of things is the consequence of the fall in silver.

8470. Well, the question I asked was, presuming that that was proved to your satisfaction, would that alter your objections to the adoption of the bi-metallic system?—No, there is another point about that. If you could prove to me that the single gold standard caused great trouble to large classes of the community, it would be a very serious argument. Still you have to prove that the restoration of the silver to its former value would raise prices and produce demands which would put those right. Now, if I am

right, I am very doubtful about that, because I do not believe the fall in prices so much complained of is due to any want of money.

8471. I am quite aware it is to be proved, but I am asking you, assuming that it was proved to your own satisfaction, would that alter your objection in the case of the people of England, as you say it would do in the case of the people of India?—I say if you could prove to me that the fall in silver had damaged the community at large, and especially the working classes, and that the restoration of silver would improve their position and restore prosperity, of course the argument is at an end.

8472. (*Mr. Birch.*) The difficulties of the Government of India might be largely increased if by an arbitrary Act of our Parliament we raised the silver again to $15\frac{1}{2}$ to 1?—Yes. If the people of India thought that thereby the charge upon them for their taxes, and their land rent was higher than the natural charge was, and that had been done by act of Government to save the Government from a loss, I think it would be a political danger more serious than any trouble arising from the exchange.

8473. (*Chairman.*) But do you think they would feel that at all. Does not the evidence go to show that the rupee in India has not fallen. If a sudden change took place they might ascribe it to the action of the Government?—Quite so. If it was a sudden change that took place, and it was understood that the Government were raising the value of the rupee in order to help themselves, and to help the official class, that might be a serious political danger. Well then, there are two other considerations which seem to me of importance. I am perfectly free to admit that these objections that I have raised have been speculative rather than absolute, and they must be so. But there are two things which seem to me perfectly clear. We should lose, and lose heavily, if this change were adopted. We should not receive gold for the interest of this vast amount of debt which is owing to us all over the world. We should no longer get gold if it suited the payers to send us silver. If that was the cheapest mode of payment they would send us silver. Well, that is a big thing, and more than that, if prices were raised we should, of course, receive less in produce for every pound of interest that we receive from other parts of the world. In both those ways we might be very seriously injured, and being the great creditor nation of the world, that is a thing which ought not to be lost sight of.

8474. (*Mr. Barbour.*) But I think you hold that the change would not raise prices?—I am told that it would. I am arguing that, if it has the effect which is predicted, and which is desired by a great many who take up this question, for I do not believe there would be half the agitation that is going on just now if it had not been for the desire to raise prices.

8475. (*Chairman.*) If it did not raise prices, so that the silver we get would buy as much of everything as the gold that we get, it would not matter to us?—It would not matter to us, of course.

8476. (*Mr. Chaplin.*) You mean as a creditor country?—As a creditor country it is important for us to receive a large amount of gold for commercial purposes, not silver.

8477. (*Mr. Montagu.*) You say they would send us silver?—If it suited them.

8478. Should not we send them back that silver instead of gold?—The satisfaction is that they are our debtors largely.

8479. Is it the case that we are always receiving a balance of gold?—I do not say we are, but it would be possible that those countries that are now sending us gold would send us silver.

8480. And we could, if it suited us, send it back again?—I suppose that it might not be possible in some cases.

8481. Then you would assume that we are constantly increasing our metal reserves?—That is in the case you are referring to. The assumption is that the people are debtors to us, and must send us metals in

some cases. The great bulk of what we receive, of course, we receive as goods. It comes in goods; it does not come in metal; but still if it suited them to send silver at any time, it is very easy to conceive, suppose silver became very plentiful, that it might suit them to send silver when it did not suit us at all to receive it.

8481a. (*Mr. Barbour.*) May I ask what the difficulty would be if a large amount of silver came?—It may be that I am so accustomed to gold that I look on the actual possession of gold as more important than it really is; but not being a merchant, I hesitate to speak too strongly about it. I think, however, that to have a mercantile reserve of gold would be very important to us even if this arrangement were made. There is only one other point that I should like to mention, viz., the danger of inflation and speculation arising from a sudden increase of the amount of nominal money in the country. It is one of those things that it is rather difficult to put clearly, but we do see sometimes such extraordinary excitements when money is extremely abundant in London, that I think the immediate effect of this change might be very serious. It might not be permanent, and, therefore, I do not want to dwell too much upon it; but I think we might have a greater amount of sudden inflations and sudden depressions than we have recently had. Since 1866, as you are aware, notwithstanding a great many oscillations of commerce and violent changes in the commercial world, we have not had a single panic, and we have had a comparatively quiet condition of money matters, and I should be very sorry that anything should be done by changing our currency which could in any way produce a repetition of former disasters.

8481b. You have said in your evidence that in recent years there has been a great cheapening of production and increase of production in the case of certain commodities of which the prices have largely fallen?—Yes, that has been so.

8482. But is it your opinion that no portion of the fall in gold prices in recent years is to be ascribed to the breaking of the par between gold and silver?—Well, I am entirely unable to trace it to that.

8483. You are aware that since that par was broken, gold and silver have altered about 28 per cent. in relative value. That being so, must not the gold and silver prices of articles bought and sold for gold and silver alter in exactly the same proportion?—I do not know that they do quite; because now, for instance, you take the Indian price and the London price, there is not that difference.

8484. But if you allow for the difference in freight at different times, is there not that alteration?—I doubt it very much. I do not think there is anything like that divergence.

8485. Then must it not become extremely profitable to export or import between gold and silver countries. You take advantage of the divergence in buying and in selling, and there is a very great profit?—I have argued that there is a profit in exporting from India to this country.

8486. Supposing that an article is worth 10*l.*, and that at one time 10*l.* are worth 100 rupees, and that at another time 10*l.* are worth 120 rupees, will not the price of that article be at one time 10*l.*, at another time 10*l.*, while measured in rupees its price would be at one time 100 rupees, and at another time 120 rupees?—That is conceivable.

8487. But is it not certain that it would be so in the same markets commercially connected?—I have not worked it out, but I do not think, as matter of fact, it is. I have looked at Mr. O'Connor's minute, and I cannot make that out.

8488. Then you think that there might be a divergence, say, to the extent of 20 per cent. between the value of gold and silver, and that the price of the article, measured in gold and measured in silver, might not vary to anything like that amount?—No, I think not, because prices depend in the country where the price is fixed, so much more upon the supply and

*Mr.
W. Fowler.*
21 Nov. 1887.

Mr.
W. Fowler.
—
21 Nov. 1867.
—

demand of the article than on any relation between gold and the article.

8489. But if the price of an article was 10*l.* here, and if the exchange fell very much and the gold price remained the same, must not the silver price rise in India?—But it has not done so.

8490. No, because the gold price has fallen?—Both prices have fallen; no doubt they have.

8491. Yes, but the gold price much more than the silver. What would have happened supposing the gold price had not fallen?—I suppose you would have had a larger export from India.

8492. Must not the gold and silver prices of articles bought and sold for gold and silver alter in exactly the same proportion in which gold and silver alter?—I think it is quite possible.

8493. Assuming that the gold and silver price is made in the same market?—Of course these things adjust themselves by a question of profit and loss.

8494. Yes, but supposing the gold and silver price were made in the same market, would there not be in that market a gold price and a silver price; and would they not vary in reference to each other, just as gold and silver varied?—I do not deny that an exporter from India, for instance, takes into account the question of exchange, that is the very thing I have been arguing all along with the other factors, but I do not think it follows that you could lay down a proposition so broadly as you laid it down at first. I cannot answer that question off-hand; I must look into it more minutely. I would not commit myself to that point.

8495. I want to put a hypothetical case to you. Suppose that in 1873 a silver standard had been introduced into Ireland, at the ratio of 15½ to 1, would not the price of agricultural produce in Ireland have escaped a fall of, we will say, 25 per cent.?—No; I doubt it very much.

8496. I assume that Ireland was given a purely silver standard in 1873. My hypothesis is that if you had done that, the prices of Irish agricultural produce measured in silver would have escaped since 1873 a fall of 25 per cent.?—If Ireland had been isolated and was at 15½ to 1 ratio, and that had been maintained, there might have been no fall in wheat when there was a great fall in other places you mean.

8497. What I say is, prices measured in silver in that country would not have fallen so much as they have done by 25 per cent.?—I do not know that that follows, it depends entirely on the supply and demand of the article in my opinion.

8498. But do you mean to say that the silver price might have fallen as much as the gold price, and yet that extraordinary divergence in the relative value of gold and silver occur at the same time?—No, but you are close to England. Of course, if you have got two markets close together like Ireland and England, the prices would be maintained at a certain ratio one to the other, according to the conditions of the country. There is little doubt if wheat is cheap in one country it will go to the other, and so on.

8499. The silver price of Irish agricultural produce would not have fallen by the amount of the divergence between gold and silver?—That may be. I am not at all clear about that. That would depend on the supply and demand, and the harvest.

8500. I am speaking of articles which could be easily exported to England, and the silver prices of those articles, such as cattle and so forth, would have to move with the variation in the relative value of gold. The prices must correspond to the altered value of silver measured with gold, otherwise there would be immense profit to be made somewhere?—The prices would vary, of course, in the two different countries, and if it was cheaper in one country than the other, it would go to the other.

8501. The exchange between the two countries would balance the alteration in price?—If you mean to say you would create a value by Act of Parliament, whatever value you like.

8502. I merely asked you, would it not have been the case, that prices of Irish agricultural produce measured in the standard of Ireland which would then have been silver, would not have fallen so much as they have done by 25 per cent.?—Well, I am not prepared to say off-hand what the effect of that would have been. No doubt in India prices have not fallen as they have fallen here; they have not fallen in silver as they have fallen in gold here. There is no doubt about that, and there is no question that Ireland might have had better prices in silver than she now has in gold.

8503. I do not say that it ought to have been done or that it would have been a good thing. I merely want the admission of what appears to me to be obvious?—You have to take a great many consequences into account before you find out what the result might be.

8504. I am not asking about the result. I dare say it might have been very injurious. I am merely asking you about this particular point connected with prices?—If in two places closely associated, you put one measure of value in one place, another measure of value in another, and the one measure of value falls and the other remains as it was; of course, there must be a great change.

8505. Well, then, seeing that that is the case, is it not pretty evident that under certain circumstances the quantity of money, or the standard, or something connected with the currency, does exercise an influence on prices?—I never said it did not.

8506. And a large influence?—I do not say that the amount of money in a country has no effect upon prices at all, but what I say is this, that it is a minor factor, and that the great cause of the changes in price is the supply and demand of the article.

8507. I quite admit that, but have I not given you an instance under which, under one standard, the prices would have been 25 per cent. higher than under another?—Yes; but you have assumed a different measure of value in two countries, and the measure of value changing in the two countries.

8508. As it actually has done?—Well, as regards India and England.

8509. But prices have altered as between Java and India. Java has got a gold standard?—Yes; there is no doubt whatever that you may have a change in that way when you have two different values in two different parts of the Empire; but that is the very thing that I have been arguing to-day, that the result has been that one part of the country is enabled to send articles here which it could not otherwise have sent.

8510. The only thing I want to bring out is this, that the standard does have an influence, and in certain circumstances a very considerable influence on prices, nothing more than that?—I do not admit that generally. There may be exceptional cases, in which you create peculiar conditions by some special arrangements of law, but speaking generally, I think it would be a profound error to suppose that the great cause of changes of prices is a change in the supply and demand of money.

8511. I merely want to know whether in certain circumstances the money standard does not exercise a certain influence on prices?—I do not say that in no condition of circumstances it does not affect prices. I do not say that. What I am trying to prove is that it would be a great mistake to alter our law with the idea that by altering the law we are going to make a great change in prices. I do not believe it.

8512. I understand from the evidence you have given that you are opposed to any attempt to influence gold prices by making any changes in the standard or currency?—I am opposed to it as at present advised, because I cannot foresee all the consequences, and I fail to see any good result, excepting the possible improvement of the value of silver and the consequent reduction of inconvenience to certain people and to the Government of India. I fail to see any good result, and I think I foresee that there might

be very evil results to our position as a great commercial nation.

8513. And you think that it would be quite useless and very wrong to attempt to counteract the effects that flow from the natural course of trade and industry, by meddling with the standard?—As a rule, I most undoubtedly do. I wish to mention what has occurred to myself in the course of my life. I recollect talking to my father as to what would happen when the sovereign was only worth 10s. I said: "Oh dear me, something must be done to help these poor fundholders." He said: "Nothing at all. Very likely before you are dead it will be all altered." And so it has been. I have lived to see the thing turned the other way; and now we see the sovereign is not only worth a sovereign, but it is said to be worth 30s., if we compare present and former prices, and therefore I should extremely hesitate to alter our currency from any idea that we know exactly what is going to happen to the precious metals. We saw that the enormous discovery of gold had not anything like the effect that Chevalier and Cobden, and many other people prophesied it would have, and I am not going to say that the changes in silver are going to have all these evil consequences.

8514. But would not that great production of gold have had a much more serious effect if there had been no bimetallic country at that time?—I am not sure about that. Mr. Currie has stated that it would have been a very good thing if the trouble had come then instead of now, and I am not sure that it would not have been so. No doubt what occurred at that time was that there was an immense demand for silver in the East, at the very moment when gold was poured into France, and the silver was taken away by that demand, but that was a commercial demand in the East, and so the trouble with regard to silver was deferred; but now we have got that trouble, and we have to meet it in the best way we can.

8515. (*Chairman.*) What was the cause of that exceptional commercial demand at that time in India?—I am speaking of the period between 1856 and 1862. It was the Mutiny, but the Mutiny did not last all the time. The Mutiny was over in 1858. The export of silver in 1856 was 14,000,000*l.*; 1857, 20,000,000*l.*; 1858, 5,000,000*l.*; 1859, 16,000,000*l.*; 1860, 10,000,000*l.*; 1861, 8,000,000*l.*; 1862, 14,000,000*l.*

8516. (*Mr. Barbour.*) You are opposed to meddling with the standard. I suppose you would admit that it should be an object of the Government to secure a good monetary standard?—Yes; the very basis of my argument has been that I think gold is better than two, than a double one.

8517. You think that a good, or what, for want of a better word, we may call a stable monetary standard is a desirable thing?—Undoubtedly it is.

8518. Now in different parts of the British Empire at the present time there are two standards; there is the gold standard and the silver standard, and within the last 14 years they have altered in relative value nearly 28 per cent.?—At different periods.

8519. To the present time they have altered nearly 28 per cent. in relative value. Do you not consider that that indicates a want of stability somewhere?—No doubt there is, but not the act of Government.

8520. But is there not a want of stability somewhere?—Prices in India are very stable.

8521. And in England?—And in England they have fallen very much.

8522. Now, as long as the ratio of 15½ to 1 was maintained, had not England and India practically the same standard for the measurement of value?—No, I do not think they had. They had not the same standard of measurement of value theoretically.

8523. But practically, so long as the two standards moved in harmony?—Practically silver and gold maintained a certain ratio during that time.

8524. And practically it was the same standard?—I do not like to use the words "same standard,"

because it is a different one altogether, and it is obvious that one was liable to fluctuations to which the other was not liable.

8525. Yes, but the same ratio between the two standards was always maintained?—If India had always had a gold standard, she would not have these fluctuations of which you complain.

8526. Could you point to any period before 1873, at which gold was not linked to silver in some country or another?—I do not know that there was any connection between us and the ratio between gold and silver. There was a nominal link.

8527. Was it not a real link?—No, it broke down.

8528. But up to 1873 it was a real link?—It is a very poor sort of link that breaks down the first time there is trouble.

8529. I do not think it was the first time?—I think it would have broken down long before, but for the accident of the Mutiny in India causing a great demand for silver.

8530. I will read you a passage from Mr. Bagehot, written in "The Economist" in September 1876. "The gold price of silver is now like the gold price of tin—left practically for the first time in history without artificial regulation, and free from the manipulation of governments. And it is into the consequences of this that the United States should now inquire, for they have nowhere been fully treated of. The first effect is that to which M. Léon Say drew attention not long ago, in a speech of much ability; the instability of the value of the two metals. In former times, he justly said, that the fluctuations in the relative value of the two metals were few and small, but now they are many and large. Particular causes, no doubt, aggravate that instability at this moment, especially the demonetisation of silver by Germany, and the supposed likelihood of great supplies from Nevada. But, though the instability is aggravated by these causes, it is not created by them, and it will not cease with them. There is no inherent reason why the gold price of silver should be uniform any more than why the gold price of platinum should be the same. The old notion of extreme steadiness is one generated by the practice of governments, and which has ceased when the practice ceased, and will not revive till it revives." Do you agree with that?—I believe that is true. I believe there is no question, as I said in the beginning of my remarks to-day, that the action of the Government created a special demand for silver which would not have existed otherwise.

8531. Since the bimetallic par was broken, have we not experienced certain evils which did not formerly exist?—I do not know what you mean by "evil"; please indicate what you mean.

8532. I would call the fluctuation in the relative value of gold and silver an evil?—Well, I am not at all prepared to say offhand that that is an evil. It is an inconvenience, and it may cause loss to certain people, but it causes gain to others.

8533. But a thing merely causes good to some people and evil to others, that does not make it on the whole a good thing?—What you are asking us to do is to alter the whole of our currency because certain people lose money. It is called an evil, because certain people lose money. I am not prepared to say off-hand that it is an evil. It may cause loss to certain persons, it may cause profit to others; but to say it is an evil involves a very large assumption.

8534. You do not think the instability of gold and silver is a benefit—you would not go so far as that?—No; personally, I should be very glad to see them at one again, but not by the proposals now made.

8535. Now, if by somebody or other the bi-metallic par were restored, would not the whole world practically have the same standard again?—I suppose we should be where we were in 1873.

8536. And would not any inflation or contraction of the currency in any country then be spread over the whole world? For instance, if America issued

Mr.
W. Fowler.
21 Nov. 1887.

Mr.
W. Fowler.
21 Nov. 1887.

inconvertible notes, and gold were driven out of America, the gold would go to France and other countries, and a portion of the silver would go to silver-using and other countries. That would be the theory?—Well, a curious thing is that during the time previous to 1873, the fluctuations in the money market were far greater than they have been since. As regards prices, I doubt very much whether the result would be permanently great.

8537. But so far as there was any effect, the result of having one standard for the whole world would be to reduce fluctuations of the nature I have indicated, though such reduction might not be of very great benefit?—I am not at all prepared to say that. I am confident that the great cause of the fluctuations in price has been invention, and the reduction of the cost of distribution, and the telegraphic communication of the world; not a question of money.

8538. I do not question that for a moment; but I merely ask you would it not be the case, if you had one standard all over the world, that those fluctuations which come from the standard would be spread over the whole world, and presumably would not be so intense in any one country?—You used a word there which involves the whole question. Now what proportion of fluctuations come from the standard? I think very few.

8539. But did we not discover a little time ago that in certain cases, say, between England with a gold standard and Ireland with a silver standard, there would have been very great divergence in prices?—What I say is, taking the whole world, which you are talking about now, that the fluctuations in prices are mainly caused not by questions of money, and therefore it is a mistake to suppose that by altering the money, you are going to restore stability of prices. I do not believe that.

8540. (*Chairman.*) What I understand you to mean is that even if there are some fluctuations which arise from money they are so small in comparison with the others as to be unimportant?—Not worth considering.

8541. (*Mr. Barbour.*) I suppose you would admit that the standards of the different countries are not in a very satisfactory state?—They are in a very unsatisfactory state; many of them have inconvertible notes which I have been accustomed to look upon with horror.

8542. And others with silver?—I do not object to silver at all. I hope silver will not cease to be used by the vast majority of the world; I have no objection to it.

8543. But you have an objection to seeing it in this country as legal tender?—Yes.

8544. And a great many countries have a large quantity of over-valued silver. France has five franc pieces?—Yes, and she is very much bothered by them.

8545. There is a great deal of silver in America?—Yes, but that is their own fault. That is an illustration of what I object to—the interference with these things by Legislatures. They have bolstered up silver by Act of Congress. The existence of these Bland dollars is a difficulty, and what is Uncle Sam to do with his Bland dollars? Supposing that silver had gone into the markets of the world, and not been piled up in those dollars in America, it would probably have done much less damage.

8546. Do you think the repeal of the Bland Bill, and the sale of those dollars, would have a healthy effect in raising silver?—I never said a word of that kind; I only said this, that I thought that by making a law, and creating dollars in this way, in the end (supposing, for instance, they were to repeal that Act suddenly) they would do a great deal more harm than if they had never coined the dollars at all.

8547. But up to the present time, do you think the additional demand for silver created in that way has actually lowered its value?—I do not think so, but

I think the effect of the uncertainty has a depressing effect on the silver market.

8548. But if it were known that they were going to repeal that law, would that not have a still more depressing effect?—I daresay it might.

8549. I merely want to get this, that things are not now in a satisfactory condition. Perhaps it is impossible to remedy them?—I never alleged that they were.

8550. Is it your opinion that the best plan for America, France, and everybody, is to allow things to drift and settle themselves somehow, or that is it advisable, under certain conditions and certain limitations, to try and do something towards putting them in a better state?—I think that question should be asked of those people who have interfered. We have not interfered; we have stuck to our gold, and steadily had one law for 70 years. I think those people who are continually changing ought to be asked.

8551. But the question affects us, or at any rate it affects the Government of India, and if silver went to 1 to 15½, which might be brought about by foreign nations without us, you say it would be a great injury to the Indian people. Are we to allow matters to drift, or should we try in any way to control them? Would it be worth our while to do anything to obtain a certain control over them?—Well, I have never seen any practical proposal that I could view with satisfaction.

8552. Are you unable yourself to make any proposal?—No, I am not. I have only thought that this might be done. You, as an Indian official, will be able to say whether there is anything in it. I have thought that gold might be coined in India as the sovereign is coined here, not making it in any way legal tender, or giving it any ratio of value, merely coining the gold. I do not know whether that would be of any use to you.

8553. We do that at present, and have done so for at least 50 years?—Why do you not coin a gold sovereign?

8554. Sovereigns are frequently imported?—You have so much gold hoarded in India that you might bring it out in that way.

8555. Is that your suggestion?—I have heard that suggested, and I think it is a very reasonable proposal.

8556. How do you think these currency troubles are going to end? What is to be done? Can you see any way out of the difficulty?—I do not know that it would be wise for me to speculate how things are going to end. The difficulty, I think, is how things are to end if you make silver legal tender here.

8557. We have got before us this difficult question, and merely to raise objections, which may be very good objections, to the course by which it is proposed to remedy the present state of affairs, does not help us towards a good solution though it may prevent us from adopting a bad one?—Looking at things from our own point of view, so far as England is concerned, I do not see what we have got to grumble at. If you could show me that England was being grossly injured by the present state of the law, I should desire to change the law, but I cannot see it.

8558. I will give you one instance in which England is likely to be injured by the present state of affairs, perhaps it is not very important. It is this: if the difficulties of the Government of India continue with regard to this exchange, it is my opinion that that Government within the course of the next year or two will have to put a check on the construction of railways, and I think an opening for the investment of English capital will be lost, and the purchase of railway material from this country to the extent of 2,000,000*l.* or 3,000,000*l.* will be stopped; it may not be a very great matter, but it is an evil which will probably arise owing to the instability of gold and silver?—I never could understand why the Indian Government was so afraid of borrowing money here,

when they can borrow it so cheap, that if they were to put away the difference between the cost of borrowing in silver and the cost of borrowing in gold, the difference with compound interest would pay off the whole of the loan in 60 years.

8559. Of course you do not see why they should be afraid of borrowing, and it is conceivable that they ought not to be afraid of borrowing; I can only tell you as matter of fact that in the present unsettled state of relations between gold and silver they are very much afraid?—I am quite aware, but I think they are over frightened. I was on a committee for five months on this subject. If I recollect rightly Indian sterling three-and-a-halves are now about 102, which shows that her credit is excellent.

8560. I think you said if we had bimetallism we might drop into silver monometallism, and gold would disappear?—I did say that, and I think it is very possible we might.

8561. (*Mr. Chaplin.*) It is one of the dangers you apprehend?—I really do think it a serious danger.

8562. (*Mr. Barbour.*) There is no doubt John Locke was a silver monometallist?—Certainly, and so should I have been if I had been living then.

8563. Supposing that in some extraordinary way all the gold in the world could be suddenly changed into silver, substituting 21 lbs. of silver for 1 lb. of gold, do you think any very serious evils would follow?—I do not know that there would. We would have paper; we must have paper.

8564. There would be no great evil?—I daresay there would not.

8565. And we would get rid of this exchange question altogether?—We would.

8566. And France and Germany, and the other Continental nations, would not hoard one portion of their currency more than the other?—Of course they would not, because they would have only one currency.

8567. And with no gold in the world, nothing but silver, England would maintain her financial supremacy?—It is conceivable.

8568. There would be nothing to injure it?—No, because everybody would know what a pound was, much as they do now.

8569. And we would not be troubled with discussing the standard, and trying to find out whether one standard was depreciating or the other appreciating?—You are making an assumption which gets rid of all those questions.

8570. Now suppose we could restore the fixed ratio between gold and silver, and give the world as much confidence in its permanence as they had before 1873, when Jevons and Cairnes thought gold and silver would never change; would not that secure for us a great many of those advantages to which I have just referred?—You might get some of those advantages; but you might get great difficulties, which I have endeavoured to indicate, as well.

8571. But on the assumption that we successfully establish and maintain the fixed ratio, and gave people confidence in it, we would get a great many of the advantages to which I have referred?—You would get a good many of the advantages, certainly.

The witness withdrew.

Adjourned till Friday.

THIRTY-EIGHTH DAY.

Friday, 25th November 1887.

PRESENT :

THE RIGHT HON. LORD HERSCHELL, the CHAIRMAN, presiding.

MR. D. M. BARBOUR, C.S.I.
MR. HENRY CHAPLIN, M.P.
SIR T. H. FARRER, Bart.
MR. C. W. FREMANTLE, C.B.

SIR W. H. HOULDSWORTH, Bart., M.P.
SIR JOHN LUBBOCK, Bart., M.P.
MR. S. MONTAGU, M.P., and

MR. GEO. H. MURRAY, *Secretary.*

MR. HERMANN SCHMIDT called and examined.

8572. (*Chairman.*) You carry on business as a discount broker, I believe, in the City of London, and have given considerable attention to questions connected with the depreciation of silver?—Yes.

8573. Do you think that there has been an appreciation of gold of late years?—I believe the purchasing power of gold has increased owing to the fall in the value of silver.

8574. You distinguish that from the suggested appreciation, by reason of the diminished supply of gold, and consequent contraction of the currency?—I prefer to put it that way, because I believe that the fall of prices proceeds from the fall in silver rather than from the contracted use of gold in gold countries.

8575. Now, in your view does the appreciation of gold, which arises from its altered relation to silver, affect gold prices generally, or only some particular gold prices?—It will at first affect those gold prices which depend upon the export of articles from the East; it will then affect those gold prices which represent articles exported to the East. In this way it affects all the commerce carried on between the

East and the West, and gradually alters the value of the standard; and then extends towards other articles in the country.

8576. Let us take first the articles which are produced in silver-using countries. In what way does it affect the gold price of that produce?—Silver prices have remained more or less stationary. The value of the rupee, and the tael, and the dollar in the silver countries has not been affected. It is, therefore, possible to import those articles from the East at lower gold prices, and every article which is exported from the East to the West is capable of being sold in the Western countries at a lower gold price.

8577. That is to say, that the producer, in the East, will get the same number of rupees—which are the same value to him—at a lower gold price?—The producer will get the same number of rupees, but the purchaser in the gold countries will have to pay less gold.

8578. But supposing that the produce in the silver-using country is a produce of the same description as

Mr.
W. Fowler.
21 Nov. 1887.

Mr.
H. Schmidt.
25 Nov. 1887.

Mr.
H. Schmidt.
25 Nov. 1887.

is exported from other gold-using countries, would the whole of the prices necessarily come down in the proportion of the depreciated value of silver, without regard to the quantity which comes from the silver-using country, as distinguished from the quantity coming from the gold-using country?—In my opinion it would, because the cheapest supply will regulate the price in the market. If there is wheat offering at 30s. in England, everybody who has wheat to sell has to take that price.

8579. Without any regard to the quantity which it would pay to offer at 30s.?—If the quantity is of sufficient volume. Of course, if it was a very small quantity, then not; but if the quantity is of sufficient volume then the gold prices would have to come down to the level of those prices which are regulated and established by the silver countries.

8580. But surely if it were not remunerative to the other producing countries, who produce much the greatest quantity, to produce at that price, and they refused to sell at that price, if what came from the silver-using country was only a comparatively limited quantity, how could it permanently pull all the prices down?—In this way: The value of the gold standard being affected by the silver country, and by the depreciation of silver, the gold countries are enabled, through the general fall in prices, to sell also cheaper. For instance, America, by the fall in the purchasing power of gold, is enabled to produce wheat now cheaper than she used to do. Nobody thought, some years ago, of America being able to export wheat at the present prices.

8581. But, I do not think I quite understand why the general purchasing power of gold should have gone down in respect of articles not produced in the silver-using country?—Because there are so many produced, and the ramifications are so numerous that gradually the whole range of prices will be affected.

8582. Let me give an illustration of my meaning; take copper, for example; why should the gold price of copper be affected by the depreciation of the silver rupee?—Because copper is produced, and also to some extent consumed, in the East, and the value of labour having fallen, copper can be produced in all gold countries at a cheaper rate. As the price of wheat goes down, as the price of the necessities of life goes down, so also the value of labour has gone down in many instances, and copper can be produced at a cheaper rate. It would, perhaps, not affect copper at first.

8583. Well, take coffee for another illustration?—Well, you cannot take single articles. Of course single articles will rise and fall in value according to the supply and demand of those articles, but the whole range of prices is affected by general considerations.

8584. Whether that is so, is matter of evidence; or do you mean it is matter of abstract reasoning?—When silver began to fall, the articles which were first affected were those articles which were exported from the silver-using countries, wheat, cotton, indigo, tea, jute, and numerous other articles. The next range of articles that were affected were the articles which were consumed in the East. The purchasing power of the silver rupee not having changed, the people in the East did not pay a higher price for these articles, and, therefore, those articles which were produced in the gold-using countries for the use of silver using countries had to go down in price in gold-using countries.

8585. Those are two things; produced, as one sees naturally, according to a change in the relation of the silver to the gold. What I was rather alluding to, and what I do not quite see at present, is why a fall on other articles, which were not affected by those considerations, should have resulted?—They would result from the general alteration in the standard which is brought about in the gold-using countries by the fall of silver. So many articles are interchanged between East and West that they

eventually produce a change in the value of the standard in the West.

8586. I am not quite sure that I understand you. Do you say they produce no change in the value of the standard, except in relation to those articles which are either imported into or exported from the silver-using country?—Oh, these are most of the articles which exist. Very few articles are not either imported into or exported from the silver-using countries. A very large consumption of every article takes place in the silver-using countries; the greater portion of our export trade is with silver-using countries.

8587. Yes, but why should the gold value of exports to other countries, to gold countries, of articles which we also export to a silver-using country be affected, because the consumer in India will give less for the articles which he gets there?—Because in other gold-using countries the value of gold was affected at the same time as the value in England. As wheat went down in England so wheat went down in Australia and America, and, therefore, the purchasing power of gold in other gold countries was affected the same as the purchasing power of gold in England.

8588. Affected, that is to say, as regards the articles which were produced in the silver-using countries?—Yes, as regards these articles, and it generally extends to other articles; you cannot in any country, in my opinion, alter the value of the standard as to a great number of articles without after a time altering the standard with regard to other articles. Of course among themselves several articles may vary according to demand and supply. My theory is quite compatible with the rise in certain articles, because the contention would be that if the general cause had not happened the rise would have been proportionately higher in those articles. The general cause would not affect fluctuations in certain articles, nor would they affect speculation in a certain article.

8589. But your view is that, because the altered relation of silver to gold alters the gold price of articles produced in the silver-using country or exported to the silver-using country, that produces a change in the gold price of all articles?—Certainly, gradually; just as the issue in a paper country of a large number of inconvertible notes will gradually alter all the prices in that country having the inconvertible paper currency, as was evidenced by the United States during the time of the inflation.

8590. But do you put that as a parallel case? The effect which you suggest is produced by the altered relation of gold to silver between two countries and affecting the dealings between those two countries; do you suggest that is a similar case to a country with a paper currency?—Yes, I do, because the fall in prices will affect indirectly the quantity of money in those countries. Supposing a great number of articles in England fell in price directly owing to a monetary cause which also affects gold, certainly gold would be exported from this country, as has been the case, and then owing to the contraction which takes place in the gold indirectly the other articles will be pulled down. Along with that depreciation of silver there has been a considerable decrease in the gold in England, which I do not think is a cause, but is one of the results of the fall in silver. I mean the fall in prices brought about by the depreciation of silver has rendered a certain amount of gold in this country, for the moment, unemployed. Although that gold has left the country we have never had a scarcity of gold in this country, but we have had a continued export of gold from this country. If you take the import and the export of gold and the industrial consumption of gold, you will find that a considerable decrease in the amount of gold in this country has taken place since the year 1876, something like 20,000,000*l.* sterling, which has thus again reacted on the price. It is a double cause.

8591. Would you explain to me, in your view, how that acts upon the prices?—Because so much less gold being in the country, all prices are gradually affected.

8592. But do you mean that prices depend upon the amount of gold at any given time in the particular country?—No, prices are formed internationally in the commerce of the world; and the amount of currency in the world has decreased, because the value of silver has been reduced by about 30 per cent. Taking the whole currency of the world to-day, as expressed in gold, you will find that the half has been reduced by 30 per cent., and that has confirmed the fall in prices.

8593. Do you include in that the silver that is used in France, and in Germany, and the United States?—Not that silver; no, the silver which is used in the East. The silver used in France and the United States has not been directly affected, but indirectly in that way, that it is not as good a bank reserve as gold would be, and therefore the national banks both of France and Germany and the treasury of the United States have been obliged to keep a larger gold reserve than otherwise they would have held, owing to the fact that gold had, so to speak, to stand sentry over silver.

8594. But when you are speaking about the fact of prices being reduced by the diminished value of the currency, you are speaking only of the silver in the silver-using countries, and not that silver which is used as part of the currency in gold-using countries?—No, not of that silver.

8595. So that comes really again very much to the same point that you were first putting before the Commission?—Yes, I only wanted to point out that the first cause should not, in my opinion, be looked for in the scarcity of gold; the first cause, the impetus which has brought about the fall in prices, is the fall in the value of silver in gold, whilst in the silver-using countries silver retained the same purchasing power.

8596. (*Sir T. Farrer.*) How do you think that silver began to lose its purchasing power in the gold-using countries? What was the original cause?—The original cause was, that in Europe, where silver was kept at a certain price in relation to gold, that relation was broken, owing to the governments, which used to coin silver at the certain price, no longer coining the silver.

8597. Then the fall in value was in Europe to begin with, and not in the East?—The fall was in Europe entirely. In the East silver has not fallen at all.

8598. (*Chairman.*) In speaking of prices hitherto, you have been speaking of wholesale prices; but of course the retail prices more or less follow the wholesale prices?—More or less.

8599. With reference to the suggestion that the rise in the purchasing power of gold really represents only a generally cheaper production of commodities owing to better machinery, lower charge of transport, and so on, what have you to say?—I would say that if the rise in the value of gold represents merely the progress of society, so to speak, we should look for the evidence of progress in some tangible form in society, and I fail to see this. If the producing power of man had increased, his well-being in a certain way ought to be furthered and not impeded by that course. I say improvement ought to show itself either in rent or in profit, or in wages in some form or other; the social condition of mankind ought to be improved by that improved method. I look to rent, and I fail to see any evidence that rent has been improved and bettered by the condition of things which has taken place during the last ten years. I look to profits, and I fail to see that profits have been improved by the greater improvement which has taken place in machinery, and one of the effects of it, in my opinion, ought to be an improvement in profits.

8600. And why should that necessarily result in improvement in profits? Supposing there is an im-

provement in machinery, by which you can suddenly very largely increase the amount of your production; does it follow that you will at once find a demand equal to your vastly increased production?—It seems to me that it follows that somewhere the evidence of an improvement of production should show itself, either in rent, or in profit, or in wages.

8601. But why in rent, or profit, or wages? Supposing that you can produce with a smaller number of labourers and more cheaply, a larger amount of cotton yarn, we will say, why should you expect that there should be more profits made?—I say that improved method of production should in some way show improved results; the world ought to be better off; mankind or individuals ought to be better off for the improvement in production.

8602. But it may be that the community would be better off if a larger number of people were making very small profits than if a comparatively limited number were making large profits, yet profits might have gone down instead of risen?—Yes, but the rate of profits would have risen, would it not?

8603. Not necessarily. Surely the community might be better off with a very large number of people making a very small profit than with a very limited number of people making a very large profit?—I should think that if the improved machinery comes in, the rate of profit on capital ought to rise.

8604. May not your improvements be such that you may turn out such a vastly increased amount of the commodity that you may be obliged—for a time, at all events—to take a small price for it, and so your profits would not be greater, in spite of diminished cost of production?—Yes, then it ought to show itself in the better position of the working classes, of the consumer, say, in general. Somewhere the improved method of production ought to show itself in the community.

8605. No doubt if you could improve the production of everything, perhaps that might be so; but I am talking now of a particular commodity; may you not diminish the cost of production, increase the amount that may be produced by a change in your machinery, and, by doing so, diminish the price, although you would produce much more of the commodity?—In former years machinery was constantly improved, and still prices were not diminished, because the improved machinery went towards the social improvement of the whole position of the community. Since this monetary disturbance took place, the social position has not, according to numerous witnesses, been improved, but the result has simply been a result acting on prices.

8606. Yes, but what has been suggested by some is this: that an era of small profits, when the margin is very small, is generally an era of great inventive activity, because people strive to find some means of lessening the cost of production. The very fact that profits are small stimulates improvements in machinery to an extent unknown when business is good, and people are satisfied with the profits they are making; and therefore a very low price tends to keep down prices, if not to further put them down by reason of an increased production?—But I do not find that the production of many articles increases. I find, on the contrary, that, for instance, taking the large field of agriculture, that the production in this country has certainly been curtailed. That has been the result of the low prices. And it is the largest industry even now in England, and in other countries still larger, proportionately.

8607. That is quite true. But taking the chief export to India, which is cotton goods, the production there has very largely increased, has it not?—Not at the same ratio as in former years. I believe the ratio of production has not been accelerated since 1875; the increased ratio of production has only been kept up.

8608. (*Sir W. H. Houldsworth.*) Is not the first result of improved machinery which reduces cost,

Mr.
H. Schmidt.
25 Nov. 1887.

Mr.
H. Schmidt.
25 Nov. 1887.

to increase the consumption of the article?—Yes, usually.

8609. And is not the first effect always of a reduction of cost to increase the consumption, and so rather to increase the profit than to diminish it, in the first instance?—That was the view which I intended to convey. Formerly increased production has tended towards improving the position of the community at large. The consuming power of the people became larger, and they absorbed the increased production. At present that phenomenon has not happened; the consuming power of the people has not increased, on the contrary, we complain of over-production. To mean that we restrict the production. In that way we decrease again the labourers who are employed; that is, we decrease still more the consuming powers of the masses. We are moving in a vicious circle; we can go back as much as we like, but we never come to the point, where, under the present circumstances, production is not overtaking consumption.

8610. (*Chairman.*) But take the case of coal, for example; there was a vastly increased production in 1873, 1874, and 1875, which diminished the price very much; but it did not, so far as I know, increase profits. It brought the price still lower and lower, very much to the complaints both of those who were getting the coal and those who were selling it?—Because since 1873 the evidence of increased prosperity, which formerly used to overtake the larger production, has been failing. That is just my contention. If it had been under ordinary circumstances, consumption would have increased, and the larger production would have been absorbed.

8611. But do you really mean, apart from any monetary question, as a universal proposition, that to whatever extent by increased invention you increase the production of any article that that must result in increased profits and not in diminution in prices, because everybody is ready to give the price in spite of the increased production; that increased supply always meets an equivalent increased demand which will keep up the prices to the old level?—I do not say that of any single article; but it is perfectly true if you take a series of articles that an increase of cheaper production will increase and stimulate the demand if it is an article that is at all of large demand; that new users will be found, and that gradually the old relation between demand and supply will be re-established.

8612. That is to say, that prices do not depend upon the relation of supply to demand, that if you increase the supply, the demand will automatically adjust itself?—Gradually.

8613. And so that prices will remain the same?—To some extent.

8614. (*Sir W. H. Houldsworth.*) Is it a fact that reduction of cost increases production?—I did not mean it to apply to any single article. It is like this, that if you take a single article that may fall; but if you take the diminished cost of production for all articles they cannot all fall together.

8615. Why not?—Where will be the diminished cost of the supply of the precious metals, and where will be the increase in the banking facilities which always, so far, has gone along with inventive genius? Why do you not apply the increase in banking facilities in the same way towards them? Along with the increase in invention, we had an increase in the banking facilities.

8616. No doubt, and that is suggested by many as an equivalent for the diminished production of gold?—To a certain extent that is perfectly true.

8617. (*Mr. Montagu.*) Is it not a fact that increased production always lowers the prices first?—In any single article at first it will certainly lower the prices.

8618. What is true of one single article must be true of several single articles?—Well, you may have over-production in a single article, and yet political economy teaches you that there can be no general over-production.

8619. (*Chairman.*) Yes, but the distinction is not between a single article and universal over-production; what is true of one article may, at all events, be true of a great many, without applying to all, may it not?—Oh, that might be.

8620. Now, you say, that if silver undergoes a sudden considerable rise or fall, the same movement will at once communicate itself to a number of other articles. Those are the articles of the description you have alluded to—those exported to us, imported from silver-using countries?—Yes, and you can see the evidence of that every day. If there is an important alteration in silver in the City, you find at once that a considerable number of articles take the same turn.

8621. You have given wheat as the example. Supposing that there had been no change in the value of the rupee within the last 30 years, do you think that wheat would have remained at the same price, notwithstanding the very largely increased production in India and the United States and Canada?—There has been increased consumption also; there is no more wheat produced at the present time in proportion to the consumption than there used to be; but of course seasons vary, and in one year you may have an increased production, but on the whole there is no surplus wheat produced at the present time. It is impossible to answer your question, because it involves so many hypotheses; but, on the broad principle that there is no surplus wheat production, I should say, unless there had been an alteration in the standard, there would have been no fall, except that produced by cheaper transport.

8622. Surely you may have no surplus, that is to say, that people will buy it, because it is cheaper; and so with the cheaper price you may have no surplus left with a very largely increased amount of production; is not that so?—I question the fact whether America would have been able to produce at the present prices, if the value of the gold standard had not been affected.

8623. I did not say at the present price at all. I was wanting to ascertain whether you considered that the entire fall in the price of wheat was due to the alteration in the standard, or whether that merely increased or exaggerated it?—Well, of course, there have been causes, as I say, which would put down prices. There is the question of transport. There has been a real cheapening of transport, which is not, of course, due to the currency question, but as much as is due to the fall in silver, that is to say, the difference between the rupee as it stands now, and as it did stand, that much of the fall in wheat I should attribute to the appreciation of gold.

8624. The fall in the price of wheat has not coincided entirely with the fall in the price of silver. Has there not been, to begin with, a much greater fall in wheat than in silver, and has there not been a considerable fall of wheat in the last two years, when there has been comparatively little fall of silver?—Because every single article independent of the standard is also affected by the supply and demand.

8625. You say, in your memorandum, that in former times the tendency towards lower prices has been counterbalanced more or less by increased currency, and improved methods of credit. What are you referring to there?—Banking facilities. Although the transactions have increased, although the number of commodities have increased, with the same amount of gold, or with a small increase in the amount of gold, every country was able to keep up about the level of prices. There was no alteration in prices originating in the standard; that alteration has only happened since the par between silver and gold has become dislocated.

8626. And that has led to a difficulty in commerce between the gold-using and silver-using countries?—Certainly.

8627. The necessity for insuring against the fluctuation, or of taking the risk of it?—Taking the risk

of it, yes; also that of the insurance, which is really an additional cost of production because it adds to the real cost.

8628. And to the same cause you attribute the absence of a flow of gold capital to the silver-using countries which would otherwise take place?—Yes.

8629. Now, so far as some of these results of the alteration in the par between silver and gold are concerned, you would regard them, as I understand, as temporary?—Some of the results are temporary, but temporary in a very wide sense. It may take a generation to adjust the matter.

8630. You mean, as I understand, that ultimately, when all prices have adjusted themselves to the altered relation, you are just in the same position as you were before?—Ultimately you will be just in the same position as far as commerce goes. But of the liabilities which extend over a number of years, very few will be adjusted, and there is this to be said, that until you have a fixity of silver there can never be a permanent adjustment. Supposing that by some accident, by some revolution, you would adjust all relations of life to the present price of silver, there is no telling that silver may not go down another 5*d.*, and you will have to readjust them again; and supposing you have readjusted them again on the new price, there may be, although there are not likely to be, circumstances that may increase the value of silver. Silver may go up again by some outside events, and then you want another readjustment, and, therefore, although the adjustment will take place ultimately, however long that time may be, it can never be a permanent adjustment until some way or other has been found to fix the value of silver.

8631. Should you have considered the evil the same since 1873 if, owing, suppose, to a diminished production, the price of silver had gone up instead of down?—The theoretical evil would have been the same. In practice, I believe, a fall in purchasing power is not so detrimental to a country as a rise is because the former decreases the burden of debt, whilst the latter increases the burden of debt.

8632. That only affects the people on whom it falls, does it not; it affects one side rather than the other?—Well, that is true enough, but still it is always easier for the creditor to bear a loss than the debtor. That is what I mean. In theory the two evils are exactly alike, but in practice, I believe, it is that the debtor is much less likely to bear an additional burden than the creditor.

8633. What would you regard as the permanent evils arising from the dislocation of the par of exchange?—I think the value of gold is dependent, to a very large extent, on the value of silver. I say the permanent evils consist in the alteration that takes place in the value of the gold standard, and in the value of all contracts which are based upon gold, and the higher the organisation of society the greater the effect, because the more contracts will be outstanding, having a long currency, and that I look upon as a permanent evil.

8634. Of course to some extent that evil is produced by a change of prices however it is caused; only your point is that here it is aggravated by a cause connected with the relation of the standard to some other standard?—That is it.

8635. As regards the silver-using country, supposing it owes a debt payable in gold, this burden is increased by the alteration?—Very much; but practically no more than other gold debts. I think that all gold debts are increased alike, although in the debt of India you see it at once. It has quite as much increased the gold debt of Australia. The real burden of the gold debt of Australia to-day is increased as much as the real burden of the gold debt of India, or almost as much, only in one case the burden is disguised, and in the other case it is evident.

8636. You mean because prices or values generally are reduced?—Prices have fallen. Australia does not, except for a very small portion of the interest

of her debt, export anything but commodities, and as these commodities have fallen in price, she really has to export so many more commodities, and therefore the burden of the debt of the gold country, Australia, has increased as much as has the burden of the gold debt of India.

8637. Well, but would it be so necessarily?—It is so.

8638. Yes, but it would not be so as regards commodities, the cost of production of which has been lessened, would it, because they are so much the cheaper? It is true the country has to export a greater quantity of them, but then they are produced at a lessened cost, which compensates for that?—That is the question; I doubt that. I deny that lower prices are an evidence of cheaper production; they are evidence of appreciation of gold.

8639. But I mean as regards goods, the cost of the production of which has been diminished. The country that has to export more commodities for its debt would not be in any way affected?—Yes, it would all the same, because even supposing the cost of the production of wheat has decreased, still they must export so much more wheat; they must raise so much more wheat. They did not incur the liabilities on the basis of the present cost of production; they incurred the liability on the old cost of production. And therefore if they have to pay the interest at the present rate they lose the difference.

8640. Yes, but supposing the price has fallen because of diminished cost of production, the person who has to give me so much value of a certain article is in precisely the same position as he was before, is he not?—I think not.

8641. He has to give me one hundred pounds worth of goods, and the hundred pounds worth of goods, we will suppose, costs him 100*l.* to produce, and now he can produce twice the quantity for the 100*l.*; he can produce the old quantity for 50*l.*, but he still gives me a hundred pounds worth of goods; how is he any worse off?—Take the case of an Australian colony making a loan here in order to build a harbour. They build that harbour, and the value of gold increases. The harbour is there, the work is done, and still the interest on that loan increases, while the dues on the harbour have been altered. All their money which has been borrowed has been borrowed nominally either to build railways or harbours or some improvement of a permanent character. It is not liquid money out there; it is all put into some permanent thing, and, therefore, as a matter of fact and as a matter of statistics I think you will find that the burden of the gold debt of all countries has increased. This is so where the money was employed productively. Where the money was spent unproductively, things are still worse.

8642. But if they get the same dues, and those dues produce enough to pay the interest with a certain surplus, they will still produce enough to pay the interest with the same surplus, will they not?—The contention is, that they do not get the same dues because the value of everything falls, you see.

8643. You are supposing that because the value of everything has fallen they have to reduce their dues?—Certainly. Take the case of America, there you can see it better. Supposing they had built a railway and borrowed the money here, have not the charges for freight on the railways gone down tremendously in America?

8644. That may be, and yet although the charges have gone down, if there has been a great increase of production of everything, their total receipts may be greater than they were before.

8645. (*Mr. Montagu.*) Is it not also the fact in the illustration you give of Australia that by borrowing at a reduced rate of interest they are more than compensated for any appreciation of gold, and that is the case with most international loans?—Well, of course, where the rate of interest has been reduced, that is another point; but where they have contracted long dated loans then the rate of old contract con-

*Mr.
H. Schmidt*
25 Nov. 1887.

Mr.
H. Schmidt.
25 Nov. 1887.

tinues; there the difficulty has arisen. Where the old contract has run out and a new contract has been entered into on a different basis, the difficulty does not exist. That I quite admit.

8646. (*Sir T. Farrer.*) Supposing that Australia contracts a debt for 10,000*l.*, and supposing at that time by the expenditure of 10,000*l.* she can produce a certain amount of commodities, and supposing in the course of time, gold remaining the same, by the expenditure of that sum of 10,000*l.*, she can produce twice the quantity of commodities; then by paying twice the quantity of commodities as interest on the debt she is no loser, is she?—She is the loser in this way, that she loses the profit which the transaction involves. It would have been her gain, instead of becoming, as it does now, the gain of the creditor. That is my argument. You may not be an absolute loser, but you are the loser of the profits of the investment which are transferred to another party.

8647. If you pay the creditors the same quantity of gold, and that same quantity of gold will buy the same quantity of commodities, but that same quantity of commodities is not worth as much in the market as it was before, the creditor is the loser, is he not?—If the same quantity of gold buys the same quantity of commodities, I should say the same quantity of commodities was worth the same amount of gold.

8648. The contract being either for a certain quantity of gold or a certain quantity of commodities?—It was for a certain quantity of gold; but my argument is, that if something happened to the standard, the man who contracts for the gold, as most men do, is prejudiced by an appreciation of gold.

8649. (*Mr. Barbour.*) Supposing A and B take loans from somebody, intending to pay the interest and repay the loan by the production of wheat, and supposing, owing to cheaper production of wheat by A, the price of wheat falls to half what it was, he is no worse off than he was before, because he produces double. Is not B much worse off?—Worse off, undoubtedly.

8650. Is it not generally the case as regards production that all articles are not cheapened in production simultaneously to the same extent in all countries, and for every person?—Undoubtedly, and therefore I say that Australia which has not the advantage of the cheapened production which, in a certain sense, India enjoyed is as much prejudiced as India is in that portion of her debt which is a gold debt.

8651. (*Chairman.*) Well, then if you set up prices in the other way you throw the burden on another class of people?—I throw no burden; I take away a burden. The burden is now thrown on the debtor class, and the creditor enjoys an advantage which it was never intended he should enjoy, nor should be given to him.

8652. And which you could only put right now by putting up the prices to some level which you consider the normal level, and which you are to keep in perpetuity or as long as any contract is running; otherwise unless you keep it at that level as long as the contract is running, one party or the other suffers this loss?—Undoubtedly, but I say if exceptional circumstances arise by which the standard is exceptionally altered then in exceptional circumstances I think it is the duty of the Governments to interfere. In the ordinary case Government interference has never been asked for, because everybody felt and saw that the change was owing to ordinary circumstances, and such risk is taken by everybody. But where extraordinary circumstances directly affecting the value of the standard have come into play, there the demand is made.

8653. Of course, your observation would only apply to contracts made prior to 1873?—Not exactly, because the fall in silver had not taken place in 1873 to the level of 1887.

8654. But that which caused it to take place had occurred, and therefore everybody who made their contracts after 1873 made them in the view of the then existing state of things?—Yes, but they never made them in the view of the now existing state of things.

8655. Yes, if they had known what they were about. They did not, because they did not contemplate it; but they knew of the cause which has produced that result; there has been no act done by anybody since the demonetisation of silver in 1873-74?—There has been no Act, but silver has fallen more. Supposing a man made a contract in 1878; he has there made it on a certain purchasing power of gold. That purchasing power has been altered between 1878 and now owing to further fall in silver, and if a man makes a contract to-day, and to-morrow silver goes down 5*d.*, his contract is vitiated the same as were the contracts of 1878 or 1873.

8656. But what right have you to say that the man who entered into a contract in 1878 did not contract on the basis that silver was not going down any lower when all the experience of the past told him it very likely would; why did not he take his chance of going lower or higher?—Because most people told him silver had nothing to do with it, and that is the contention of many people even now. If you had published to the world, "Now be careful, the value of gold depends on the value of silver; every contract you enter into you must take into view, not only the possibility of a rise, but also of a fall in silver," then everybody would have known it; but even to-day they deny there is any connexion.

8657. (*Mr. Barbour.*) Is it not the case that proposals were made for a fixity of value in silver and gold at the ratio of 1 to 15½ before 1878?—They were made in 1878 officially, but before 1878 by certain private writers.

8658. But since 1878 they were made officially, and different strong governments supported these proposals?—Yes, France and America.

8659. And consequently any person who lent gold in 1878 must have known, like the person who borrowed it, that there was a possibility that the Governments might establish this ratio, 1 to 15½. Everybody who enters into contracts now, long contracts in silver and gold, must take into consideration the possibility not only of a fall but of a rise; not a fall or rise brought about by ordinary circumstances, but by Government action?—We are standing now in America before the question which will in a few years at the latest become a burning one, whether the Bland Bill is to be repealed or free coinage of silver to be granted. It will come to one or the other either by ordinary circumstances or Government action. Every contract you enter into now is made on the chance that one or other is to happen. Which value are you to take? Are you to take 1 to 16, which would be the ratio if free coinage of silver were granted, or 1 to 30, which very likely would be the proportion if the Bland Bill were to be suspended. How are you to do it?

8660. I suppose at any rate you would say that either America must go to a silver standard practically or drop the Bland Bill?—I think this will be arrived at either by the action of the law or by the action of the Gresham law.

8661. It is impossible, I suppose, that they could go on coining, say, five million pounds worth of over-valued silver every year?—They issue this year much more. They issue 50,000,000 dollars. They will coin about 32,000,000 of dollars under the Bland Bill, and they have passed a law in the Spring calling in the trade dollars, and recoinage them into subsidiary dollars, which would make probably another 18,000,000 dollars. They actually may put 10,000,000*l.* sterling silver into circulation this year. How long can that go on; there must be some issue one way or the other.

8662. (*Chairman.*) Then I gather, in your view, the only remedy for the evils to which you have

directed attention is the creation of a fixed relation between gold and silver?—Yes, my Lord.

8663. Do you think it practicable?—Undoubtedly.

8664. What ratio do you think it would be practicable at?—Do you mean theoretically practical? You can fix any ratio you like.

8665. Yes, but should you think that it was proper in view of the rights of the different parties to which you have called attention to fix any ratio you please?—Well, the choice would be between the ratio of 1 to 15½ and the present ratio; any ratio which lies between these two extremes would certainly answer the purpose. It remains then for statesmen and legislators to decide which will be the ratio which would suit best all the interests concerned in these transactions.

8666. Do you think that the fixing it at the existing ratio would be as effectual as fixing it at 1 to 15½?—Fixing it at the existing ratio would leave matters about where they are now; it would stereotype the present condition of things which has been brought about by the fall in silver. It would not improve matters; it would not put prices up to any higher level except by the action of credit. For instance, the silver you speak of in Germany and France would become more effective; not so much gold would, therefore, be necessary to keep sentry over the silver, so to speak, and through the action of credit a certain rise of prices would take place, such as can always occur, independent of the precious metals; but the broad level of prices would be undisturbed if you fixed the present ratio.

8667. (*Mr. Barbour.*) There has been a great fall in prices and an alteration in the relative value of gold and silver. Do you think that all gold values or prices and all silver values or prices have adjusted themselves completely to that alteration, or is the adjustment going on? Does it take time for the adjustment to be effected?—The adjustment is going on.

8668. So that if you stereotype the present ratio between gold and silver there would still remain some adjustments to be effected?—There would still remain some adjustments to be effected, such as would otherwise effect themselves in course of time.

8669. But, possibly, if you went back to a slightly higher ratio than the present one, you might prevent those adjustments?—Certainly; and there is another point to which I may draw attention. Supposing you stereotype the present ratio, and there is an extra demand for silver for the East, which possibly may happen either for India or for China—China, of course, is an uncontrollable factor—there would be no large stock of silver to fall back upon unless silver rises to the old ratio of 1 to 15½. There is no available stock of silver at any time in the world to any extent; and if a special demand were to arise, silver, in spite of being fixed at 1 to 18 or 20, would be able to rise to 1 to 15½.

8670. (*Mr. Montagu.*) Would that be the case if America issued its silver under the Bland Bill, and Germany its bar silver both at 20 to 1?—No, not if it happens after these States do that. I only speak of present circumstances. If these States enter into convention, and coin at the new ratio a large number of pieces, of course, there would be the available supply. Under the present circumstances there would be no available supply, and with a ratio of 20 to 1 you would protect yourself against the fall without protecting yourself against the rise of silver.

8671. (*Mr. Barbour.*) I think you said that the gold price of indigo had fallen?—It would be affected by the price of silver.

8672. Have you any knowledge of the indigo trade?—No, no special knowledge.

8673. You said that the fall in gold is due, not so much to the scarcity of gold as to dislocation of the par of exchange between gold and silver?—The first fall in prices would be brought about by the fall in silver and the fall of the commodities in the gold

countries which are imported from the silver countries.

8674. Do you consider that the fact that the silver money on the Continent is not now available for international purposes, and that there are difficulties in the way of getting gold on the Continent, may have had any influence in lowering prices, or keeping down prices?—Only so far as they have to keep a larger amount of gold to watch the silver. If the silver were perfectly available, the superstructure of credit which they could raise on their present bank reserve would be larger.

8675. Do you think it has had an influence?—It has had an influence by not allowing these countries to build such a superstructure of credit on their combined mass of gold and silver as they would under other circumstances be able to do.

8676. In other words, silver and gold have not been so effective as money as they would be if there had been a fixed ratio between gold and silver?—Quite right.

8677. And I suppose the same thing would be the case to a certain extent in America. There is a certain amount of silver there which is practically non-effective as money?—Well, that amount is decreasing. They have been able last year to use that silver owing to the printing of one and two and five dollar silver certificates.

8678. But it has been practically forced into circulation to take the place of the paper, has it not?—I mean in America at present that cause does not act quite so much as it did a year ago, but it may act any day again.

8679. It is not available for international currency?—For international currency you are quite right; I supposed you meant as regards prices.

8680. If it is not available for international purposes, is not its effectiveness to a certain extent impaired?—No, I think not, because you could get as much gold for international purposes as you wanted. There never has been any difficulty in getting gold from America.

8681. Well, there may never have been any actual difficulty, but has there not been the feeling that in case of necessity you could only get a certain amount from America?—Not from America.

8682. But from France?—France has always given the gold at the premium.

8683. And Germany?—Germany is now not quite ready to give gold, but, whenever a great emergency came, they would give gold. When Italy established the gold standard, Germany gave a lot of gold to Italy. They were very eager to give the gold, because they actually placed it at the disposal of the parties who wanted it,—not at the central office at Berlin, but at the frontier, so that the carriage would be less.

8684. (*Mr. Montagu.*) Is that the case within the last few years?—In the last few years they have shown more reluctance to give gold.

8685. Is it not the fact that no banking house there would venture to export gold from Germany on account of pressure put upon them by the Bank?—I know a banking house that exported considerable amounts of gold from Germany within the last three months.

8686. (*Mr. Barbour.*) Did they get the gold from the Bank of Germany?—No, they did not.

8687. I understand you to admit that in some places there is over-valued silver which is not all available for international purposes, and there is some difficulty in getting gold in certain places?—Yes, that is at present the case.

8688. That would, so far as it has any effect upon prices, tend towards keeping them down?—Certainly.

8689. I suppose you are aware that all the silver that has gone to the East,—or a very large proportion,—has been and is being hoarded or made into ornaments?—Certainly.

8690. It is not used as money?—It is not used as money.

*Mr.
H. Schmidt.*
25 Nov. 1887.

Mr.
H. Schmidt.
25 Nov. 1887.

8691. And I suppose if silver is hoarded or made into ornaments, it has not the same influence on prices as if it were made into money?—As far as ornaments, I think, it has an opposite influence; converts money into commodities.

8692. Now do you think that the breaking of the par of exchange between gold and silver has led to a larger export of silver to the East in recent years than would otherwise have been the case?—That is very difficult to say, but I doubt it; because I believe that the export of silver to the East depends on other circumstances besides the actual production. There have been years in which India has not absorbed all the production, and there have been years in which India has absorbed all the production, as well as a certain amount taken from the circulation of Western Europe.

8693. If the par of exchange had been maintained, you think less silver would have gone to the East than has actually gone?—It is very difficult to say. I see no reason why it should not.

8694. You have seen some criticism on the system of index numbers, especially by Mr. Forssell. One of his arguments is the following. He divides the articles over which index numbers are given into groups, and he shows that for each group you get a separate curve, rising in recent years in the case of one curve and falling into the case of another. Have you any remarks to make on Mr. Forssell's argument?—That, I think, the facts will disprove.

8695. (*Chairman.*) Does he not say that there has not been a universal fall in prices?—No, he says, "That hypothesis, therefore, which attempts to attribute the present price fluctuations to a change in the proportion between the respective quantities of gold and commodities, is not only improvable, because it lacks the support of sufficient induction; it is also insufficient, because it cannot simultaneously explain both the falling and the rising prices of commodities; it is finally, also, superfluous, as there are other more complete and more conclusive explanations for a widespread fall in price. Thereby collapses the whole edifice of price-theories, which with so much trouble have been raised upon a frail foundation." He does not say that there has not been a fall in prices; he says it is not provable that it is due to a deficiency of currency. That is all he says. In the course of the book he says there has not been that fall in prices.

8696. I did not understand him to do so, because he accounts for the fall in prices, which he admits in the case of a variety of articles. What I understand him to say is, it has not been universal, and does not apply to all articles which it ought to have done, if there was a common cause applicable to all, namely, the appreciation of the gold, and as regards those articles which have fallen, he can show you or suggest a cause quite apart from the appreciation in gold. That, I understand, to be his argument, whether sound or not.

8697. (*Sir T. Farrer.*) And that it is not fair under those circumstances to draw a general average and say that it shows a general fall in prices.

8698. (*Mr. Barbour.*) The question I wish to ask is this, that Mr. Forssell divides up the articles included in those index numbers into different groups, and shows in the case of each group that you get a different curve as representing the movement in the prices, and I ask if you have any remarks to make with reference to that particular argument?—I should say that the fact that some articles have risen is no proof at all against the theory of the general appreciation of the standard, because in the ordinary course of things over a number of years it is natural that, owing to alterations in supply or demand, certain articles will rise in relation to other articles; therefore, it seems to me much fairer to take the curve given by all the articles rather than the curve given by some articles which have risen, and then compare it with the curve of some other articles which have fallen. I have here the latest number, an October number, of a

German review, which contains a paper on prices not all written with reference to bi-metallism. They have taken the average, the arithmetical mean, they call it, of all the 275 articles which are quoted in Hamburg from 1876 to 1886, taking the prices of 1871 to 1875 as mean or 100, and I see that the fall has been for the period of 1876–1880 to 93, and then it goes on in 1883 to 76, and in 1886 to 66; so, according to these Hamburg prices, taking the whole 275 articles quoted in Hamburg, the fall is even more considerable than that made out by the "Economist."

8699. (*Chairman.*) Yes, but what strikes me about that is, that your mean may be arrived at by taking some great fall in particular articles, while there has been no fall in a great many. Your mean might be produced, I do not say it is in this particular instance, by a great fall in half-a-dozen articles, though the other 260 had remained stationary. That would not be proof of a universal fall or even a general fall?—That is not the case here. If you go into the figures you will find that there are only three articles which have not fallen at all.

8700. What I am suggesting is, for the purpose for which those statistics are arrived at, can it be satisfactory to take the mean?—I think it can, if before taking the mean you find that there is a similar tendency in all the articles. Of course, if you find that the mean is brought about by the fall in one or two articles, and all the others have risen, then I quite admit the mean would not be right; but after looking over and taking a general review of the whole situation before going into the details, if you find the tendency is downward, and only a few articles have risen, then I think it is much more reasonable to say there were special causes to account for the erratic movements of these few articles, and the movement of all the other articles are the movements which indicate the course of prices.

8701. You are aware that there have been attempts, at all events, made to account for the fall in these articles which have fallen?—Yes.

8702. Well, have you seen any attempt made to account for the absence of the fall or rise of those articles which have either remained steady or risen?—The articles which have remained steady or risen; I can give you them all. First, ivory. The natural explanation would be that, owing to the falling off of the elephant supply, the ivory is getting scarce. Gum. I believe there has been a failure in South America of the crop; the trees have not given so much.

8703. During all this time you mean a continuous failure?—I mean during the last ten years. I mean those are all the articles; pepper, ivory, gum, and dried fish.

8704. Cotton; there has been no substantial fall in cotton, has there?—Oh, yes.

8705. Is not American cotton now pretty much at the same price as it was before the American Civil War?—Ah, but I speak for the last 15 years.

8706. Of course, if you begin at the 15 years at 1872, probably the production in America had not recovered altogether from the effects of the war; but why should cotton not have gone down as between now and the time before 1873, say, 1863? We were told by a witness that cotton had not gone down, that it was now much what it was before the American War, that is, before this monetary change. Why should cotton not have gone down?—From 1868 to 1872, cotton is put down at 113; and from 1881 to 1885 at 83.

8707. That includes Indian cotton, no doubt. Indian cotton would be, as you say, affected by this rupee question; therefore, for this purpose you ought to look at American cotton only?—Well, American cotton has gone down the same as Indian cotton.

8708. Well, has it; we were informed to the contrary?—There is always a difference in price between Indian, American, and Egyptian cotton, but they go up and down together in proportion. There is always a difference between the different qualities

of cotton, but they all go together just like wheat. Californian wheat is higher than Indian wheat, but if Indian wheat goes down, then Californian wheat goes down, except if there is a corner in the article which must break down in time, and then the old state of things would be re-established.

8709. (*Mr. Chaplin.*) Then, in the list of 275 articles you have given us, I understand you to say, that the fall has not been brought about by a fall in a few articles, but that practically it is a fair representation of the whole?—That is the result arrived at in this recent review, a study of prices, and written rather against bimetallism; I mean the writer is not in favour of silver remonetisation.

8710. I understand you to say that the appreciation of gold affects the prices, in the first place, of articles that are exported from the East to the West?—Yes.

8711. And then it affects, in the second place, the articles which are exported from the West to the East?—Quite so.

8712. The category of these articles includes, I think you said, the larger number of all the articles that are in existence?—The commerce of the world consists in the interchange of commodities between the East and the West, and there are very few articles which do not enter into that commerce.

8713. And in this way, then, all commerce is deranged, and ultimately, you say, the price of all articles is affected?—Commerce is deranged temporarily. Commerce, of course, always adjusts itself to any basis of prices. Commerce will adjust itself to a paper currency. Commerce will adjust itself very quickly, but the stability of the gold standard is disturbed, the purchasing power of the gold standard is permanently altered.

8714. Some witnesses have suggested to us that the fact of this country having made large foreign investments in gold is a reason why we should not adopt bimetallism, and if we did it would inflict heavy loss on this country; is that your opinion?—Well, there is some reason for that remark, but it is a one-sided remark. The capital of this country is partly employed in silver-using countries, and partly employed in gold-using countries. That portion which is employed in gold-using countries, certainly has enjoyed advantages, which must be termed exceptional, though they have been legal; but that portion which has been employed in silver-using countries has had exceptional disadvantages; and, therefore, although the creditors who own gold obligations would, with bimetallism, forego an advantage which recently they have had, I think the creditors of the whole country will not suffer, the more so as by the very action of the appreciation of gold some of the debtors have become less solvent; some of them had to reduce the rate of interest; others have not done so yet, but owing to the difficulties in which they are placed, they may have to do so one day. Even the gold debt of India is less secure now than it was when the rupee stood higher.

8715. I think you said that the tendency of adopting bimetallism at the ratio of $15\frac{1}{2}$ to 1 would be, undoubtedly, to raise the price of wheat, and the gold price of Indian wheat in this country?—Certainly.

8716. Are you aware that it has been suggested that the only effect of that operation would be to transfer the wheat trade from India to Russia?—Of course, the Russian wheat export is affected by the low value of the rouble; but inasmuch as that rouble is already at the present time depreciated by 40 per cent. in proportion to its par value, whilst the silver is only depreciated, in proportion to gold, by about 24 per cent., Russia enjoys already under her paper currency an additional export bonus, so to speak, of the difference between 40 and 24, that is 16 per cent., and there is nothing at all preventing her to-day from increasing this difference, if she wants to export wheat cheaper. She has simply to lower the value of the rouble, which she could do to-morrow by further issues in order to increase her exports. But the export of wheat from Russia is only one element, and the fall of the value of the rouble has so many counter-

acting disadvantages, that it is generally admitted, that it is far better for a country having a paper currency, for that paper currency to go up than to go down. The same as India, on the whole, has not benefited by the fall of silver, but has rather been hurt.

8717. The depreciation of the rouble, I understand you to say, is greater than the depreciation of the rupee?—By 16 per cent. at present.

8718. The rupee in India retains its original purchasing power, whatever that may have been?—Oh, yes.

8719. But does the rouble do the same thing, and to the same extent?—Well, as long as the rouble depreciated, owing to a further printing of roubles, the rouble, I believe, lost in purchasing power, but lately the fall in the rouble has really been another aspect of the appreciation of gold. I believe, for instance, that if you were to adopt $15\frac{1}{2}$ to 1, and raise the price of wheat, the more logical result would be a rise in the rouble, and not an increase in the export of wheat from Russia. Of course it is impossible to foretell with certainty.

8720. (*Chairman.*) But why should India, when you have made this change to $15\frac{1}{2}$ to 1, continue to rule the market, and why should not Russia then rule the market; why, if the change comes about and Russia rules the market, should it put up the price of the rouble, and not put down the price of wheat?—I will tell you; because Russia will export a certain quantity of wheat, we will say, the same quantity, I will not even say more; for that quantity of wheat they will draw bills on London, and inasmuch as the amount for which these bills are drawn increases with the rise in wheat, there will be more bills on London offered in Russia, *i.e.*, the demand for roubles will increase, and the rouble will rise.

8721. But what I want to arrive at is this; I did not understand from you whether the rouble in Russia still retains its full purchasing power in the same way as the rupee in India?—Not in the same way.

8722. To that extent it would not act in the same way as a bounty to Russia?—To that extent it does not quite; the paper currency is not the same as the silver, because it is well-known that when the United States issued more paper, the consequence was a rise in prices within the States; but lately the lowering of the rouble has not been due to the issue of more roubles, but rather to the general fall in prices.

8723. Why on your view should not Chili regulate the price of wheat, because she has got depreciated silver and depreciated paper currency, and she is a wheat producing country, and does export wheat to England. And we are told that wages are paid without any addition to their amount in those paper dollars. Why should not Chili regulate the market, as you said the cheapest place always would?—Her export would have a certain influence on the price, but I suppose her exports were not sufficient. The export of Chilean wheat is very small.

8724. Must it not depend on the proportion which the production of this silver-using country bears to the general production? I understood you to say that it would always be the cheapest country that would regulate the price?—The price is not regulated by the proportion, it is regulated by the cheapest production, supposing that production is of a certain extent.

8725. (*Mr. Chaplin.*) Supposing the proportion is sufficient to rule the market?—Supposing the whole value is sufficient to rule the market.

8726. Well, the imports of wheat from India are quite sufficient to rule the market?—Undoubtedly; they are the largest next to America. Now they beat Russia.

8727. But the rouble, as I understand you, is depreciated partly from its being paper money, and partly from its being a silver rouble; is that so?—Well, you may put it that way; but they have really now the bi-metallic standard in Russia; that is to say, gold is theoretically a legal tender the

*Mr.
H. Schmidt.*
—
25 Nov. 1887.
—

Mr.
H. Schmidt.
25 Nov. 1887.]

same as silver, and therefore you might compare the paper also with gold. Of course it makes no difference which you compare it with. If you compare it with silver, it has gone down only to 16 per cent.; if you compare it with gold, it has gone down 40 per cent. It has gone down 16 per cent. to the silver, and an additional 24 per cent. to the gold.

8728. Well, up to the present time, at all events, although Russia enjoys an advantage in the rate of exchange of 40 per cent., whereas India has only, as I think you said, 24, the Russian imports have not exceeded the imports from India, and they are not growing in the same way that the Indian imports are of wheat?—No, they are not growing like that.

8729. And even supposing that the ratio of $15\frac{1}{2}$ to 1 were adopted, you do not agree in the opinion that one effect of that would be to transfer the wheat trade from India to Russia?—It is impossible to say for certain, Sir, but I think it is just as logical and just as correct to argue, that the alteration would be a rise in the rouble. There are people who say that India would lose her wheat trade. Mr. O'Connor argues that she would do nothing of the kind, and the alteration would be a rise in England of the price of wheat. I think Mr. O'Connor is right.

8730. That the same amount of wheat would come to England, but at rather a higher price?—The price would be raised by the rise in silver; that is Mr. O'Connor's argument.

8731. It has been submitted to us by one or two witnesses that the fall in prices can in almost all cases be explained without reference to money. You disagree with that altogether?—Yes.

8732–3. It has also been stated, that the full effect of the inventions of science, of new machinery and cheaper transport, and so forth, have only been felt since 1873. Do you agree with that opinion?—Well, I think that is a statement which has nothing at all to confirm it, because I should think the first effect of the introduction of telegraphy and railways was by far the greatest and the mere extension of the system has had considerably less effect. We have other causes which come into play in 1873. It is these causes, in my opinion, which have brought about the changes that have taken place.

8734. At all events, whether the effect of those inventions has been felt more or not since 1873, it has not been sufficient to account for the great difference in prices as between before 1873 and the present time?—Certainly not.

8735. Are you of opinion that this great fall in prices indicates the general progress of society?—I think not; because if it were progress of society, I should want to see the progress among the general population, and I fail to see it. The progress of society would mean better employment, higher wages, more contentment, and I fail to see that anywhere.

8736. We have had a great deal of evidence given before us to the effect that many classes of the country are suffering extremely at the present time, and among them, the working classes in the North of England in particular; do you believe that that effect is produced by the present state of things?—I should think the present state of things very likely would have that effect, because the present fall in prices does not really mean cheaper production, but it simply means appreciation of the standard. If it meant cheaper production, real cheapness of production, it would have increased the well-being of the different classes.

8737. Have you seen an interesting statement that is just published in the November number of the "Board of Trade Journal," with regard to the great fall in the wages of agricultural labourers in the South of England, in Essex, and Kent in particular, and the very great number of them that are now out of employment?—I have not seen that statement; but I have seen it generally stated in different documents, that the wages of agricultural labourers are being reduced, and that even the number of those that are employed is decreasing, and that seems to me a very

natural effect to follow from the present state of things.

8738. The very first place which I find in the return which heads it is Aylesford, in Kent; and the reduced rate of wages for piece-work is put at 30 to 40 per cent. I believe that is about the character of the return generally, although the reduction is not so great in many of the cases, or nearly so great. But would you be disposed to attribute this reduction in wages and the number of the unemployed to the same cause?—I attribute it to the retrogression of the agricultural industry in this country, which of course employs fewer labourers, and employs those labourers at a smaller wage.

8739. And what do you trace the agricultural depression to?—To the fall in prices, caused, as I believe, by the fall in silver.

8740. (*Chairman.*) Now take the case of cattle. I believe that though wheat has fallen largely, and has been falling since 1873, cattle have only fallen at all considerably quite recently?—Quite recently. Beef has not been affected at first.

8741. That, of course, is not affected directly by any relation between this country and silver-using countries?—No, that is only the after effect; therefore, the more remote the connexion of any article with the export or import from or to silver-using countries, the later the effect will be felt in the price of these articles.

8742. (*Sir T. Farrer.*) Do you not think that it is more likely to be attributable to the increased facilities of transport for cattle, which undoubtedly have taken place in later years, and which did not exist in the earlier years?—To some extent that would be the case, but not to the full extent.

8743. I do not quite understand your view of the origin of this disturbance and difficulty. You say that it was due to what is called, whether correctly or not, the demonetization of silver by the Latin Union and by Germany, that that made the value of silver lower?—The demonetization of silver caused one portion of the demand to be dried up, to be closed, and a demand which always existed at a certain ratio, and from that moment, of course, silver could fluctuate to anything.

8744. But it operated on silver by diminishing the demand?—By diminishing the demand; yes.

8745. And that was a cause which operated in Europe?—In Europe.

8746. Consequently, it made silver cheaper in Europe?—The price of silver in Europe fell.

8747. Then you say silver did not fall in the East as against commodities?—The purchasing power of silver in the East is, I believe, on the whole, stable.

8748. Then if silver has become cheaper than it was as against commodities in Europe, and remains of the same value as against commodities in Asia, why does it not go from Europe to Asia?—There is no silver in London. Where is the silver?

8749. You said that it is cheaper; surely if it is cheaper, it is to be got cheaper?—No, it is not, not the silver that exists as coin. You cannot get an ounce of French silver coin below $15\frac{1}{2}$ to 1; you may even have to pay a premium. I will give you an illustration. When Italy resumed specie payments, the Italian Government contracted with the bankers to supply them with a certain amount of gold for their specie resumption loan, and a certain amount of silver. The contractors of the Government were under the impression, which I believe, on the whole, was a correct one, that it was difficult to get the gold and that it would be exceedingly easy to get the silver, and therefore what did they do? They at first tried to get all the gold in order to complete that part of their contract, and succeeded in getting it. When they had the gold, they wanted the silver, and they found that the silver was not to be had except at a premium, and they also completed a portion of the other part in gold, because they found they could get the gold cheaper than the silver, for the Bank of France asked a premium on the silver.

8750. You say that if there was a demand for silver in India, that is to say, if silver would buy more in India than it would in Europe, silver would not go there. If so, how is it that the value of silver is not the same in India as it is in this country?—The value of silver is the same. In commodities silver does not buy any more in India than in Europe. Silver is cheaper only as regards gold. Gold is appreciated.

8751. Did not all economists prophesy, when silver first fell, that silver would go to India; is not that what Mr. Bagehot said?—Mr. Bagehot said silver would go in increased quantities to the East, and prices in the East would rise.

8752. Why has not that been so?—The railway communication in India opened up very large areas where silver was very little known in commerce, and it is now filtering in and being absorbed in commerce.

8753. That would create a greater demand still in India for silver, would it not?—It should create a greater demand, but what happens is not exactly this. The point that enters here is that India is under an obligation to discharge every year so much gold debt to England; this is an obligation which necessitates the offer of so many rupee drafts, which are equivalent to silver, and those Indian Government rupee bills and other interest notes go to India instead of silver to a large extent every year,—20,000,000*l.* sterling. If it were not for that, I think what Mr. Bagehot prophesied would have happened.

8754. You mean that the council bills have caused the value of silver to fall?—They necessitate an increase in the imports from India, and they check the flow of silver and other things in India. Of everything else as well as silver.

8755. But still that does not answer my question; why, if according to your hypothesis, silver will bring more in London than it will in India, it does not go to India?—It does go to India.

8756. But not to an extent, according to you, to equalise the value in Calcutta and London?—It goes to a large extent.

8757. I perfectly understand that, because a certain quantity of silver does go, and I suppose the silver that does go, goes because it is more valuable in India than in England, that is why the bullion merchant sends it there. Is it not?—I do not think so; I think it only goes because it is the only place where silver can be used. It cannot be used here, so it is sent to the country where it can be consumed.

8758. Why does it not go until its value in commodities is the same in India as in England?—Because it is not there; all the silver that is here goes to India.

8759. All the silver that is here goes to India?—Yes, every farthing of it.

8760. But surely if there were that demand for it in India, its value would be raised in Europe. Well, then, to turn from this point, I gather that you think that the effect of this change has been to transfer a great quantity of production from the west to the east, *e.g.*, the wheat industry, and cotton industry, and so on?—Yes, temporarily, that has been the effect.

8761. But you think, while it has done great harm to Europe and America, it has done no good to India?—No good to India.

8762. That these industries are no good to India?—I do not say that.

8763. That the ryot is no better off for cultivating his wheat?—I do not say that.

8764. And that the Bombay spinner is no better off for spinning his yarn?—The Bombay spinner is better off for spinning his yarn. The ryot is better off for cultivating his wheat, but the people of India are no better off, because *pari passu* with the increase of the cotton mills, and the increase of the agricultural industry, the gold liabilities of the country increased; therefore, the country is no better off as a country, although some individuals are better off as individuals.

8765. Turning from points of detail to the general question, you are aware, I think, that at many previous times in history, people have attributed to alterations in currency great misfortunes and great fluctuations in trade, which subsequent inquiries have shown to be due to quite other causes; and I would ask you, having that in view, whether you think that a mere alteration in the legal value of silver effected by France and Germany is sufficient to change the whole productive and exchanging powers of the world?—I do believe that. I believe it was a measure of such paramount importance which has altered so entirely the relative prices of gold and silver that everything else is a simple corollary to that fact.

8766. (*Sir W. Houldsworth.*) Would you anticipate, if the international arrangement was made, that gold would become less and less the currency, and silver would take its place?—That would depend upon the production of gold.

8767. Yes, but as far as you can judge of the present position of things, I suppose the final effect would be to stimulate production of silver?—I should think not, because the production of silver is not dependent upon its price. If I am right in contending that as the value of silver falls, the value of gold increases, the production of silver in gold countries will not depend upon the price it will fetch. You see silver is either produced in gold countries or in silver countries. You will admit that the production of silver in silver countries will be absolutely independent of the price it will fetch, you admit that proposition? The production of silver in gold countries will, in my opinion, be not immediately, but after some time, independent of its price for this reason; that as the price falls the currency becomes appreciated as a currency, and when it has become appreciated the price of everything falls in the country, and therefore the fall in silver will be compensated for by the increased purchasing power of gold; that, in my opinion, even on economic grounds, even supposing that the production of silver were subject to the same economic laws as the production of any other article, will be sufficient to account for the fact that the production of silver is independent, more or less, of the price it will fetch.

8768. Have you any anticipation that the cost of producing silver will diminish, and is diminishing; it is asserted that the cost of producing silver is decreasing?—I believe the actual cost of producing everything may be said to be decreased by better machinery. That may be the case.

8769. Then would you anticipate that the fall might be owing to gold being used for industrial purposes, or hoarding, or any other cause; would you anticipate that the effect might be that the currency might become silver and gold go?—Well, for the moment we have a very large amount of gold in circulation. It would take centuries to absorb that gold. There may theoretically be a possibility of such an event, owing to the cessation of the production of gold, but if that is the case what would be the position of the gold countries if the production of gold were to cease? Why, surely, we should then be far better off under the bimetallic standard than under the gold standard.

8770. I was only asking what your anticipation was?—Well, of course the production of gold and silver is dependent, more or less, on chance.

8771. Then you would not anticipate that gold would be driven out very quickly?—Where can it be driven to; on the contrary, I believe, to a certain extent hoarded, gold will come out in India. Gold has been hoarded there more for the very reason that the natives see that they hoard an article which possesses all the advantages of silver, and still increases in value. If it ceases to increase in value, the stimulus to hoarding will be taken away.

8772. Then you think the statement by Professor Marshall, that gold will disappear from circulation, is

Mr.
H. Schmidt.
25 Nov. 1887.

Mr.
H. Schmidt.

25 Nov. 1887.

not well founded?—I asked him where it would go to, and he said into pencil cases.

8773. (*Mr. Barbour.*) If it did disappear, and you had the single gold standard, that result would be unfortunate; but if you had the bimetallic standard you would have the silver to take the place of gold?—Yes.

8774. (*Mr. Fremantle.*) Do you think silver would be as useful as gold?—Yes.

8775. And as convenient?—More so, because for large payments you do not pay either silver or gold, and for small payments you can divide the silver better than the gold into smaller change. But that is only a minor matter, the finance of small commerce, because after all you will always have some gold. If you were to introduce the bimetallic standard into large countries, the question of the flow of gold and silver would regulate itself to the demand. That country which finds the gold most convenient will have the gold, and that country which finds the silver most convenient will have the silver; there will be no artificial restriction.

8776. (*Mr. Montagu.*) Is not the lower range of discounts during the past few years, partly due to the use of paper against silver by the different Great Powers?—I believe that the lower rate of discount is due to a smaller demand for capital. The rate of discount is really not so much dependent on the quantity of money, as on the capital in the country, and the demand for that capital.

8777. But a very large amount of paper is at present based upon silver held by the banks on the Continent, and by the Treasury in America; and the paper, therefore, making the currencies redundant, would make money cheaper in the same way as gold?—I should not like to put it that way. I think the rate of money, except for temporary purposes, is dependent upon the supply and demand of capital.

8778. When people talk of gold being abundant, they usually mean circulation being abundant?—Yes.

8779. You recommend that bimetallism should be established internationally?—Well, that would be the best. There are very few countries that could establish it by themselves, but I think international bimetallism is by far the best arrangement.

8780. Are you inclined to propose any particular ratio?—I am not prepared to propose any ratio. I think the ratio must be left to statesmen and legislators.

8781. (*Sir John Lubbock.*) I think you said that, in your opinion, the production of silver would not be stimulated by an increase of its value in consequence of bimetallism being adopted?—No.

8782. But do you not think that in most articles the production is stimulated by an increase in the value?—Precious metals are articles which are not produced under the same economic conditions as other articles. If yours were a correct proposition, then I say owing to the fall in the value of silver the production of gold ought to have increased, and the production of silver ought to have fallen, and we have seen just the opposite. As silver has fallen so its production has increased, and in some instances demonstrably in consequence of its fall. There have been mines which gave a certain profit, and in order to keep their men employed they had to mine more silver and to increase the output when silver fell, and the increase in the production of silver is there directly attributable to the fall in its value. We have seen a fall in silver and a rise in production. Why then must a rise in silver be followed by another rise in production?

8783. Did I correctly understand you to say that, in your opinion, there was a surplus of gold in this country which had led to its exportation, and that this affected prices?—What I meant to say was this, that there is a certain relation between the mass of money and the commodities. That relation is not mathematical, but there is a certain relation. Increase the money and you raise the prices; decrease the money and you lower prices; but this relation is not necessarily such that the cause is always the money,

and the effect always the prices. Prices may be acted on first, and then money adjusts itself to the prices.

8784. Then, in your judgment, as compared with, say, 15 years ago, there has been a surplus of gold in this country which has led to its exportation, and that has affected prices?—There has been an exportation of gold without there ever having been an actual scarcity.

8785. (*Chairman.*) I understood you to say, that the exportation would not produce an effect on prices necessarily, because prices were regulated not by the amount in any particular country, but by the general currency in all nations?—Yes, also that.

8786. I do not understand quite the transfer from one country to another?—The transfer has taken place because prices all over the gold countries have fallen, and, therefore, the same mass of gold which existed formerly had to suffice, and the same production of gold which had to furnish supply for only one or two countries, now suffices to do service for a greater number of countries without ever producing an actual scarcity of gold. There never has been a scarcity.

8787. (*Sir John Lubbock.*) At any rate, you consider that there has been an exportation of gold owing to the surplus in this country?—There has been an exportation from this country, but this is a local element in comparison with the general element, the formation of prices, which are formed in the commerce of the world and not in any one particular country.

8788. And that exportation was owing to there being a surplus of gold in this country?—In this country, yes, relatively.

8789. You stated, if I correctly heard you, in answer to another question, that the currency of the whole world has been decreased because silver has been reduced by 30 per cent. of its value?—The value of the total amount of money in the world has certainly decreased, if you look upon it from the gold point of view, because the silver which circulates on its present value has become 24 per cent. depreciated.

8790. When you say it has become 24 per cent. depreciated, do you mean in relation to commodities generally?—No, in relation to gold.

8791. Then, in relation to the commodities of the world, you would not hold that currency has been diminished by 24 per cent. in consequence of the diminution in the value of silver?—In relation to commodities the standard, if looked upon from the gold point of view, has become less and therefore has altered.

8792. But the values of commodities have, in your opinion, become less, have they not?—Exactly, because the mass of money from the point of view of gold is decreased.

8793. But putting gold on one side for a moment altogether, the relation between silver and commodities has not altered materially in view?—The relation between silver and commodities has not altered.

8794. Then, I think you spoke of our adjusting our prices to the fall in silver. Did I correctly understand you to use that expression?—I say, the general range of prices adjusts itself to the fall in silver.

8795. I do not quite understand what you mean by the prices in this country adjusting themselves to the fall in silver?—I mean in gold countries prices go down owing to the influence of the prices of the silver countries. Owing to the fall in silver, the articles from the silver countries can be imported at lower prices, and the articles to silver countries must be exported at lower prices too; therefore, a considerable number of articles are being circulated in the gold countries at lower prices and that cannot happen, without gradually affecting the whole range of prices in those countries.

8796. But then, do you mean that because there is a fall in the price of silver, therefore there would be a corresponding fall in the price of coal?—Yes, certainly,

8797. But you say that the changes in the price of silver are very similar to the movement of other articles?—Yes, because silver is the cause, and the other articles represent the result.

8798. Now, would you kindly explain to me in what way you consider that a fall in the price of silver affects the price of wheat in this country?—Because wheat can be imported into this country at so much less, can be laid down in this country at so much less.

8799. Why?—Because it can be bought in India at the old price, and the old price at the present value of rupees represents so much less gold.

8800. Then you mean, that although the value of silver has altered in the East, the value of the wheat has not altered in the East?—In the East, the value of wheat in silver has not altered any more than the value of any other article in silver. Silver has retained the same purchasing power that it had in the East.

8801. (*Sir T. Farrer.*) Are you sure of that?—Well, that is the evidence of everything.

8802. (*Sir John Lubbock.*) Well, if that is the case, I think you said in answer to Sir Thomas Farrer, that silver did not go from here to the East as much as you would have expected, "because there is no silver here"?—I did not mean to say there is no silver whatever; I meant to say all the silver that comes here goes to the East. There is no permanent stock of silver here; nobody has silver in London.

8803. Then, do you mean that our price here is a nominal price?—It is a nominal price, if you want any more than there is.

8804. If the price is a nominal price, and the price which really affects matters is the price in India, why do you attach so much importance to the price here, which you say is nominal?—I attach importance because the actual transactions that take place between the two countries are based on that price, nominal or real. It is not so much the price of the silver itself, but it is the price of everything that is based on silver. All the Council Bills, for instance. And for them the price is not nominal. You get those Council Bills at those nominal prices.

8805. As regards the wheat grower in India, I quite understand that, so far as his fixed charges are concerned, namely, the rent which he has to pay, and the taxes which he has to pay, those being fixed charges in rupees, are less in consequence of the fall in silver?—Yes.

8806. But do you consider that in growing wheat he has any advantage over and above the diminution in the actual amount of his fixed charges, which remain nominally the same, but are practically lower?—Well, the wages, if they enter, he has the advantage of the depreciation in the currency.

8807. Then you consider it is the alteration in the fixed charges, and assuming that wages remain nominally the same, the alteration in the real weight of the wages?—Yes.

8808. But you would not go beyond that?—Not beyond that.

8809. Now, with reference to the Bland Bill, you expressed the opinion, if I correctly understood you, that America must either suspend the Bland Bill within two years, or else adopt the free coinage of silver?—I do not like to bind myself to any time; I simply say that it is logically and practically impossible for America to go on, in the present condition of things, without one of two events happening. Either they will halt one day, and say, "It is impossible; we are going to the silver basis, we must stop the coinage of the Bland dollars," and then you will have a great tumble in silver; or else they will go on the silver basis, either with their eyes open, by an Act of legislation, or because owing to continued large coinage of silver there will be such a mass of silver in the country that one day there will be a scare, and the gold will be exported. The Gresham law must come into operation in America one day.

8810. I do not want to bind you to two years, but I understood you meant in a comparatively short time?—Well, there are authorities who say five or ten years. It would happen quicker if there was not this increase of American cultivation that retards the day, but it must come one day.

8811. But if you remember that the total amount of silver certificates is 115,000,000 dollars, and that the whole circulation is 1,750,000,000 dollars, do you not think that as the amount of silver certificates is still so small in proportion to the whole, the effect you anticipate may be, even from your point of view, considerably delayed?—Well, the silver altogether is about 350,000,000 in America, it is even, perhaps, 400,000,000 dollars.

8812. Assuming your own figure, namely, 350,000,000 dollars, the total being 1,750,000,000, it has still so small a relation to the whole that the question I asked you was, whether you did not think the effect you anticipated might not be delayed for a considerable time?—It may be delayed, sir, but I dispute the correctness of comparing the silver to the whole circulation. I think the question is to compare the silver with the gold, because, after all, it is on the gold that they will fall back. By your assumption, by comparing the silver to the whole circulation, they could obviate all difficulty by issuing more green-backs, because, the more paper they have, the larger the circulation, and the smaller the proportion of the silver to the whole mass. Do you see my argument?

8813. I am afraid I do not. I should have thought that the more silver certificates they issued, the more notes it would be necessary for them to call in?—That is right enough. But you referred to silver and the whole mass of the circulating medium, and you say, because silver is 350,000,000 and the whole mass of the circulating medium about 1,750,000,000, it is a very small proportion. I say, from that figure of yours, you must deduct everything that is not gold, because, if you include things like green-backs, supposing you increase the silver dollars by 100,000,000, you would simply have to add 500,000,000 of green-backs, and you would have the old proportion again.

8814. You are aware that while the issue of silver dollars, and silver certificates have considerably increased within the last 10 years, on the other hand the circulation of State bank-notes, and National bank-notes, has very largely decreased?—Not so very largely. It is decreasing every year, owing to the calling in of the Funded Debt.

8815. Do you consider that the effect of bi-metallism, would be to raise prices, if the rate of 20 to 1, were adopted?—No, to a certain extent, I told you it would, because credit would be more easily obtained, and become more effectual, but otherwise it would not.

8816. Then you would not anticipate any considerable effect?—No considerable effect if you take the present price of silver as the basis of the ratio.

8817. Did I correctly understand you to say that you consider that the fall in the value of silver enables a silver-using country to sell its wheat to greater advantage here?—At a lower price, I said.

8818. Well then, would a fall in the paper money in a country having a paper circulation affect it?—Not necessarily; I told you if that fall in the paper money is produced by over-issue of paper, by a further issue of paper, the result would be within that paper country a rise of the prices.

8819. And you think that there is a difference between the case of a fall in the value of silver and a fall in the value of the paper circulation?—There might be a difference. The case of the United States, which in recent years is the most prominent instance, is certainly to that effect, for when they issued more green-backs, up went the prices.

8820. You said you thought it was impossible that gold could be driven out by the adoption of bi-metallism; have you considered the very large amount of gold which is used in the arts?—I said it could not be driven out through bi-metallism, but it might be used

Mr.
H. Schmidt.
25 Nov. 1887.

Mr.
H. Schmidt.
25 Nov. 1887.

up in the arts. If the production of gold continues to be insufficient, or would become insufficient, no doubt it would be used up in the arts, but that would happen whether you had a bi-metallic or a gold standard; that would be entirely independent of the question of standard, and the practical result would be far less dangerous under the bi-metallic standard than it would be under the gold standard.

8821. You stated that in your judgment the appreciation of gold is the result not of any actual scarcity of that metal as of the effect of the fall in the price of silver on general gold prices?—Yes, I believe that is the case.

8822. You also state that the constant fluctuations between gold and silver have added a new element of difficulty to commerce. I think you are not practically engaged in the commerce with the east yourself?—No, but I have a great deal to do with Indian banks, and I follow their transactions very closely, and it is on that experience that I said it; but I believe it is generally admitted that there is a new element of uncertainty which you either have to take into account yourself or insure against.

8823. And you are aware that evidence has been given before the Commission that, practically, the difficulty can be met very easily?—By insurance; yes, by paying for it. If you pay for it, it is an item of actual increased cost of production, and if you do not pay for it, your transaction becomes a speculation.

8824. (*Sir W. H. Houldsworth.*) Can that insurance be done to an unlimited extent?—I should say yes. There may be circumstances where it cannot be done; for instance, if India were to export a great deal without importing, it cannot be done; but as long as exports to and imports from countries balance, so long can banks step between and balance them. If exports and imports were to exceed even 500,000,000 $\frac{1}{2}$, it is quite possible for the banks to step in and take the risk for a consideration.

8825. Would you confirm the evidence given by some of the witnesses that there was considerable difficulty in the smaller houses engaged in the trade between England and India, in effecting the insurance?—It is a question of credit with small houses, because in those cases the bank takes the risk from each side. It is quite possible for a small house to have a difficulty in getting such credit.

8826. Then, practically, large houses can insure, while smaller houses cannot?—That may happen.

8827. (*Mr. Fremantle.*) Are they not able to insure, or must they insure at a higher rate?—They may not be able to insure at all.

8828. (*Mr. Montagu.*) Do you think that in the event of bimetalism being established on the basis of 20 to 1, which is about 47 $\frac{1}{2}$., that India would send silver here and take gold away?—Why should she; for what purpose?

8829. For hoarding?—I believe the hoarding of gold would be less. There is a stimulus now to the hoarding of gold in India, because the people know it is appreciating, but take away appreciation by fixing the price of gold in India, and they will just as well hoard silver as gold.

8830. (*Sir John Lubbock.*) You said that you considered that silver, on the whole, was more convenient for currency than gold?—I said so, because silver can be more sub-divided for small transactions, it is more convenient.

8831. At present, in this country, anyone who wishes to have silver for small transactions has no difficulty in obtaining it?—Certainly not; I do not say there is any inconvenience at all from the gold standard. I stated that there would be no inconvenience if silver were to become the standard, and I said so because for the small transactions you have already silver now; for the larger payments you will have the same facilities as now to pay them in cheques; and for the medium payments, if you pay them in silver, you will no doubt have notes like the American certificates.

8832. (*Mr. Chaplin.*) You have stated just now that it would be for statesmen and legislators to decide what ratio would best meet the interests involved. I should like to know your opinion as to what that ratio should be, and what ratio, on the whole, would probably be the best and fairest for all those interests?—I should like the ratio somewhere near the American ratio of 1 to 16, personally; but I am not prepared to say this is the best, or that it would best meet the case all round. I think it would, but I do not like to give an opinion upon that. It requires a great many considerations. It certainly would raise prices a great deal, and would make many trades profitable which have ceased to be profitable; but, on the other hand, many liabilities have been incurred since the fall has taken place, and it may hurt other interests.

8833. A ratio of 15 $\frac{1}{2}$ or 16 to 1 would remedy, at all events, the crying injustice which you speak of, and by which I understand you mean the great breaking of contracts which has taken place?—Certainly.

8834. Any other ratio would inflict considerable inconvenience, would it not, upon France and Germany, and those countries where there was a large existing currency in silver?—It may be a practical question, whether the other countries would accept any other ratio except 1 to 16 or 1 to 15 $\frac{1}{2}$; I am not prepared to say that.

8835. It would involve the recoinage of their silver currency?—Gradually. They would open their mints at once to the free coinage of silver on the new basis, but the re-coinage would be done gradually.

8836. In any circumstances you would not wish to see a ratio of 16 to 1 or 15 $\frac{1}{2}$ to 1, which would involve such large changes, adopted suddenly?—Oh, certainly not. I think a sudden and immediate adoption of the ratio of 1 to 15 $\frac{1}{2}$ would create so much disturbance that it is highly to be deprecated.

8837. (*Mr. Montagu.*) Could not France coin a new coin at 20 to 1 without interfering with her present circulation?—I think they have so much at present, that they would have to recoin part of the old stock.

8838. Or would it not answer the same purpose if the banks bought bar silver in the same way as they buy bar gold?—They would do that in any case, I think.

The witness withdrew.

Adjourned till Monday.

THIRTY-NINTH DAY.

Monday, 28th November 1887.

PRESENT:

THE RIGHT HON. LORD HERSCHELL, the CHAIRMAN, presiding.

MR. D. M. BARBOUR, C.S.I.
MR. J. W. BIRCH.
MR. HENRY CHAPLIN, M.P.
SIR T. H. FARRER, Bart.

MR. C. W. FREMANTLE, C.B.
SIR W. H. HOULDSWORTH, Bart., M.P.
SIR JOHN LUBBOCK, Bart., M.P.
MR. S. MONTAGU, M.P., and

MR. GEO. H. MURRAY, *Secretary*.

LORD BRAMWELL called and examined.

8839. (*Chairman*.) You have devoted some attention to the subjects into which this Commission is inquiring?—Yes, some.

8840. I believe you have read the evidence which has been given before us, so far as it has been published?—Well, I have read it so as to have a notion of what it is. I cannot say I have read it in the scrupulous way in which I should if it had been a brief, perhaps.

8841. But you have read, at all events, sufficient to be acquainted with the views which have been put before the Commission of what bi-metallism is, and how far it is practicable?—I think so.

8842. Now in considering the question of the proposed fixed relation between gold and silver, you may have observed that those who advocate bi-metallism, or some of them, do not propose that the power to contract, even if bi-metallism were established, for payment in one particular precious metal should be excluded?—I see Mr. Gibbs says that particularly.

8843. Does any observation occur to you as to the effect that that might produce with reference to creating or augmenting the premium upon one of the precious metals?—It undoubtedly would have a tendency to do so: if bi-metallism were firmly established and the ratio firmly established, it would be said that there never would be any occasion for a premium upon either of the metals, but it has always, in my mind, an absolute tendency to create a premium upon one of the metals, and upon gold, at least, if the ratio were established at 15½.

8844. A premium, at all events, upon what one may call the dearer metal?—Something of the nature of an agio or a premium; but I think it would have another very mischievous consequence, which I will mention at once, if you please. I think it would tend to create an enormous quantity of confusion and litigation. A man would owe a debt; he would say "Well, I contracted to have the right to pay this 'in either metal,'" and his creditor would say "No, 'you did not, you contracted to pay it in gold,'" or what not. Well, there would be litigation, confusion, quarrels about that. Further it would be a very extraordinary thing that a great quantity of what a man had to pay, his taxes, and other things, which did not arise out of any contract, should be paid at one rate or in one metal, and the other should be paid in an optional rate, as agreed between him and his creditor. I have not the slightest doubt in the world that it would have a tendency to create confusion and litigation, which, I dare say in time, would abate, to a considerable extent, but it would always exist to some extent.

8845. That is in contracts not reduced into writing?—Not reduced into writing. If they were in writing, I suppose they would have a tolerably intelligible meaning; but I should think you and I have seen a good many writings, especially when merchants draw them up, which have not a very intelligible meaning, with all submission be it said.

8846. Now with regard to the possibility of a bi-metallic system which would work; what observations have you to make?—I have come here to do what is called give evidence; but I should like to preface what I have got to say by this, that I have not a fact to lay before you, not one. I have only got opinions to lay before you, and I see round the table, and know there have been called before you, those who are more competent to give good opinions upon the subject than I am; but if you like, if it would save you any trouble, I would just give you, as shortly as I can, my general opinion upon the subject.

8847. If you please?—In the first place I know what bi-metallism is. I have always had some doubt about it till I read the evidence that has been given before you. Of course I knew that it always meant a free coinage; that is to say, an unlimited coinage (I do not mean to say without any charge for it), of the two metals with a fixed ratio between them, and either of them a legal tender. But the thing that I never did know with absolute certainty till Mr. Gibbs mentioned it, was whether persons would be allowed to contract themselves out of the right to pay in either metal; in other words, that they should be allowed to stipulate for payment in one only of the two metals. I incline to think that bi-metallism is a possibility; that is to say, that you might get rid of the Gresham Law if you got a sufficient number of minters, all great states minting largely who would agree to it, but I am not sure even then; I think it might do if you got a sufficient number, but the great difficulty is to say what is a sufficient number. If you got so many that there was no market for either metal in particular, that is to say, no reason why the Gresham Law should apply, why then I suppose bi-metallism might exist and might flourish. But even if you were to get the United States, and France, and Italy, and Germany and England to agree, I am not at all sure that you would not find yourself disappointed by the action of China and India and other countries. But, however, assuming that bi-metallism is a possibility, what occurs to me is, I have no objection to its being considered a lawyer's view of the case, if you like; because as I have said several times, I think lawyers take a better view of a case than any other class of people; but it seems to me that the burden of proof is upon those who say that bi-metallism would be preferable for this country. Now mind, I am not going to say a word of a cosmopolitan character. All other countries may take care of themselves. I think what we ought to do is to take care of this one, and I think that those who say that bi-metallism would be better than mono-metallism for this country have got to make their case. Now I have no particular admiration for what Tristram Shandy calls "the under strapping virtue of content." I think if anything could be done better than we have now, it should be done, and I think if anybody could show it and make it out, it should be adopted; but the burden of proof, to my mind, is upon those who would make a change in that,

Lord
Bramwell.
28 Nov. 1887.

Lord
Bramwell.
28 Nov. 1887.

which is undoubtedly, I should say, a preferable condition to that of any other nation; that is to say, our condition is better than that of any other bi-metallic or mono-metallic country in the world, and I say, therefore, that the burden of proof is upon those who would make the change. And I think to begin with, that one may show that there would be a great many disadvantages attendant upon that change. Now the first and most remarkable disadvantage I think that would attend upon it is this:—The bi-metallists tell you, and I think they are right, that bi-metallism,—at all events with a ratio of $15\frac{1}{2}$ of silver to gold (and it seems to be conceded that unless that ratio is agreed to, bi-metallism is an impossibility, and I think good reasons might be given for it) the bi-metallists tell you and it seems to me that if bi-metallism were established with a ratio of $15\frac{1}{2}$ inevitably there must be a depreciation of gold. I think one may say to the bi-metallists “that is your contention, and it is one of your great objects. You wish to reduce the value of gold. You wish to raise prices which can only be done by lowering the value of gold.” Well now it seems to me that that would be attended with a most grievous and cruel injustice, because every creditor would find his debt reduced in proportion to the diminished value of gold, so that in fact if he had a hundred sovereigns owing to him, the purchasing power, if gold fell ten per cent., his hundred sovereigns would only equal what ninety sovereigns were before, and it seems to me that it is no answer to that to say, that if he loses, his debtor would gain because in the first place that seems to me to be merely saying that you will compensate A for an undeserved loss by making B an undeserved gain. And there is another thing, one does not want to go into any metaphysics upon bi-metallism, but I suppose everybody would admit that the pain and grief and inconvenience to a person who loses a particular thing is not compensated for or anything like compensated for by somebody else getting the good and benefit of that thing which he never counted on.

8848. What should you say to the contention that the opposite state of things, the converse state of things has been brought about by the demonetization of silver in 1873, and that it would be only restoring the condition of things which had existed prior to that date?—Well, I should say to that, I think it really is rather surprising to me that anybody could bring it forward; it seems to me as unreasonable as the dying remark of an old barrister. He said, “Well, I have won a great many verdicts that I ought to have lost, but then I have lost a great many that I ought to have won, so upon the whole justice is done.” His notion being that an amount of injustice on one side, was set right by a corresponding amount of injustice on what you may call the other side. It seems to me really with great respect to those who think otherwise, the most unreasonable thing in the world. This demonetization dates from 1873, that is about 14 years ago. People have got used to the present condition of things. How old must a thing be before it is disturbed. What justification is it to a man who has bought a railway debenture, upon which he is entitled to 5*l.* a year in a mono-metallic country to say that “when you were a boy of about 15 some injustice was done to debtors by making them owe more than they did owe”; that is to say, by demonetizing the silver currency. But there is another thing the very question assumes that there is an appreciation of gold. That there is a depreciation of silver I know; but the notion of compensating a man, by taking away from another that which he ought not to have, is founded upon the notion, that that other has got something that he ought not to have; that is to say, that there was an appreciation of gold. With the greatest respect in the world, I extremely doubt that. I have the very greatest misgiving about it; that is one thing. Another thing is this. The demonetization of silver, if gold is appreciated, and is appreciated owing to the demonetization of silver, was a thing that was brought about

by what you may call natural causes. Now it may have been a piece of good fortune to gold creditors. I deny that it was; I do not believe it was, but it may have been. But what right have you to tamper with the currency, for the mere purpose of diminishing the value of the credits which at present exist. I can understand very well that if, for currency purposes, it were desirable to demonetize silver, one might fairly say to any man, who lost money by it, “Why you must have known that the currency would always be managed so as to be the best possible currency.” But if he could say in answer to that, “But that is not your object, you do not want to amend the currency for the currency’s sake, but want to amend the currency for the purpose of lowering the value of gold, because it has appreciated.” It seems to me just as reasonable as if he would give a valid answer they said “We will put 20 per cent. of alloy in the sovereign.”

8849. I understand, that supposing it were thought for currency purposes,—for purposes entirely independent of the alteration of prices—fit to adopt a different currency system, you would not think that unjustifiable, because incidentally it might happen to affect the relation of debtor and creditor?—That is my opinion. I think a man would have no more right to object in that case than he would to the issue of one-pound notes. If it was thought a desirable thing to issue one-pound notes for currency purposes, although it should have the effect—I am not sure whether it would—of lowering the value of the sovereign. I think the man would have no right to object to it.

8850. You have said that you doubt whether there has been that appreciation of gold which has been contended for. Would you favour the Commission with your reasons for expressing that doubt?—Well, in the first place, I may say that it is for those who say that there has been such an appreciation to make it out. I know very well how they attempt to make it out. They attempt to make it out by showing a great fall in price in a great number of articles, and then they say that inasmuch as there is such a vast fall in price in such a great number of articles, the true solution of it is, not a fall in their value, but an appreciation of the purchasing material, that is, say, gold. Now, first of all, I desire to make this general remark about that, that if that were true there ought to be a universal fall in prices; and I deny that there is. With respect to the particular instances that are brought forward, without pretending to go through the whole of them, it seems to me that the immense majority of them have been explained by other causes, and the first and most material of all the causes is, that the immediate produce of land can be placed in this country at a much lower rate than the price existing formerly. I used that word expressly, because it not only can be brought here more cheaply, but it is cheaper in the place from which it is brought than it is here. Take wheat for instance, you need go no further than that. Take cattle, say, coming from America. Formerly I suppose cattle could scarcely be brought to pay from America; the voyage was so long, and possible injury to the cattle; and the amount of the freight was such that they could hardly be brought here, and now they can. They can be brought here, that is to say, they are cheaper in the country from which they come than what they are here, and they can be brought here at a very much less rate than they could formerly be brought here. Well, now, if you take it that the earth’s produce is landed here, so as to be saleable at a much less price than it formerly commanded here, why you have as a consequence not only a fall in the price of those products, but you have a fall in the price of the land which produces them. Well that accounts for a very great many falls in price. Then, in addition to that, you have the falls in price from diminished freights as to foreign goods; and as to things of home production, you have better means of production, better machinery. Well, then you have, owing to tele-

graphs and this speedy communication between different places, the less necessity for keeping a stock than there was before, and there is a variety of other things, which do not at the present moment occur to me, which will account for a great many falls in price. Now I should just like to mention to the Commission one or two things that have occurred to me. I believe the amount of gold and silver plate manufactured has not only not diminished, but has very considerably increased as shown by the duty payable. It may, perhaps, be said that that is because silver plate has been very much increased. I really cannot tell. I really cannot answer that; but it is a fact, I believe, that the duties now payable upon gold and silver plate have risen in amount very considerably. I take such an illustration as this: A pair of carriage horses. Will you get them more cheaply than you could have done in the year 1873? Certainly not. A carriage. Will you get that more cheaply? No. Do you pay less for labour than you did? No. Can you get pianofortes more cheaply than you could? No. Do you pay less to singers and dancers or lawyers? No. Do you find that those people are being paid at a less figure in amount than they were. And if you look—I have not prepared myself with a list or catalogue of them—but I think if you look at those things, where a fall in the price of them could not be accounted for in any of the ways that I have suggested, nor any of the ways that have been suggested. I doubt extremely whether you will find that there is a fall in prices. Take this case: I believe now that in Belgravia, and probably in Mayfair, the price of very large mansions—very expensive things—has gone down. Well, what is it attributable to? I could name a particular case where a tenant had lived for very many years in a great mansion, and I was told that he was leaving because, being a landowner and having his income diminished, perhaps one half, or whatever else it was, he could live there no longer. Well, that accounts for the price of such mansions as those going down; but if you look to smaller houses, such as are occupied, not by landowners, but by lawyers, and merchants, and bankers, and others, you will not find any fall in price. I do not think that the value of land in the city of London has fallen, and I do not think that the value of land in the suburbs has fallen; I do not believe, though I cannot speak with certainty, that such things as pictures, old and new, old china, rare books, have fallen in price; and upon these considerations, and perhaps also because I have read that excellent production of Mr. William Fowler's upon the supposed appreciation of gold, I have the greatest doubt in the world whether there has been an appreciation of gold. That there has been a depreciation of silver everybody must admit, but the other I doubt very much indeed. And I think one may put another thing: if gold has appreciated—I think Mr. Gibbs says it has appreciated 30 per cent., I think he does in one instance—well, according to that, you know, the burden of the National Debt ought to have increased one third, and I do not believe anybody thinks it is or says it is.

8851. You have spoken hitherto of the suggestion of a scheme of bi-metallism at a ratio of $15\frac{1}{2}$ to 1?—Yes.

8852. Some of the objections which you have expressed, as applicable to such a system, would not, as I understand, in your view, be applicable to a system of bi-metallism if the ratio were the existing market ratio?—I should think not. I understand that bi-metallists say a ratio of $15\frac{1}{2}$ to 1 would cause a rise in silver and a loss in gold. Well, the reason by which they prove that seems equal to saying that if it were 20 to 1 it would not be attended with any such consequences.

8853. What objection would you have to suggest, apart from the mere objection against any alteration, unless the alteration be proved desirable, to a bi-metallic system with a ratio of, say, 20 to 1?—It is a difficult thing to deal with. In the first place, I

believe it would be absolutely impossible—I do not suppose you could possibly get France to agree to it; but that is not your question.

8854. Why do you think that it would be impossible?—Because I suppose France never would agree to it. I suppose they would say immediately, "Why you increase the burden of our National Debt very considerably; you put 30 per cent. upon it."

8855. (*Sir John Lubbock.*) And not only France, but the Latin Union generally?—Yes, certainly.

8856. (*Mr. Birch.*) And the United States and Germany?—Yes.

8857. (*Mr. Fremantle.*) And Holland and Spain?—Yes. I hope, if that practice is adopted, that our mint will stipulate for having the first issues.

8858. (*Mr. Barbour.*) I think you said that that change would increase the burden of the French debt by 30 per cent. How would it have that effect? Suppose you adopted the present ratio, would it increase the burden beyond what it is at present?—Why, at present they can pay in silver. We will suppose that they can purchase quantities of silver with a definite quantity of gold, and if $15\frac{1}{2}$ were established as the ratio they could only get $15\frac{1}{2}$ of that silver, with the same quantity of gold.

8859. But how would the adoption of 1 to 20 or 21 increase the burden of the debt as compared with what it is at present?—Why, because in order to get the money with which they pay their National Debt they would have to give 20 where, in fact, they give $15\frac{1}{2}$.

8860. But they cannot, at the present day pay their debts with silver at the ratio of $15\frac{1}{2}$ to 1. If any man has got hold of five-franc pieces he can pay with them, but they have a special value. He cannot take his silver to the mint at the ratio of $15\frac{1}{2}$ to 1 and pay with that?—That is my judgment. France is now mono-metallic, and its silver currency is a token currency.

8861. Then, I ask, how the adoption of a ratio of 1 to 20 would increase the present burden of their debt by 30 per cent.? It might be inconvenient to them in other respects, because they hold over-valued silver, but I do not think it would increase the burden of their debt by 30 per cent.?—Well, the difficulty is this, that at present their silver being a token money it may be said that it costs them as much as a bank note for 20 francs if they bought it in gold. But it seems to me that to get the silver to pay their debts, if you were to depreciate silver it would cost them more gold to get the requisite amount than it would if you made the ratio $15\frac{1}{2}$. I have always thought so. I confess at this moment I cannot give a very sensible or connected reason for it, but that is my impression.

8862. (*Mr. Birch.*) On the silver that they now hold the loss would be so great. Now it is valued at $15\frac{1}{2}$ to 1. If you made it 20 to 1 the loss would be very heavy upon the stock which they hold?—Yes, that is so.

8863. (*Mr. Montagu.*) But if the nations agree to the 20 to 1 to prevent very great loss, you would have no objection then?—I was going to say, one answer I have to make to it is, if a ratio of 20 to 1 were agreed to, it seems to me that there would be no object in it at all; I cannot see what would be the good of it.

8864. To promote trade between this country and silver-using countries, and to prevent future loss in the stock of silver held by these countries?—I doubt it very much indeed. I dare say many members of the Commission saw what was in the last "Economist," in which it seems that in spite of the tremendous difficulties in dealing with silver countries in the year 1872, the number of yards of cotton exported to India were 859,705,000; in 1886 the exportation was 2,118,838,000, that is to say, an increase of $2\frac{1}{2}$ times as much as there was in the year 1872.

8865. (*Chairman.*) It has been suggested that the tendency of a depreciation of silver as compared with gold is to reduce the price of commodities produced in silver-using countries, and also of the commodities which are exported to silver-using countries; and what is alleged is that, although after a time matters would

Lord
Bramwell.

28 Nov, 1887.

Lord
Bramwell.

28 Nov. 1887.

adjust themselves (even as regards labour in this country) to the altered state of prices, yet that such an adjustment causes considerable friction and difficulty and disturbance, and that so long as you have no fixed ratio, and therefore a constant change, you never can get a real adjustment, but you will be always going on with the process, which will never quite keep pace with the alteration of price; and that on that account there would be an advantage, if it were possible, in having a fixed ratio which would prevent that fluctuation, and the consequent friction, caused by the adjustment of prices?—I am not a competent judge of the difficulties of dealing with a silver-using country, but I suppose there may be some inconvenience. It seems to have been to some extent got over by contrivances with the banks, but then they were paid for that, and I daresay if the difficulty, the friction, or whatever it is, could be got rid of, it would be better. It may possibly be that for their goods exported to India, if the man who did so were not a speculator in the value of silver at the time of his exportation. That may be. I cannot help thinking that these figures make that very doubtful. When you find that 859,000,000 in 1872 had become 2,118,000,000 in 1886, I should doubt it very much indeed. I should think, if it could be done, it would be better that there should be not a continual fluctuation in the value of silver, but you must set against it the mischiefs that would arise to this country from bi-metallism; that is to say, I do not say but what the present condition of things may not be some prejudice to dealings with silver-using countries. I think it may be; I think there is some evidence to show that there is some objection to it. It does not seem to me to be a very great one, and, I confess, I do not think it compares with the mischief that bi-metallism would cause to this country.

8866. Would you state what are the mischiefs that you would anticipate from bi-metallism, assuming it to be possible to fix a ratio which would not be above the market value of silver as compared with gold; that is to say if the ratio was such that there would be no tendency to cause a fall in the value of gold?—Well, one of the reasons is this: I rather think that the foreigners pay 100,000,000*l.* a year now upon our investments, and other claims upon them. I should be very sorry to see that reduced in value by 10 per cent. or 20 per cent., or what not. Then I am very much struck with the evidence of Mr. Currie, who speaks on a subject that I cannot pretend to know anything like so well as he does, that is to say, that at the present moment this country is what you may call the headquarters of the settlement of affairs between other countries, that is to say, a man in America buys tea in China and he pays for it by a draft upon London; and matters of that description seems to go very much to show that a great danger might arise to this country to lessen the supremacy that at present it has in those matters, it seems to me very reasonable. Mr. Fowler says that bi-metallism might, if we did not take care, degenerate into a mono-metallism of silver. Then, another thing I should like to say is, if you supposed such a ratio as has been mentioned in the first place, there would be the objections that I state, that people would be sure to have quarrels and disputes as to what metal they were to pay in. There is this other thing, it is a small matter, but if bi-metallism is to do anything, somehow or another it is to make silver part of our currency, and I want to know what good it would do to this country if prices are not altered, mind you, what good would it do to this country that instead of having to count sovereigns you had to count four-shilling pieces. It may seem a comparative trifle, but it would go for something, and if it is a trifle on the other hand, what is the good of bi-metallism at a ratio between gold and the present value I really have not seen, except perhaps with respect to India and silver-using countries, I have not seen an argument to show that any human being would be benefited by bimetallism at that rate, in fact it would be apparently

attended with no consequence, except, as I said before, that you would have to carry a greater weight of metal and coin and greater number of coins, so that my answer to that question is, though I cannot see any very great mischief, I can see some, and I can see no good.

8867. Is it not the case that in America they have a great deal of silver as the basis of their currency, but they carry very little of it, or coin very little of it?—Exactly, they carry silver certificates. And as I said before America is a mono-metallic country, a gold-using country entirely, and her silver coins are token coins. You know you cannot go to the American mint and say I insist upon your coining this.

8868. (*Mr. Barbour.*) You said that if we had bi-metallism there might be a great deal of confusion among people who made contracts, and a great deal of litigation owing to disputes as to which metal the contract was made in?—Yes.

8869. Was there a large number of disputes of that kind in the countries which have been bi-metallic for a long time; were there disputes of that nature in France and other countries when they were bi-metallic?—I do not know.

8870. Then you only give us your own opinion; it is not based upon any facts as to what actually took place in bi-metallic countries when they were bi-metallic?—No; nor can I say it is based on any particular knowledge, it is a speculation.

8871. You said that you thought our country was better off as regards its standard than any other country. Do you think it is better off than the silver mono-metallic countries?—I think what I said was, that somehow or other our country was better off as a commercial country than any other generally.

8872. Do you think that is due to its standard?—If I were to look at a dozen different objects and I found that one that was the best of them had some peculiarity about it, although I could not trace its goodness to that peculiarity, I should be very much inclined to doubt whether that peculiarity had not something to do with it.

8873. Then you think that the goodness of our standard has something to do with the state of our trade?—Let me put this case to you. Take a dozen farmers with equal capital, and suppose an equally fair chance, and one of them always produces a better crop than the other eleven do, would not you suppose that there was something about that?

8874. I would suppose that there would be something, but not necessarily a good standard. It might be good farming?—Well, suppose you found there was some peculiarity about him, for instance, that he got up at 6 o'clock in the morning, and the others did not get up till 8 and so forth, you could not trace rising at 6 o'clock in the morning to an increased crop of mangel-wurzel, but I should think you would be very much inclined to say that it had something to do with it.

8875. But would you not say in that case that his prosperity is due to his getting up at 6 o'clock in the morning, and not to the fact that his rent was fixed in gold?—It is always very dangerous to argue by examples, because however clever you think you make them, you find someone cleverer than yourself who sees quite a hole in your argument. My opinion is nothing more than this: I find a particularly prosperous condition of things here. I am very much inclined to think that our currency laws may have something to do with it. I cannot perhaps trace in what way, but I say be careful; the burden of proof is upon you who would alter the condition of things in this country.

8876. As regards the case you gave of a man in America buying tea in China and paying for it by a draft on this country, that is a case where a man in a gold standard country purchases tea in a silver-standard country, China?—Yes.

8877. Do you think that the fact that we have a gold standard makes him draw a bill upon us because

*Lord
Bramwell.*
28 Nov. 1887.

it is a bill upon a gold country?—I feel inclined to say that your question is not quite a fair one, because I expressly said that I referred to Mr. Currie's evidence upon the matter. I really cannot tell why they draw here. I do not think they draw here because it is a mono-metallic country directly, but I think they draw here because they feel perfectly safe that their bill will be honoured in gold in an unvarying metal. That probably has got something to do with it.

8878. There has been an explanation given of that, which I think is this: that the course of bills follows the course of trade; that there being a great deal of trade between Eastern America and England and a great deal of trade between England and China, and not very much direct trade between America and China, it is better to draw on the country which is the centre of trade, because bills can always be drawn from there with advantage on other countries. Would that be a reasonable explanation do you think?—I cannot pronounce it to be an unreasonable one, but what I observe to you is this, that they not only do not draw upon China, but they do not draw upon any other European country.

8879. That might be from the trade causes?—It may be; I say I am not a very competent person to form an opinion upon such a thing. I would rather take the opinion of one who is as competent as Mr. Currie.

8880. If gold disappeared from the world and was replaced by silver by some extraordinary act, I suppose our position would remain very much what it is, financially and commercially?—I do not know. I confess I do not see any reason why it should not. I do not see why we should not do with silver what we have done with gold, that is to say, get such a command of it that people can thoroughly trust us. It is attributable to our wealth.

8881. Then with regard to the alteration in the relative value of gold and silver which has taken place since 1873, you think that people have got used to the present state of things, and that there is no necessity for making any change. I think that is your argument?—That is my opinion. I think if it were perfectly certain that no mischief would result it might be worth while with reference to India that we should have bi-metallism; but in my opinion it is not only not certain that no mischief would result, but it is absolutely certain that very great mischief would.

8882. Can you guarantee that the present state of things will remain, that gold and silver will not alter very much more in relative value?—No, I cannot indeed.

8883. Silver might fall still more and gold might rise?—It might.

8884. Would there not be a certain advantage in getting as it were a sort of resting place so as to remove the possibility of change?—I suppose the theory of bi-metallism is such, and I am not prepared to say it is wrong, that if instead of a certain weight of silver being worth only one-twentieth part of the same weight of gold it would turn out, owing to extra production of silver, to be one-fiftieth part only of the weight of gold, so that there was a still greater fall in its value in one sense when uncoined, still it might happen that bi-metallism would exist, and that the effect of such finding as that would be to diminish the value of the total bulk of gold and silver all put together, and so throw out of work the poorest gold mines, and by some contrivance or another bi-metallism would still subsist, and I suppose there is some difference of values between the two metals which would prevent that; but where that is I am afraid I do not know, and I do not suppose anybody would undertake to say.

8885. You hold the opinion that there is no appreciation of gold?—No sensible appreciation.

8886. The fall in prices you think can be entirely explained by cheaper production?—I have not gone into every case of a fall so as to say that in every case

it could, but I say the great bulk, the great majority of them, can be explained in the variety of ways in which they have been explained by people who know more about the matter than I do.

8887. I believe it is the case that there has not been in silver prices any very remarkable change; that wages and prices payable in silver do not seem to have risen so much as some people expected they would?—I believe that is so.

8888. So that although gold and silver have altered in relative values 25 or 26 per cent., it does not appear that all silver values and gold values all over the world have risen or fallen to that extent?—No, and that is equally true with a country with depreciated currency, such as Russia or Chili.

8889. That variation in the relative value of the two standards seems to disclose itself more in the international trade than in the internal prices and values of the gold and silver countries?—Well, it discloses itself in international trade and it also discloses itself very strongly in the two metals in European countries.

8890. But prices and values in the interior of the two countries do not seem to alter as rapidly nor to the same amount as the metals themselves?—I think that can be accounted for.

8891. Perhaps you would give the reasons for it?—Why it takes some time to spread into the interior, that is to say, the thing which has caused a fall in the value of any commodity I should think; but confining oneself to silver it takes some time for that to spread into the interior of the country. The Ryot or other person in India has been accustomed to get a certain quantity of silver for his produce. He has no reason for asking anything more because silver has fallen in England. But what would happen would be this, he will be found out by the man who can get silver more cheaply than he could formerly, and in order to induce him to sell to that man instead of selling to anybody else a little more silver will be offered to him. Well that would put him in possession of a little more silver and will enable him to offer better prices to other people that he deals with, and so in time the coin will lessen in exchangeable value in the interior until it has got to the same condition in the interior that it has out of the country or at the ports.

8892. On the supposition that the man who in the first place gets that little extra amount of silver, instead of using it to purchase anything immediately hoards it, that process of adjustment would be seriously interfered with?—I heard Mr. Justice Willes say once to Lord Campbell that you ought not to traverse a hypothesis. But if the hypothesis is an impossible one, as that if twice two are five, how much will twice three be, I think you may fairly traverse the impossible hypothesis or decline to answer them, and I mean, if you will allow me to treat this in the same way. It is impossible to suppose that all the sellers will hoard all the silver that they get. Some of them will not hoard all.

8893. I do not think I assumed that they would hoard all the silver they get, but only the extra amount. It is possible to suppose that they might hoard the greater portion of the additional silver which they get?—All I can say is that the process will be a longer one.

8894. And might not be carried to the same extent?—I dare say not.

8895. Now you have said that it takes time for prices and values in the silver countries to adjust themselves to the alteration in the relative value of gold and silver?—I think so.

8896. I suppose you would be equally prepared to apply the same argument to prices and values in this country?—Certainly.

8897. And say that it is quite possible that the price of carriages and horses, perhaps of singers and dancers, might ultimately fall here?—Oh, yes, they may, but then what I say is, if you rely upon the fall that has taken place in other matters those who are of a different way of thinking are entitled to rely upon

Lord
Bramwell.

28 Nov. 1887.

that which has not taken place in the particular things I mentioned. They may be reached in time.

8898. You are no doubt aware that silver was originally the standard in this country?—Yes, I suppose it was. But I object very much to the word standard as applied to either of the metals or both of them. They operate as a standard, but they are not standards in themselves; they are things which fluctuate in ordinary exchangeable value, but with regard to silver it was at one time a legal tender to any amount.

8899. More than that. There was a time in this country, very long ago, when silver coins were the only coins that were coined?—Yes, I suppose so.

8900. Is it not the case that subsequently gold came to be coined also, and that generally Government fixed the ratio between gold and silver for the time being?—Guineas were not coined until rather late in the reign of Charles II.

8901. I believe I am right in saying that in those early days silver was looked upon as what was really the standard. Although the coins were often debased, silver was the standard of England, and the pound sterling contained a definite amount of silver. The gold coin which was legally of the same value as, say, 20s., might vary in the amount of gold it contained, but silver coin was not supposed to vary. Are you aware that that was the case?—I really cannot say at the present moment; but you will excuse me if I make this remark with great submission and with great respect. It seems to me so foreign to the matter in hand.

8902. But to show that what I state was the case I will read you a passage from a speech by Sir Robert Peel which he made in 1844, which shows that the pound sterling in silver was supposed to contain always the same amount of silver, but 20s. in gold might contain more or less gold. This is what he says:—"It was not until a late period of the reign of Queen Elizabeth that silver being then the standard of value received that determinate weight which it retained without variation with constant refusals to debase the standard of silver, until the year 1816, when gold became the exclusive standard of value." That is, that the silver pound always contained the same amount of silver from the time of Queen Elizabeth to 1816, but the 20s. in gold might contain more or less gold. You are not prepared to deny that?—I am not prepared to deny that. It is rather in accordance with what I remember.

8903. You are aware that we changed from the silver to the gold standard at the end of the last century and the beginning of the present one?—I should say so; yes.

8904. The change came not all at once, but by degrees?—Yes, I think it did.

8905. I think that during the whole time we were changing from the silver standard to the gold standard there was practically fixity of relative value maintained between silver and gold in the market; as matter of fact the market value of silver did not, during all that time, fluctuate very much. It may have changed from 15 to 15½?—I have no reason to say that it did; if you say it did not, I am sure I would not differ.

8906. Assuming that that is the case, it would follow that the authors of our present gold standard adopted that standard at a time when difficulties had not disclosed themselves, which have since appeared, that is to say, the great and frequent fluctuations in the relative value of gold and silver?—Why, what you ask me almost to say is that the year 1796 was considerably before the year 1872.

8907. That I have no doubt of; but what I want you to say is that at the time we changed from the silver to the gold standard, there was practically fixity of value between silver and gold?—I take it to be so.

8908. And, therefore, those who adopted a gold standard in this country could not have had practically

before them the difficulties that follow from frequent fluctuations?—That follows.

8909. And since the time we adopted the gold standard I believe the commercial and financial relations between different countries have very much increased?—Oh, enormously.

8910. There is probably more communication now between England and India than there was at that time between England and Ireland?—Oh, yes.

8911. So that the importance of having the same standard of value, or practically the same standard of value, in two different countries, was not so great in the beginning of the present century as it is now?—No, certainly not, whatever that importance may be.

8912. And consequently it may be a question whether or not the gold standard would have been introduced at that time if those difficulties had presented themselves to the authorities?—How can anybody say what would have been done in the year 1796 if people could have foreseen what would happen in the year 1886.

8913. At any rate you would not say that, in view of the additional experience we have had and of the altered conditions of foreign trade, it is not unreasonable to review what was done in the beginning of the present century?—I should say it would be utterly unreasonable, if it were different to what it is now. A thing is either right or wrong, not according to the time when it originated, but according to the time when it exists, that is now. Suppose this had taken place, instead of in 1796, in 1496, could you say that there was any possible reason for reviewing it now? Review it now upon its own merits as it stands now, not upon considerations that if they had existed in 1796, when they did not exist, might have influenced people who acted upon other considerations.

8914. But if we review it now we should have to take into consideration facts which did not exist at the time the former change was made, and could not have been before the authors of that change?—Certainly, because if you review it now, review it upon the circumstances which exist now.

8915. You have no doubt seen the estimates of the consumption of gold in the arts and for ornaments?—I have seen them; I frankly own to you I have not paid much attention to them.

8916. You think it very doubtful if they are correct?—Whether they are correct or not, I do not think it matters. I do not think it affects this question before you at all.

8917. If they were correct, does it not show that there must have been a great increase in the consumption of gold in that way in recent years?—I do not know; I really cannot say.

8918. The consumption of gold in the arts, ornaments, and hoarding is supposed to be sixteen and a half millions sterling. As the production of gold in the beginning of this century was only about two and a half or three millions sterling, it follows, if there is sixteen and a half millions sterling used in the arts and for hoarding, that there must be an increase?—That is a curious argument in favour of the appreciation of gold, to say that more gold is used for the purpose of luxury for which it need not be used. Now in my opinion, if gold had appreciated—I was going to give that by way of illustration—if a man found that in order to get a gold watch he had to give that which would purchase, say, 30 quarters of wheat, when formerly he would only give that which would purchase 20 quarters of wheat, I think he might hesitate about having his gold watch, and consequently the more you show that gold is used in the arts and for purposes other than currency, the more to my mind you show that it is not appreciated.

8919. I did not say that the use of sixteen and a half millions of gold in the arts and for hoarding proved that there was appreciation of gold. As the production of gold in the beginning of this century was only two and a half millions sterling or thereabouts, it follows, if there is sixteen and a half

millions sterling used in the arts and for hoarding, there must be an increase?—I cannot say.

8920. But assuming for the moment that that estimate is correct, there must have been a great increase in the use of gold in this way in recent years, and may it not be possible that gold will appreciate too rapidly to be a good standard of value in the future?—I cannot say that that is not possible, but I protest against its being called a standard of value. The metals are not standards of value except to this extent, that there is no better standard. They are things that fluctuate in their exchangeable value, and therefore they cannot be standards; the only reason for calling them a standard of value is that there is no better. What they are is this, they are materials of the circulating medium. That is what they are, and what they are ought to be considered.

8921. But contracts for payments extending over a long time are generally made in terms of gold or silver?—Yes, and for those contracts they are in a rough way intended to be a standard. In that sense you may not unreasonably use them as a standard of value, but it is only because, as I have said before, you have no other, and I quite agree if the circulating medium were made up of two metals, though the fluctuations might be more frequent, as to the value of any part on account of the greater or less production of either of them, yet as a whole, inasmuch as the bulk would be greater, I suppose, as a whole, the fluctuations would be less upon each occasion.

8922. (*Chairman.*) I suppose you would not dispute that that substance would form the best standard of value, using the term in its common acceptance, which would least vary in value from any causes inherent in itself, or relating to itself?—Well, I should be very much inclined in answer to your question to agree; but you must always bear this in mind, if you would have a definite ratio between gold and silver, and you get so many countries to agree to it, and to bi-metallism in its full sense, the result is that the total circulating medium of the world is made up of the two metals, and whatever has a tendency to raise or lessen the value of one has a tendency to raise, therefore, or lessen the value of the bulk, and inasmuch as you would have two things, the production of which varies in facility, you would have two causes for instability, and the only set off against it would be that, although you would have more frequent causes of instability you would have a larger bulk to be operated upon, and the fluctuations would be less.

8923. (*Mr. Barbour.*) Can you give any reason why gold and silver should have altered in relative value so much as they have done?—In the first place (I cannot help thinking) the unfortunate demonetization of silver in Germany, in Holland, in Italy, and to a very large extent in France, and in the United States, where they have taken to token currencies.

8924. You think that is the chief cause?—Yes; I do not know that there has been a very great extra production of silver to cause the difference, and of course I do not think gold has anything to do with the case. I think gold has remained stationary in price.

8925. Gold as against gold has remained stationary?—Yes; the real exchangeable value of gold has not diminished or increased.

8926. But gold will purchase more now than formerly, will it not, taking things all round; that may be due to cheapening of the production of commodities, but gold will purchase more, will it not?—Certainly; it will buy more iron, it will buy more silver. I was going to say it will buy more wine, but I am not quite sure about that.

8927. But still if you take the average of things all round it will buy more, because wine is a small portion of the world's goods, though perhaps an important one?—Well, I should say in the same way, a large emerald has got a larger purchasing power than it had. I know it is not currency.

8928. You would not use an emerald as a standard of value?—No, and I do not call gold so either, any more than can be helped.

8929. I think that your evidence is to this effect, that while you do not deny that there are some benefits to be derived from fixity of value between gold and silver if it came, still you do not think it would be worth our while to change our standard on the chance of obtaining them?—Certainly, I do not think it would be possible, and if the ratio were to be $15\frac{1}{2}$ I am quite sure that it would not be. I have a misgiving about that. Let me tell you there is a thing which you have not mentioned, which I think is a very important one, whether bi-metallism would cure it or not. I do not know, but the expenditure of the Indian Government being to very considerable extent in gold, and the taxation being in silver, one can see very clearly that the cost to the Government of India is greater than it was before, and unfortunately, until the silver falls in value in the interior of India, you cannot augment taxation, I am afraid without difficulty.

8930. That is, as regards the Government of India, a certain difficulty?—Yes, it is undergoing considerable loss, and I do not see how it is to set itself right.

8931. It has been suggested that if gold and silver came to be used as money at a fixed ratio, gold might ultimately disappear from the currency, or that it might be given a value different from the legal ratio and be used for special payments. I suppose that might happen?—I am a firm believer in the Gresham law.

8932. The cheaper metal driving out the dearer?—Yes.

8933. Gold might get so scarce that the market ratio differed from the legal one?—If there was bi-metallism?

8934. Yes?—No, I think not.

8935. You think it would not?—I think it would not. A professor of political economy was very much afraid that some such thing might happen, but I said to him, you are aware that the supposition is that such a number of mints are parties to this transaction; you are afraid that the gold would be taken away. Where would it go to? Who would buy it? Well, he was compelled to confess he could not answer the question. It was a tolerably obvious one. I do not take any great credit to myself for having put it, but it seems to me tolerably clear if you have so many mints engaged in this matter that they are almost monopolising customers, you have got no other customers for them. If you have got another customer for them your bi-metallism goes to the ground; but if you have no other practical customers for them it seems to me that the ratio would be preserved and that neither metal would desert a country. Just allow me to make this remark while I think of it. I have been asked whether the same thing could be done with beef and mutton; whether there could be a definite ratio between beef and mutton so that whenever beef was sold at nine pence a pound mutton must be sold at ten pence. The answer is, no, because there are so many consumers of beef and mutton that you could not get them into that agreement. Beef and mutton have a value in themselves which is not of an artificial character like currency, but you might possibly establish a bi-metallism with a definite ratio which would continue between gold and silver if the sufficient number of consumers would agree to it; but you could not establish a ratio for articles where there are so many different customers as there are in the two things that I have suggested.

8936. I do not know whether you are aware that Locke's opinion of the best standard was this, that silver should be coined, and silver coins be the legal money; that gold should also be coined, but that there should be no ratio between the gold coins and the silver coins; and that the gold coins should pass for whatever anybody chose to take them for?—I am afraid I must give the same answer as I did before. I have the very highest reverence for Locke,

Lord
Bramwell.

28 Nov. 1887.

Lord
Bramwell.

28 Nov. 1887.

but I do not think his opinions have got much to do with the matter in hand:

8937. But Locke wrote upon the currency at a time when there were a great many difficulties, and I believe it is very generally admitted that his opinions were very valuable, and had a great influence in guiding the government of the day to a sound decision, and therefore it is, I should say, worth while considering what his opinion was on this question, although circumstances have changed since his time?—I merely mention to excuse myself not knowing more about it than I do. I think this question must be discussed on other considerations which could not have been present to the mind of Locke.

8938. It has been put forward as a great objection to bi-metallism that if you adopted a legal ratio, the legal ratio and the market ratio might be different. You say that in your opinion they would not. So far as your evidence goes that ends the matter; but as regards other persons, it is desirable to point out that if that state of affairs arose to which they strongly object, we should merely have got to a currency system which Locke thought would be best of all?—But if there was a difference in the value of the two coins other than the ratio, that is to say, if the sovereign was worth more than five four-shilling pieces, and people would give more for it, and they were at liberty to do so, as Mr. Gibbs says, they ought to be, why the answer is, there would be an end to bi-metallism altogether.

8939. But we should then have got to that state of affairs which Locke thought would be the best of all?—Well, you had better say so at once; instead of having bi-metallism, use one metal and stamp the others with an ounce weight, two ounce weight or so much, and let them be the subjects of purchase and sale.

8940. The one metal would be legal currency, and the other would be a money merchandise. Do you think that system would work well in practice?—I do not think it would work; I am at a loss to see the good of it.

8941. It would give all countries the same standard, the metal coined and made current by law would be the standard everywhere; it would prevent fluctuations in exchange between two countries?—If you were to make England mono-metallic in silver, and allow coins of gold to be bought and sold at the price people thought fit to give and take for them, I cannot see what good would be done.

8942. Well it would give all countries the same standard; silver would be the standard everywhere, and it would prevent fluctuations in exchange between different countries?—Well, then I think it would be attended with this, that people dealing with us now deal, knowing they will be paid in gold, and they would then deal knowing they would be paid in a metal which fluctuates very much in value.

8943. But I have been assuming that silver would be the standard everywhere so that it could not fluctuate as regards itself?—Besides there is another thing, as I understand, the object of bi-metallism is to raise prices.

8944. Some people have said it would prevent an evil, a fall of prices caused by appreciation of gold?—There is no appreciation of gold, and therefore the reason for it does not exist.

8945. You have heard it said that in modern commerce gold is less and less used every day; business is done more and more by credit and paper?—Yes, certainly; most remarkably so.

8946. But I suppose there is a limit to that?—I was going to say, I hope you will not think me rude, I suppose there is a limit to everything. Since I have been living near two little towns in the country, a branch bank has been established in each of them.

8947. I merely wish to put the matter in this way, that it is conceivable that gold might become so scarce as not to be suitable for the standard even though great economy in the use of gold were attained?—I do not think so. I think if that magical wand were waved, of which I think we heard a little while ago, and every sovereign became half the size that it was before, it

would do its business quite as well as now or nearly; I do not think it would be as good as it is now, because I think the present is a convenient size to have. Of course the proportionate wear and tear would be greater, and no doubt it would rise in value as an article of use. For instance, watches and what not.

8948. But still there must be a limit to the reduction of gold which would take place if it is to continue to be a good standard?—If you had a sovereign reduced to the size of the threepenny piece I suppose it would be a nasty thing to finger.

8949. But besides that there would be a limit below which you could not reduce the gold reserve in any country. For instance, when the gold reserve became so small that a ring of capitalists could operate upon the money market in order to make gold scarce, then you would be approaching that limit?—But I do not believe in a scarcity of gold in that sense.

8950. It is theoretically possible, but practically you think we need not fear any such thing as that?—No, I will utter a paradox if you will allow me. I think every country has as much gold as it wants, and no more. I think if 50 million sovereigns were paid into Her Majesty's Treasury here at this moment the consequence would be a small rise in prices, and after a time the sovereigns would make their way out of this country, and there would be more in France and more in Germany and more elsewhere, and probably the value of the gold would not very much rise all over the world; on the other hand, if by any chance 50,000,000 were taken from us, the effect would be we would send our goods abroad. A smaller price would tempt us abroad inasmuch as when that price came here it would be of a greater value than it was before. I believe every country has as much gold as it wants.

8951. Has its proper share of the gold of the world?—Has a share of gold sufficient for its circulating medium, considering its wants; that is to say, its banks, its notes, its credits, and what not.

8952. (*Chairman.*) Do you think that now the prices of commodities in different countries are so much more linked together by reason of immediate connexion by telegraph, and so on, that the same shifting from one country to another of a certain amount of bullion would not be as likely to affect prices as it was before?—I do say that. A country wants as much coin as will enable it to do the circulation of its commodities. If by a chance a quantity of that coin should go, there would be probably a small fall in prices. There would then be an extra tendency to export and get money for the things exported, and so supply that deficiency which existed.

8953. (*Mr. Birch.*) I gather that you are of opinion, after giving every attention to the question, that as far as England is concerned, it is better not to attempt to interfere with our present monetary system as regulated by the law of 1816?—That is my firm conviction.

8954. Still you seem to think that there would be no great difficulty in arriving at an understanding with regard to fixing a ratio between gold and silver likely to be maintained under all circumstances?—I think there would be great difficulty in coming to an understanding with other countries.

8955. I understood you to say that you did not see any great difficulty?—Well, I cannot tell. I suppose that the United States and France are willing to discuss this matter with Germany; but whether they would agree upon terms I have the very greatest doubt. And what I meant to say also was this; it seems to be a very difficult thing to say that we could agree with a sufficient number of gold purchasers to insure the continuance of the agreed ratio.

8956. (*Chairman.*) I understood you rather not to speculate so much on the possibility of our coming to an agreement as to say that if we did come to an agreement with a sufficient number, bi-metallism was practicable?—My difficulty was the sufficient number.

8957. (*Mr. Birch.*) Then I said, supposing a ratio fixed, would you feel certain that no circumstances could arise to induce nations to separate themselves from the agreement as the Latin Union did in 1876?—It would be utterly impossible to say that that is impossible.

8958. And probable rather?—And probable. Suppose we went to war with any one of the countries and they thought that by departing from this agreement they would do us a mischief, they would do so. An agreement to the contrary would be like boys fighting under an agreement that there would be no hitting in the face.

8959. If the production of gold has not increased at the ratio of 20 to 1 of silver, is it not probable that if you raise the value of silver to $15\frac{1}{2}$ to 1, there would be less inducement to produce gold?—Certainly you know it is manifest that that rise in the value of silver would have a tendency to lower the value of gold. Perhaps the gross value of the two together would not be greater than it was before; silver rises, gold falls. Well then the inferior gold mines or gold works go out of work.

8960. Now you see we give 20 pieces of silver for one of gold, and then we propose to give $15\frac{1}{2}$, consequently there would be less inducement to work the gold mines?—Certainly, and more inducement to work poor silver mines.

8961. You agree with Lord Liverpool's view that for a country in the position of England, gold is the best measure of property?—I am afraid I must make the same answer to you that I did before. I am sorry to say I have not studied Lord Liverpool's view very much.

8962. The alteration in the value of silver proceeded in no way from any action on the part of England?—I should say certainly not; I never heard it suggested that it did.

8963. It was by the action of the Continental Powers, with which England had nothing whatever to do?—Certainly.

8964. And do you think it advisable in any way that England should subject herself to foreign Powers in any matter connected with her monetary arrangements?—I think she would manage her own affairs better for herself than anybody else would.

8965. (*Mr. Chaplin.*) Did I understand you to say that the demonetization of silver was brought about by what might be called natural causes in France and Germany?—I think I used that expression, but it was not a very satisfactory one. What I meant was, it was not brought about with a view to raise the value of silver or gold, or depreciate the value of silver; it was brought about for currency purposes by the Germans mainly.

8966. It was brought about by the action of foreign Governments and by legislation?—Yes.

8967. You saw nothing objectionable in that?—It seems to me that they had got a serviceable currency in silver, and the effect of what they did was to purchase gold and diminish the value of the silver that they have now in their coffers. They cannot sell it. They seem to me to have been losers by the transaction.

8968. But apart from its wisdom, you see nothing unfair or objectionable in that way?—Not the slightest.

8969. Then you would see nothing unfair in what is called its rehabilitation?—No. Well you could not call it unfair. Every nation has a right to do that which is best for itself, and if the Germans thought fit to have bi-metallism in their own country, why so be it, with all my heart, but I should rather like to see them try the experiment.

8970. And would the same argument apply to this country?—If, as I said before—possibly you do not remember—if for a *bonâ fide* currency purpose bi-metallism was thought to be a good thing, I do not see that anybody would have a right to object to it. The man who stipulated for payment in gold in a mono-metallic country, did not stipulate that the currency should continue mono-metallic, in my opinion. All he stipulated for was that his gold should not be

depreciated in value for the benefit of his debtors and to his detriment.

8971. And that statement of opinion of yours would be quite irrespective of the ratio which might be arrived at?—Yes; quite so.

8972. You doubted, I think you said, the appreciation of gold, because if it had appreciated naturally, the fall in prices would have been universal?—Well, subject to this qualification, you know that there are some things that might rise in price of themselves, and therefore there would not be a fall. For instance, take my case of the dancers; if there was a scarcity of dancers they might rise in price, I suppose.

8973. You quoted another commodity which had not fallen. I think you said we pay as much for labour. Are you well acquainted with the condition of the labour market?—Certainly not; I cannot tell.

8974. Then you would not dispute the evidence given us by people intimately conversant with the working classes, that labour has fallen very considerably?—Since when?

8975. Well, the dates that were given us, between which a comparison was made, were the five years before the demonetization of silver, that was before 1873, and the last five years before the present time?—And do they say that the wages of labour are less now than they were five years before the demonetization of silver.

8976. Yes; the evidence amounted to this, that after allowing for the buying of commodities cheaper, the loss in real wages was something over $12\frac{1}{2}$ per cent.?—In the first place, I cannot but have the very greatest doubt about it, because it certainly is contrary to the opinion of everybody, that the labourer is better off than he was; not only that the exchangeable value of his labour is greater than it was, but there is another thing to be said about it. Why make a comparison between five years before the demonetization of silver and five years now? What happened during the first five years after the demonetization of silver, because if the gold rose it ought to have risen then?

8977. I am speaking from memory; I think the fall was described as gradual throughout; but that was the evidence that was given by that particular witness. But in addition to the loss in wages, it was also stated that there was at least 10 per cent. of the artisans out of employment altogether?—At the present moment I have not the slightest doubt in the world that there is some distress, and that some labourers are suffering.

8978. I should like also to call your attention to the last number of the "Board of Trade Journal," and in that is published, for the month of November, a return prepared for the Kent and Sussex Labourers Union, and the effect of this return is as follows: It makes a comparison between the numbers unemployed and the rates of wages with those which prevailed in 1880, and then it says: "From this it appears that many more labourers are now without employment than there was seven years ago. It will also be seen that not only rates of day wages, but also piecework prices, have been during the same period materially less." That is the evidence with regard to agricultural labourers in the south of England?—I am not able to express any opinion upon it except in this way, that there is not the slightest doubt in the world that the condition of agriculture is such, partly from the changes in cultivation, partly from the poverty of the farmers, and their distress in a variety of ways, that there is less work for agricultural labourers than there used to be. Well, they shift about, and look for employment, and compete with those who were formerly carrying on other trades and occupations, and therefore one might suppose that that would bring about a fall in wages. One might suppose that that would be a natural consequence of it; but what I meant to say was, that it did not seem to me, looking at the wages paid to labourers, that it would be in any way traced. I thought they were so much better off since the commencement of the time when it was said gold began to appreciate, that I thought I was

Lord
Bramwell.

28 Nov. 1887.

Lord
Bramwell.

28 Nov. 1887.

justified in saying—perhaps I am not—that there was not a fall in wages.

8979. Then I gather now that you admit that we are probably paying less for labour than we were?—I cannot contradict any facts; I have not the statistics sufficiently in my mind.

8980. (*Chairman.*) But that would not apply to all labour, would it,—domestic servants for example,—and a variety of classes of labour which all ought to have fallen on the theory of the appreciation have not fallen?—No.

8981. (*Mr. Chaplin.*) I think you admitted that the present system may be prejudicial in dealing with silver countries?—I cannot deny that it is because gentlemen who have come before you who do trade with silver countries, who are entitled to respect in every way for intelligence and good faith, will tell you that there is an inconvenience.

8982. But you hold that whatever relief might be gained in that matter by the adoption of bi-metallism would not be compared with the mischief it would do to us as a whole?—That is my opinion as far as I can form a judgment on the subject. I have no doubt of the question of the mischief.

8983. Then you say that undoubtedly it would be very injurious to us as a creditor country. That, I think, is your first objection?—Well, let me say not the first objection; I do not know which is the stronger one of the two—altering the value of every debt that is owed in the country or altering the value of every debt that is owed out of the country.

8984. But altering the value of the debts that we are owed out of the country would be very injurious?—I think so.

8985. But would not these objections to the adoption of bi-metallism be more than compensated for by the advantages which the bi-metallists claim for it, supposing they could prove their case?—I think not.

8986. You have studied their case, of course?—Yes, I have read their case.

8987. And you have come to the deliberate conclusion that the injuries would be greater than any advantages that could be derived from it?—I do, without a misgiving; and it seems to me that the great advantage that they would get would be a lowering of the value of gold, which, as I say, I think would be mischievous. But they say if you lower the value of gold, if you raise prices it would create an immense quantity of trade. In my opinion it would do nothing of the sort. I cannot see how it would have that effect, except this—this of course may possibly happen: I have always thought as far as the world is concerned the discovery of a great gold mine, or a great silver mine, was a bad thing. It set people digging for the metal, getting the metal instead of producing consumable articles, and the only consequence was that you get a bigger coin to do your circulating business than you had before, and the illustration which has always occurred to me is this: Suppose that by hammering a sovereign for a week you turn it into two sovereigns. I do not know any chemical process by which it could be done; but if I might put an impossible hypothesis, what would be the consequence at the end of the time? You would have had everybody hammering at gold, take it to be done in three days, and would you be the better off for it? If a gold mine is discovered in a particular country it would be very good for that country, because by means of it they would be able to get many other things from other countries. Forgive me for that long introduction. It seems to me that if you raise prices it may be that there is a temporary spurt given to trade which is very beneficial to those who are producers and manufacturers, but then it seems to me that it is very mischievous to those who have to pay extra sums for it.

8988. And do you think that the great discoveries of gold in California were a disadvantage?—To the world at large. I do not think the world gained anything by it. You must always bear in mind that gold is an article of consumption. You have gold watches

and gold plates for false teeth and so forth, and gold decorations for your houses. So far the world is a gainer by cheap gold; but so far as currency is concerned, I do not see that the world is a gainer by cheap gold. California gained very much by it.

8989. Was not there a general increase of trade and prosperity in this country after the discoveries of the gold?—That would be so for the reasons I have given. Suppose I were to land in the Isle of Wight with a millions overegns. I am going to spend these million sovereigns. I should create a great quantity of business in the Isle of Wight, which after a time might spread to Hampshire and possibly be traced to London.

8990. Would not that be a general advantage?—It would be; but supposing, instead of having the sovereigns dropping from the clouds in vast bags, I had a lot of people digging them out of the earth. I believe it is said that gold mining does not pay, that if you look at all the mines and all the gold got you would find it did not pay; but if you alter the position of people and give one man more than he had before, and to a certain extent take away from another something that he had, why you may create a business between those two until their positions are to a certain extent restored to what they were before, but I do not know that any good would be done by it.

8991. Then you cannot see that the adoption of bi-metallism can do any good whatever?—I think if you could raise the value of silver, it would be a good thing. I am bound to think it a good thing, because those who know all about it say it would be a good thing if you could have the two metals in such condition that neither of them should be subject to any very great fluctuations in value. For instance, as at present is the case with the silver, because in that case the man who at present exports from the gold country to the silver country is to a certain extent a speculator in silver. I suppose it must be, as those who know all about it say, that it would be a good thing to get rid of. As far as I can judge, it is not of very great consequence. Another thing undoubtedly would be good, if you could raise the value of silver you would diminish the expense of the Government of India. As to that I suppose there is no doubt. It is an Indian difficulty.

8992. And in those respects that you have mentioned you admit that it probably would be advantageous; but they do not compensate for the injuries that would be inflicted upon us as a creditors country?—That is my opinion, that is my strong belief.

8993. In other respects you do not think it would be useful?—I do not.

8994. And you disagree, generally speaking, with the contentions of the bi-metallists?—I do.

8995. (*Sir John Lubbock.*) To go back for a moment to the question of demonetization of silver by Germany. When she altered her currency she adopted, did she not, the then actual ratio of value between gold and silver?—I believe she had gold coins, though not many, and I believe she coined them in the relation of $15\frac{1}{2}$ to 1, before the demonetization of silver, did she not. I said that with reference to your word "adopt." I think it existed there before.

8996. I mean she made gold legal tender at the then existing ratio between gold and silver?—Yes.

8997. Of course it would have been a very different thing if she had instituted by law a new ratio of $15\frac{1}{2}$ to 1, when the market ratio was 20 to 1. You said it was not just; but there is this difference that what she adopted was the then ratio. If she had adopted a different ratio you would then, as I understand, consider that she would have been doing an injustice?—I hardly know. If Germany had adopted, to use your own word, a different ratio than $15\frac{1}{2}$.

8998. The present ratio of gold to silver is 20 to 1. What the majority of bi-metallists propose is that we should not only adopt bi-metallism, but that by law we should enact that the ratio should be not 20 to 1, but $15\frac{1}{2}$ to 1. That you would consider would be an

injustice?—I should say it would be attended with great injustice.

8999. And as regards India also, if I understand the general tenor of your evidence correctly, you would think it unjust to a debtor who had undertaken to pay a certain number of rupees per annum with a rupee of 1s. 5d., if the rupee should be designedly altered and raised to 1s. 10d.?—Yes, I certainly do. for the same reason. It seems to me that a man may fairly say, "I stipulated for payment in a metal which might be affected by currency arrangements for currency purposes, but which cannot fairly be affected only to make the situation of debtors more easy and creditors disadvantageous." That is an unfairness.

9000. And you would consider, as regards this country, that it would be extremely undesirable to make any change in our legal tender unless for some great cause?—I do.

9001. You said that if there was another use for gold and silver besides that for purposes of coinage, then bi-metallism falls to the ground; and I understood you to say that there are no definite facts as regards the proportion of gold and silver used in the arts?—No.

9002. But Mr. Soetbeer and others have estimated that out of an annual production of 43 millions of gold and silver no less than 17 millions are used in the arts; that is to say that something approaching to one half is used in the arts. The proportion is about 17 millions in the arts and 23 millions for coinage. Of course that is very rough; but assuming that there was anything like that amount used in the arts, in your judgment it would render it very difficult to maintain the ratio between gold and silver?—I do not quite see that the quantity used in the arts, as it is called, would augment the difficulty. I wish I had got a paper here that I wrote a good many years ago, which is in Messrs. Gibbs and Grenfell's book, in which I suggested a possible limit; there must be some limit. The ratio must be such that it would not be worth the while of the metal owner to use it for production in the arts, as it is called, rather than have it coined; but I think, subject to that limit, I was of opinion it was rather an elaborate matter that the amount of the ratio would not matter very much, for the somewhat similar reason. I am still of opinion that the quantity used in the arts cannot matter very much, that is to say, I think it is like the old story of the labour, as I think, as soon as it is wanted for currency it would be applied to that purpose, preferentially to its being applied to any other purpose,—either metal.

9003. My impression had been that the use of gold in the arts being so considerable, if you arbitrarily laid it down by law that while gold is now worth 20 times the value of silver in the arts, it should, for coinage purposes, be accepted at the rate of 15½ of silver, that the tendency would have been that gold would have been used more for the arts and gradually gone out of circulation?—I think that would be so.

9004. And therefore the tendency would be that we should practically become mono-metallic with a silver currency?—I have got this sort of notion that as soon as ever your currency has, what shall I say, more silver in it than it ought to have, gold will be diverted from the arts and applied to currency purposes; but I see your objection. I am not prepared to say it is not a well-founded one, I assure you.

9005. (*Mr. Fremantle.*) If that were the case, and gold were largely diverted to the arts, there would remain a superabundance of silver in circulation in this country, would there not?—Yes. There would not remain more than was necessary for the circulating purpose.

9006. But the amount of silver would be larger in proportion to the amount of gold?—Certainly.

9007. Do you think that would be an inconvenience?—It would be an enormous inconvenience.

9008. That is to say, so long as we keep up our habit of using metallic money in all small trans-

actions, it would be a great inconvenience that we should be deprived of our sovereigns and half sovereigns?—I would undertake to say that there is not a gentleman at the table who has got 10s. in his pocket in silver. No, they will not carry 10s. worth of silver.

9009. Lord Liverpool says in his letter that gold was adopted as the like standard of value, in consequence of the preference that people showed for it?—Yes.

9010. And you have no reason to doubt that that is the fact?—Not the slightest.

9011. If it is true, and it undoubtedly is, that silver was the original standard of value, is it not probable that, when Government regulations were made fixing the relative price of gold and silver, the price laid down as the price of gold followed the preference of the public, and that if an advantage was given to gold in the valuation, it was done because the public had shown a preference for it?—And the raising of the thing. I should say that would account for the preference perhaps.

9012. (*Mr. Barbour.*) Have you specially looked into that question as to whether Lord Liverpool was right?—No, I have not.

9013. (*Mr. Fremantle.*) Has it not at any rate been the case that since gold coinage was first introduced it has been the coinage of preference in the smaller transactions?—Preferable to silver.

9014. Preferable to silver?—I should say undoubtedly, and for the obvious reason that it is less weight to carry and less to count.

9015. I should like to ask your opinion on the principle of bi-metallism, namely, whether you consider that it is undesirable in principle to fix a proportion between gold and silver?—If no good were to be got out of it, I should say it was objectionable, but then they say that some good is to be got out of it, and one cannot conceive that that might not be. But then you must consider what good is to be got out of it compared with what mischief will result out of it. I do not say absolutely no good could result from a definite ratio between the two fixed for all time. I suppose it might. I suppose our trade with silver countries would be easier than it is now.

9016. But looking at it as a matter of principle, has such a thing ever been done in the history of this country as to fix the relative value between two articles, whether metals or other commodities?—Not that I know of.

9017. Would you limit your objections to bi-metallism to the question whether it were shown to be desirable or not?—I should look upon it as a whole.

9018. As far as the principle is concerned, you would not object to it?—It is so difficult to say. I should be very glad if we could get the good of it without that, because it seems to me that it cannot be attempted without a risk of failure either at the very moment of doing it or at some subsequent time.

9019. (*Sir T. Farrer.*) Do you think it is possible, considering what the habits of the city of London are, that if we had a bi-metallic ratio fixed by law merchants and bankers might insist on contracting that their debts should be paid in gold?—I suppose they could do that, but then what would happen suppose a banker discounted a bill of exchange and then wanted a payment in gold from the acceptor, the acceptor might say no.

9020. And from him silver would be legal tender?—According to the scheme.

9021. But supposing that the bankers, who have a great deal in their power if they choose, were to say, "We will not lend except on the understanding that you pay in gold, and if you do not pay in gold when the time comes you will not have money from us again"?—Mr. Gibbs says he would allow that. Of course it could be done. I suppose a banker could say to his customer directly he came in, "Gold in our dealings," then there would be a bargain which would be a lawful one and enforceable one; but what I am putting is this, supposing he discounted a bill for

Lord
Bramwell.

his customer, and not his customer had to pay but the acceptor, he might say, "I do not know what you agreed with your customer, but here is silver for you."

9022. Are you aware that that case actually occurred in California? That in California when the United States made their greenbacks legal tender the people refused to accept the greenbacks and insisted on doing their business in gold?—Yes.

9023. And are you aware that the case was taken into the Californian courts?—I do not know that, but I am quite certain that the Californian people carried the day. They succeeded; the greenbacks did not get into circulation.

9024. I may mention exactly how it happened. The first point was this, that the Californians made their contracts to pay in gold. The Californian courts held that those contracts were valid, notwithstanding the United States law that greenbacks were legal tender. But the courts held that they had no power to give damages except in legal tender, and consequently there was no remedy. The Californian Legislature thereupon passed an act to enable their courts to enforce specific performance to pay in gold. That law, I believe, has been upheld, and under that law all dealings in California have since been in gold. You are aware that their dealings are in gold?—I was aware that the Californians had managed to get rid of the greenbacks, and that they had refused to have them foisted upon them.

9025. Does not that show that under certain circumstances, whatever the law of legal tender may be, if people have a strong inclination to deal in gold rather than in notes or in silver, they will find means of doing so?—I suppose you might put your question in a more general way. If people are minded to do something which is contrary to the spirit or intention of the law, will they not contrive in some way or other to do it? Well, they will generally.

9026. And if that were done or done generally in the city of London, the result might be that there would be a premium or agio on gold?—Certainly.

9027. And that might lead to diversity between the practice and the law, which might be attended by considerable inconvenience?—Certainly; and it occurs to me that that permission to contract yourself out of the law is eminently calculated to increase the confusion which would otherwise exist.

9028. You said that if a man had a debt owing to him he would have no right to complain if an alteration of the currency were made for general currency purposes by which the value of his debt was reduced?—I should say not.

9029. I quite agree with you; but you would not deny, would you, that the consideration whether making an alteration in the currency law would have the effect of altering the value of all debts or not would be a very material consideration in making the alteration in your law?—A most material consideration, because it would be a consideration whether you should inflict a certain amount of grief and sorrow upon half the community for the benefit of the rest. I cannot but think that that would be a very important consideration.

9030. (*Mr. Barbour.*) You said in answer to Sir Thomas Farrer that bankers in London might insist on making their contracts in gold?—I suppose so.

9031. And there might be other bankers in London who would be prepared to make the contracts in the ordinary currency of the country without any stipulations as regards gold?—There might be. I am pretty sure if one currency was worth more than the other there would be both sets of bankers.

9032. And it is not unreasonable to suppose that customers might prefer to go to those bankers who did not impose any special stipulation?—I do not think they would care.

9033. Then as regards California, is it not the case that the people in California were practically unanimous in refusing to take greenbacks?—There must have been an enormous majority, or practical unanimity.

I do not see how otherwise they could have kept the notes out. Because if any number would have taken the greenbacks somebody would have been found to take them away from them, and so they would have permeated the whole society.

9034. So long as a country is practically unanimous in refusing a certain standard there is no possibility of enforcing that standard upon it?—I should say not. But if the majority of the people of this country came to the conclusion that silver was good for currency, that objection would cease. I do not say they are likely to come to that decision or that they ought to; but if the majority of the people of this country came to that conclusion, that objection would cease?—I think that if bi-metallism were established by law in this country and either metal made a legal tender, it certainly would be introduced into the country. Somebody would come with a quantity of it and tempt somebody who had something to sell, that man would get it, and he would go and tempt somebody else who had something to sell, and so silver would be introduced into the country.

9035. The real difficulty would be in convincing the majority of the people of this country that they ought to accept silver; once you had convinced them that silver was a good standard your difficulty would be at an end?—I do not think there would be much difficulty about it. A man would have a horse to sell, and another would say to him, "Well, what is the price of your horse?" "50*l.*" "Well, I have got "50*l.* in silver for you; you can have it if you like." I think rather than not sell his horse he would take the "50*l.*" in silver. And he would have "50*l.*" in silver, and he would go to his baker to pay his baker's bill, 20*l.* The baker might say, "I do not want all this silver." The man would say, "I have got nothing else." And the baker would take it. The baker would give some to the miller, and the miller some to the farmer, and so on, I should think.

9036. (*Mr. Montagu.*) Might I ask you, with regard to the legal difficulties that you apprehend through contracts being made for payment in gold, whether you are aware that abroad, especially in Italy, where bills are occasionally drawn and accepted payable in gold, such payments in gold cannot be legally enforced?—No.

9037. Do you know whether it is the same in any other countries abroad?—I do not know. I did not know it was the case in Italy.

9038. Then for all commercial purposes would it not be sufficient to engage to pay in legal tender?—Certainly, it would. There would be no other engagement it seems to me.

9039. It is stated that bankers might refuse to discount bills unless their customer agreed to repay them in gold. Do you think it at all likely that such bankers would engage to repay all the money deposited with them in gold?—I suppose that would depend upon what their customers insisted upon. If their customers insisted upon an undertaking to pay in gold, I suppose bankers, like other commercial people, might engage to do so. They would be very glad to have the option, no doubt.

9040. (*Chairman.*) Would not there be likely to be competition enough amongst the bankers to prevent that being done?—I think it is extremely likely. It was not my suggestion, mind you.

9041. (*Mr. Montagu.*) What possible object could there be in asking for gold if silver or bank notes based upon silver or gold were legal tender?—It seems to me that the question is based upon the supposition that, notwithstanding bi-metallism, there would be an agio upon one of the metals—a premium upon one of the metals.

9042. But why should there be a premium for internal currency?—I do not know. I do not say. I think it is extremely likely that there would be, for some reason or other.

9043. Can you suggest any reason?—Yes, I can suggest this, that you have not got a sufficient agreement among the people of the whole world using the

two metals to prevent one of them being partially driven out of the country by the operation of the Gresham Law.

9044. But if you had all the great Powers agreeing, you think that that would be a sufficient agreement?—If you had all the great Powers I should think it might be; but I do not know even then, unless you include among the great Powers China and India, that it would suffice, and that even then,—well of course one cannot suppose that the value of the metals would be affected very much in Thibet and Central Africa; but I am not quite sure that there might not even then be a tendency to get gold from gold-using countries with a view to its hoarding or something or other.

9045. You would see no inconvenience in the legal tender or the bank notes being based on the silver or gold, would you?—No; bank notes based upon silver and gold are done for two objects, one is, I suppose, in order that there might be a security for their re-payment, but another was this, to keep the currency of the country constant, so that whenever you issued a thousand-pound note after the 14 millions or whatever it was, and added the thousand-pound note to the circulating medium of the country, you withdrew a thousand pounds in gold. I think that was the scheme of the Bank Act. Lord Overstone gave evidence to that effect. Certainly if bi-metallism existed I should think the principle of that measure would be infringed if you issued a thousand-pound note on a thousand pounds worth of silver, because a thousand pounds worth of silver is not part of the circulating medium. It is a chattel. It is not like gold. But if you had bi-metallism, then you might issue your notes upon silver as much as upon gold.

9046. But there would be no personal inconvenience to the public whether their five-pound notes or one-pound notes were based partly on silver and partly on gold?—I suppose not subject to the remark I made that those silver certificates really are notes; they are circulating medium and notes.

9047. You mentioned that we receive about 100,000,000*l.* sterling annually from foreign investments. Do you not see a risk affecting such investments from a further great fall of silver; that is, in silver-using countries they might not be able to pay us the gold that they have contracted to pay us?—There is that possibility, but it would not arise from the fall in the value of silver; it would arise from an appreciation of gold, which I do not believe.

9048. Supposing the railways, and the other large English investments in India, with the rupee of 1*s.* 6*d.*, may find a greater difficulty in paying the stipulated interest?—They do; they certainly find a difficulty.

9049. And if the rupee were further to decline, do you not see some risk of their not being able to pay?—I never considered that thing, but I suppose one may put it as a risk in this way: I suppose the fares and rates in rupees would not increase, and I suppose it might happen that silver would fall so that the rupees paid for the fares would not be enough to pay

the expense and leave a margin for a dividend. That is a possibility. I should like to make one remark upon that. It is impossible to say, but it does seem very much to me as though silver had come to its bearings.

9050. (*Mr. Barbour.*) Do you mean that it is not likely to fall any further?—It is not likely to fall any further. Allow me to say that I give that with the greatest distrust. I know nothing of silver mining. Let me make this remark also. Some people have been very greatly alarmed because it is said that silver can be produced at 6*d.* or 1*s.* an ounce. But it is not the cheapest-produced silver that regulates its price. It is just like the old theory of rent, you know. The poorest silver mine pays no rent. If there is any other silver mine which is of greater value than that, they do not reduce their price to the consumer of silver in consequence, but they pay rent to the owner of the mine.

9051. (*Mr. Montagu.*) There is only one more question that I will trouble you with. Sir John Lubbock made a remark with regard to the consumption of gold in the arts. Would you not think that the consumption on balance would tend to diminish because of the use of old material in re-coining. Gold does not wear out like other things, and gold chains and watch cases and such like can always be used again. Do you not see that to compensate the possibility of gold going out of use there would be all the old material available. There is very little gold absolutely wasted ever in gilding silver?—I suppose some is actually consumed, some is lost, some is worn away.

9052. Yes, but the bulk of the gold used in the arts really would accumulate?—Yes, I should think so.

9053. (*Sir John Lubbock.*) Suppose the Indian railways scarcely paid their expense owing to a fall in the rupee would not the obvious remedy be to raise the fare so that the actual revenue would be the same?—Yes, it would, certainly; that is to say you can, but then the difficulty in the way of doing that is the same difficulty is that in the way of additional taxation—that the thing has not fallen in the country.

9054. Several questions were put to you rather seeming to imply that there was a possibility of bankers in London setting themselves against the law, against the general feeling, in the matter of these payments. Have you any reason to suppose that they would be likely to do so?—I should not think so. What is my opinion worth compared with yours upon that subject?

9055. No, but several questions put to you seemed to imply that, and you have not warranted any such opinion in any way, I think?—Not the slightest.

9056. (*Sir T. Farrer.*) Are you aware that shortly after the passing of the Bland Bill, which made silver legal tender in America, the banks of New York and the Government of the country came to an agreement between them that all the dealings between them should be in gold and not in silver?—No, I was not aware of that.

Lord
Bramwell.

28 Nov. 1887.

The witness withdrew.

Adjourned till Friday.

FORTIETH DAY.

Friday, 2nd December 1887.

PRESENT :

THE RIGHT HON. LORD HERSCHELL, the CHAIRMAN, presiding.

MR. D. M. BARBOUR, C.S.I.
MR. HENRY CHAPLIN, M.P.
SIR T. H. FARRER, Bart.

MR. C. W. FREMANTLE, C.B.
SIR JOHN LUBBOCK, Bart, M.P.
MR. S. MONTAGU, M.P., and

MR. GEO. H. MURRAY, *Secretary*.

MR. WILLIAM FOWLER recalled and examined.

Mr
W. Fowler
2 Dec. 1887.

9057. (*Mr. Chaplin.*) The general result, I think, of your evidence is this—or one general result—that you deny that there is any scarcity of gold, or that the fall in prices is owing in any way to that scarcity?—I have been unable to trace the connexion.

9058. And in saying that you agree with the contention of M. Cernuschi?—To that extent.

9059. You admit, do you not, that the demonetization of silver, and the refusal of the foreign mints on the Continent to go on coining silver, has, to that extent, thrown more work upon gold?—I am not sure. The effect of that operation was, I think, to lessen the demand for silver and to throw a great deal of silver on the market—that is, German silver; and at the same time, practically to take away the old demand; but as to its putting more work on gold which can be defined and measured, I do not say that it did.

9060. Is it not the fact that, prior to 1873, all the gold and all the silver that could be brought, and that was brought to those mints, was coined, and that they equally performed the functions of money?—Yes; but then you see so much depends on what you consider gold does in the matter of exchange. I have contended throughout my evidence that the function of gold was much more as a measure of value, and, what I may call a balance, than as the operator in the exchange itself. That is effected by credit; the great bulk of the transactions is done by credit and not by gold. But whatever the functions of gold were, those functions before 1873 were equally performed by gold and silver. I do not know that you can draw a very fine distinction. I understand that in Germany silver is legal tender now, and in France silver is legal tender, so that gold and silver are operating in Germany and in France now.

9061. But it is the case, I understand, that since 1873 silver is no longer freely coined on the Continent, and the work which formerly was done, partly by gold and partly by silver to that extent, now falls upon gold alone?—Yes; it is quite true, in one sense, but I can only repeat that I consider that the work performed by gold is a very small work.

9062. But whatever the work is, that is done by gold, whether it be small or whether it be great, the same amount of gold does more and goes further than it did before?—No, I do not agree with that, because you find from the returns that the amount of the reserves of gold has increased very much indeed since 1873.

9063. You mean that there has been more gold coined since then?—The amount of reserves of gold has very greatly increased since 1873.

9064. I did not perhaps explain my question quite as clearly as I ought to have done. When I said the same amount of gold, I meant that the amount of gold which comes from the mines and is coined goes further and does more work than it did before?—I do not think it would be possible exactly to define that. Each individual bit of gold tends to do less and less work from the development of credit; all over the

world, at least all over the civilised world, keeping out of view such countries as Russia.

9065. And yet I understand you to say that in addition to the work which gold did before, it now does that portion of the work which was done formerly, and would still be done by silver if it was still freely coined in the same way as gold?—Yes, if you consider that an important point, I daresay that is true, but I do not myself think it is of very great consequence.

9066. But is not that to say, that to that extent there has been a distinct appreciation of gold, although it is no scarcer than it was before?—Not a bit. I do not think it has made any appreciation at all.

9067. I think you said that you agree with M. Cernuschi in some things that he said as to the effect of the exchange?—I said that I agreed to some extent with what he said. I admit entirely that the fall in exchange does give a benefit, in certain events, to the exporter from the East, but I do not agree with the way M. Cernuschi puts it.

9068. I think your opinion upon that point was this: that the exchange did give a certain bounty to the exporter from the East?—Yes, in certain conditions of trade, I think it is so, but I may perhaps call your attention to this fact, that there are only two articles which are of any consequence exported from India which are produced in this country. Those are wheat and wool. All the other articles are not produced here to any important extent, and therefore the greater the benefit to the exporter the better for the English consumer. I think that is a very important distinction.

9069. M. Cernuschi's contention, I understand, is this, that the present state of things acts like a protective tariff against goods imported from the West into the East, and as a bounty upon goods exported from the East to the West?—Yes. It is very difficult to make that square with the facts. If it were so you ought to have an increase in the export and a decrease in the import. You have had an increase in both, and the proportionate increase of the import from England to India is greater than the increase of the export from India to England in a certain period of years. The figures are these: 1870–5 the exports from India were 285,000,000; imports into India, 161,000,000; net exports in that period, 124,000,000; 1875–80 the exports from India were 312,000,000; the imports into India, 188,000,000; net exports, exactly the same, 124,000,000; but in 1880 to 1885, when the exchange had fallen so much more, the exports from India were 411,000,000; the imports into India, 253,000,000; net exports, 158,000,000. And the five years 1880–85 show, as compared with the years 1870–75, an increase in exports from India of nearly 45 per cent., and of imports into India of more than 50 per cent.

9070. In this last pamphlet of M. Cernuschi's, at page 26, he says, "Let a bale of English merchandise be forwarded to Bombay, on which, if 10,000/

Mr.
W. Fowler.
2 Dec. 1887.

"be not made, it is a losing affair. At the time of the bi-metallic par, with the rupee at 2s., the 10,000l. were realised if the bale sold for 100,000 rupees. With the rupee at 18d., the bale must sell for 133,000 rupees." Now if that is so, English merchandise, it seems to me, cannot be sold unless the price is increased by 33 per cent. under the present regulations?—But you forget the fact that the English merchandise has fallen in England so enormously that you are able to sell in return for the exports what you could not otherwise have sold. That is a hypothetical case. It does not deal with the facts of the situation at all.

9071. But he is taking a bale, as I understand, of English merchandise, which is now worth 10,000l. at the present price of goods in England, and he appears to me to point out that it cannot be sold in India unless the price is increased by 33 per cent.—I am not going to quarrel with anything that he says as regards this particular hypothetical case, but what I say is that the fact is that we are sending a great deal more, in spite of this fall in the exchange.

9072. But as far as the fact that he states is concerned his argument is correct?—I daresay it may be correct. I have not examined it minutely. It is a question of calculation. A certain hypothesis is laid down, and he says a certain result works out.

9073. I was anxious to get the results of your critical examination upon it?—Well, I have only this moment taken it up; I daresay it is right enough, but I do not think it has much to do with the case. We have to deal with the situation as we find it.

9074. Quite so, but assuming that argument is correct, does it not prove that a bale of English merchandise which is now worth 10,000l. at the present price of goods in England cannot be sold in India unless the price is increased by at least 33 per cent., and therefore there is a protective duty to the extent of 33 per cent.?—But the simple answer to that is, that we are sending more English goods than ever. I do not see how you get over that.

9075. You admit that it does have that effect upon his hypothesis?—If you take a certain supposition, and leave out all the other facts, you may prove almost anything.

9076. Then, would you mind going to the next paragraph at the top of page 27, where he says, "Let a bale of Indian products be forwarded from Bombay to England, on which, if 100,000 rupees be made, it is a profitable affair. At the time of the bi-metallic par, with the rupee at 2s., the bale, in order to make 100,000 rupees, had to be sold for 10,000l. With the rupee at 1s. 6d. it is enough to sell it for 7,500l.; it is quite an upset. The prices of English merchandise must be increased 33 per cent. in India and the prices of Indian products, destined for England, may be lowered 25 per cent." Indian merchandise, therefore, can be sold in England at 25 per cent. less than when the rupee was at 2s. The rupee, therefore, at 1s. 6d. does act like a bounty of 25 per cent.—I am not quite clear about that; I think it acts to a certain extent as an assistance to the exporter, and I should like to take what the Indian officials say on this subject, because they have examined it from a bi-metallic point of view, and I will read a passage in Mr. O'Connor's memorandum. He sums it up at page 4 of this paper that I have in my hands, paragraphs 15 and 16. "The exporter therefore has not gained directly by the fall in exchange, he has simply been saved from a certain portion of loss. If the exporter has gained anything, if the cultivator has received a stimulus to increased production, other causes for these facts must be looked for. These causes are to be found in the reduction of cost of transport from the field to the port of shipment, and from the port of shipment to the consuming market by the extension of railways, by reductions in railway rates of freight, and by reductions of sea freight." That is his deliberate conclusion, and he bases it upon this re-

markable fact that you see no connexion between the fall of exchange and the increase of exportation; that in the recent years, when the fall in the exchange has been the greatest, the exports have tended rather downwards, and, therefore, it is impossible to say that it acts in the way you speak of. If it were so you would have a very direct connexion so that the lower the exchange the more the export would be, but it is not so, and I do not see how you are to get over that.

9077. Then it seems to me that the only way in which you are able to meet the argument as stated by M. Cernuschi consists in the fact that the exports from England are greater than they ought to be if his argument were right?—The exports from India are less than they ought to be if his argument is correct. If his argument is correct it seems to me that the exports ought to have been a great deal larger. The true explanation may be that the prices which are the governing factor in exports and imports have much less to do with the question of the money than we suppose in our ordinary ideas about these things.

9078. Then with regard to M. Cernuschi's statement, I think I sum up your opinion correctly in saying this: that theoretically no doubt his argument is correct, but that it is not borne out by the facts which ought to have followed upon it if it is correct?—If there was nothing to control the theory which he lays down, no other factors much more important, of which he apparently has lost sight. It has always seemed to me that there was, as Mr. Bagehot pointed out before the Committee of 1876, a bounty or an encouragement, or whatever you call it, to the export, from the fact that you can get a gold price in London, with which you can buy silver cheaper than you used to buy it for remittance to India, and that there has been a fall in prices in silver in India.

9079. Then you practically admit that there is a bounty from the exchange, but you contend that, even admitting that there is a bounty, we have no right to interfere with it by creating a fictitious value of silver, and that it would be hard upon India if we were to do so?—Certainly, and we have no reason to do it for this reason, that there are only two articles to which it would have any application.

9080. And your second contention is, and I wish to examine you afterwards on both these points, if I may, that even if we did interfere as regards India, and did abolish this bounty as regards India, we could not help it as regards Russia and other countries with inconvertible notes; and that in the case of the wheat trade, at all events we should simply be transferring it from India to Russia?—Certainly.

9081. Well, I want to examine you, please, upon both of those points, for one moment. In answer to question 8381 you asked us "to consider whether, if there be an advantage to the exporter in India, it is right for us to endeavour to get rid of that advantage by raising the rupee, not by any ordinary commercial action, but by a special action of this country interfering with the natural course of commerce and creating a fictitious value for silver." I do not quite understand what you mean by creating a fictitious value?—Well, if the natural course of commerce lowers the price of silver, and you say it shall not be lowered, we will put it up, if Government can do it; that is what I call fictitious.

9082. You mean the rehabilitation of silver would be what you would call giving it a fictitious value?—Certainly. Giving it a value as near as you can, the same as it had before and which it lost, largely owing to the action of other Governments, not our Government, for we had nothing to do with it.

9083. But have not we already given gold a fictitious value in this country?—No, I do not think we have.

9084. Why are we to be said to give a fictitious value to silver if we give it a status as money by law and not to give a fictitious value when we do exactly the same thing with gold?—It is fictitious in this

Mr.
W. Fowler.

2 Dec. 1887.

sense, that you ask us to take two metals into our standard instead of one.

9085. Then you admit that we have given a fictitious value to one?—I do not know that it is a fictitious value; but I do admit this, that if you suddenly said, you would not coin any more gold, you would probably reduce the exchangeable value of gold. Of course that stands to reason. A great country coining a metal and making it its measure of value, does give it its principal source of demand. No one can doubt that. In that sense, if you like, you may call it fictitious, only you must have something of that kind, some measure of value, or you get into utter confusion.

9086. But I still want to arrive at the distinction you draw between the right and the propriety of giving a fictitious value to gold and not giving a fictitious value to silver?—I say if the natural value of a certain thing in our commerce is a certain figure, and you say you would coin that stuff—supposing you said you would coin copper, it would give it a fictitious value. It would create a higher value than the ordinary value of the article. You are proposing to take into your standard a new metal, and you thereby make a new demand for it, which is not natural, but is fictitious.

9087. In the case of a new metal?—A new metal, and to a certain extent you do in the old, because I admit freely it is common sense that if you coin any metal and make it your measure of value, that is creating a demand for it which did not exist before. A better illustration, I freely admit, happened in 1873 when the German Government and the Latin Union altered their course of policy with regard to silver. The German Government threw a lot of silver on the market. There was no immediate sufficient demand for it, and it fell.

9088. Well, then, I think your reply comes to this: that we have an equal right to give either of these metals that value, which you call a fictitious value, but in your opinion it would not be expedient to give it that value in the case of silver?—Well, I do not use that word in any technical special way. Of course Parliament can do anything, except turn a man into a woman, and therefore it can make silver money if it likes, I quite admit that.

9089. Well, then, the second point on which I wanted to ask you was this: in answer to question 8382 you say, "Then I say if it be doubtful even if there would be a great benefit to the community, it would be extremely hard upon India to take from her any advantage that she may have." Why would it be more hard upon India to take from her that advantage which she now enjoys under this system, than to leave us in England under a disadvantage?—I am not prepared to say that it is a disadvantage.

9090. But the question was asked on the assumption that it was?—I never allow that. What I meant was this; that India in the luck of things, as it were, has obtained a certain advantage, and some people think that by that advantage she has put an extra burden upon England, and I think that it would be a serious thing for us, having regard to our duties towards India, to turn round and say, "We will take this advantage from you, because we think certain classes in our country are, to some extent, injured by it." I think it would be a very serious thing to do if that was the motive. There are other motives higher than this, about which I have nothing to say.

9091. You have always admitted that, provided that it was shown to be expedient and desirable on other grounds, these things being incidents in the transaction must be accepted?—On that supposition I would give it up.

9092. Your next point was, that even if we got rid of the difficulty in India, we could not get rid of the difficulty with regard to Russia and those countries, which have inconvertible notes. You said, "The difference would be this, instead of taking your stuff from India, which takes an enormous quantity of our productions and is part of our own territory, we should be taking the stuff from Russia, in larger

" amounts possibly, which puts very heavy duties upon our imports, and is generally not very friendly to us; and to compare the two arrangements I must prefer the present arrangement." Well, upon that I asked you, first, whether the depreciation of the rouble was not greater than the depreciation of the rupee, and you were good enough to explain to us that it was; and the depreciation of the rouble being shown to be greater than the depreciation of the rupee, I then proceeded to inquire (if the depreciation itself acted as a bounty) how it was that in the case of the country enjoying the larger bounty, the exports of wheat, which is what we are speaking of, did not exceed the exports from the country having the smaller bounty, and I quoted some figures and some returns to establish that fact. You replied that the returns to October were no criterion as regards Russia at all, and I understood you to contend, that later in the year, that is to say, in November and December, the larger amount comes in?—No, I beg pardon. A great deal comes in in the spring as soon as the Sea of Azov and the Baltic are open. Although the merchants know perfectly well what the probabilities of the crop are, the mass of the new crop of wheat does not get here till the following spring, excepting a certain portion that comes from Odessa all the year through.

9093. I got yesterday from the Custom House the returns for November, and to a certain extent they bear out what you say, because the return from Russia for November is valued by them as 420,000*l.*, as against 182,000*l.* for October?—But the real effect of Russia on the market is in the future, and a gentleman, who is the first man in the trade, said to me on Wednesday, "Russia rules the market."

9094. Of course, if your contention is correct that the figures for the present year afford no criterion of the imports from Russia, it is useless to pursue the argument; but upon the figures which are before us up to the present time at all events it would still leave that difficulty to be explained?—The real figures are: January to October 1885, 9,484,000 cwts; whole year, 11,975,000 cwts. Then you must not forget you have also Chili and Australia, which are growing countries. You have the Argentine Republic, which is rapidly advancing as a wheat-producing country, and all these countries would not be affected in any way by this change; so that all I contend is this, that you would not get rid of the competition of those countries, if you got rid of the competition of India.

9095. In the case of these other countries, at present their competition is not at all sufficient to regulate the market?—Well, I am telling you that at this moment Russia rules the market.

9096. I am speaking of those other countries. Chili brought in last year 1,700,000 cwts. and Australia brought in 738,000 cwts.?—But in 1885 Australia brought in 5½ millions, and I am not aware that the alteration proposed would affect the United States any more than that other great exporter, Canada.

9097. Is it not the natural assumption, which no one can dispute, that India sends a large quantity of wheat into the market, and she is enabled to do this in consequence of this bounty?—That raises a point of much importance. Four years ago I took great pains to investigate this question of Indian wheat and the railways, and I was a member of the Committee that sat in 1884 on that question, and I came to this conclusion, that if India were properly developed by railways nothing could prevent her from being a most important competitor in the wheat market, and I think that this question of the bounty is a very small matter compared with the development of India by railways, and unless you are prepared to say that you will not develop India for fear she should injure the wheat producers of England, my opinion is that India will have a still greater influence every year upon the wheat market of the world. At the present moment she is not so important as Russia. I did not assert or intend to assert that Russia would always rule the

market, but Russia rules the market this year and has overcome India from the circumstance that Russia had last year a most extraordinary crop of cereals.

9098. But when you say that Russia is the most important factor at the present moment, how do you establish that fact, because I do not find it at all borne out by the official returns?—The authority I have given is so high that I have not the least doubt of its accuracy. I admit that there are recent years in which Russia has stood below India, but if you take the other table that I have in my hand, the total amount that Russia has sent to all the world, the figures are not at all small. Take, for instance, the total exports of wheat from Russia in Europe:

	Cwts.
1880 - - -	19,185,303
1881 - - -	25,694,991
1882 - - -	40,071,741
1883 - - -	43,956,250
1884 - - -	35,531,250
1885 - - -	48,309,375
1886 - - -	27,853,604

(See Appendix VI.)

9099. Yes, but as regards the difficulty that you have pointed out to us, namely, that the getting rid of the alleged bounty in India would do us no good, because of larger Russian imports, I still want to know how you establish that in view of the fact which I understand you to admit, that, with a larger bounty enjoyed by Russia already, her imports have never greatly exceeded at any time, since the Indian trade really began, those of India?—It is quite true. I am not prepared to explain exactly why it has come about, but all I say is this, you have there an enormous granary of wheat, and if the effect of this change was to discourage the import of wheat from India, it would probably be to encourage the import from all these other countries which are perfectly able to send it to us. You cannot get rid of competition, and I am convinced that all you can do by the manipulation of silver will not take away the competition even of India in the wheat market.

9100. I do not think that we differ at all upon that point, but what I want to arrive at is this, is it not the case that you would take away the competition at the lowest price which is rendered possible by the alleged bounty; that is the point we want to arrive at?—I greatly doubt that. I doubt whether the bounty has anything like the effect you suppose upon prices.

9101. But you admit, I think, that it has some effect?—I think in certain states of the market it may have an effect, but a great deal will depend upon the condition of things in India itself quite independently of silver. If, for instance, you have an enormous harvest in India you might be able to send wheat at a price at which you could not send it if there was a moderate harvest, and therefore you cannot lay down a proposition that this bounty operates always with the same force. At one time it would operate much more than another, and Mr. O'Connor's opinion is that it is not an important factor at all. I am rather inclined to think more of it than Mr. O'Connor does.

9102. Would you mind reverting to M. Cernuschi's pamphlet on this very question of wheat. At the bottom of page 28 he says: "To reckon the price of Indian wheat sold in England there is no need to know what the production of that wheat costs, nor what the carriage to the shipping port costs. It is enough to know the price at which that wheat can be sold in England, and what has been laid out in maritime transport and sale expenses. Let us take the price of 33s. per quarter, maritime transport and sale expenses are known to require an outlay of 6s. per quarter." Is that a correct statement as far as you know?—I should say that was rather below the mark.

9103. Then, "Subtracting 6 from 33 there remain 27, which at the exchange of 18d. produces 18 rupees. It follows that Indian wheat can be bought

"at 18 rupees on ship at Bombay, to be sold at 33s. in England. But to make these 18 rupees, if the bi-metallic par at 2s. per quarter still existed, 36s. would be required instead of 27s. The difference, 9s., which would have to increase the selling price if the bi-metallic par had not disappeared." Now, is that a statement of fallacy, and if so, can you point it out?—It does not accord with the facts. I am entirely of opinion that if I were to argue it out on my own head I should say that there is a very considerable bounty given to the exporter from India, but I cannot make that square with what I see is going on in the imports and exports.

9104. You cannot dispute the theory, but it is not borne out by the facts?—The reason being, I apprehend, that all the facts are not taken into account.

9105. I think you said one of your objections to the adoption of the bi-metallic proposal was that you were afraid that it might raise the prices of commodities?—I do not know that I said that except as a consequence of a possible inflation. I did say that I thought there might be inflation. I am not prepared to prophesy that it would be so, but I think my general argument would be all the other way.

9106. Would the general rise in prices be necessarily an evil, in your opinion?—It all depends upon which side of the hedge you are.

9107. Taking people upon both sides of the hedge?—I am inclined to think that it is very doubtful. If I were a buyer I should think it was a bad thing.

9108. You are not prepared to assert an opinion that a rise of prices would necessarily be an evil?—It all depends, I think, upon the circumstances. I think that if a rise in prices arose as it did in 1871, 1872, 1873, in consequence of real prosperity in the country, arising from the miseries of our neighbours, I can conceive a rise in prices not injuring our own community at large; but in ordinary times I apprehend that high prices must be worse for the community than low.

9109. You may remember that in the Report of Lord Iddesleigh's Commission they assigned the fall in prices a very leading place as one of the causes of this prolonged depression?—Well, I am not prepared to agree with that.

9110. You differ from that?—I think that the process of fall is very nasty, and when you have got down to the bottom probably the country is better off. But if I am right in my view, the altering of money would not raise prices permanently, if that is what you want to do.

9111. But you have told us before that indirectly and temporarily it might?—It might; I would not prophesy about that.

9112. You have given us a great many reasons, as far as I could gather from your evidence, why there is no necessity for the adoption of bi-metallism, and why it would not have the effects that are anticipated from it, but I am not aware that you have pointed out any very special objections, except in this respect, that we are a creditor country?—Well, the first objection that I raised was that I thought it was in principle a wrong thing to try and create an equation of value between two articles; and that I was very doubtful whether it was a possible thing as a permanent matter; and one reason of that was, that this equation depends on the agreement of a number of people, and it would be very doubtful whether in the case of a real trouble that agreement would be kept, and if it was not kept it might land us in great trouble and confusion. That I think is a very important consideration. Then it seems to me that giving this value to silver—I dare not call it fictitious after what you have said—but this new value to silver might encourage silver mining and discourage gold mining very much, and lead to an excessive supply of silver, which might result in our gold going away and our becoming a mono-metallic country upon silver only. Mr. Giffen has expressed a very strong opinion to that effect. I am not going to prophesy how that would be. I should be very sorry to be so rash, but I think if it did occur it might be a very serious thing for the commerce of the

Mr.
W. Fowler.
2 Dec. 1887.

Mr.
W. Fowler.
2 Dec. 1887.

country; and in that connexion there is another consideration which is not I think unimportant, that the Indian people are great holders of silver, both in coin and in hoards, and if they took it into their heads, in consequence of our having given silver this large value, to turn out their silver and take our gold, we should very soon be stripped of all that we have got, so that again in another way we should be a mono-metallic country upon silver. Then there is another point. I mentioned that I was excessively puzzled as to what ratio you were to adopt supposing you were to do it. M. Cernuschi seems to be indifferent. He does not care what it is, whether it is 10 or 20. Mr. Gibbs says, as I understand him, that you must go back to 15½ to 1.

9113. Pardon me for interrupting you for one moment. Those are all admirable reasons against doing it which I admitted you had already told us; but what I wanted to know was whether you could point out any positive objection or evil results likely to flow from this when once it was done. When it was done whom would it harm?—Surely those very things that I have said are some of the possible injuries; and a preliminary objection is that you cannot settle the par between yourselves.

9114. Assuming that that has been done—if it could be done—I want to know what are the evils which are likely to flow from it?—Another objection is this, that all nations cannot be included if it were done. M. Cernuschi lays that down that India ought not to be admitted; he lays that down very strongly.

9115. Why is that an objection?—It is an objection, because I think if you were going to have one money it seems strange that you should leave out a great country like India.

9116. Well, but would not the effect of the bi-metallic arrangement be universal, whether India was left out or not; assuming that the gold nations, the United States, France, Germany, and England agreed to it? Was not the effect universal before?—The value of silver no doubt was maintained steadily before, but I only mentioned that to show that these countries are and will continue to be great users of silver, and it is not necessary therefore that we should take up silver, there being an ample field for the use of silver outside. Perhaps I ought not to have mentioned that, because it is not exactly an objection, but it is rather a point showing the non-necessity of the change now proposed.

9117. I admit you have given a number of very powerful arguments against it; I only want to arrive at the possible objections when it is done?—I think also that it would tend to discourage the exports from India and thereby lessen the power of India to take our manufactures and so would materially injure a large class of our people. According to the argument that I understand you to have used to-day, you lay great stress upon this export bounty. If it be so, it leads to a considerable increase of the exports from India, and therefore a large increase in the exports from England to India, and Mr. O'Connor says if you have great export you must have great import; and that is the universal rule of commerce—goods go against goods.

9118. What you mean is this, that it would interfere with the development of India, and so far injure India as a market for us?—You would injure India and England too, because India if she did not export, could not buy. Then supposing this alteration raised prices in England largely all round, as some people think, and with many bi-metallists the great object is to raise prices, it would discourage our imports into India in another way. The reason our imports have kept up so well has been their low price, but if we are to raise prices all round we should discourage the imports into India most seriously. As I pointed out to you just now the imports into India have, notwithstanding the rate of exchange, surpassed the exports from India in the proportion of increase during recent years.

9119. (Mr. Barbour.) But if at the same time that the gold prices rose here, the exchange rose too, the

silver price of English exports to India might not rise at all, so that there would not in that case be a discouragement; that is, there could be no discouragement to exports if there was an alteration in gold prices which was not more than sufficient to balance the alteration in exchange?—I cannot tell what the alteration in prices would be. Nobody can predict that. But I suppose you are right. Then I used an argument which I think has some force. The very best authorities think that the gold is overtaking the silver in production. Some think just the other way, but if these people are right, we shall get all you want without the trouble and risk of changing the whole of our currency system. I am old enough to recollect that everybody was extremely frightened because there was so much gold, and now I have lived to see the other fright coming on about too much silver. Then I am extremely doubtful whether the commercial community would accept the change—that is to say, you would have England doing what America is doing now—making bargains in gold. That is my impression. Mr. Currie said he was certain that that would be the case with him. Then if we were drained of all our gold, I think it might lead to most serious commercial disasters in our own country from alarm and panic. There is no country in the world which does such an enormous business with such a small basis of cash as we do. I gave you the figures of the circulation of 1845 and 1885 last time, and they are most extraordinary, showing how rapidly our business has advanced with hardly any increase in our cash, and therefore, anything that we did in the way of altering our currency which might have a tendency to create alarm, is, in my opinion, a most serious matter. Then I mentioned the view, that if the pound no longer meant so much gold, but meant gold or silver at the option of the payer, our commercial position would be seriously endangered as the great settlers of the business of the world; and I also referred to the position of England as a creditor nation.

9120. Why should we lose our commercial position?—I do not say we should lose it; I think there is danger. It might not have any effect; I am not going to prophesy, but it is one of those things that I do not feel comfortable about.

9121. Do you hold that our financial supremacy and our commercial position are a consequence of our having the gold standard?—I do not say that; but it is one of the things that has assisted; that everybody all the world over has known exactly what a pound has meant for the last 70 years.

9122. (Sir John Lubbock.) And would there not be a further fear that if we made one alteration we might proceed to make others also?—Of course there would.

9123. (Sir T. Farrer.) I propose to sum up the very valuable evidence you have given us, by asking you questions in the order in which they are put to us by our instructions so as to see what your answers to those questions would be. You are aware that we are instructed to inquire:—First, whether the changes in the relative values of the precious metals are due to the depreciation of silver, or to the appreciation of gold, or to both; and what are the causes of such depreciation or appreciation. Secondly, what is the effect of these changes on India or the United Kingdom. And, thirdly, if there are evils proved, then to inquire whether any and what remedies can be adopted?—Yes.

9124. First, as regards the depreciation of silver; is it not the case that when silver first began to fall attention was directed to the increase in the production of silver from the mines: to the diminution in the demand for silver caused by the demonetization of silver in Germany, and to the refusal of the Latin Union to coin silver. Is that not so?—It is so, but I should say, to make the matter quite clear, that in the debate in the House of Commons on the 12th June 1879 Mr. Goschen denied that there was up to that time any serious increase in the supply of silver.

Mr.
W. Fowler.
2 Dec. 1887.

9125. Did not these circumstances, or some of them, naturally lead to the conclusion that silver was falling as compared both with gold and with goods in consequence of increase in the supply and failure in the European demand for silver?—Yes, that was the impression, but my impression has been for a long time, especially since I read that debate, that the real cause was, that a considerable amount of silver was at once thrown upon a market where the old demand had been practically destroyed.

9126. Did not Mr. Bagehot and other economists say that the effect of this would be that silver would go to the East in increased quantities as it had done in former times; that export from India would for the time be stimulated, and imports into India for the time discouraged; that silver prices in India would rise; that the disturbance would be temporary; and that when prices were adjusted in India things would go on as before?—Yes, but Mr. Bagehot forgot one point; or rather he did not foresee what has happened since, that the prices of goods here have fallen enormously.

9127. Does not the reasoning on which these predictions were based appear to be satisfactory, assuming the premises to be true and complete?—Yes, that is so.

9128. But as matter of fact, though silver has gone to India, it has not gone in any abnormal quantities; exports from India do not appear by the returns to have been more stimulated than imports; silver prices in India have not risen but have fallen; and the fall in exchange has continued?—Yes, but the reason I think that silver has not gone in such large quantity is that owing to the fall in prices here of goods generally sent to India, our goods have gone instead of silver to a very large extent. That is to say, if we had not had this heavy fall we should have had a great amount more silver sent to India, so that you have had two things, the large drafts by the Home Government upon India which have checked the export of silver to India and also very large exports of our goods to India, which would not have gone had it not been for the heavy fall in prices.

9129. But the facts that I have mentioned seem to disprove the hypothesis that the changes in the relative value of the precious metals are chiefly or entirely due to a depreciation in silver alone?—Certainly.

9130. But whilst this is so does it not remain true, that the causes above mentioned are real causes for the lowered gold price of silver, though they do not account for the whole of the phenomena?—Yes.

9131. And you think it probable—I think you have just said so—that the operation of these causes has been aggravated by the increase of Council bills which check the demand of silver for India?—Yes, certainly.

9132. Well, then, to turn to the other alternative mentioned in our instructions, the appreciation of gold; if the depreciation of silver alone is not enough to account for the facts, are we not driven to inquire whether the changes in the relation between gold and silver are due to the appreciation of gold. Strictly speaking, appreciation of gold and fall of gold prices are the same thing, are they not?—They are as matter of language.

9133. But appreciation of gold may mean a general and uniform appreciation as compared with all other things, and in using the terms as identical do you not think that care must be taken not to assume a general and uniform fall of prices where no such fall has been proved?—Certainly.

9134. May not a fall in the gold price of any given article be due to either of two causes, namely, to a change in the demand for and supply of the article itself, or a change in the demand for or supply of gold?—Yes, and I have tried to prove that in all the cases which have been analysed, the fall has arisen from the change in the demand for and supply of the article.

9135. Well then we come to what you think to be the cause of the actual fall in prices. It is alleged that a fall in prices has taken place since 1873, which

date is taken because it was the time at which the so-called demonetization of silver took effect. Are there not other causes in the period 1871, 1872, 1873, which make it difficult to take the level of prices of those years as a fair datum or average level?—Yes. I think it is a very important consideration for the Commission to bear in mind, and I should very strongly recommend some reference to the articles at the end of 1872 and the beginning of 1873 in the "Economist," where the writer in the first place proved, I think, that there was no depreciation of gold up to the end of 1872, although there was such a great rise in prices. That was proved from the condition of the coinage of the country. Then there being no depreciation, he was inclined to think, writing in January 1873, that things would go on pretty quietly. But what happened was very curious. In the autumn of 1873 came a terrible American panic, the worst that has occurred there since 1842. That had a very depressing effect on credit, and on commerce generally. America did not recover from that till 1878—five years practically. Well, then, in 1875 we had one of the worst sets of failures that I ever recollect in London, also very greatly damaging credit; and, if my argument about the effect of credit on prices is correct, tending to lower prices very much. Then we come to 1878, when we had another tremendous set of failures, the City of Glasgow Bank, the West of England Bank, and a number of others, and if we had actually been short of gold we should have had a panic. But the Bank rate never rose beyond six per cent., though during that whole time credit was very much affected; but after the recovery of America from her depression we had a considerable advance in prices for a short time, and then we went back again to the low level of prices of which so much complaint has been made. I think the situation in 1873 was most peculiar, and there was a great amount of accumulated loanable capital after the panic of 1866 which led to a great rise in prices, and a great excitement in business, especially also increased by the war of 1870, and the great profits that resulted to England from that war. I should like to read a few lines from page 3 of the "Economist" of January 1873: "The amount of unused savings which accumulated after 1866 was much greater than at any previous period. And to this accumulation was added the stimulus given by long continued cheap corn; the greatest stimulus known to industry. The result was our past prosperity; that this country went forward, not by steps, but by 'leaps and bounds.' . . . The premature rise in the rate of discount has arrested the periodical turn. It has prevented our lending too much money to trade, or our lending it badly; it has restrained, by a constant and healthy apprehension, the stimulated energies of trade; and therefore we look forward to 1873 without apprehension." The point is this: Mr. Soetbeer calls this the swindling period, the period of 1871 to 1873; the period of intense excitement which led to an enormous advance in prices. Then I mentioned just now there were after that time many causes, apart from money, which naturally led to a rapid fall.

9136. You admit, I think, that a fall is proved to have taken place since 1873 in the wholesale gold prices of many, if not most, of the great articles of commerce?—Yes, but there are very considerable exceptions, as I have mentioned in my evidence.

9137. But you do not admit that the fall has been proved to extend to all classes of things for which gold prices are paid, as for instance to land, to services of various kinds, and many other things?—Certainly not.

9138. And as regards the articles contained in the different lists of wholesale prices, you do not admit that the different lists which have been laid before us, namely, from the "Economist," from Dr. Soetbeer and others, coincide with one another?—No, I do not necessarily.

9139. You have also stated that their lists contain

Mr.
W. Fowler.
2 Dec. 1887.

a number of articles of very different character; that whilst many have fallen, some are stationary and some have risen; and that most of them are known to be affected by special causes; and you have also pointed out, that to average such prices; to draw curves from them purporting to represent a general level of prices at different times; and to derive from them conclusions as to a general and uniform fall of prices, much more as to one single cause of fall, is fallacious and misleading?—Certainly.

9140. You have told us that with respect to most of the articles comprised in these lists there are special reasons in the supply of and the demand for these articles themselves which fully account for the fall in price, apart from any scarcity of gold?—Yes, certainly. Let me add one word. I mentioned when I was here on the 7th November the article of copper. It has risen since I was here from about 44l. to 66l. a ton, and sugar, as I understand, has risen in about two months something like 25 per cent., so that we really need not be in despair of ever getting prices up, if we are so anxious that they should rise.

9141. You have given us details concerning the special causes for fall of price of many of these articles, and for further details you have referred us to several publications, your own pamphlet, Mr. Forsell's pamphlet, Mr. Laughlin's article in the "Boston Journal of Economics," and above all Mr. D. A. Wells' recent articles in the "Contemporary Review"?—Certainly.

9142. Generally speaking these causes consist in new inventions and improvements in machinery, in improved cultivation and in increased production, in the cheapening and shortening of transport by land and sea, in the increased rapidity of communication by letter and telegraph, and in less costly modes of doing business?—Yes, certainly.

9143. You think further that partly owing to the greater development of inventions, partly to the cessation of the great wars of the previous decades, these causes have had a fuller and greater effect since 1872 than they had before?—Certainly.

9144. You think that these causes are amply sufficient to account for the falls in wholesale prices which have occurred since 1873?—Yes, I do, adding also those considerations which I have just now mentioned as to the peculiar condition of credit in the period between 1873 and 1880.

9145. (*Mr. Barbour.*) But do you think that there has been any deficiency of credit since 1879 or 1880 up to the present date?—No, I do not say there has been any special deficiency of credit since 1880, but I do not think credit is anything like as good as it was in times long past; there has been far more disposition to scrutinize paper and to look carefully after everybody's transactions since the panic of 1866.

9146. (*Sir T. Farrer.*) You also think that the differences in the changes of prices of the different articles, which as you say correspond wherever, they can be traced, to the special circumstances of the article, show that the fall has in each case been due to these circumstances, and not to any general cause such as the scarcity of gold?—Certainly.

9147. Then, to turn to the abundance or scarcity of gold. Considering the amount of gold added to the world's store between 1850 and the present time; considering that it is the whole stock of available gold, and not merely the annual produce of the mines which constitutes the supply of gold for currency purposes; and considering the economies of gold currency in the modern commerce of the western world on the one hand; and comparing these facts with the demands for gold since 1870, on the other hand, you say, I think, that there is not the least reason for supposing that the demand for gold for currency purposes has outrun the supply?—Yes. There is a figure I should like to mention in Soetbeer. He sums up the reserves of gold at the end of the years 1872 to 1885, so far as the returns have been made, and I should like you to note 1881 and 1885. In 1881 he makes them 170,000,000*l.* and only four years after 220,000,000*l.*

9148. Well, now to turn to the relation of gold to prices in wholesale dealings, little or no gold is used, is that not so?—Yes, I mentioned when I was here something about the development of credit in our own country. I was talking to a country banker the other day and he told me that where a few years ago on a market day he could turn out 5,000*l.* of his own notes he cannot now get rid of 1,000*l.*, though his business has increased, so universal is the system of cheques.

9149. Well, these wholesale dealings—it is wholesale prices we have been speaking of—are affected by credit and these credits are settled by a set-off against one another without the use of gold?—Yes.

9150. In fact does not each transaction create its own circulating medium, so that the medium expands with the demand?—Yes, that is true.

9151. Consequently cannot great additional business be carried on with little or no additional need of gold?—Practically gold is unseen in what is called business.

9152. And dealings of all kinds which in simpler states of commerce were carried on by the actual use and transfer of the precious metals are now carried on in Europe and America, at any rate, without using gold at all?—Yes.

9153. Is not this economy of gold a process still in course of development and capable of further extension?—I think so; very decidedly.

9154. At the same time is not gold still the measure of value; and are not all prices and all instruments of credit expressed in terms of gold?—Yes.

9155. Is it not also the basis of all credit, or, to drop metaphor, is not every instrument of credit a promise or obligation to pay in gold?—Yes.

9156. But in the course of ordinary business these promises are seldom enforced or expected to be enforced. That is so, is it not?—Yes.

9157. Still, though not enforced, does not the obligation remain; is it not this obligation the one thing which keeps credit sound; and is not a certain quantity of gold in certain events required to discharge such obligations?—Yes, certainly; that is the great reason, as I understand it, why we have reserves in gold, reserves not very large, it is true, but still considered to be sufficient so long as credit is maintained.

9158. Reserves are kept in the banks to meet these special requirements?—Yes.

9159. When these reserves run low is not the acknowledged means of maintaining and renewing them the raising the rate of discount?—Yes, certainly; the whole idea, as I understand it, of raising the rate of discount, is that there is a deficiency of gold—practically of currency, which is based upon gold, for the purpose of doing the business of the time. Demands come for gold from abroad, and it has to be sent away. That leads to a reduction of the banking reserves of the Bank of England, and the Bank gets alarmed and raises its rate, and thereby attracts gold from other countries with more or less success.

9160. Well, then, is not the rate of interest or discount in such cases the price paid for the use of gold?—It is the price paid for the use of loanable capital; it is the same thing as saying it is the price for the use of gold.

9161. Is not the existence of a low rate of discount, in other words, of an easy money market, other things remaining the same, an evidence of cheap loanable capital, and is not the tendency of this to encourage speculation, to stimulate credit, and to raise prices; and is not the tendency of a high rate of discount, other things remaining the same, the reverse?—It is so, but one could point out cases where you have had a very high rate of discount and high prices, and you have had a very low rate of discount and low prices.

9162. Is not this relation of the gold reserves to the rate of discount and of credit to prices the only clear relation known to exist between gold and wholesale prices?—Yes; so far as I know it is so.

9163. If therefore the gold reserves have been full, and if the money market has been easy at one time as compared with another time, is it not evidence that

trade has not been suffering from want of gold at the former time more than at the latter time?—I should say so.

9164. You have given us figures to show that since 1873 the reserves have been fuller, and also that the rate of discount has been lower and less fluctuating than either had been in the periods immediately succeeding the gold discoveries and preceding 1873?—Certainly.

9165. You think, therefore, do you not, that this shows that whatever may have been the cause of the depressed trade or low prices since 1873, it is not due to a scarcity of loanable capital or of the gold which is the basis of that capital?—Certainly.

9166. Whatever may be the differing relations between gold, loanable capital, credit, and prices, one thing is not possible, namely, that low prices should be due to a deficiency of gold at a time when, in the only reservoirs and channels through which gold affects prices, there is known to be abundance of gold?—Certainly that is my view.

9167. Whether, therefore, we look to the real causes of the fall in wholesale prices since 1873; to the stocks of gold in the trading world; or to the demands on those stocks as shown by the state of bank reserves and the money market, do you not think that there is strong, if not overwhelming, evidence for believing that there has been no appreciation of gold due to an increase of demand for gold out of proportion to the supply, and for concluding that the fall in the gold value of silver cannot be due to this cause?—That is my strong impression.

9168. May I not sum up what you have said on the subject of depreciation of silver and appreciation of gold as follows. First, that though there may have been depreciation of silver arising from an increase of supply of and diminution of demand for silver—this alone is not sufficient to account for the phenomena. And secondly, that whilst there may have been appreciation of gold in the sense of a fall of many gold prices, there has been no appreciation of gold arising from a scarcity of gold—in other words, there has been no diminution in the proportion of the supply of gold to the demand for gold?—Yes.

9169. Does not this lead us to the conclusion, speaking with all due reserve on so difficult a subject, that the most probable answer to the first question referred to us is as follows:—There has been a depreciation of silver arising from the proportion of the demand to the supply having diminished?—Yes.

9170. There has been an appreciation of gold when compared both with silver and with many or most wholesale goods; but this has not been caused by a diminution in the proportion of the supply of gold to the demand for it, but as regards silver by the depreciation of silver above referred to, and as regards goods by an increase and cheapening in the production and transport and exchange of the goods?—Yes, certainly.

9171. Have not these two forces acted simultaneously but independently of each other, and without being intensified or in any way affected by changes gold?—Yes, I think so.

9172. If these are sound conclusions, shall we not find that they throw great light on the further questions that remain to be answered?—I believe they do.

9173. To turn now to the second point of our inquiry. We are asked to inquire what is the effect of the change in the relative values of the precious metals on various matters of practical business connected with India. First, as regards the Government; you admit, I think, that in respect of the payments which the Government of India has to make on old or fixed contracts, it is put to much inconvenience by having to spend a larger quantity of rupees in purchasing its gold remittances; and also by the uncertainty in the present state of exchange as to what the remittances may be?—Yes, I agree with that.

9174. You also admit that this inconvenience may amount to a serious difficulty, and even possible danger,

if under the peculiar circumstances of India the Indian Government have to increase taxation for the purpose of meeting loss by exchange?—That is my impression, and I should like to read a few lines from Mr. Cross's speech on 12 June 1879 as regards that. "India sent us a very large quantity of surplus products. She sent us nearly 20,000,000*l.* a year more than we send her in merchandise. Where India would take, had she her own way, the returns in silver, salt, and shirtings, we force her to take all kinds of things that she did not want. We made her take expensive soldiers, and still more expensive civilians, and we made her pay for absentee soldiers who never went near her. He was not blaming in particular Government. He had shown that in 1868 the home payments amounted to a sum equal to 43½ per cent. of the land revenue, and that in 1879 they required a sum equal to the whole net land revenue. This showed an increase of annual charge upon India of 104,000,000 rupees in 11 years." I was sorry to see the other day there seems to be some probability of a famine in Burmah, which is another illustration of the heavy expense we incur by annexation. Not that I am going to argue here and now against the annexation of Burmah, but it is an illustration of the great danger and expenses we incur by the development of our empire in comparison with which this loss by exchange seems to me quite unimportant.

9175. As regards the country of India, as distinguished from the Government, do you think that India as a debtor country suffers, or that England as a creditor country, gains unjustly by the increased cost in goods or in silver of the gold debt. Let me explain what I mean. Is it not the fact that if India has had more to pay, she has had more to pay with?—Yes, I think she has.

9176. Is not this argument supported by the fact that India's power of producing goods has been largely increased by the loans for railway and other purposes which England has made to her?—Yes. I have always thought that although there is a great deal said about this tribute, and the very heavy charges upon the Indian people, India has been an enormous gainer by what we have done, which is represented by the money on which she has to pay interest. It seems to me there can be no question about it, and if, for instance, you take the railways—and leave out what may be called the war railways—this outlay has been astonishingly successful, and in the present condition of the world India would have had no chance of competing with the other great producing countries in the markets of the world, had she not had someone to find capital to make her railways.

9177. As regards gold payments by the Government of India on new or current contracts, do you think the Indian Government suffers any loss?—No, they gain.

9178. If the fall in silver is accompanied by an equal or greater fall in gold prices of the articles which the Indian Government is buying, that Government, if it has to pay more rupees for the same amount of gold, also gets more goods for the same amount of gold?—Certainly; there is no doubt about that whatever. Of course it is clear, as regards what she buys in England, railway materials and such things, she benefits very much by the fall in prices.

9179. Are not the goods which the Indian Government buys in England, such as railway material, stores, &c., things the gold price of which has fallen largely?—Yes.

9180. The next point we are instructed to consider is the case of the persons in India who have to make remittances in gold. You will agree that they all obtain less gold for the same number of rupees. So far as they spend it on things which have not fallen in gold prices, are they not real losers?—They are real losers in this way, that when a man gets his salary in rupees, and he wants to spend money in

Mr.
W. Fowler.
2 Dec. 1887.

Mr.
W. Fowler.

2 Dec. 1887.

England, he must turn it into gold, and must lose by that.

9181. If the things which they buy have fallen in gold price as much as the silver, they are not then losers?—They would not be losers then. Take education: that is a thing that has increased in cost. Notwithstanding all the fall in prices, I suppose we should say that it was more costly than it was 20 years ago. The officials are certainly losers by the present condition of things.

9182. Well then, does not this explain the case of the Indian Government servants? Is it not probable that many of their expenses, such as house rent, wages, and education, have not fallen as much as silver; and to this extent will they not be real losers?—In some of those cases there has been a rise in cost, not a fall.

9183. Well then, the next case we are instructed to consider, is that of producers in India. You have, I think, stated, that you believe the fall in exchange has given some stimulus or bounty to production in India, but that in the presence of far more important facts, it is not such as permanently or seriously to injure the trade?—Yes, I think I have explained very fully my view in answer to Mr. Chaplin. I do wish to insist most particularly on the consideration that as far as I can discover from Mr. O'Connor's enumeration of the principal exports, there are only two (that is wheat and wool) where India sends things that we grow in any quantity, and as regards the case of wool I should like to give the figures of the amount sent by the British East India possessions compared with the total of our importation of wool. Our total importation of wool in the year 1886 was 596,000,000 pounds, and from our British possessions in the East Indies, put as a whole, there was only 34,000,000 pounds out of that total.

9184. You are aware that Mr. Secretary Manning stated in his last report to Congress that the fall in exchange had lowered the price of American and European wheat by 25 per cent., and that this statement has been repeated frequently in this country and in France?—Yes, I am aware of that, but I am not prepared to admit it. I quite think this, that so far forth as there is an increase in the export of wheat, or wool, or anything else to this side, it does tend of course to reduce the price here; so far forth as there is an increase arising from this condition of the exchange, but, how far that goes is another question.

9185. (Mr. Chaplin.) But I suppose you admit that the bounty, as you have described it, has an effect in lowering the price?—I say so far as it tends to increase the quantity that comes from the East, but I have endeavoured to point out that that only applies in any important sense, to two articles, wheat and wool.

9186. You do not admit it to the extent named by Mr. Manning, but you do admit it to some extent?—I do not think anybody knows how much exactly it is.

9187. (Sir T. Farrer.) You will admit that any complaint of this kind from an interest suffering as English agriculture is now suffering deserves most respectful attention, and that it is important to ascertain with as much precision as possible what truth there is in the allegation?—Yes, certainly.

9188. It is obvious, is it not, that if the gold price of American, Russian, or Australian, which had fallen in Liverpool, and the silver price of wheat in India had not fallen, Indian wheat could not have been sold in Liverpool without a fall in the gold price of silver?—Certainly.

9189. To this extent therefore is it not clear that the fall in exchange did enable the Indian wheat growers to compete with American and other wheat in the English market, and of course with English wheat too?—Yes, there are cases that we have discussed this morning where they, at any rate, avoided a loss.

9190–1. Unless silver had fallen he would have had that burden upon him?—Unless the wheat had fallen

in India very heavily he might have had a loss but for the fall in silver.

9192. But is it not quite another question whether the fall in silver was the true and original cause of the fall in wheat?—Certainly; it is quite another question.

9193. According to your opinion the improvement in production and transport from America and elsewhere were the real causes of that fall. And are you of opinion that similar causes operated on Indian wheat?—Yes, I have explained that, I think, very minutely.

9194. Has the fall in the price of wheat been shown to be much, if at all, greater than the fall in the cost of transport?—No, Mr. O'Connor thinks not. He puts that forward very prominently. I had a conversation with an Indian merchant in Manchester some days ago and he said that the fall in the railway rates in the last few years has been very large indeed, and I think some evidence has been given before this Commission upon that point. Mr. O'Connor has set forth, I think, in his paper some very remarkable reductions in railway rates at the bottom of page 55, and on page 56. I need not read all of them. I do not say that is the only cause, but it is one of the causes; and the fall of freights has been of course enormous.

9195. I gather that according to the hypothesis which you think most probable, gold has remained stationary, the gold price of wheat has fallen from causes which affect wheat; and at the same time the gold price of silver has fallen from causes which affect silver?—Yes, certainly, I think that the silver has fallen from one cause, and wheat and other things have fallen from other causes.

9196. (Mr. Barbour.) What are the causes of the fall of silver, increased production, and reduced demand?—I believe there has been an increased production in the last few years, but up to 1879 Mr. Goschen, after a most careful analysis, denied that there was a sufficient increase in the supply to account for it.

9197. The causes for the fall of silver are increased production of silver in recent years, and reduced demand for it?—A reduced demand arising from the operation of Germany and the Latin Union.

9198. (Sir T. Farrer.) If I have stated your hypothesis correctly, is not the fall in the price of silver a collateral circumstance, so that silver has happened to fall at the same time as wheat?—Yes.

9199. May not the fact that the silver price of wheat in India has fallen, in other words, that the gold price of wheat has fallen much more than the gold price of silver owing to diminution in the cost of production and transport in India, be looked on as confirming this view?—I think it does.

9200. In Mr. O'Connor's last report on the trade of India, I find this passage: "In the period between December 1881 and December 1885, the silver price of wheat in Calcutta fell 21 per cent.; in London it fell 32 per cent., while the fall in exchange was only 11·4 per cent."—Yes, I read that passage.

9201. You will agree, I think, that it is very difficult to give accurate figures of comparative prices, and that in taking Mr. O'Connor's or any other figures of silver prices in India and gold prices in London we cannot expect absolute accuracy or even consistency?—Certainly.

9202. Allowing for this, and taking his figures as an illustration of what may have happened, is not the most probable explanation of them as follows, namely, that between 1881 and 1885 Indian wheat as well as all other wheat fell in gold price in the London market 32 per cent. from causes affecting wheat. During the same time silver fell in gold price from 11½ per cent. from causes affecting silver. The two falls, though independent, were simultaneous?—Yes.

9203. The silver price of wheat in India during the same time fell 20 per cent. from causes affecting wheat?—Yes.

9204. And the gold price of silver fell during the same time 11½ per cent. Consequently the whole

Mr.
W. Fowler.
2 Dec. 1887

fall of 30 per cent. in the gold price of wheat, though due to causes affecting wheat alone, is exhibited in 20 per cent. fall in the silver given for the wheat plus $11\frac{1}{4}$ per cent. in the gold given for the silver. That is a theoretical explanation?—Yes, it is a plausible explanation, and very likely perfectly correct, but it is subject to the important consideration that I think I mentioned just now, that there may be many causes at work as regards the price of wheat in India that we do not here thoroughly appreciate.

9205. I am giving that only as a possible theoretical explanation of a somewhat hypothetical difficulty?—Yes.

9206. If silver had never fallen, or if we could now by a fiat do away with the fall in silver and restore the rupee to 2s. or 1s. 10d., would not the effect be, in raising the exchange, to lower the silver price of wheat in India to the same extent?—Yes; as a matter of theory, assuming that the exchange has the effect upon prices which is supposed.

9207. You agree that this would be the case upon the hypothesis which attributes so much importance to exchanges?—It might be so, but it might not be so if there were special causes in the condition of wheat in India to counteract it.

9208. Quite so, I am eliminating the case of exchange and putting that by itself?—Because I do not put such stress upon the money question as many people do as regards prices.

9209. I wish to put this suggestion upon the hypothesis that the fall in exchange has affected prices in the manner and to the extent suggested in some of the questions put to you. Upon that hypothesis raising the exchange again would lower the silver price to the same extent?—Other things being equal.

9210. But unfortunately they never are?—Unfortunately they never are.

9211. (Mr. Barbour.) Would you not say that what must happen is this, either the gold price of wheat must rise or the silver price must fall, or the trade will stop, or partly the one result and partly the other will follow?—Quite so.

9212. (Sir T. Farrer.) If so the gold price of Indian wheat would remain what it is now, as far as the exchange is concerned?—You know of course if silver had not fallen here, prices in silver in India would have fallen far more than they have done; supposing there had been a gold currency in India they would have fallen, I suppose.

9213. (Mr. Barbour.) If the old rate of exchange had been maintained, either silver prices in India must have gone down, or gold prices in England must have risen or partly the one result and partly the other result must have followed?—All things being equal.

9214. (Sir T. Farrer.) In short, is not the exchange the mode by which gold and silver prices which are media of exchange adapt themselves to real values, and are not these values created by quite other factors?—Well, I think these values are created by quite other factors, and the exchange probably is, as you say, the adjuster, but with all due qualification as regards other circumstances.

9215. Is not any attempt to alter real values by altering the exchanges like attempting to alter the trade between two countries by altering the yard measure or the pound weight?—I think so.

9216. But since fluctuations in real values exhibit themselves in the exchanges, is it not natural for persons who are dealing with exchange to attribute to it consequences which are really due to some other cause, and of which exchange is only the symptom?—Yes, that is quite true.

9217. (Mr. Chaplin.) The great fall in the price of wheat I think you said was since 1884?—Yes, I believe that is correct.

9218. And it is concurrently with that large fall that the largest importations that have ever been sent from India have taken place?—I have not got the exact figures before me at the moment.

9219. Well, I find that in 1883 there were 11,000,000 cwts.; in 1884 nearly 8,000,000 cwts.; in

1885 nearly 12,000,000 cwts.; and in 1886 11,000,000 cwts.?—That is only to the United Kingdom, is it not?

9220. And during these years since 1884 it is the fact, I think, that the fall in the cost of transport has been comparatively small?—So you informed me; I was not aware of that before.

9221. (Sir T. Farrer.) To return from this digression to the main argument. Have you looked at Mr. O'Connor's report above referred to, and especially at the figures which he gives, showing the fall in the gold and silver prices of Indian exports?—Yes, I have.

9222. Do not these figures confirm the views you have expressed throughout, viz., that the changes in price of each article depend upon circumstances connected with the supply and demand for each article rather than in currency?—He gives the fall of prices in Europe, and then he gives a number of the falls in India, and there seems to be no kind of relation. Wheat has fallen largely, linseed has gone up, rape seed has fallen 21, hides 13, indigo has risen 7, jute 18, shellac has fallen 41, rice actually rose 30 per cent. in India.

9223. (Mr. Barbour.) In what part of India has rice risen 30 per cent.?—Calcutta rice 30, Rangoon 15 (Bengal rice in England had gone down 18), silk fell 21, and in England 40, tea 10 in India and 34 in England. I think these figures again strongly illustrate what I believe to be the fact, that prices in India in silver, and in England in gold are mainly dependent upon the conditions of the articles and not upon these money questions.

9224. (Sir T. Farrer.) If this is the true view of the exchanges and their effect on price, can any permanent or serious change in real value of wheat or anything else be effected by alterations in the relative values of gold and silver?—No, except so far of course as I have admitted, that Governments do sometimes interfere with the natural course of events and cause confusion and disturbance.

9225. Do you agree with Mr. O'Connor in the paper above referred to when he argues that a low exchange does not specially stimulate Indian trade or Indian exports, and that the low exchange has really operated merely to counterbalance the loss to Indian trade which would have resulted from low prices, subject to what you have said?—I have explained all that to Mr. Chaplin, I think. I take a rather stronger view than Mr. O'Connor as to the possible effect of the exchange.

9226. You agree with him to a great extent, but not entirely, on the question of a supposed bounty or stimulus. But do you agree with him at all when he says "that the heavy fall in prices, and the low exchange, are both of them the outcome of one cause, viz., the appreciation of gold," supposing by that he means the appreciation arising from scarcity?—No.

9227. I gather from what you have said that whilst you agree in many of his arguments you think that both the lower gold price of silver and the lower gold price of Indian goods are due to causes affecting the silver and the goods respectively, and not to appreciation or scarcity of gold?—Yes, I do.

9228. Mr. Schmidt says in a paper which he has laid before us, and which he has supported in evidence: "Sufficient stress seems scarcely to have been laid on the fact that the appreciation of gold is the result, primarily, not so much of actual scarcity of that metal as of the effect of the fall in the gold price of silver on general gold prices, of the dislocation of the par of exchange, which up to 1873 existed between the East and West. Owing to the fall in the price of silver (in gold) the produce of the East could be shipped to the gold countries at lower gold prices. The production of the West, on the other hand, did not command higher silver prices in the East, for the purchasing power of silver, as regards commodities, remained unimpaired. As a result, prices in gold countries gave way all round. The purchasing power of gold was altered. This connexion between the purchasing power of

Mr.
W. Fowler.
2 Dec. 1887.

"gold and the price of silver accounts for the fact that the curve which describes the movement of the price of silver is very similar to that which describes the movement of the 'index numbers.' Retail prices and prices regulated by custom will have to follow similar movements at a greater or smaller distance. The appreciation of gold is specific. It has been suggested in examination that the rise in the purchasing power of gold really represents only a generally cheaper production of commodities, owing to better machinery, lower charges of transport, &c., and that the price of silver being shaped by like influences, has followed a similar course. This can be proved to be erroneous, for it is a well-known fact that if silver undergoes a sudden considerable rise or fall, the same movement will at once communicate itself to a number of articles which in their turn will move other articles in the same direction?" I want to ask you, do you agree with that? No, as I have said before, I go with him to this extent, that so far as the fall in exchange has increased exports from India, it will of course have tended to reduce prices here of the articles thus exported, but I wish again to impress upon the Commission how unimportant that is practically when we consider that a great part of the articles are not produced in this country at all.

9229. (*Mr. Barbour.*) But do you think the fall in exchange would have any effect in reducing the gold price of articles which are commonly exported to silver countries, because the fall in exchange having taken place, either you must sell the article for a larger silver price, or accept a lower gold price?—I am only dealing here with what he says in this paper.

9230. But I think Mr. Schmidt does deal with the question to which I refer. He says the fall in silver causes a fall in gold prices of all articles exported to the silver countries, because they cannot be sold for higher silver prices, and that the people in the silver country will not give a higher price?—I have not gone into it from that point of view. It is conceivable, but I am dealing with exports from India which we have been talking about to-day. I find there is only one practically which can be affected by it; the other articles are those we consume, and raw materials, like cotton.

9231. Do you think the fall in exchange would have any effect as regards the gold prices of articles exported from the gold to the silver countries?—I do not think it would.

9232. (*Sir T. Farrer.*) Do you think it possible upon any intelligible hypothesis concerning the appreciation of gold or the depreciation of silver that a change in the relative value of the two metals which form the media of exchange can have any such effect on the trade between gold and silver using countries as Mr. Schmidt suggests?—I do not.

9233. On the hypothesis that silver alone has depreciated from causes affecting silver, would not silver, as Mr. Bagehot suggested, go to the East, until prices were adjusted, and would not the effect be temporary?—Yes, but I have mentioned where I think Mr. Bagehot was mistaken—not mistaken, perhaps, but failed to prophesy what has since happened.

9234. He expected other things to be equal, and other things were not equal?—Yes.

9235. (*Mr. Barbour.*) Do you think he was wrong in assuming that the cause of the fall was a very large supply of silver in the market?—I do not think he was right upon that. He thought, no doubt, that the German sales were more important than they really were. Mr. Goschen pointed that out in his speech very strongly, that there had been great exaggeration about that. To that extent I agree with you, that I think possibly Mr. Bagehot exaggerated the influence of the German sales, but you must always remember in these questions of prices it is the moral effect as well as the mere quantity. If you go into the Stock Exchange and want to sell a very small quantity of a thing nobody wants, the price goes down exceedingly without any change in the intrinsic value of the thing.

So this silver was thrown on the market and there was no demand—or at any rate a lessened demand at the moment, because the Latin Union began to fight shy of silver.

9236. (*Sir T. Farrer.*) To return to Mr. Schmidt's hypothesis. Does it not seem probable that such views as those expressed by him are due to a notion that though silver does not go to India in abnormal quantities, it can continue to be of one value measured in goods in Europe, and of a different value measured in the same goods in India?—Yes, he appears to have that idea; I do not share it with him.

9237. And such a thing is not possible, is it?—It could not last.

9238. It has been alleged that the Indian ryot has an advantage because his rent, or land-tax, is a fixed payment in silver, and he can detain silver more cheaply. Do you agree in this?—Yes, I think that is so.

9239. If and so far as this goes, is it not in effect a lightening of taxation, a sort of transfer from the Indian Government, which wants the silver taxes to buy gold with, to its taxpayers?—Yes, I think that is so.

9240. (*Sir John Lubbock.*) Do you think that there is any other point of view in which the fall in silver has benefited the Indian wheat producer beyond the lightening of his fixed charges?—It has benefited him if there has been any kind of bounty given to the export of wheat, and it has, therefore, increased the price which the dealer can give him for his wheat. Mr. O'Connor says that is not so; that prices have fallen in India as well as here, and that the cultivator is not getting more since the fall in exchange than he was before. That is what he says, but of course if it is a fact that you get a higher price at the port for the wheat than you could have got before the fall in exchange, one would suppose that the cultivator would get some benefit from it.

9241. But you yourself do not say that he derives any advantage, except that which he derives from the lightening of his fixed charges?—I think so far as there is a bounty upon the exports of the goods which he produces he has an advantage.

9242. I thought you said in your previous answer—perhaps I did not quite follow it—that so far as you are concerned, not being specially conversant with that trade, you did not see that there was any such bounty?—I did not say that. I have all along thought as a matter of theory that there would be something in the shape of a bounty, but the figures as regards export prove that there is no clear connexion between the fall in exchange and the increase in the export.

9243. Could you explain to the Commission in what manner the fall in the exchange, apart from the diminution in the actual weight of a fixed charge, acts as a bounty?—Well, I speak with great deference not being in the trade, but it seemed to me in this way, that if a man in India sells his stuff for a gold price, and with that gold price can buy silver at a much lower rate than he could formerly buy it, and then having transmitted the silver to India there is a fall in prices in India, so that he can buy more of most articles with each rupee than he could before, such a state of things must, I should say, tend to give an encouragement to the exporter.

9244. When you speak of a fall do you mean a fall during the operation?—I mean to say this, that in London you can buy silver for 1s. 6d. that used to cost you 2s. Well, then with a given amount, say 30s., you can buy more rupees now than you could before for 30s., and these rupees you can transmit to India, and then the curious point is, that though silver is so plentiful in India, and such an enormous quantity is sent, prices have fallen in India as a rule, so that each rupee that you have obtained for your wheat will buy more of most things than it would have done 10 years ago.

9245. (*Mr. Chaplin.*) That is to say, you get more rupees for the same quantity of wheat, and they buy

more than they did before?—That apparently is so on the face of it.

9246. (*Sir John Lubbock.*) Then your argument is, as I understand, that the prices have not yet adjusted themselves?—They have not adjusted themselves.

9247. (*Mr. Chaplin.*) What you say then amounts to this, that although the Indian producer gets a lower price for his wheat in England, he does get for it as many rupees as he did before, and those rupees are appreciated and buy even more than they did?—So I am informed.

9248. What you have been stating on the subject of bounty is theoretical?—Yes, theoretical and does not agree with the facts.

9249. (*Sir T. Farrer.*) Now let us turn to the facts. If the fall in exchange had the effects which have been attributed to it, would not you expect to find these effects in these statistics of trade. You would find, would you not, fluctuations of exports from silver money countries corresponding in some degree to fluctuations in exchange?—Yes, I think I have explained that several times.

9250. Well, looking to the figures given by Mr. Waterfield and Mr. O'Connor, do any such fluctuations exist?—No.

9251. There is no correspondence between the fall in exchange and the exports from silver-using countries?—I am not sure that I quoted the figures, but they are really worth mentioning from Mr. O'Connor's paper. They are so important. The exchange fell specially in 1884–85 and 1885–86, and the total exports from India in 1884–85 were minus 5·6 on 1883–4 and the increase of exports in 1885–6 was only ·5 of 1.

9252. (*Mr. Barbour.*) Could you give the imports?—I do not know that I have the imports at this moment.

9253. (*Sir T. Farrer.*) Do not these considerations fortify you in the view to which you have attached so much importance that real values, and the real terms of barter of goods between nations, depend upon causes affecting the supply and demand for the articles, and not upon currency, and that the effect of fluctuations in exchange upon these terms is temporary and comparatively unimportant?—I think most strongly.

9254. The next class of persons to whom our attention is directed are the merchants of India. I suppose you will admit that one additional element of speculation is introduced into their business by fluctuations in exchange?—Yes; but you hear the most contradictory statements upon that subject. Mr. Goschen very strongly urged upon the House to remember that these fluctuations in exchange were nothing like as important, as a matter of business, as some people made out, that you could do very large business with the countries where the exchange is very fluctuating, and it is quite absurd to say that business is at a standstill because of the condition of exchange. The figures that I have quoted about the imports and exports show that it is not so as regards India, and we know very well that a very large business is done with South America, Austria, Russia, and all these countries, notwithstanding a very fluctuating exchange. I have heard some gentlemen in the trade speak very warmly as to the inconvenience of the present system; others deny that there is any difficulty, and say, like Mr. Bythell, for instance, that they are perfectly able to settle their transactions without interfering with business. Mr. Goschen says there is no doubt that these fluctuations have been troublesome, but nothing more: “I do not wish to minimise these causes for regret; if, on the other hand, I call attention to the fact that this country has continually done a prosperous business with countries subject to no less violent fluctuations in their exchanges. Look at the trade with the United States when gold was at an immense, but ever varying, premium. Look at the Russian exchanges, utterly without stability; at the Austrian exchanges. Yet England has not failed to do good

“business with such countries nevertheless.” (*Speech of 12th June 1879 in House of Commons.*) He might have added something about South America.

9255. Then the next class of people are the taxpayers of India. The effect of the fall in exchange on the taxpayers of India is involved in what you have already said about the Government and ryots of India. Have you anything to add?—I have not; I think I have mentioned that several times.

9256. Then it has been alleged that the fall in the fluctuations of silver increases the difficulty of investing in silver countries. What do you say to this?—Of course there is a difficulty. People say, “We will get back our interest in silver, and therefore we are rather afraid about our capital, but where there is a real profit to be made the money goes.” You have a remarkable example in the profits recently made from the nitrate business of Chili, spite of the great depression of the dollar as against gold, so that the railway company has to remit gold at a heavy loss.

9257. Then the next class of people are the English merchants in trade with India. Their case is substantially the same as that of the Indian merchant who trades with England. Have you anything to add?—There is a great difference of opinion. I am not in the trade, and I do not want to give evidence on anything that I have not personally to do with.

9258. As regards the manufacturer or producer at home who trades with India, is not his case the converse of that of the Indian producer, and will not the same arguments apply *mutatis mutandis*?—As far as that goes anything which increases the exports from India to England is very favourable to the manufacturer in England, because it ought to increase the imports into India.

9259. That does not include the production of food, I suppose, in which the English producer is in direct competition with the Indian producer?—I am speaking of what is ordinarily spoken of as a manufacturer.

9260. You are aware that we have had much evidence to show that Lancashire is losing and India is gaining the manufacture of coarse cotton yarn and probably also of coarse woven cotton goods. I gather from your general evidence that you would attribute this to the special circumstances of the manufacture, and not to exchange?—That is my impression very strongly, but the peculiar position of India gives her that great advantage as regards that trade, and not the exchange. At the same time, I quite agree that there may be, in certain cases, greater convenience for India in dealing with a silver-using country than for England.

9261. Then the next point referred to us is the effect of the fall in exchange on the trade and industry of the United Kingdom, and I think you are of an opinion that speaking generally the fall in the gold price of silver has had no such bad effects as have been attributed to it?—I cannot see it.

9262. As regards the trade of the United Kingdom with India and other silver money countries, do the statistics afford any evidence that this trade has been injured, diminished, or interrupted by the fall in exchange?—I have not seen them.

9263. Do not the statistics, so far as they go, point in an opposite direction?—I think they do.

9264. Do you, under these circumstances, think in the terms of our instructions, that the changes in the values of the precious metals are not causing permanent or important evils or inconveniences to any of the interests above referred to?—No, I think I explained that in my answer to Mr. Barbour.

9265. We are instructed, in the next place, if permanent or important evils or inconveniences are proved, to inquire whether remedies can be suggested which would be effectual in removing or palliating them without injustice to other interests, and without causing other evils or inconveniences equally great. I gather that you think that the evils or inconveniences of the present state of things have been much exaggerated, and that they do not call for serious changes or questionable remedies?—Yes.

Mr.
W. Fowler.
2 Dec. 1887.

Mr.
W. Fowler.
2 Dec. 1887.

9266. Some minor remedies have been suggested, such as the adoption of 1*l.* notes, and the abolition of the silver duty and of compulsory hall marking; but as they have not been inquired into, I will only ask you whether you are not a strong advocate for 1*l.* notes?—I am; I think it is very important to avoid the wear and tear of sovereigns. Nothing can do it so well as that.

9267. The remedy which has been hitherto urged on us is the adoption of bi-metallism in this country in concert with other trading nations. That you are quite aware of?—Yes.

9268. Is not the special ratio to be adopted of the very essence of this question?—Certainly.

9269. Many witnesses have urged bi-metallism but have refused to say what the ratio should be; is not this, in your opinion, to evade one of the vital points involved?—I think it is.

9270. The old ratio of 15½ to 1, or the market ratio for the time being, are the two alternatives generally suggested. Am I not right in saying that you object altogether to the ratio of 15½ to 1, as a compulsory alteration of existing engagements by authority of British law?—Well, I object to it, but I am a good deal puzzled, because I find one authority on one side and another on the other. So far as I can see, it would be a very awkward thing to change the existing value by a sudden process of law.

9271. Do you not also object to it on the ground that England being a creditor country, and her debts being chiefly gold debts, England would in adopting it be sacrificing gratuitously what is her just due?—Yes.

9272. Would bi-metallism at the market ratio view for the time being be open to these objections?—Not to all of them.

9273. You admit that the experience of the action of France and other bi-metallic nations down to 1873 and of the small variation in this ratio down to that time, is strong evidence from experience to show that by a concert among nations, especially if England were to join, a tolerably steady ratio might be maintained in future?—Subject to what I have so fully explained both the other day and to-day, that I would not pledge myself to say that it would be steady, I think it might be.

9274. Is it not the theory of bi-metallism, that if every one has the option of paying either in silver or gold money at a fixed ratio, and has also power to convert silver or gold into money, debtors will pay in the money cheapest to them for the time being, and that they will in so doing so raise the demand for the cheaper metal as to prevent it from parting company with the dearer metal?—Yes.

9275. In fact, does not this theory and the so-called Gresham Law on which it is founded, rest on the generalisation that of two courses men will choose the cheaper? May we not admit that this generalisation is, on the whole, a sound one?—It has great exceptions, I think.

9276. On the other hand, is not there also much truth in the generalisation, which is relied on by the opponents of bi-metallism, "that it is impossible by law to determine the value of one thing in terms of another"?—I have explained my view about that, I think.

9277. You think there is considerable force in that?—Yes, I do.

9278. Is it perfectly certain that men will always choose the cheaper coin in which to pay their debts?—It is generally so, but I do not think it is always so.

9279. I am aware that the authority of Lord Liverpool and of the great authorities who have followed him has been questioned, as I believe without good reason. But is it not the fact that according to Lord Liverpool the people of England at a time when silver had been the ordinary money, insisted on receiving and paying their debts in gold coin at a higher ratio than that fixed by law; that they did this in spite of efforts by the Government and Parliament to keep up silver; and that the legal ratio only became the practical and popular ratio when, under the advice of

Sir Isaac Newton, the Government altered the legal ratio and effected a compromise between the two?—I believe it is true.

9280. Is it not also the case that in California, when the United States Congress made greenbacks the legal tender, the Californians insisted on making their contracts, and on paying and receiving in gold, and did keep and still keep gold as their medium of exchange?—Yes, they do.

9281. Is it not also the case that after the passing of the Bland Bill which made silver tender the banks of New York and the Government agreed that their dealings should be in gold?—Yes.

9282. Do not such cases as these show that there is or may be something which determines men's actions, over and above the consideration of "which" is the cheapest?—Undoubtedly, that is so; it was in California.

9283. To apply this to the present question is it, or is it not, possible or probable that the merchants and bankers of the City of London might, if a bi-metallic ratio were adopted by Parliament, come to a determination only to buy and sell, lend or borrow, in terms of gold?—Yes.

9284. If so, might not the practice of the City be at variance with law and great confusion be the consequence?—Certainly.

9285. Are you able to speak with any confidence what the feeling of the City would be on the question of adopting bi-metallism?—Well, I cannot speak off hand upon that, but my impression is that it would be very unfavourable.

9286. Again, is it not the case that England and America are the only two nations in which gold is treated on a purely commercial footing; and that other nations, whatever their legal currency or their law of legal tender, do hoard gold, or make difficulties in paying drafts in gold?—Yes, I believe that is so.

9287. Have we any security that they will not do this in the future?—None.

9288. It is not possible to foresee what might be the results to our business, if they were to act in this way, and if we were at the same time bound by an agreement with them to coin and pay and receive gold and silver promiscuously?—Yes, but it would be, I suppose, something like a breach of agreement if they did it.

9289. But one for which it would be very difficult to find a remedy?—There would be no remedy unless you had a war.

9290. Is it not possible that under such circumstances the arrangement might break down with worse consequences, in the way of fluctuations in values to our trade than are likely to happen under our present system?—I think I have explained my view on that.

9291. Is it possible to foresee with any degree of certainty what the consequences would be?—That is exactly why I object to it.

9292. As regards the effect on trade and on prices, you have said that the Act of 1844 was a disappointment to its promoters. Were they not some of the ablest financiers and statesmen we have possessed, and is not this a warning not to take a leap in the dark?—Yes, I think I explained in my first day's evidence the reason why that disappointment arose, viz., that they made too much of the bank note question in dealing with the Act of 1844.

9293. We have been told that London is at present the financial centre of the world. Some witnesses have told us that in their opinion this supremacy rests on peace, security, and good government. Others have told us that it is intimately connected with our system of currency and finance, and on the certainty that a commercial contract to pay in gold in London will be performed, and they think that this supremacy might be endangered if we were to alter the character of the terms in which these contracts are made. To which of these opinions do you incline?—I incline to the latter.

9294. On the whole I gather your opinion to be that the alleged evils and inconveniences of the

difference in values of gold and silver do not exist, or, that if they exist, they are of no great importance; that the remedy I suggested, of adopting a bi-metallic ratio, if at $15\frac{1}{2}$ to 1, would be attended with injustice and evil; that no bi-metallic ratio would produce the advantages expected from it; and that the results of adopting it, and consequent hazards to our trade, are too great to justify its adoption, unless on much stronger grounds than have hitherto been shown?—That is generally the result and the conclusion I have come to.

9295. (*Mr. Barbour.*) You said, I think, that your view was this, that gold had not appreciated, but that silver had depreciated, from natural causes, that is, from increased production and reduced demand?—Yes.

9296. And that commodities have fallen in gold price simply because of cheaper and larger productions of commodities?—I think so, generally.

9297. Do you think that there is anything in the nature of things that prevents gold from appreciating or depreciating?—No, I do not know that there is.

9298. It is possible?—It is conceivable; but of course the way which gold is used, as a coined metal, has a powerful influence upon its condition.

9299. In the way of preventing any material change of value?—Yes.

9300. But I suppose the way in which silver is used, as the standard over certainly the larger portion of the world, has some effect, too, in that direction?—Certainly.

9301. But you think the reduced demand for silver, and the increased production of it, have depreciated it?—Well, whether they permanently depreciated it, I am not at all clear.

9302. Well, for the time being?—For the time being they have depreciated it here, in Europe, but not in India, so far as I can understand.

9303. But do you think it is possible for an article like silver, that is easily carried, to be depreciated—in one portion of the world, and not depreciated in the other when there is close commercial intercourse between the two places?—The figures look like it.

9304. Why do you think that the increased production of silver has tended towards depreciation, and the reduced production of gold has not tended towards appreciation of gold?—There you come upon the old question. After all, as regards gold, the production is reduced no doubt; but, on the other side, gold is less and less required for the purposes of business. I suppose that the value of gold in exchange, is maintained by its being, used by such a large number of nations as the coin of those nations, and I think that any change in the supply, in any moderate space of time, having regard to the fact that the mass of gold is never used up, but is kept in the reserves of banks and otherwise, is utterly unimportant. It is conceivable that if you had a long course of years with an enormously diminished supply, compared to the old supplies that the world had, some change might arise; but at present this is not the case, and all the evidence that we have is that, notwithstanding the diminished supply, we have been able to pile up larger reserves than ever.

9305. But does not the same argument apply, to a very great extent, to silver. Silver is not used up, but is very largely used as coin. Has the increased production of silver been sufficient to produce this great effect?—Undoubtedly that is so; but of course you had a very peculiar state of things in 1873 with regard to silver.

9306. But does that peculiar state of things exist in the present day?—You have still in this sense, that you have got an increased supply of silver from the mines since about 1880–81. They say they have an increased supply, and at present Europe does not incline to take more silver than she did. The demand for the East is still large—very large.

9307. Then as regards the question of demand, you say rightly enough, that there is a reduced demand for silver, but has there not been an increased demand

for gold?—I doubt very much whether there has been an increased demand for gold, except in this sense, that certain nations have taken the gold, and thus have had large hoards of gold; but I do not think their getting large reserves of gold is taking it out of circulation, and destroying the gold. It is in reserve. They have issued notes on it.

9308. If the Americans, using paper before, resolved to go upon a gold basis, and to accumulate gold, surely that is an increased demand for it, though it might not raise the value very greatly?—But they issue notes upon that gold.

9309. But if they had not gone on a gold basis, that gold might have been in Europe somewhere?—I have often thought that if America had not taken to gold we should have been very much bothered with an excessive supply of gold.

9310. Then you seem to think that the additional demand for gold merely swallowed up what we may call the superfluous supply of gold, that there was too much before that demand arose?—The increase, as you know, of gold during the years from 1848 to, we will say, 1870, was something enormous.

9311. I am aware of that; but you would not say that there was too much gold in the world at present. Would it be an evil, if there was gold enough in the world to put Russia, and Austria, and Italy on a gold basis, without lowering prices?—I am not prepared to say that. I have no prejudice, either against gold or silver.

9312. (*Mr. Montagu.*) I asked you at a former sitting if you could obtain any estimate of the loss imposed upon the trading classes by the undue raising of the bank rate of discount for the special purpose of attracting gold, say by 1 per cent. for three months. Have you formed any opinion as to the amount of such loss?—I have found it impossible.

9313. Mr. Giffen writes to me that he thinks the bills afloat at one time do not exceed 300,000,000*l.* Would not a rise in the discount of 1 per cent., for three months, represent a loss of 750,000*l.*; and would not that loss fall mainly upon the trading classes?—Well, if you assume all those facts.

9314. Besides that loss, is there not a very large amount advanced by bankers, in the United Kingdom, on loans to traders, and would not such a rise in the bank rate increase that charge?—Certainly.

9315. The Bank of England, in order to attract gold, raised the rate on the 3rd of August from 2 to 3 per cent., and on September the 1st, from 3 to 4 per cent., which is its present rate. Has that action attracted gold?—I have seen it stated that it is a very small sum which has come.

9316. On August the 3rd, the total amount of gold was 20,964,534*l.*; on December 1st it was 20,352,622*l.*, or about 600,000*l.* less. Allowing for the gold, which will shortly return from Scotland, has there not been a very small amount of gold, if any, attracted on balance from abroad?—I should think it had been quite small.

9317. Do you not consider that the loss inflicted upon the trading classes by a rise of 2 per cent. in the bank rate, for over three months, would exceed 1,000,000*l.* sterling?—Well, it all depends. I do not believe in the estimate of 300,000,000*l.* of bills. I do not think anybody knows anything about it.

9318. Does not a higher rate for money tend to depress values and diminish the profits on our home and foreign trade, and in the latter case would not advantage be given to our foreign competitors who work with cheaper money?—Provided they do; if you assume that they do.

9319. Those competitors who work with cheaper money?—Certainly, if they do, of course.

9320. Is it not a high price to pay for the purpose of attracting a million or two of gold, which has in the present instance been ineffectual, owing to European competition for gold?—Well, there you see you raise the point which I referred to in my first day's examination. I think, and I have always

*Mr.
W. Fowler*
2 Dec. 1887.

Mr.
W. Fowler.
2 Dec. 1887.

thought, that having regard to our enormous operations, we keep too small a reserve.

9321. Are you not of opinion that the fall of the rupee from 1s. 11d. to 1s. 5d. has on the whole been of advantage to India?—I think the balance of evidence goes to show that the low silver is beneficial to the mass of the people of India.

9322. Do you think that a further fall, say to one shilling, would also be advantageous to India?—I cannot say.

9323. You stated that the fall in roubles facilitated the export from Russia of wheat and oats. Do you believe that this depreciation of the currency is an advantage to Russia?—I never said so.

9324. You do not consider it an advantage?—Well, you have to take so many things into consideration, before you say it is an advantage, because there is the credit of the nation and other things to be considered before you arrive at a conclusion, as to what is a general advantage; but you may have an advantage to certain classes of exporters, and an injury to the people.

9325. Do you think that inconvertible paper currency is ever of advantage to the country?—I have said once before that I look upon it with horror.

9326. Is not the Indian currency depreciated; and can a depreciated currency be a disadvantage to Russia, and an advantage to India?—It depends so much upon circumstances. The depreciation of silver, I think, from all I can learn, is a benefit to the masses of the people of India, but an injury to the Government and to the official classes. It is possible that the state of things in Russia may benefit the mass of the people. I do not know, but looking to the credit of the nation, I should not advocate any such change, any depreciation of the currency.

9327. And do you think that an inconvertible paper currency can be an advantage to the masses of the country?—I do not say that it can, but you see you have got to take into account all the circumstances of the case. It may be an advantage, for instance, to-day, and may cause a very great loss a few years hence, by some international difficulty arising out of that inconvertible currency.

9328. Then you would say that an inconvertible paper currency, as a permanency, would be a disadvantage to the country?—It certainly must cause, I should think, on the whole, great injury to a country.

9329. Then is not the Indian currency inconvertible?—It is a metal currency.

9330. Is not the Indian currency inconvertible. Could India sell any considerable portion of her currency?—I do not think that is a practical question at all, because no country ever tries to sell the whole of its currency.

9331. Could India use her silver in payment to any other country outside India?—No, I do not suppose she would, unless it was a silver-using country.

9332. But apart from that, therefore, internationally the currency of India and China would be inconvertible?—Well, the only way of removing that difficulty would be to give her a gold currency.

9333. But at present her currency, therefore, is inconvertible, the same as the paper currency would be?—I do not think that it is at all the same as a paper currency.

9334. If it cannot be converted or used?—I cannot assume off-hand that it can never be used.

9335. With regard to Russia, how is it that the exports of wheat from Russia have not largely increased during the many years during which the rouble has been low, and been so large as to rule the market?—Well, that, I think, arises from the general cause I have referred to, that the condition of the markets depends upon the supply of the article, not upon the question of the rouble.

9336. And should increased export of wheat occur in Russia, would not the paper rouble rise in value?—It has not done in recent years with an increased

export, that I can see. For instance, it remains stationary in 1883, 1884, and 1885, with a great change in the export.

9337. It would tend to increase the value of the rouble?—Well, it should do.

9338. If, therefore, Russia were to, as you suggest, rule the wheat market, as a necessity the rouble would be enhanced in value?—It ought to be, but it depends entirely upon what amount they have got out.

9339. Well, the information already given is that the amount is kept within reasonable bounds, and even diminished?—It depends upon what you call reasonable bounds. I have got the amount of notes here, it is an enormous amount.

9340. About 80 or 90 millions sterling, the entire currency of Russia, and notes?—Yes, but then only consider what a very poor nation they are.

9341. Would not therefore they require more currency?—No, I do not think they would. The great mass of the people never see that currency.

9342. You stated that the chief objection to a ratio of 20 to 1 would be that it would render permanent the loss to the Indian Government by the increased burden of its gold debt. Would not the Indian Government be benefited in two ways, that the Budget estimates could be fixed in the future with greater certainty, and that internal loans could be raised on less onerous conditions, rupee loans? Do you consider it would be prudent to invest capital largely in India, and in silver securities, such as rupee loans in the present condition of silver?—Well, that of course involves the question what the probable future of silver is to be. Now there is such a diametrical opposition amongst people as regards that question that I should hesitate to give a very strong opinion.

9343. But you, as a prudent banker, would you like to invest money largely in India and in silver-using countries in silver securities, such as rupee loans, in the present condition of silver?—Well, we bought some rupee loans not long ago.

9344. Would India be at all likely to send silver to England in exchange for gold, should the ratio be fixed at 20 to 1, when India does not do so now, when silver is discredited?—I do not know. I cannot tell. I would not give a very strong opinion upon that. I was referring more particularly to 15½ to 1 when I mentioned about their sending over their silver.

9345. There would not be the same inducement at 20 to 1?—There would not be the same inducement. You never can tell what these Indians will be at.

9346. India would not part with her currency. If silver were sent from India, before it reached Suez it would be ordered back again?—I have heard such statements made, but on the other hand I have heard extraordinary statements as to the amount of hoards held in India.

9347. Then if we did not lose our gold our supremacy would be maintained under a bi-metallic ratio?—If we did not lose our gold there would not be those dangers to which I referred, but as to the supremacy that is another question altogether.

9348. But if all the other Powers were situated in the same way as regards monetary convention, surely the supremacy of this country would be maintained?—Well, yes, if the United States and Germany and France joined, I suppose the supremacy would depend upon other factors.

9349. And in case of a bi-metallic ratio being brought into force, bank notes would be as readily taken, would they not, in this country even if based partly on silver and partly on gold?—Bank notes are out such a short time that it would not be of importance.

9350. And when you talk of engaging to pay in gold, you really mean engaging to pay in bank notes?—I do not know about that.

9351. But supposing a man accepts a bill for 1,000*l.* he does not engage to pay the 1,000*l.* at the

due date in gold; he engages to pay in bank notes?—It is gold nominally.

9352. It is engaged to be paid in legal tender, but it would be a satisfaction of his debt if he did not pay in gold, but paid in bank notes?—It would be so, no doubt.

9353. Therefore there is no such thing as an engagement in this country outside the Bank of England to pay in gold?—You have to pay nominally in gold. It is really what represents the gold.

9354. In fact nobody could insist on your paying him in gold?—Because you can tender him the notes.

9355. Can you conceive that it would be to the interest of any nation to go out of a convention of say 20 to 1?—Well, I was asked that question the other day, and I said I could not tell all the possible circumstances.

9356. Can you give me one example, where it would pay a nation to go out of such a convention as that?—I do not know, but I know that France went out of her convention practically.

9357. Was that quite the case. Did she break faith with any country?—No, she did not break faith; but the whole Latin Union broke faith with the whole world; that has caused all the trouble.

9358. But did they engage with the whole world; they engaged between themselves?—No; but they gave out that they were free coiners of silver, and then they stopped it.

9359. The reason of that was, that Germany commenced to take all the gold from France. Germany sent out silver to France to be coined, and to be exchanged into gold; and it was from ill-will to Germany, or jealousy of Germany, that France refused to continue to coin silver?—If you say so, I do not dispute it.

9360. (*Mr. Barbour.*) Do you think it would be possible to have a gold standard in India?—I do not think it would. It would cause great difficulty if you told the ryot to pay in gold.

9361. But we might use the rupees as they use the five-franc pieces in France now. We might con-

tinue the rupees as they are?—I am afraid it would be very much misunderstood. It is a very large question.

9362. A man having the rupees would pay them just as before and would not perceive any change?—I should not see any such great objection, if it can be done, but I do not see myself how it can be done, and yet maintain India as a market for silver as she is now—as full as she is now.

9363. Certainly, as a market for silver, her power would be decreased. Do you see any evil in that?—That I should think would be very objectionable and intensify the present trouble.

9364. Just as England says, "It is my business to look out for my commercial supremacy; I will have nothing to do with silver." India might say, "I act for myself, I see no reason why I should inconvenience myself to make a market for silver for the rest of the world?"—That is quite a reasonable argument, but I think it would be a very dangerous thing myself, as far as I can understand it, and I think it would be a great pity that one of the largest markets for silver should be decreased. I am not one of those who cry down silver, and say it is of no consequence.

9365. You may know that gold was at one time a legal tender in India?—Yes, I do; before 1835.

9366. So that to use gold in India would be only going back to what once existed before?—No; but they did not use gold as we use it here.

9367. They chiefly used silver, but they also used gold to some extent?—But comparatively little to what it would be now.

9368. But is it not rather hard upon India to maintain the present difficulties in order to provide a market for silver for the rest of the world?—Well, if you can show that India was very much injured by the process it might be so, but I doubt whether it is.

9369. But even if she has not been injured in the past she might be very much injured in the future?—It is conceivable in circumstances that might arise, undoubtedly.

The witness withdrew.

Adjourned till Monday.

FORTY-FIRST DAY.

Monday, 5th December 1887.

PRESENT :

THE RIGHT HON. LORD HERSCHELL, the CHAIRMAN, presiding.

MR. D. M. BARBOUR, C.S.I.

MR. J. W. BIRCH.

MR. H. CHAPLIN, M.P.

SIR T. H. FARRER, Bart.

SIR JOHN LUBBOCK, Bart., M.P.

MR. S. MONTAGU, M.P., and

MR. GEO. H. MURRAY, *Secretary*.

Mr. DANIEL WATNEY called and examined.

9370. (*Chairman.*) You have given considerable attention to the questions which have been raised in the controversy with regard to the existing condition of the currency?—Yes.

9371. And specially to the changes in the ratio of value of silver to gold, and the results which are alleged to have flowed from those changes?—Yes.

9372. Let me ask you first with regard to the suggested appreciation of gold, as having been the cause of the reduction of price which has taken place in many articles of consumption of late years. What observation have you to make with regard to that?—

My difficulty is to admit that it is a cause. The one is not the cause of the other. If you say that gold has appreciated with reference to commodities, you can only mean that commodities have gone down in price with reference to gold; you could not say that gold having gone up in value was the cause of the others going down. It is stating the same fact in two different forms.

9373. No doubt that may be so if you are speaking of a fall in the price of all commodities, but you would not say, I suppose, that the fall in the price of a single commodity, though it showed an appreciation

Mr.
W. Fowler.
2 Dec. 1887.

Mr.
D. Watney.
5 Dec. 1887.

Mr.
D. Watney.
5 Dec. 1887.

of gold in relation to that commodity, showed an appreciation of gold generally?—No, of course you have to take all of them.

9374. May not one regard the matter from different points of view, that a change in the relation of commodities to gold may take place either from something affecting commodities or from something affecting gold. In either case you have a change in the relation, which may be expressed as an appreciation of gold in relation to the commodities, or an appreciation of commodities in relation to the gold; but you would admit, I suppose, that they are two different things?—If you confine me to one commodity, I should consider that that would be travelling outside the currency question altogether.

9375. You mean that there may be something in the circumstances relating to that commodity which has altered its relation to gold?—Exactly.

9376. Do you think that there has been what has been called a scarcity of gold?—I think not at all: there is ample gold in the world for all the purposes to which it need be applied, provided there is a due economy in the use of it. I think it has been used in a most improper manner, and that the demand for those uses has caused its great appreciation.

9377. Do you think that an increase of the money in circulation increases prices?—The increase of the money in circulation will create a demand for the precious metals, and if a demand for the precious metals is created, that renders them comparatively scarce, and therefore appreciates them and lowers the price of the commodities.

9378. You say an increase of the money in circulation; why should that add to the demand for the precious metals?—Assuming that we are speaking of increasing the circulation without increasing the fiduciary issue, there must be more of the precious metals used. If more is used there must be a demand for it, and that demand takes it out of the general bullion market, thereby causing a comparative scarcity. I assume that France, in comparison with England, has in circulation perhaps double the quantity of precious metals per head, and that if France were to have no more precious metals per head in circulation than England there would probably be liberated 200,000,000*l.* of precious metals, all of which would be thrown on the bullion markets of the world.

9379. What do you suppose would be the effect of that?—That would, of course, render the precious metals of less value than they are now.

9380. Those, you mean, which are the standard currency of the French nation?—In France both metals would be liberated, in what proportion I cannot tell; but on the general question I feel no sort of doubt, viewing it merely as a sum in arithmetic. If we abstract the precious metals from circulation we must throw them on the markets of the world, and that would render the precious metals comparatively cheap. On the other hand, let me take the converse of my previous proposition, and suppose that England adopt the same course which has been adopted in France, not as State policy, but as individual policy, we should then have twice as much in circulation per head as we have now. We should have to attract that money from the bullion markets of the world, and thus by creating a great demand for the precious metals we should appreciate them very considerably.

9381. In what way do you suppose an increase of the money in circulation would be produced?—It could only be produced by reducing the banking facilities now existing in the country. I should like, however, to remark that I am arguing on a supposititious case, which it is almost impossible to imagine, because by adopting such a course we should be going backwards. On the other hand, the people of France by increasing their banking facilities would much reduce their money in circulation.

9382. If you were to increase the circulation here, you say that that would only be done by a reduction of the banking facilities?—Exactly.

9383. That is to say, you mean the greater the amount of credit which is founded upon the stock of the precious metals the less the need of quantity of those precious metals?—I do not quite understand the meaning of the word credit, unless the fiduciary issue is meant, but it appears to me that the fiduciary issue is another part of the subject, and has nothing to do with banking facilities. The essential part of credit with reference to banking facilities is the credit or confidence which the customer has in his banker. It is this which liberates the coin from his strong box and brings it into the bank. My point is this: we will suppose that there are a great many banks all over England, and that there are a great number of shops which are constantly taking money over the counter. In the one case where there are banks they would take that money straight to the bank, and the moment it is taken into the bank it enters into the general circulation of the world; in other words, into what I call the bullion markets of the world; whereas, if they held it in their tills or in their strong boxes it would be just the same as hoarded coin. On the other hand, in France there are very few banking facilities, and the consequence is they are obliged to hold this stock in their houses waiting for the collector to call for it. I will admit that cheques to a certain extent assist very considerably. I do not think that cheques with reference to all that enormous number of transactions that I am now speaking of produces so great an effect as the rapid collection of the money that is taken over the counter. You cannot imagine one without the other. You cannot imagine the banking facilities without the cheques; therefore, I think they had better be always taken together.

9384. You are speaking chiefly of the effect of the coinage of the country being rapidly returned to the banks?—Yes.

9385. Instead of being kept by a vast number of people in their houses or shops?—Yes, that is what I mean by banking facilities.

9386. I observe that you have written suggesting that the view that an increase of the money in circulation raises prices is false, but I do not think you have explained to us why you maintain that?—The increase of the money in circulation will cause a demand for the precious metals, and when a demand is caused for the precious metals, they become scarce; their value appreciates and the prices of commodities go down.

9387. What is your opinion with regard to the effect of the change in the relative value of silver to gold upon the fixed payments made by the Indian Government to this country and the supposed bonus on the exportation of wheat?—Probably it would be best to treat the bonus first. It does not exist; it is a mere statement without any proof. My argument was given in a letter to the "Times" of August 10th, 1886. If permitted, I should like to read it:—

WHO GAINS BY THE CURRENCY CRISIS?

To the Editor of the "Times."

"SIR,—In my letter under this heading, which you did me the honour to insert in the 'Times' of yesterday, I left out of consideration the case of shippers to and from India, because I am of opinion it can be proved that the currency crisis does not affect them. It happens, however, that, under the heading of 'The Currency Question,' you printed in the same impression a letter from Mr. J. T. Mackenzie, in which he sums up an argument by saying that 'it is futile to contend that this state of exchanges does not greatly benefit the shipper from India, as for the same cause it is adverse to our home exports to India.' The argument is that a few years ago, when 10 rupees were equivalent to 1*l.*, a Bombay merchant shipping wheat which cost him 1,000 rupees would sell it for 100*l.* and receive back his 1,000 rupees, but that now, when making a smaller shipment, he would receive back 1,454 rupees. This might be true, if wheat retained its old price, but I

contend that the prices of most articles, including wheat and silver, as expressed in terms of gold, have receded in about the same ratio. This being so, the loss in the price of his wheat would be made up to the supposed shipper by the gain on the exchange. The same effect, *mutatis mutandis*, would be produced when goods are shipped to India. But that the question of exchange may be left out of the calculation altogether is shown by the following method of stating the case. Supposing a shipper of wheat from Bombay were to send a cargo to England with instructions to have the proceeds applied to the purchase of goods for export to India, the wheat would be sold at its present reduced price and the goods to be returned would also be purchased at an equally reduced price; so that as much goods would be sent for the wheat as would have been sent before the prices were changed. That is not an extravagant supposition, for trade being in a normal state, the exports and imports must necessarily coincide in value. It is of advantage to India that the influences arising from the present currency crisis, which are disturbing other nations, have no effect on the mutual relationship of the various classes by whom her trade is carried on. Indeed the serenity of her present condition may, in this respect, be considered almost a positive gain. Unfortunately, the Indian trade is not in a normal state, owing to the large amount of debt which is repayable, capital and interest, in gold. Of course, India exports articles, chiefly wheat, to pay its obligations. The wheat is sold at the reduced price, but no profit on exchange takes place, as the proceeds are retained here. When the price of wheat is 30s. a quarter, one-third more must be sent than when the price is 40s. Thus, so far as exports and imports balance one another, the state of the exchange produces no effect, but so far as debts are paid by exports, the low price is a grievous misfortune to India. How Mr. Mackenzie can call this misfortune a benefit surpasses my comprehension."

It will be observed that Mr. Mackenzie says:—"It is futile to contend that this state of exchanges does not greatly benefit the shipper from India, as for the same cause it is adverse to our home exports to India." In my letter I disprove both of these propositions, stating in full the argument about the bonus, but stating the converse merely under the expression *mutatis mutandis*. But there is another mode of looking at this question which may appear to some minds clearer than the foregoing: commodities, when they come from India, can be exchanged for the same quantity of silver as formerly, and this silver can purchase the same quantity of commodities to return to India as formerly. Commodities from India, however, can only be exchanged for a much smaller quantity of gold, and commodities sent in payment of debt have to be exchanged for gold. This necessitates a much larger quantity of commodities to be sent in payment of debt, and causes a corresponding loss to India.

9388. It has been suggested that the fact that the gold price of goods exported from this country to India would be necessarily lower than it would have been before is a mischief as regards this country, because it takes away the profit which is made upon the manufacture of the goods and compels or may compel a diminution of wages in this country?—The appreciation of gold is a very great disadvantage to the capitalist in this country until everything is righted; until all his obligations can be expressed in the new terms, wages among them.

9389. So that it would tend to a diminution of wages?—Eventually.

9390. What have you to say with regard to its effect upon India and Indian officials?—I think the letter I have just read sufficiently answers the question as regards India.

9391. That is the effect upon India. The Indian officials would suffer, I suppose, so far as their pensions are paid in silver, by the diminished value of

silver as compared with gold?—There is no doubt that they suffer considerably from a practical point of view. I hardly know how to give you my ideas upon that subject, for I think when things are righted it will make no difference at all. As I have said before, when everything is righted I anticipate a crisis, I cannot help saying so, I anticipate a crisis in wages, and when that takes place it will most likely be in consequence of some other crisis happening. It is a long time coming, but after it has come everything will be righted.

9392. What is suggested against that view of everything being righted is that whilst it is admitted that if silver now remains stationary in price or value everything would be righted, it is said you can never have things righted, because the price of silver is continually changing, and therefore this righting of things is continually going on, and there is no finality?—The gold price of silver has remained tolerably stationary for some considerable time, but wages have not gone down at all to correspond with the appreciation of gold, and a great many other things in like manner have not gone down. Rent has not gone down.

9393. The rent of agricultural property surely has gone down very much?—But we were not talking of agricultural property just now, I think; the subject that I had in my mind was the Anglo-Indian officials.

9394. What you mean is that all rents have not gone down?—No. There was a very clever letter, as I thought, in the *Morning Post* from Colonel Hughes-Hallett upon this subject. He said many people considered that the officials were very much worse off, with reference to their receiving pensions payable in rupees, when they had to spend the money in this country, and with reference to the money which they sent over from India for their families living in this country, but thought, with reference to all that part of their expenditure which occurred in India, that they were under no disadvantage. But Colonel Hughes-Hallett said that a great number of the articles that they required for their use in India really came from this country, that these had not gone down in price, and therefore that exactly as the exchange altered so their incomes went less far.

9395. Did he indicate what the articles were which now fetched the same gold price, and therefore a higher rupee price?—He says: "Look in any direction, crockery, glass, cutlery, plate, ornaments, books, clothing, boots, toilet materials, medicines, groceries, all liquor from whiskey upwards, saddlery, these and other things are all from England."

9396. That, of course, would be correct so far as regards all articles the gold price of which had not fallen in England?—Exactly.

9397. I observe that you object to the expression "depreciation of silver"?—Undoubtedly, because I believe silver can buy everywhere as much as ever it did, except gold.

9398. Surely not, if that statement is correct; silver will not buy as much as it did before of all the articles which are enumerated there?—No, it will not; but this is because of the extra profits made by the shopkeeper and his servants.

9399. Now is not the expression "depreciation of silver" a proper expression, inasmuch as all gold prices have not fallen?—All gold prices have not fallen, though they have almost all fallen in wholesale. Those which have not fallen give extra profit to someone. There is great tenacity in keeping up prices.

9400. Take rents, which you say have not fallen. If silver will not purchase as much of household accommodation as it did before, does it not show that silver is depreciated?—Yes, with reference to these exceptional things it is, of course.

9401. (*Mr. Barbour.*) Have you any facts to show that the rent of houses has not fallen, because it was mentioned to me a few days ago that the rents in some places had fallen very largely?—Oh, yes, some

Mr.
D. Watney.
5 Dec. 1887.

Mr.
D. Watney.
5 Dec. 1887.

rents have fallen, also some wages. Those that have gone down will not have to go down when that crisis I was speaking of comes, but those that have not gone down will have to go down.

9402. (*Mr. Chaplin.*) You say that wages have fallen?—I do not think they have fallen universally, by any means. I think there is a very large fall in some.

9403. In what particular class, artisans?—Artisans have nearly the same wages now as before the appreciation of gold. This is one of the causes, I believe, perhaps the principal cause of the depression of trade. To the loss of trade caused thereby I attribute the number of men now out of employment.

9404. And agricultural labourers?—Agricultural labourers must be vastly better off than they were 20 years ago.

9405. Is that borne out by facts and evidence on the subject?—I can give no evidence as to the fact. I am merely stating what I hear is the universal belief.

9406. Are you well acquainted with the condition of agricultural labourers?—No, I do not think I am an authority on the subject. On the subject of depression of trade there is a peculiar phenomenon which has never been published by me or, so far as I believe, by anyone else. Being a creditor nation, we have been receiving interest from our debtors in goods. Let us suppose all to have been paid in wheat. The appreciation of gold caused more to be sent. The tendency of sending the increased quantity was to lower the price still further, and this lowering of price increased the debt when expressed in terms of wheat, thus causing even more to be sent. During the years when gold was going up in value, *i.e.*, until the price of wheat reached about its lowest point, this mysterious cause was being added to all other causes, and was producing a great depression of trade, in other words, was rendering trade difficult to be carried on without loss. The usual tendency is that when the price falls, it checks production. The peculiarity here is that it stimulated production.

9407. (*Chairman.*) Now, with regard to the suggested remedies, specially the remedy of bimetalism; do you think that a bimetallic arrangement such as that suggested would be beneficial?—No, certainly not.

9408. Would you give us your reasons for saying so?—Well, I suppose that in giving an answer to that question one might be allowed to consider whether the thing is possible, because if it is not possible it is hardly worth while to entertain it. Probably the first thing to know is what are the necessary conditions of the problem. I think that first of all there must be a treaty with all the coin-using nations of the world; I mean including China and India. I cannot exclude them. I know that bimetalists wish to do so, but I could not exclude them.

9409. (*Mr. Barbour.*) You speak of China as one of the coining nations of the world, but I think the Chinese Government does not issue coins at all?—Well, but they use precious metals.

9410. They use precious metals, but I think it is private individuals who use bars or pieces of silver. I think there is no mint in China?—The fact whether it is a State regulation of coinage now or not does not matter; it is private now; it may be a State regulation in five years' time.

9411. (*Chairman.*) Therefore, you include it because, if not now coining, it might coin, having a silver standard?—Yes; at any rate it uses precious metals to a very large extent; in what form it uses them I do not think is of any consequence for our present inquiry.

9412. You say that the first condition would be to get the consent of all these nations?—Of all these nations.

9413. Do you think it would not work if you excluded China and India?—Supposing that they are

now using principally silver there, and supposing that after we had started it they were to change their currency to gold, it would so completely upset the whole of the calculations that it would be impossible to conceive what the effect of it would be.

9414. The first condition is that all nations must concur; what is the next condition?—Well, of course, they would have to concur in the idea, not only of bimetalism, but also as to some ratio. I cannot imagine the ratio myself. They all say $15\frac{1}{2}$ to 1.

9415. But you do not think all nations would be likely to concur in such a ratio?—I do not see how they could at present. It seems a most extraordinary thing when the ratio is upwards of 20 to 1 that it should be changed all in a moment to $15\frac{1}{2}$ to 1. It seems a sort of arbitrary change that I cannot imagine.

9416. What is the third condition?—I consider there is a most important condition that would have to be introduced into the treaty, which would be the relative quantities of the precious metals which are to be held in every country, and a proper arrangement made so that these relative quantities should be altered from time to time as the demand for the one or the other became greater.

9417. Why do you consider that a necessary condition?—You must take care in this case that the ratio is the exact ratio, as nearly as possible the ratio that is in the market; if not, it would break down, the same as it did when Germany flooded the bullion market with silver and absorbed gold.

9418. What is suggested is that the fact that the mints of the agreeing nations coined silver or gold indiscriminately at a fixed ratio would be sufficient to maintain that ratio between the two metals?—It has failed so far, and I do not see why it should not fail again. The bimetalists assume that bimetalism caused the ratio to be moderately well maintained during the 70 years so much talked about; but they neglect to consider the extraordinary coincidences that took place during those 70 years. When the counterbalancing coincidence did not happen to arise the whole thing broke down. Who could have expected, when gold was found in large quantities in California and Australia, that France would have absorbed such an enormous quantity of it; and who could have supposed that, liberating as France did large quantities of silver, India would take that silver away?

9419. You regard the comparative fixity of the relative value of gold and silver during those 70 years, or nearly 70 years, as due to accidental circumstances, and not as the effect of the then mint regulations?—Certainly not cause and effect with reference to the mint regulations, though, of course, they assisted very much as between one time and another. I have compared that to the fly wheel of an engine. It equalises the speed between one time and another; but it has no force, no power. Bimetalism has no power; it is merely something which, by oscillating in the reverse sense to the immediate tendency, will influence changes so that they may take place quietly. It has no effect except when there are nearly equal causes operating in opposite directions; and then it would appear to the unphilosophical looker-on that neither cause was in operation.

9420. (*Mr. Chaplin.*) But it did keep the ratio quiet?—It did keep the ratio quiet within time, that is between one week and another, and I think it checked speculation which would have been a very sad thing.

9421. I understand you to say that it had the effect of keeping the ratio steady for 70 years?—No, I do not say it; I say it is stated.

9422. (*Chairman.*) You say the keeping of the ratio steady was an accident or a coincidence not dependent on the existing bimetallic regulations?—Certainly.

9423. (*Mr. Chaplin.*) You think the existing mint regulations during those 70 years had nothing to do with that?—No, I do not say they had nothing to do

with it. I think they had something to do with it; I think they kept speculation out and gave general confidence. Besides they steadied people's minds so as to prevent panic and violent fluctuations.

9424. Had they a good deal to do with it?—Very little, for their effect was only felt between short periods of time.

9425. (*Mr. Barbour.*) You compared bimetallism to the fly wheel of an engine. You would not deny that the fly wheel of an engine is a very useful thing?—Oh, no; I think bimetallism would be a most useful thing, provided it were practicable.

9426. (*Chairman.*) You have given us three necessary conditions; have you any other to add?—No, I do not think there is any other necessary condition, but if you were to have bimetallism, I have stated very clearly what an alteration it would make to contracts. I do not know whether morality would not require that every contract should be considered with a view to compensation on one side or the other.

9427. In what way do you suggest that the alteration would alter the relative situation of contracting parties?—I cannot tell you unless I know how many and what countries are to be included in the treaty. It is evidently the wish of the bimetallists to include no countries which would create a demand for gold, their object on the other hand being to substitute silver as much as possible for gold. By this process gold would fall in value and silver would rise. Perhaps the two metals would approach in value to one another till they reached a less ratio than 20 of silver to one of gold. If any such ratio should be adopted—in my opinion an idle supposition so long as China and India are left out of the treaty—debts now payable with gold would be payable with the cheaper metal. Between paying debts with a cheaper metal and with clipped coin I see no essential difference. This I consider is the object of the bimetallists, and would lead to a rise of prices which would be a corresponding benefit to debtors. I have previously said that in my opinion India and China could not be left out of the treaty, and I wish it to be understood that my arguments founded on any other basis are academic rather than practical.

9428. (*Mr. Barbour.*) Is it not an object of the bimetallists to secure a fixed par of exchange between gold and silver countries, apart from the question of raising prices?—They say that.

9429. Is not that put forward as one of the possible things?—I think it may be put forward, but we do not think very much of those little arguments.

9430. (*Chairman.*) But I understand you to say that you think that if bimetallism could be arranged it would be a good thing. I suppose the reason why you think it would be a good thing would be, not that it would raise prices, but that it would create fixity of exchange between the gold and the silver countries?—Exactly. Well, it would be comparatively fixed. Of course, you know there is no such thing as a fixed ratio possible in the world. In my published writings I have said:—"Let us imagine the great silver producing country to exist in longitude 90° west, and the great gold producing country to exist in longitude 90° east. Each precious metal would be cheaper in its own producing country than in the other. All intervening countries would be affected in like manner, though probably in a less degree." In order to fix the ratio it would be necessary to abolish interest and cost of transit by the annihilation of time and space.

9431. You would say comparative steadiness of the ratio?—Comparative. There was only comparative steadiness during the 70 years when the ratio went up to 15.83 to 1, and went down a good deal below 15½ to 1, and there were times, I believe, when in France you could not get silver change.

9432. And there were times, we have heard, when gold was at a slight premium?—Yes. I do not know whether I might, upon the points that have just been raised, suggest a consideration; supposing that

India and China were to join the bimetallic treaty, what would be the effect of it?—I think it would produce an enormous effect upon the demand for gold because they must have their proportion of gold there, the same as we should have our proportion of silver here. It would create a demand for silver here and for gold there. I do not know what it would do in the United States. They have so much silver and so much gold that possibly it would make very little difference to them. France also has a very large quantity of silver and of gold, and so has Germany. We do not know how much silver Germany has, because they do not publish the accounts, so I have been led to understand. It might very possibly happen if India and China were to be included that the demand for gold would be very much increased, and that we should have in consequence of that, instead of a rise in prices, a very considerable further reduction of prices. It is easy to determine the tendency of a certain cause to produce a certain effect, but I doubt if any man could estimate the extent of the effect of the causes now under consideration. My opinion is that the man does not live who could do it.

9433. Do you think that there are other means than bimetallism by which an economy of the use of gold might be effected, and so the suggested scarcity caused by the adoption by Germany and the United States of the gold standard be obviated?—I have suggested three. The first is the issue of 17. notes. I have not developed that idea in print, but I have made a little memorandum here of what was in my mind when I suggested it. I assume that the gold in the hands of the public, besides banks, is 75,000,000*l.* 17. notes might be issued and might come into general use to the extent of 45,000,000*l.* If they did not come into general use the whole thing would fall to the ground. All this gold would come into the issue department in exchange for the notes. Then I assume that the fiduciary issue of the bank might be increased by 15,000,000*l.*, thus leaving in the issue department 30,000,000*l.* of gold out of the 45,000,000*l.* abstracted from circulation. There would be no use, of course, for these 15,000,000*l.* of gold. The new fiduciary issue would represent it; therefore it would have to leave the country, and would be thrown on the bullion markets of the world, thus slightly perhaps inappreciably lowering the price of gold.

9434. What advantage would you gain by that?—It would have an effect, but it would be a slight effect, and I thought it proper when I was writing to state all that I could think of. I wanted to economise gold, and I thought this was a mode of economising it, and therefore I put it in.

9435. (*Mr. Barbour.*) May I ask why you wish to economise gold; with the view of raising prices?—It would have the effect of raising prices there is no doubt, though to so slight an extent as to be almost inappreciable.

9436. Is that the object?—That is one of the objects.

9437. Then you think the appreciation of gold affects us injuriously so far as it lowers prices, and your object is to obviate the effects of the appreciation of gold, and therefore to raise prices?—It would have that effect. It would be our contribution—the only one I know of that we could make by legislation.

9438. (*Chairman.*) What I understand you to suggest is this, that if the currency difficulty is to be remedied and to be met, rather than meet it by bimetallism you would meet it by the suggestions you are making?—Yes. I can quite see that people may taunt me that my wish is to get prices raised. But I think it would be perfectly legitimate, for economy can never be a wrong policy. Raising prices by economy is very different from legislating that debtors may pay in cheaper coin. Besides this it would have other effects which would benefit the country. Firstly, according to my supposition, the issue department would then hold its present 20,000,000*l.* as well as the 30,000,000*l.* withdrawn from circulation, together

*Mr.
D. Watney.*
5 Dec. 1887.

Mr.
D. Watney.
5 Dec. 1887.

50,000,000*l.* of gold. I think this 50,000,000*l.* would be a very great evidence of strength, and would produce a considerable effect on the public mind. Such a quantity of gold could hardly be expected to fail, and would most probably take away all prospect of panic. Secondly, supposing the circulation of 1*l.* notes reached 45,000,000*l.*, of which 15,000,000*l.* were fiduciary issue, the annual gain of interest would be 540,000*l.* In my published writings I have assumed the nett expense of the note issue at 50,000*l.* a year, allowance being made for the saving of the loss by abrasion. But on these points I have no special knowledge, and only mention them in order to indicate the necessary conditions of the problem. If the issue of 1*l.* notes should cause much greater confidence to be felt by the general public thereby reducing to a *minimum* the chances of a panic, and if it should lead to a saving of 400,000*l.* a year, I could well bear the taunts of those who should say that it would also slightly raise prices. Perhaps I may be allowed to add that I do not use these figures for any other purpose than to fill up the argument, which I contend is good whatever figures are used. The conclusion is that, if 1*l.* notes are issued, it might be desirable to increase the fiduciary issue from time to time by one-third of the amount of the 1*l.* notes issued.

9439. (*Sir John Lubbock.*) Would you propose that the Bank of England should keep the numbers of the notes and keep the notes themselves as they do now with the 5*l.* notes, or do you propose that they should reissue them, or have you not gone into that?—I have not gone into that.

9440. You do not know what the cost would be?—No.

9441. Have you looked into the great forgeries of 1*l.* notes when we had them in the beginning of the century, and which led to their abandonment?—No.

9442. You have not considered those points?—I have given them consideration, and I know they are important points, but I cannot give you any evidence upon them.

9443. (*Mr. Montagu.*) You assume that there is 75,000,000*l.* of gold in circulation in Great Britain?—Yes.

9444. But are you aware that bank notes are legal tender in Ireland and Scotland, and that the 1*l.* notes exist there?—Oh, yes, I know.

9445. Therefore you take off, would you not, from your estimated circulation of gold the amount circulating in Ireland and Scotland?—Well, I do not wish to go into so much detail as that.

9446. I think that no one has proposed to issue so large an amount of 1*l.* notes. They may be issued for the convenience of those who desire them, but your proposal would be rather to force them into circulation?—Oh, no.

9447. You would hardly expect people for the sake of convenience to take so large an amount in 1*l.* notes?—They might in time. When travelling in Scotland I found a large number of 1*l.* notes. People seem to like them there, and if they liked them here they would take them.

9448. If the effect of issuing 1*l.* notes raised prices, would not that also affect contracts?—The issuing of 1*l.* notes, taken by itself, would have no effect on prices. The increase of the fiduciary issue would have the same effect as altering contracts, but the contracts would not be altered.

9449. (*Chairman.*) Your next suggested economy is an increase of banking facilities?—Yes.

9450. You anticipate that there will be increased banking facilities in foreign countries which have not adopted them so fully as we have?—Perhaps I have no right to anticipate an increase of banking facilities in foreign countries, but I am sure, if such increase were to take place, it would be a great benefit to them. If my estimate of the possibility of liberating by means of banking facilities 200,000,000*l.* from circulation in France is correct, the profit to the nation would be certainly 8,000,000*l.* a year. There might also be, I

believe, a still further increase of banking facilities in this country. The effect on prices of such transactions would be a prodigious rise, and in comparison the issue of 1*l.* notes, accompanied by an increased fiduciary issue, would be a mere bagatelle. And it should be observed that the increase of banking facilities would be carried out by the action of private individuals, and require no legislative or State action whatsoever.

9451. I think you had a third suggested economy?—Of course that does not come in the slightest degree within the power of this country; it is for other countries who have now a gold currency or a quasi-bimetallic currency to adopt a silver currency.

9452. Then you would not suggest that for us, I suppose?—Not at all; we should not do it because being a creditor nation it would be an enormous injury to us. The other countries in the world have brought this difficulty upon themselves. The United States more particularly I am thinking of.

9453. I think that covers all you have to say about economy of gold?—I think so. I may, however, add I feel perfectly certain that the United States are going to adopt a silver currency, or else the Bland Act would be a foolish thing. In fact if they had intended to adopt a silver currency, they could not have made a better preparation than by passing the Bland Act, which requires that at least 2,000,000 silver dollars should be coined every month. This has been going on for the last nine years, and is going on now. The old vaults are full, and new vaults have lately been erected in which to store the dollars.

9454. You mean that paves the way towards the adoption of a silver currency?—Yes, people say they have done it innocently, but if they had had the longest heads in the world they could not have adopted a better method.

9455. May they not have adopted it because the silver interest was strong, and those who had to sell silver were powerful?—I know that. On the other hand, it may have been in order to hide their design that they proclaimed their wish to benefit themselves.

9456. (*Mr. Barbour.*) I think one of your chief objections to bimetalism is that you could not get all the nations of the world to agree, and you could not be sure that they would keep the agreement. That is one objection?—Yes.

9457. After the principal nations of the world had agreed, India and China might become bimetallic, or might start a gold currency and create such a demand for gold as to destroy the effect of the bimetallic agreement?—When I said that I said also that I did not conceive it possible that a bimetallic treaty could be entered into unless those two countries did join.

9458. And you could not depend upon such a country as China, I suppose?—No, I could not. I do not know anything about the civilisation of China.

9459. What you propose is various measures that would effect an economy of gold?—Yes.

9460. But supposing that after these measures had been introduced, and the economy of gold had been effected, China started a gold standard, would not that swallow up all the results of the economy of gold?—Yes, it would, and we should have to take other measures for economising gold.

9461. We should be no better off than we were?—Possibly not.

9462. So that the objections to bimetalism apply also in some degree to your scheme for the economising of gold, unless you can get an understanding with all the chief Powers. And if you cannot get an understanding for bimetalism, I suppose you could not get an understanding for a scheme such as you propose?—I should not ask for it. But I think it hardly fair to call mine a "scheme" for economising gold, for my proposition of issuing 1*l.* notes and of increasing the fiduciary issue by one-third of the 1*l.* notes issued is the only one which would require legislative sanction. I have explained that it would affect the

value of gold very slightly, its chief advantages being collateral. My second proposition, as regards banking facilities, would be entirely dependent on individual effort, and yet this would be by far the most efficacious of the three. And the third, the change of the currency in the United States, from gold to silver, though within the scope of legislative action there, could not form the subject of a treaty.

9463. But if after you have effected this economy of gold Austria resumes specie payments on a gold basis, you would be no better off than you were before?—The same remark applies to Austria as to China and India.

9464. Or suppose that India adopted a gold standard, a measure which has been proposed, then that also would be sufficient to swallow up all the economy of gold?—Yes, of course, if India is stupid enough to do it; the loss to India would be stupendous.

9465. May I ask how India would lose by adopting the gold standard?—By the demand for gold that would be created. If she had a gold standard the debt would be thereby increased enormously.

9466. But suppose she adopted the gold standard at the market ratio of to-day, 20 to 1, it would leave matters very much as they are, would it not?—A gold standard is a gold standard; there is no ratio then. I do not agree that the ratio between silver and gold to-day is 20 to 1.

9467. But in changing from the present silver coins to the future gold coins, she might adopt the ratio of 20 to 1, so as not to increase the burden, you know?—You could not have a gold standard for India without having a large stock of gold in India.

9468. But there is a very large quantity of gold in India?—I know. How are you to get it?

9469. Of course there is a difficulty; I do not deny that; but India does import at the present day 3,000,000*l.* sterling worth of gold every year, and about 5,000,000*l.* worth of silver, which is mostly coined. If she adopted a gold standard, I presume, instead of importing 5,000,000*l.* worth of silver every year, she would import 5,000,000*l.* worth of gold, and coin that every year?—Possibly.

9470. Do you see any objection to that?—I think it would be a great demand on the stock of gold in the world.

9471. But if these difficulties in silver continued, India might be forced to that course in self-defence?—Forced to injure herself! forced to stab herself! I cannot imagine that. There is no reason in it. It would be the most awful catastrophe for India to have a gold standard.

9472. (*Sir T. Farrer.*) You mentioned a crisis once or twice which you thought was likely to happen. I did not quite understand what you meant that it was, or what you supposed it would arise from?—I assume that there are currency troubles in the world, and I assume that they will right themselves. As soon as all prices come to a natural level again there will be no longer any trouble, and I do not think it is likely that they will get to a natural level again without a crisis.

9473. Then do you think that the fall in prices which has occurred is due to the divergence of gold and silver?—No; not to the divergence between gold and silver. The fall in prices is a necessary coincident of the appreciation of gold. I do not see anything else. Silver is merely one of the commodities that have altered.

9474. But do you think that the appreciation of gold or the fall in prices arises from the scarcity of gold?—Not from the absolute scarcity of gold, but the scarcity of gold relatively to the use to which it is now being put, as I think, most foolishly.

9475. Then you do think that this fall in prices is due to the alteration in the relation between the demand for and the supply of gold; is due to an increased demand or a diminished supply, or both?—It is due principally to an increased demand, though, of course, it so happens that there was a reduced supply

at the same time; but that was a very small cause in comparison with the increase in the demand, because when you come to work out the figures you find that the increase of demand was prodigiously large, and the decrease of supply was comparatively small.

9476. (*Sir John Lubbock.*) Have you formed any estimate at all what the fall in prices has been, say, since 1874?—Well, I generally say 33½ per cent., but I find it is extremely difficult to arrive at anything like a precise figure.

9477. I suppose you would agree, would you not, that the demonetisation of silver by Germany and the closing of the mints by France and the Latin Union have considerably decreased the demand for, and therefore the value of, silver?—Yes, but other causes have neutralised that. Silver has not gone down in relation to commodities.

9478. But you consider that part of the fall in silver in relation to gold has been due to the demonetisation of silver by the mints of the Latin Union?—Yes; but it would be much more agreeable to me if I might put it that the cause of the great appreciation of gold is that there has been great demand for gold in the United States, Germany, and elsewhere.

9479. That was not the question I asked you. I was speaking with reference to silver. You will agree that silver has been demonetised by Germany, and the mints of the Latin Union have been closed, and the question I asked you was, whether you consider that that had had much effect on the value of silver?—So far as it put silver on to the market of course it had the effect of lowering the value of silver. It had a tendency in that direction, but as there is no actual depreciation of silver there must have been other causes to counteract it.

9480. Then do you consider that the value of silver now is what the value of silver used to be, and that the difference is owing to the appreciation of gold?—Yes.

9481. Several witnesses who have been before us have attributed part of the fall in the other commodities to the great increase in the supply, owing to diminished cost of production, cost of transport, and so on; do you doubt that?—Well, I suppose there must have been a decrease in that respect; of course there must have been a decrease of expense. I know many people who have thought that there has been over-production.

9482. But they have taken, for instance, the price of wheat, the price of sugar, the price of various other commodities, and they have pointed out the great increase in the stocks, the great increase in the supply, the greater facilities of transport, and have expressed the opinion that the fall in prices of those articles has been mainly, or perhaps even some of them entirely, due to those causes?—Well, the decreased cost of production is one thing, but the increased production or over-production I cannot imagine to exist, for I believe that in every trade now goods are going more directly to the consumer than ever they did before, and if there are fewer goods held in warehouses and so on, which I believe is the fact, there must be fewer stocks, and, in fact, even the change from sailing vessels to steam must have enormously decreased the stock of commodities in the world, and therefore I cannot see that there is any such thing as over-production.

9483. Do you mean to say that you consider that there is a smaller stock of most of the staple articles in warehouses than there was 20 years ago?—Yes; I believe so. Probably iron may be an exception.

9484. Now taking the case of sugar, there has been a very considerable fall in the price of sugar. Is it only affected owing to the appreciation of gold, and do you consider that the real value of sugar is the same as it was 15 years ago?—There is no doubt that sugar has had various causes to operate upon it.

9485. Again, take the case of wheat; do you consider that the real value of wheat is the same as it

Mr.
D. Watney.
5 Dec. 1887.

Mr.
D. Watney.
5 Dec. 1887.

was?—No, I think that wheat has fallen in price more than $33\frac{1}{3}$ per cent., and I think the same with sugar.

9486. Then 33 per cent. of the fall you attribute to an increase in the value of gold, and anything over and above that to a fall in the real value of the article. Is that your contention?—It is very much like that, but I should be very sorry to pin my faith on to the 33. You see I hold that gold has appreciated with reference to silver about 28 per cent.

9487. I think you have already expressed the opinion that the ratio of silver to gold being 20 to 1, there would be great injustice in compelling those who had made contracts in silver at that ratio to fulfil contracts at the ratio of $15\frac{1}{2}$ to 1. I think you have already expressed your opinion on that?—Yes; and further I think it unjust for the Legislature to alter contracts, however or whenever made, unless compensation is made to the sufferers according to the price current on the day of the change.

9488. Supposing bimetallism were adopted with the ratio of 20 to 1, would you consider that that would have any effect upon prices?—Well, I think it would.

9489. Are you prepared to express a decided opinion upon it?—It would be a very slight alteration, because it would not be far from the market price.

9490. You think it would have an effect, but a very slight one?—Yes.

9491. (*Mr. Montagu.*) Do you say that increased circulation tends to lower prices?—Certainly.

9492. And if you increase the circulation, say, by the issue of paper or anything of that kind, would you not lower the value of money and lead to the export of gold?—If the paper were founded on gold it would be the same as gold.

9493. But would it not lower the value of money and lead to the export of gold?—You cannot increase the circulation without decreasing banking facilities.

9494. I will put it in this way, suppose 3,000,000*l.* of gold should arrive in this country and go into circulation naturally, would you not lower the value of money and lead to the exportation of gold?—There is no demand for it here; we do not want the 3,000,000*l.* of gold, and therefore as soon as it came it would go, because there is a demand for it elsewhere. It is not wanted here.

9495. But I understand you to say that increased circulation would lead to a demand for gold. Would not it lessen the demand for gold?—I do not know how anybody is to provide for an increased circulation, except by creating a demand for gold; that is, supposing the fiduciary issue is not changed.

9496. But surely if gold arrived in this country and was taken to the Bank of England, and notes issued against it, that would increase the circulation, would it not?—Yes, if anybody took them.

9497. They must take the notes against the gold they deliver?—Yes, but they do not want the gold, I suppose, and I cannot imagine the circumstances that are being considered.

9498. Do you see any connexion between the fall in the rupee and the fall in wheat?—Undoubtedly, because gold is appreciated, and, therefore, it affects all commodities, silver among them.

9499. You stated that an exporter of wheat from India received as much goods as formerly. Would you take the instance of copper, which, I believe, is largely exported to India, and has risen now 50 per cent.? Of course you would expect that the exporter of wheat from India would not receive the same amount of copper as formerly, owing to this great advance?—I was very desirous, if I possibly could, not to take up individual cases of that description. I thought that it was generally assumed that gold had appreciated with reference to almost all articles, and I take that as the basis of my argument.

9500. We have heard it stated that the fall in the rupee is a benefit to India. Do you agree with that?—I daresay you notice how very much disinclined I am to say that there has been a fall in the rupee.

9501. The rupee is now *1s. 5d.*; it was *1s. 11d.*?—I say there has been a rise in gold, but there has been no fall in the rupee. I have a great objection to the phrase a fall in the rupee. I prefer to call it a rise in gold; I understand that, but I do not agree there has been a fall in the rupee.

9502. Supposing that Germany saw no advantage in continuing to hold her useless silver and sold it, would not silver and also rupees decline in value?—Undoubtedly, by throwing more silver on to the market of the world; there is no doubt it would have an effect that way.

9503. (*Chairman.*) But in that case would not you call it a decline of the rupee rather than a further appreciation of gold, inasmuch as it is produced by an increased supply?—It is very possible it might be then. It has not arisen yet. In fact, all the silver that has been thrown on the market has been more than absorbed, for silver is slightly appreciated. I am very strong upon that point. I am sorry to be so pertinacious, but I cannot agree that silver has gone down in value.

9504. (*Mr. Montagu.*) Why should a bimetallic convention, say, at 20 to 1, break down, if all the important nations joined in it?—I should have to suppose that everybody is wise to suppose that it would remain. I cannot suppose that everybody is wise. Just think of the folly of the United States when they were a debtor nation in adopting a gold coinage. They knew nothing about currency matters; they did not know that it was going to increase their debt enormously.

9505. Is the United States a debtor nation?—I call it so.

9506. What leads you to suppose that?—Well, I believe there are enormous quantities of stocks held in this country for railways and all sorts of industrial enterprises for which dividends are received in this country. Besides, if you look at their imports and exports you will find that invariably they are a greater exporting than an importing nation.

9507. You are aware that almost all her public debt is held in America?—Oh, but that is very small in comparison with the other debts of the United States; so I believe.

9508. Do you think France could alone maintain bimetallism at the time, 1873; do you think she was able to maintain bimetallism alone?—Oh, dear no.

9509. And, therefore, you use the refusal to help Germany to exchange her silver for gold as an argument against bimetallism?—Yes; but I prefer to change the word refusal into inability.

9510. Because France singly could maintain it, and refused to help Germany to exchange to gold, would you consider that an argument against universal bimetallism?—Again I deny that France could singly maintain bimetallism. In fact, it broke down upon that point. It is difficult to imagine a stronger argument.

9511. Bimetallists do not for a moment assert, I believe, that one nation or two nations could maintain the bimetallic convention?—No, they have various views. I have had a long correspondence with Mr. Grenfell, who thinks one nation is quite enough for it.

9512. Would you think that a bimetallic ratio of 20 to 1 would interfere with contracts?—It would, I think, to a small extent, very likely.

9513. Considering that it did not raise silver at all, would it interfere with contracts?—It would raise silver in comparison with its present price; that is to say, if you paid in silver instead of in gold—to that extent it would be an injury.

9514. You advise foreign countries to adopt silver currency while we keep out of it. Do you think that

advice is likely to be followed?—There again I have to make an estimate of the folly of mankind. I have said it would be to the interest of the United States to adopt that policy, and that therefore it would be foolish for them not to do so.

9515. Do you think any other country has a greater interest than this Empire in silver?—This country has little interest in silver. It would be to the interest of this country that every other country should adopt a gold currency.

9516. If the United States of America followed your advice, and became monometallic on silver, do you not see great danger in her supplanting us in the trade with India and the East?—Oh, dear no.

9517. You see no facility, then, between one silver-

using country and another trading?—Oh, none whatever; that is only a bogey.

9518. And you think that if a man imported from China, tea, and had to fix his price in silver, that he would be under a disadvantage to an American who had silver ready at hand?—Oh, no; it makes no difference, whatever the currency is. I hope you understood me to say just now that a universal gold currency for every country in the world would be the greatest possible advantage to this country, because we are the greatest creditor nation in the world, and it would increase the world's debts to us enormously. This is an undoubted fact, though no one could properly, I may say honourably, recommend it as a policy.

Mr.
D. Watney.
5 Dec. 1887.

The witness withdrew.

Adjourned till Friday.

FORTY-SECOND DAY.

Friday, 9th December 1887.

PRESENT :

THE RIGHT HON. LORD HERSCHELL, the CHAIRMAN, presiding.

MR. D. M. BARBOUR, C.S.I.
MR. J. W. BIRCH.
MR. H. CHAPLIN, M.P.

SIR T. H. FARRER, Bart.
SIR JOHN LUBBOCK, Bart., M.P.
MR. S. MONTAGU, M.P., and

MR. GEO. H. MURRAY, *Secretary*.

LORD ADDINGTON called and examined.

Lord
Addington.

9 Dec. 1887.

9519. (*Chairman*.) You are one of the directors of the Bank of England?—I am.

9520. And have given considerable attention to these currency questions?—To currency questions generally, but to the bi-metallic question I cannot say that I had given much attention, until your Lordship's invitation was read to the Bank Court, which I felt I ought to respond to, if I possibly could, and thereupon I prepared this paper, which I put in in place of verbal evidence.

The Theory of BI-METALLISM.

Many trades and industries have recently suffered, and the severe and general depression of price for agricultural and manufactured products has entailed serious loss on those engaged in the production of such articles.

Amongst the articles which have materially fallen in price, silver is conspicuous. The price of bar silver in 1873 having been 60 pence per oz., and now in June 1887 being 44 pence per oz.

The fall of silver as compared with gold is a far more important incident than the fall of price in any other commodity, for silver is a precious metal; it is in many countries the medium of exchange and the measure of value, and a fall of prices estimated in silver as a measure

of value, has, consequent upon the fall in silver as a commodity, varied still further from the level of prices previously expressed in gold.

This conflict of standards has been especially vexatious in the dealings between England with its gold and India with its silver standard of value, and while all concur in the advantage that would accompany a common standard for the two countries, no agreement has yet been attained as to the mode of procuring it.

The most prominent of the competing schemes is the one designated Bi-metallism, which may be thus defined:—

Bi-metallism is the combination,—for the purposes of currency, and as the standard of value and measure of price,—of gold and silver in a fixed ratio to one another (say of 1 part of gold to 15½ parts of silver).

The civilized nations of the world would join in the adoption of Bi-metallism by an engagement which would involve an obligation to coin, free of charge, or at a uniform charge, all the gold and silver brought to each national mint, they would bind themselves to constitute, as legal payments, all payments in gold and silver coin at their permanently assigned value.

Upon the execution of this cosmopolitan treaty, Bi-metallism would be established. Its consequence would be,—

1. That every standard silver coin would bear a fixed proportionate value to every standard gold coin.

2. That payments to any amount might be made in either metal at the option of the payer.

Lord
Addington.

9 Dec. 1887.

3. That silver would, as a commodity, acquire and retain the value given to it by international law.

4. That holders of silver coins would possess coins of invariable and international value, and that owners of silver mines would command a certain cash price for any quantity which they could produce.

5. That fresh discoveries of either gold or silver would add to the compound mass, but would not affect the price of either silver or gold separately.

6. That the complexity attending the computation of price between countries now using different standards, and the uncertainty attending the realization of transactions would, so far as they arose from the variability of the relative values of gold and silver, wholly disappear.

7. That, as touching the intercourse of India and England commercially and financially, the operation of Bi-metallism would materially diminish the clerical labour involved, and terminate the fluctuating value of the rupee.

These consequences would seem to follow upon the establishment of Bi-metallism, but can Bi-metallism be established?

An affirmative implies,—

1. That all, or at least the principal, civilized nations of the world would concur in framing and observe the provisions of the bi-metallic treaty, and that each contracting state should have, as the basis of its own concurrence, a solid reliance on the good faith and capacity of every other state for the permanent observance of the treaty in all its parts.

The theory of Bi-metallism is attractive, and I discover no logical inaccuracy in its construction. Its practical value must depend upon the feasibility of the premises on which it is based, and obviously this is not to be easily secured.

Before, however, determining that Bi-metallism should become an object of general desire and laborious diplomatic efforts, it will not be superfluous carefully to investigate the motives alleged for its adoption.

REASONS FOR ADOPTING BI-METALLISM.

Bi-metallism is prescribed as a remedy for commercial depression alleged to be mainly the effect of an appreciation of gold.

The depression is unquestioned; the appreciation of gold as its cause has not been demonstrated. I will attempt to investigate the allegation.

The appreciation of gold implies its scarcity, independently, at least, of those accidents which affect its value in use and in exchange.

Excluding, however, all qualifying circumstances, it necessarily ensues, upon a scarcity of gold, that it commands, as capital and as currency, a higher rate of interest in use, a larger quantity of commodities in exchange. When both these indications are visible, an appreciation of gold arising from its scarcity may be assumed, but as an evidence of scarcity in the present discussion an enhanced rate of interest has been conspicuously absent. Mr. Gibbs, indeed, designates this stipulated evidence as an error, involving an ambiguity in the use of the word money. "The phrase 'Money is cheap,' has (he writes) no reference 'whatever to any scarcity or abundance of coin. It 'relates rather to *time* than to *money*, to the rate of 'interest or discount payable for the anticipation of 'money not yet due."

Of course, *time* is an element in the computation of interest, it measures the amount of the consideration, but the *rate* of the consideration for use is dependent upon the abundance or scarcity of the money seeking investment.

The effect of an influx of gold may be temporary, the bullion in the bank may subside, and, concurrently, the rate of interest may decrease, but if the bullion in the Issue Department and the reserve in the Banking Department are maintained above the average level, the rate of interest will range below the average and securities will rise in value.

Throughout the whole period 1873-87, to which the controversy relates, the bullion in the Issue Department and the reserve in the Banking Department have been maintained at an average level which has entailed a rate of discount indicating rather an excess, than a scarcity of gold. The bullion in the Bank of France rose in the same period from 30 to 140 millions, of which the gold alone was 55 millions, so that in the two chief financial capitals there is recorded a distinct refutation of the theory that gold has been appreciated through comparative scarcity. Mr. Gibbs thinks that the production of gold within the last 10 years has scarcely supplied the consumption and

wear and tear, and he states that within the same period Germany and Italy have acquired some 100 millions for currency purposes, while other states have also taken considerable sums. Upon these premises, Mr. Gibbs concludes ("Fortnightly," October 1886, p. 484):—"So, then, 'supply has diminished, demand has increased, gold is 'dear, commodities are cheap." The propositions of this sequence seem to me irreconcilable with facts. I do not find the affirmation, "Gold is dear," to be true upon the average records of the period under review, for I hold that dearness in use is inseparable from scarcity of gold, and I demur to the exclusive application of the terms "cheap money," or "dear money," to the rate paying for a loan with few days to run, or for money at call; a limitation which would render it irrelevant to the argument. The rate of discount for three months' bills, and the price of Government stocks and other first class securities, are real tests of the scarcity or abundance of money seeking investment, and these evidences are distinctly at variance with the assumed dearness of gold from 1873 to 1887.

A single proof, however, may carry conviction, and there is still offered in evidence the list of depressed prices accompanying the alleged appreciation of gold. The evidence deduced from prices, to be effectual, must, however, be universal, and the depression of prices must be capable of being distinctly traced to the influence of the scarcity of gold (or rather of gold and silver, each of which acts as a measure of value).

The universality of the depression of prices may be open to argument, and the scarcity of gold may be debateable, but the connection of these two facts as cause and effect, if real, should be demonstrated. It is here that bi-metallists fail; they assume the coincidence of depressed prices in view of a diminished production of gold, and of the adoption of a gold standard by Germany and Italy, to be equivalent to the depression of prices consequent upon a scarcity of gold, but they make no attempt to trace the economic operation.

There is really no necessity for ascribing to some occult and inexplicable influence the connection between the recent decline of prices and the diminished production of gold, when, as regards a very large portion of the articles depressed, depreciation can be explained upon the recognized principle of supply and demand; of supply not necessarily excessive in relation to the past, but excessive relatively to a present diminished demand.

A period of prosperity leads to enlarged production and the expansion of any branch of industry stimulates others. A multiplication of ships leads to a rivalry for cargoes, low freights lead to cheap imports, while, again, the velocity of steam, and the instantaneous telegraphic order supersede the necessity for keeping stocks. Every scientific advance tends to the depression of price.

THE EFFECT OF THE SILVER DISCOVERIES OF THE SIXTEENTH CENTURY.

The rise of prices consequent upon the silver discoveries of the sixteenth century is cited as illustrating the connection between the mass of precious metals in its varying magnitude and the prices of the commodities which it served to circulate. It may be useful to refer upon this subject to Tooke and Newmarch, "High and Low Prices," and from the 6th Volume, Appendix 2, I gather these facts:—

The precious metals in the old world in 1492, were estimated by Jacob at -	£ 33,342,000
Gold and silver produced from 1492 to 1600 - - - - -	143,658,000
Gold and silver produced from 1600 to 1700 - - - - -	337,000,000
Gold and silver produced from 1700 to 1809 - - - - -	880,000,000
	1,394,000,000
Leaving, after deduction made for wear and use, a sum existing as coin in 1809, in Europe, Africa, and America - - - - -	280,000,000

The effect of variations in quantity upon the power of gold and silver as measures of value must depend upon the proportion borne by the amounts newly added to the currency to the pre-existent amounts; and it would be natural to find that the extensive discoveries in the 16th century would make a sensible impression upon prices subsisting concurrently with a metallic currency in the old world of no more than 33 millions sterling. The effect of the new discoveries seems to have been slow and gradual, and Adam Smith remarks, "that the discovery of 'the mines of America does not seem to have had any

"very sensible effect upon the prices of things in England till after 1570, although even the mines of Potosi had been discovered more than 20 years before. The price of wheat had, since 1350, fallen gradually from four to two ounces of silver, equal to 10s. of our present money, the price at which it was estimated till about 1570.

"From 1570 to 1640 the variation between the value of silver and that of corn held a quite opposite course. Silver sank in its real value, or would exchange for a smaller quantity of labour than before, and corn rose in nominal price, and came to be sold, not for two ounces or ten shillings, but for six or eight ounces of silver, or about 30s. or 40s. of our present money.

"The discovery of the abundant mines of America seems to have been the sole cause of this diminution in the value of silver in proportion to that of corn (between 1570 and 1640). Europe was, during this period, advancing in industry and improvement, and the demand for silver must consequently have increased. But the increase in the supply of silver, had, it seems, so far exceeded the demand for it, that the value of that metal sunk considerably."*

Here cause and effect are distinctly perceived, and the connection between them shown. The first owners of the newly discovered silver, barter it for the commodities which they covet. This abnormal demand for any article raises its price, which the purchasers readily provide out of their metallic abundance. Their customers in turn seek the articles which would gratify them, and, in the face of an enlarged demand, readily meet the higher price out of their profitably acquired silver. Another (and another) circle of operations diffuses the influence of the new demand, until the power of purchase in the silver is determined by the cost of its production.†

In general terms, Adam Smith considered that the American discoveries raised the price of the quarter of wheat threefold, i.e., from two to six ounces of silver. The stock of gold and silver having, within the same period, increased sevenfold, viz., from 33 millions sterling to 220 millions.

EFFECT OF GOLD DISCOVERIES OF 1848 AND 1850.

I proceed to the consideration of the discoveries of gold in California in 1848, and in Australia in 1850, seeking my information in Tooke and Newmarch's 6th volume, p. 368.

The aggregate amount of gold and silver coin in Europe, Africa, and America in 1809 was estimated by Jacob at	380,000,000
He computed the increase of that stock up to 1829 at	103,000,000
	483,000,000
The exports to India and the loss by wear and tear in the same period at	170,000,000
Leaving for coin in Europe, Africa, and America (in 1829)	313,000,000

There is good reason to believe that the total stock (of gold existing) in various forms in Europe and America in 1848 was—(Tooke and Newmarch, 6th vol., p. 230)—

Of gold - - - 560 millions

And of silver - - - 800 „

Together 1,360 „

that the new supplies of gold from 1848 to 1856 from California and Australia amounted to 174 millions, and that an equal amount of 174 millions sterling was in the same period added to the gold coin in England, France, and the United States, raising its aggregate by one-third from 560 to 734 millions.‡ It was to an existing stock of 560 millions in gold and silver coin that the new discoveries were to be added, and it is important to trace the effect on prices of an addition within nine years of nearly one-third.

In 1849 the gold of San Francisco was eagerly sought and wrought by a vigorous company of adventurers rapidly increasing from a mere handful to many thousands. They came inadequately provided with tools or implements, yet in the earlier days of their labour they averaged 2l. or 3l. worth of gold dust as the result of a day's hard work. With experience their gains increased, and men have been known to gain for days successively from 100 or 200 dollars a day up to five or even eight hundred dollars. Wealth easily acquired was as easily spent; provisions rose enormously in

price, eggs were sold at 4d., 8d., and 10d. each. Sugar, tea, and coffee at 16s. a lb. Picks and shovels at from one to three pounds each; a suit of clothes for 200 dollars, a pair of boots for 100 dollars. Iron tacks were bought at their weight in gold. All had gold and all wanted commodities which as yet were but scantily supplied, and of which the price was consequently extravagantly raised. The abnormal demand quickly attracted fresh supplies, and within a couple of years a strong reaction had set in. This again in time subsided to an elevated though more equable level regulated in proportion to the gains of labour at the mines.

The working of the Australian mines was in full activity from August 1851 to July 1853, and during that period the rush of immigrants to the Victoria diggings, and their successful labour, rapidly raised wages fourfold, and enormously enhanced the prices of spirits, beer, provisions, clothing, tools, carts and horses, in fact, of all commodities which the miners required.*

The effect of the excessive demands by the miners was soon evidenced in the exports from the mother country, and the trade returns show that ten articles, of which the value exported to the United States and Victoria was 11½ millions in 1849, had risen to 29½ millions in 1853—the increase of 18 millions being attributable to the demand created by the gold discoveries.

Rapid had been the inflation of prices and the rise in wages in Australia; rapid also was the reaction, and severe the crisis consequent on the overwhelming supply of every conceivable article. The crisis extended over the whole of the year 1854, but it subsided between February and August 1855, and the torrent of imports having ceased, trade assumed a more settled and hopeful aspect, which prevailed continuously throughout 1856.

It has been remarked by Mr. Newmarch, "That the rise of prices in 1851–3 followed precisely the increase of expenditure arising out of the augmented incomes of the inhabitants of the Colony, that the incomes first augmented were those of the unskilled labourers, then the incomes of skilled labourers, then the incomes of retail dealers—and so on in upward progression."

The facility and certainty of obtaining fresh supplies precluded the recurrence of extravagant prices for imported articles, but for articles of local production, such as meat, dairy, farm, and garden produce, required by vast numbers of thriving labourers, inordinate prices were easily secured by fortunate purveyors, until competition moderated their profits, and the gardener who sold a cabbage for 5s. in 1854, was reduced to accepting 2d. for the same article in 1856.

A review of the history of Victoria during the years 1851–1856 justifies the conclusion that the discovery of gold led to the immediate elevation of prices in the Colony, but that this effect had, as regarded most articles, passed away with the year 1853, and that prices during the entire period under survey were visibly determined by the relative forces of supply and demand.†

In relation to the present controversy, the question is not what effect the gold discoveries of California and Australia had upon prices of commodities in those countries, but what effect they had upon prices in England.

Classifying the articles noticed, I find that the chief articles of colonial and tropical produce, tea, sugar, coffee, tobacco, silk, cotton, and indigo are scarcely higher in price at the close of 1856 than they were in 1850. That raw materials generally experienced a progressive rise from 1851 up to the close of 1856; that the Russian War of 1854–6 exercised a disturbing influence upon prices; but that no change of any magnitude is recorded which does not admit of explanation upon purely mercantile reasons relating to supply and demand.

Mr. Tooke (A.D. 1857) concludes "that while no immediate influence of the gold discoveries can be traced in the present range of prices, the eventual subsidence of them, when disturbing causes have ceased, is likely to be at a higher level than could otherwise be maintained."‡

The effect of the gold discoveries of California and Australia upon prices in England was brief in its duration and difficult to assess. I have now to ascertain what were their direct effect upon the rate of interest, and the price of interest-bearing securities.

The bullion in the Bank of England for the five years 1845–9 averaged 13,898,000l., and, on the 5th April 1851, the bullion in the issue department of the bank stood at 13,294,000l.; the rate of discount was 3 per cent., and the price of Consols 96½. The influx of gold had, by the 6th October 1852, raised the bullion to 20,990,000l.; the rate of discount had fallen to 2 per cent., and the price of

9 Dec. 1887.

Consols had risen to 100%. The accumulation of gold ceased early in 1853, with the rumours of an impending war between Russia and Turkey, and the measures consequent on the certainty of hostilities aided the reaction, which, by the 5th October 1853, reduced the bullion in the Bank to 15,032,000*l.*, the price of Consols to 91, and raised the rate of discount to 5 per cent.

For years the bullion in the Bank continued to decline, and it appears therefore that although the enormous gold production of 1850–1856 averaged 28 millions annually, of which three-fourths came to this country, yet, under the influence of commercial activity and of war expenditure, this flood of gold had been diffused so rapidly and so widely that, subsequently to the brief inflation of 1851–1853, it left no sensible effect upon prices which can be assigned to the vast addition made to the metallic wealth of the universe.

We have been challenged to consider the depression in connection with its alleged cause—an appreciation or scarcity of gold—and I have therefore referred for guidance to the great events in the history of the precious metals which occurred, first, in the 16th century and again in the midst of the 19th century, for in the absence of mathematical demonstration reasoning by analogy becomes an important form of argument.

1. Bi-metallists assert that the present depression of prices is mainly the consequence of a scarcity and appreciation of gold.

2. That gold is now appreciated owing to its supply being inadequate for its purposes.

3. That to create a new standard of value, combining gold and silver in a permanently fixed ratio to one another, would enlarge the compound mass of the measure of value, and relieve prices from the disturbing influences to which they are now subject.

Upon these propositions I remark :—

1. That the effect of a diminished production of the precious metals may be not to create a scarcity but to mitigate a surfeit; and that the diminished production of recent years has not been such, relatively to the existing stock of gold, as to superinduce the first and most unquestioned test of scarcity, viz., “dearness in use” preceding “dearness in exchange.” I have traced the process through which the owner of newly found and easily acquired gold yields it in larger measure in exchange for the articles he desires. Let us endeavour to trace the action prompted by a scarcity of gold arising from diminished production. The evidence of that diminution will be found in the gradual absorption of the unwrought metal through its coinage in replacement of the incessant wear and tear of the current coin, in the consequent subsidence of the metallic deposits in the national banks, in the contraction of their reserves, and in the increase of their charge for discount—and, as the sequel, a rise in the rate of interest, which discourages the holding of stocks of merchandize, and creates a disposition to realise which inevitably depresses prices.

At this moment the rate of interest, instead of indicating by its elevation a scarcity of gold, is lower than ever was known in the history of the world. Advances are readily obtained, and three months’ bills easily discounted at 1 per cent. per annum. In the face of this great fact, and of the increased value of solid securities, the assumption that there is a scarcity of gold is clearly untenable. If, however, some intrepid bi-metallist affirms a connexion between the prevalent low prices and the assumed appreciation of gold arising from scarcity, let him explain the “modus operandi”; let him set forth the process of reasoning, the motive which impels a seller to accept, except upon the issue of the struggle between supply and demand, a lower price for his goods in the face of an abundance of capital and of a low rate of interest.

The assumption of a scarcity of gold is visibly refuted by the returns of the gold and silver held on the 1st May 1887, given in detail in the “Economist” of 4th June, the results being that the United States’ Treasury and the Banks of France, England, and Germany held as their aggregate amounts of—

	1881.	1887.	Increase.
Gold	87,168,582	147,026,334	59,857,752
Silver	82,018,115	113,141,974	31,123,859
	169,186,697	260,168,308	90,981,611

In the face of these statements of the stocks of gold and silver, and of the unprecedentedly low rate of interest, it seems futile to affirm that the low prices of the day are the consequence of an appreciation or of a scarcity of gold.

2. Accepting the prevalent depression of prices to be in some degree an evil, I question the results of the proposed remedy—bi-metallism.

Gold and silver act now separately as measures of price; if united, as parts of a joint currency, they would still fulfil the same office, and I fail to see how or why (for instance) meat and wheat, butter and wool, should rise in price because bi-metallism had been proclaimed. The convenience of a common coin, as of a common language, may be admitted, but the effect bi-metallism would have on prices is very problematical. The certainties are these :—An enormous boon would be conferred on the owners of silver mines, assuming that which is the basis of the movement to be well founded, that silver is becoming more abundant; and so far as the union tended to depress or limit the comparative value of gold, countries which, like England, have on other countries large claims payable in gold would be proportionately damaged.

I do not ignore the practical inconvenience which results from maintaining a gold standard of value in England and a silver standard in India; but the consideration of the mode in which that inconvenience operates, and of the means through which it might be removed or mitigated, I have deemed to be outside the present inquiry, which is intended to ascertain the connexion between an alleged appreciation of gold and the depression of prices, and the expediency of adopting a universal bi-metallism as the remedy for the depression.

I have confined my remarks to these points, and I submit, as inferential from the evidence I have adduced, the following conclusions :—

1. That a theory of bi-metallism may be constructed on assumed bases and terms which, if established and enforced, ought logically to succeed in creating an international currency and standard of value.

2. That the prevalent depression of prices cannot be the effect of an appreciation or scarcity of gold, since a scarcity of gold which would depress prices through its dearness in use is non-existent.

3. That a system of international bi-metallism is not required as a remedy for the depression imputed to a scarcity of gold, inasmuch as the existence of such scarcity has not been manifested.

9521. This paper conveys your views upon the subject?—It does.

9522. (*Mr. Barbour.*) Would you be in favour of the gradual demonetization of silver everywhere, and the adoption of the gold standard instead of it?—No, I do not want to interfere with any existing system.

9523. Assuming that the practical difficulties in the way of establishing what is called bi-metallism are insuperable, and that both gold and silver must continue to be used as standard money, can you point to any satisfactory principle on which the division of the countries of the world into gold-using countries and silver-using countries can be based?—I do not appear either as an advocate for or an opponent of bi-metallism. It appears to me that the theory has very much which is fascinating about it, but I give no opinion as to whether it is practicable or not, beyond a general opinion as to the very great difficulty which would attend its adoption. I am not prepared to depreciate any of the advantages which would result from having a cosmopolitan currency; like a common language, I think it might have very many conveniences. I think the arguments on both sides have been exaggerated, both the difficulties which would attend the operation of such a theory, if it were practicable, and the injuries which result from the present system; but I am not prepared to point out any mode of escape from the existing difficulties which every one acknowledges.

9524. There has been an objection raised to the use of silver, which has been strongly put by The Hon. David A. Wells in an article in the *Contemporary Review* for this month, and I should like to read you a passage which explains that objection :—“In respect of portability, convenience for use, adaption to domestic and foreign business alike, the balance of advantages for all transactions above 5*l.* is also largely on the side of gold; as will be evident when it is remembered that it required, even before its depreciation, 16 times more time to count silver in any considerable

"quantity than an equal value of gold; 16 times more to handle it; 16 times more packages, casks, or capacity to hold it; and 16 times more expense to transport it. In other words, in this saving age, when the possibility of extensive business transactions is turning on profits reckoned not in cents, but in fractions of cents per yard, per pound, or per bushel, to use silver for large transactions in the place of gold, is a misapplication of at least fifteen-sixteenths of a given unit of effort, time, expense, and capacity, when one-sixteenth would accomplish the same result." Do you think there is much force in that objection?—No, I do not; I think there is some confusion there between currency as a medium of exchange and currency as a standard of value. I conceive that that is exactly the point where large exaggeration prevails. You might have a gold standard and yet have silver very largely in use as a currency, and as a country is more or less civilized, and more or less in a condition to adopt banking facilities, so you find the modes of payment more or less clumsy; but I do not think that the inconvenience of a silver currency is at all to be measured by the multiplication of its inferiority to gold; in fact, one might illustrate that opinion by a reference to a country of which I know something—Russia. When I first knew Russia the operations of currency very seldom used to be made in silver, they used to be made in bundles of notes. If large payments in India are in question, I think banking facilities would be found as the means of paying large sums by notes or cheques, without having the burden of carrying about a large mass of coin.

9525. The evidence given before this Commission has not been to the effect that the Bombay cotton mills are handicapped, as regards Lancashire mills, by the use of silver instead of gold, but the contrary. There is a difference of opinion as to the amount of gain, but I do not think there is any difference of opinion as to the fact that there is some gain, and that would corroborate your opinion that the use of silver, as currency, is not open to any serious objection on the ground of its weight. Does not this show that though silver may be less portable than gold, still under certain conditions, and for certain purposes, it may be a better standard than gold?—I do not think it is, but there is no doubt that countries using silver have at this moment, with the depreciation of silver, a certain disadvantage in the payments that they receive for their productions. If India sells her cotton or her wheat for silver she receives in that silver mode of payment an article worth one-fourth less than it was worth a few years back.

9526. Yes, but presumably she gets more of it?—Well, that ought to be, no doubt, but I have understood from the evidence that has been given before this Commission that the variations in price in India have been remarkably small as compared with the variations in silver.

9527. She gets comparatively more than if the standard had been gold; would you admit that? The Indian producer may only get the same amount of silver as he formerly did for what he sells, but if India had had a gold standard he would now get less gold than he formerly did?—Well, if she had got gold, the price might have been different, because the truth is that, notwithstanding the general tenacity of prices, the price of her commodities varies with the absolute value of the article which is given in exchange, and therefore, if India sells wheat at a given price, and that price is paid in silver when the price of silver is reduced by one-fourth, it certainly receives less than it would have sold the wheat for if it had been paid in gold.

9528. You said just now, in connexion with this question of the standard and the currency, that there were really two questions; first of all, the stability of the standard, and, secondly, the convenience of the ordinary circulating medium?—Yes.

9529. And I suppose you would say that, looking simply to the standard, a country should choose the material which would give the greatest stability of purchasing power; and, looking to the circulating medium, a country should choose that form of circulating medium which would be most convenient in actual practice?—Yes.

9530. Should you admit that it would be a great mistake to choose the standard of value merely with reference to its convenience as a circulating medium?—I think so, because it is more important to have a satisfactory measure of value than to have a currency which is convenient, inasmuch as you can vary your form of currency; you may use either silver or gold, or you may use paper representative of either one or the other, but the standard itself is of the highest possible importance.

9531. I should like to read you a passage from Lord Liverpool's "Treatise on the Coins of the Realm," with which, I have no doubt, you are familiar: "It cannot, I think, be doubted that the metal of which this principal measure of property is made should correspond with the wealth and commerce of the country for which it is intended. Coins should be made of metals, more or less valuable, in proportion to the wealth and commerce of the country in which they are to be the measure of property. In very poor countries coins have been and still are principally made of copper, and sometimes even of less valuable materials. In countries advanced to a certain degree of opulence silver is the metal of which coins are made. In very rich countries, and especially in those where great and extensive commerce is carried on, gold is the most proper metal of which this principal measure of property and this instrument of commerce should be made; in such countries gold will, in practice, become the principal measure of property and the instrument of commerce with the general consent of the people, not only without the support of law, but in spite of almost any law that may be enacted to the contrary, for the principal exchanges and purchases cannot there be made with any convenience in coins of a less valuable metal." Does it not appear to you that, in writing that passage, Lord Liverpool looked rather to the convenience of the circulating medium than to the stability of the standard of value?—Certainly the language appears to be directed to that point. Probably he had both in his mind, but it is exceedingly difficult for anyone to say what may have been in Lord Liverpool's mind, and I am not prepared to hazard an opinion upon the subject.

9532. But the argument which he uses in that passage in favour of the adoption of the gold standard is based entirely on its convenience for making payments, that is, as a circulating medium?—In this country you may say in both respects, both as a standard and as a medium of exchange it is far the best standard to adopt. It does not follow that the same thing would be the case in China or in India. In India the condition of the people and the prices which prevail there may make silver a more convenient medium of exchange than gold would be.

9533. (Mr. Birch.) You referred just now to Russia in your early days, but is it not very much the same system now that all payments are made in bundles of notes?—No, now the banking system has very much extended itself, and they pay by cheques; they take cheques.

9534. I understood you to say that you did not see any objection to silver currency, but you would object to any attempt on the part of England to establish a double standard with a free mintage of gold and silver at a fixed ratio?—As regards England I see no motive whatever for making any change from our present system.

9535. Would you not consider that in the event of the ratio of 15½ to 1 being established it would materially interfere with the production of gold and

Lord
Addington.
9 Dec. 1887

Lord
Addington.

9 Dec. 1887.

give facilities for the increase of the production of silver?—I do not think that it would interfere with the production of gold, because probably the profit upon the production of either gold or silver is sufficient to keep the miners at work, whatever their relative proportions may be; but I regard an absence of any distinct proposition on the part of bi-metallists as to the proportion between gold and silver to be fatal to the serious entertainment of their scheme at all. I have never yet found any agreement. Some want $15\frac{1}{2}$ to 1, and some want $20\frac{1}{2}$ to 1. At the present moment it would be impossible to go practically into the consideration of a bi-metallic system which would take any other than the actual proportion between the value of gold and silver.

9536. Then I understood you to say, in reply to Mr. Barbour, that in your opinion there is no necessity for India having the same standard of value as England?—I see no necessity for it. There, no doubt, would be a very considerable convenience in it. It is a very great advantage to be able to know almost intuitively what the price of one coin and of one commodity is in the currency of another place and in another country; but, on the other hand, it is the business of merchants to make these calculations, and they are made without much difficulty, and I do not for a moment believe that the absence of that great facility of calculation interposes any practical difficulty in the exchange of commodities. If India produces commodities that we want we shall have them. If we produce manufactures that India wants she will have them; and it is only a certain difficulty in the arrangement of price which is the result of the present anomalous condition between England and its dependency, India, in the standard of value.

9537. You have had nothing yourself, I think, to do with business with the East?—Not with India; but the trade with Russia is carried on exactly in face of the same difficulty which prevails in India—a variable exchange. The inconvertible paper money of Russia is of course variable, and it has varied even more than the price of silver, so that the difficulties there are precisely analogous to those which have prevailed in India, but they do not restrict operations. Merchants have only to make their arrangements with regard to the fixing of the exchange and also to determine the value of what they want to sell or what they buy.

9538. The fact is, it is an inconvenience, but it is an inconvenience which can be overcome by the ordinary mercantile arrangements in all parts of the world?—Yes.

9539. If you import wheat from Russia you take into calculation the rate of exchange and the price there, and thus arrive at the price at which you can sell?—Yes.

9540. (*Chairman.*) Do you find that gold prices of the productions in Russia have become less of late when the rouble has been more depreciated?—Prices altogether have been subject to such very large variations of late that it would be very difficult to determine how much of that was attributable to the change of policy; but in Russia, I must say, the standard has never been absolutely gold. It has been silver. The legal currency of Russia is a silver rouble, which ought to be worth $37\frac{1}{2}d.$, but which is only worth now $21\frac{1}{2}d.$

9541. Yes; but have you observed at all, one way or the other, whether there are variations in the rouble price corresponding with the variations in the exchange?—There is no doubt that at the export markets the variations take place closely upon those lines. In the interior of the country, just as in the interior of India, people have not the same information, and prices remain unaffected for a long time. They are much more slow in feeling the effect of either the depreciation in the value of paper or the depreciation in the value of the silver.

9542. (*Sir T. Farrer.*) Do you find that a fall in the value of the Russian paper is followed by a lowered price, an increased purchase of Russian goods, and increased imports of Russian goods into this country?—I suppose we may say, with regard to the trade in Russia and to the trade with India, that it is English adventure and English capital that carries it on, and therefore the London merchant can give his order at a certain price with reference to the value of the commodity here, and the execution of that order depends upon the concurrence of a certain price with a certain rate of exchange. If the exchange has gone down, he could give a higher price there for the commodity that he wants to buy. The native seller, of course, would raise his price when he found that his foreign customer is prepared, owing to the fall of exchange, to give a higher price in rubles.

9543. Then the fall in exchange shows itself more in a rise of the Russian price than in a fall of the English price?—Yes.

9544. (*Chairman.*) Why should the merchant here be willing to give a higher price? Of course he can afford to give it, but he would try to get it at as low a price as he could, and unless the situation was thoroughly appreciated by the people throughout the country, would not he be able to get it at a lower price, and so be in a position to sell at a lower price here, and better compete with his rivals?—Certainly. I do not suggest that the London merchant would give a higher price. He may give a higher price in rubles to the Russians, but owing to the fall in the exchange, it may still cost him less than previously. He gives his order to buy at the lowest price at which he could get an article, but that price has its limit.

9545. (*Mr. Montagu.*) By competition of Russian merchants in Russia?—Clearly; the limit of the price to be paid is the price at which he can expect to sell at a profit.

9546. (*Sir T. Farrer.*) As I understand you, the Russian price follows the English price rather than the English price the price of the paper rouble?—Certainly.

9547. (*Mr. Montagu.*) Has there not been a diminution in the circulation of Russian notes of late years by destroying them?—There has been, I am told, from time to time a diminution, but I am afraid there has also been an extension, if I may judge from the state of exchange, because the state of the exchange has never recovered itself.

9548. Information has been given that about 25,000,000 of roubles have been destroyed each year latterly, and that no fresh issues have been made?—I was not aware of the fact.

9549. I have received information, and I wanted to know whether you could confirm it?—I cannot confirm it.

9550. Is not the inconvertible paper a great disadvantage to Russia?—It has the disadvantage of keeping values in a very fluctuating and uncertain state. I do not know that it has any other disadvantage, and the confidence it commands is unbounded. It passes as readily as the bullion itself would.

9551. (*Mr. Barbour.*) You said, in reply to Mr. Birch, that there was a certain amount of inconvenience arose when two countries with different standards traded with each other, but that was not, you thought, very serious?—I say it was not so serious as to prevent the operations which supply the two countries with the articles that they severally require from each other.

9552. But it is an inconvenience, though not, in your opinion, a very serious one?—It is an inconvenience.

9553. Are there not also financial difficulties besides the commercial difficulty. For instance, if one country borrowed money from another when the exchange was at a certain rate and the exchange altered very much before the time for repayment came round?—Clearly, there would be a financial difficulty, but that is one

which those who are interested only become familiar with by their own experience.

9554. But if you had contracted a debt at a time when you had no reason to suppose that there would be any such fluctuation in the relative value of the two standards, you might find yourself in a difficulty afterwards?—That is perfectly true, but where debts have been contracted in the legal currency of a country, and that currency has afterwards, according to the law of that country, been depreciated, the debtor would be naturally damnified, and very seriously.

9555. (*Mr. Chaplin.*) I suppose the value of the Russian rouble depends to some extent upon Russian credit?—Upon the credit of the Government, in fact.

9556. And that would affect it in its relation to commodities as well as in its relation to gold?—Yes, certainly, it would.

9557. I observe in the paper that you have been kind enough to submit to the Commission you say: "I do not ignore the practical inconvenience which results from maintaining a gold standard of value in England and a silver standard in India; but the consideration of the mode in which that inconvenience operates, and of the means through which it might be removed or mitigated, I have deemed to be outside the present inquiry." Well, among other things, we are instructed to inquire into the effects of the present system upon the internal trade and industry of the United Kingdom, and it has been alleged by various witnesses that it does injuriously affect certain industries in this country. Have you considered that at all?—I am not aware of those injurious results.

9558. I will take the wheat industry, for instance; are you prepared to dispute that the Indian exporter does derive an advantage from the fall in the exchange between gold and the rupee?—If the Indian producer only receives the same rupee price as he did before, he would actually be damnified rather than advantaged by it, because he would receive a consideration which has no longer the value which it formerly maintained. If he has varied his price in proportion it would come in the end to the same thing; and I imagine that although there may be a certain amount of friction to overcome, yet, sooner or later, the depreciation in value of the currency which has formed the medium of exchange will affect the price that is given, and that the price of wheat, therefore, in India, if it is paid for in depreciated silver, will ultimately be enlarged, and that, as a consequence of that same depreciation, the Indian buyer of English commodities will have to give more for them in rupees. In fact, when the price is paid in the depreciated currency the amount of the price must vary to counteract the depreciation.

9559. May I put this case to you; at the period before silver was demonetised, 40s. a quarter was not an uncommon price for wheat to be at, and, therefore, the Indian producer received 2*l.* in gold for his quarter of wheat. Now he gets 1*l.* 10*s.* in gold?—Yes.

9560. That is the price also which the English grower receives. The English grower is suffering a loss to the extent of 10*s.* a quarter, but is it not the fact that at present, with his 1*l.* 10*s.* in gold, the producer of wheat in India is able to purchase as many rupees as he could formerly buy for 2*l.*, and is it not also the fact that at present, at all events in India, the rupee retains all its original purchasing power?—There is no doubt that with 30*s.* in gold he can get 40*s.* in rupees; but the price here is not determined by the price at which he can buy the rupees.

9561. Not quite so, but I am looking to the position of the Indian producer?—Well, the Indian producer receives, we may say, so many rupees, and the rupees are worth 25 per cent. less than they were.

9562. But the most universal evidence, I think, has been that in India itself the rupee retains its original purchasing power?—That is one way of putting it, but that is a mode which I cannot accept at all. Gold and silver being so easily carried from one place to another cannot vary in their cosmopolitan value more than by the cost of carrying them from one point to another. If, therefore, you find that the rupee in India will buy a certain proportion of any commodity as it did before, it is because the price of that commodity itself has not varied, and this is only one instance, of which there are many, of the great tenacity of prices in countries which are only half civilised, or not thoroughly permeated with means of conveyance and intercommunication.

9563. (*Chairman.*) Would it not follow that by reason of that great tenacity of prices in such countries the producer in that country would have his full dram, if I may use that expression, whilst the producer in the more civilised country would not?—It depends on whether he is a buyer or a seller. If he is a seller, and the silver which is given to him is worth less, he ought really to raise his prices upon it, and that is what he will do ultimately; if the silver remain the same, then the price of wheat in India will ultimately rise to the value at which it will satisfy him to grow it.

9564. Or would have prevented from fall?—That is another way of putting it. It is the price which is variable and not the value of the gold and silver. Silver is variable, we know, from gold, but it would not necessarily be variable with regard to the price of commodities in India.

9565. Supposing that in India all prices remain the same, so that, although wheat sells for the same number of rupees, the seller can buy any other commodities that he wants at their old silver price. Supposing that in this country the seller has to take 30*s.* in gold instead of 40*s.*, if all the commodities which he has to buy have fallen to the same extent, then he would be in the same position as the producer in India, where silver prices have all remained the same. Would you agree to that?—I quite see your position, but I hold that that is a course of events which is a most improbable one. I cannot contemplate the fact of the currency of India being depreciated 25 per cent. in value and prices throughout the country remaining the same. They must, sooner or later, work down to what would be their commercial value. That commercial value would be the price at which they could sell or at which they could buy.

9566. (*Mr. Barbour.*) May I ask on what grounds you hold that the standard of India has depreciated 25 per cent.?—Because it is in silver, and because silver is worth 25 per cent. less in gold than what it was some five or six years ago.

9567. You might put that in another form by saying gold has appreciated as regards silver?—Quite so.

9568. (*Mr. Chaplin.*) Well, then, is not this the case, that it does not so much matter whether the rupee has reduced its purchasing power, or whether the prices of commodities have fallen. The Indian producer is, at all events, in this position, that he is not suffering the loss which is felt by the English producer, who is getting 1*l.* 10*s.* a quarter for his wheat instead of 2*l.*, which he got formerly?—The command of those rupees, if they enabled him to buy other products at the same price as before, no doubt would appear to put him in an advantageous position; but, as I said before, I cannot imagine that state of things being a permanent one. The natural course of Indian trade under the influence of a fall in silver, would, I imagine, be thus wise. A Liverpool corn merchant orders his agent at Bombay to purchase so many thousand quarters of wheat at such a price, cost and freight included, or a larger quantity if secured at a lower price. The agent, owing to the fall in silver

Lord
Addington.

Lord
Addington.

9 Dec. 1887.

obtains more rupees for his draft on Liverpool, and if the price of wheat in rupees has not risen, he secures the larger quantity at a price which enables the Liverpool merchant to sell it at Liverpool at (say) 30s. a quarter. The larger import of cheap foreign wheat depresses the price of English wheat and the English farmer suffers. India has sold her wheat, but she wants cotton cloth, but the Bombay importer wants more rupees in their depreciated value than formerly, and if India refuses the advance in price, the goods are withheld or sold at a loss for the Manchester manufacturer. There would be a struggle in the negotiation, but sooner or later, if silver do not recover its price, India would give a higher rupee price for its cotton cloth; and finding its rupees less effective to buy with, she would require more of them in payment for her wheat. That the movements of commerce are not persistently obstructed by variations in the medium of exchange is clearly proved by the statistics of the period under review.

9569. I think you said that you are neither an advocate nor an opponent of bi-metallism?—No.

9570. But you do not want to change anything?—Not in this country.

9571. But at the same time you are not prepared to formulate to us any positive objections to the bi-metallic system?—It appears to me that the chief ground alleged for its adoption for it does not exist.

9572. You say also in your paper, "That the prevalent depression of prices cannot be the effect of an appreciation or scarcity of gold, since a scarcity of gold, which would depress prices through its dearness in use, is non-existent. That a system of international bi-metallism is not required as a remedy for the depression imputed to a scarcity of gold, inasmuch as the existence of such scarcity has not been manifested." Supposing it were shown to you, and you were convinced that bi-metallism might in some degree be a remedy for that evil, am I to assume, then, that you would not object to it?—Certainly. If I found that any nostrum was able to cure a certain disease I should be very foolish if I opposed its adoption.

9573. You expressed the opinion just now that the ratio which you thought might be accepted without objection would be the ratio that was current at the moment?—Yes.

9574. But the ratio at the present moment constantly varies, does it not?—Of course it varies every day with the price of silver.

9575. Well, would that not be rather an arbitrary proceeding, then, to fix it at the ratio it happens to be at a particular moment?—Precisely; but that is the only way in which you could do it. I think you could not go back to an old proportion. It would have this effect of giving the enormous bonus at once to all the holders of silver. The moment you raise the value of silver from the proportion of 1 to 20 to 1 to 15½, you give a bonus to that extent to the holder of silver.

9576. (*Sir T. Farrer.*) Have you ever thought of the effect of a return to the ratio of 15½ to 1 on the silver that is now held by other nations (for instance, the United States) and which passes at a gold value?—I take it that the stock of silver which exists anywhere would, if it were not already, or even if it were already, in a state to be estimated, would have its value raised in the general convention of bi-metallism.

9577. It would if it were current in the world at the gold rate in which silver in the London market is current; but take the case of the silver which is held by the United States, and which is current, or for which certificates are current, as a gold value, would that be altered in value?—I think so. That silver is not capable of being circulated at its legal value now, and it remains therefore in deposit.

9578. Have you thought at all what would be the effect of the ratio of 15½ to 1 upon the debts due

by other countries to this country?—So far as the introduction of silver at the rate of 15½ to 1 into a common unit of value went, it would have the effect of diminishing the value of the debts of other countries to this country, where it is already a sterling debt. We have gold claims over nearly the whole world, and those gold claims, if they were diluted by being brought into a bi-metallic system, would become less effective by the difference between the power of the gold and the power of the blended gold and silver standard.

9579. (*Chairman.*) But why should that be so on the assumption, which is, of course, the assumption of the system of bi-metallism, that in all the leading commercial nations, after the arrangement, the stipulated ratio of silver will buy as much as every commodity as its equivalent in gold, then would it matter to us whether we were paid in the silver or in the gold. It would not be transmitted in the metal in any case; would not it give us the right in any country to just as much commodity as we could have got if it had been still represented by gold only?—I do not think I admit the premises in that question. It assumes that a currency may be indefinitely extended, even so far as regards that which is the standard of value, without affecting its general efficacy.

9580. You think it would affect prices?—I think it would affect prices.

9581. But that would be, of course, a different consideration. If it did not affect the prices in the country it would not matter, would it, whether we got paid in gold or silver. If there was no alteration in the general scale of prices, and if a given amount of silver would buy as much as the old amount of gold, it would not matter whether we got silver or gold. We should really get commodities, and really get the same quantity?—At present the gold claims of this country are valued in gold and gold only, and they have a certain efficacy and purchasing power. If that standard were diluted by the introduction of silver in a given proportion it would no longer be the same standard. I hold that, being mingled with silver of a lower proportionate value than that which it has previously maintained, with the effect of diluting the general value of this standard itself, the new standard would be disabled from purchasing the same quantity of commodities as before.

9582. (*Sir John Lubbock.*) In fact, for any rise in the value of silver which it created there must be a corresponding fall in the value of the gold?—Quite so.

9583. (*Mr. Barbour.*) And, I suppose, you would hold that the breaking of the old ratio of 15½ to 1 did raise the value of gold. If the restoration of it would lower the value of gold, I presume the breaking of it must have raised the value of gold?—That depends on whether you would say that gold was appreciated or silver depreciated.

9584. There was practical fixity of value between silver and gold for a very long time, and when that ceased and the ratio became 20 to 1, did not gold get a higher value than it would have had if the old ratio had been maintained?—I do not think there has been much difference in the value of gold, but it is in silver, owing to the circumstances which affected it in its larger amounts, brought from the mines, and the dealing with silver by the German Government, all had the effect of lowering its value.

9585. (*Sir T. Farrer.*) I gather that you rather regard gold as the stable point, and silver, like commodities, as varying with relation to it?—I do.

9586. And you believe that there has been no fall in prices due to an alleged scarcity of gold?—I can find no evidence of such.

9587. And, on the contrary, you find evidence in the state of the gold reserves of the banks, and the rate of discount, that there has been no such scarcity?—Quite so.

9588. (*Sir John Lubbock.*) I gather that in your opinion, the present ratio of value of gold to silver being 21 to 1, you consider that there would be an injustice in compelling debtors who have made contracts in silver at 21 to 1 to fulfil their contracts at the rate of 15½ to 1?—Decidedly.

9589. Several witnesses have expressed the opinion that, with reference to our commerce, it was very undesirable to make any change in the standard of value unless there was some very strong reason for doing so. Do you concur in that?—I quite agree to that.

9590. It has been said several times here that the fall of 25 per cent. in the price of silver constituted practically a bounty of 25 per cent. upon the production of wheat in India. I gather that you see no reason for any such statement?—I fail to understand how the word bounty has got any place in that position at all.

9591. And, apart from the question of the alleged bounty to India, you cannot see that there is an advantage of 25 per cent. to the wheat grower?—No, I do not.

9592. In your paper I think you rather implied that you thought it might be possible to maintain a fixed ratio of value between gold and silver, assuming that the principal nations of the world were to agree upon one; but having regard to the very great amount of gold which is used in the arts,—it is assumed to be about 12,000,000*l.* out of an annual production of about 20,000,000*l.*,—do you not think that some doubt is thrown upon the possibility of maintaining a fixed ratio between gold and silver?—If bi-metallism were once established, then the proportion never could vary; it would be definitely fixed. Whatever the quantities of the gold or silver might be after that the proportions would be fixed.

9593. But do you not think that the result might be in the first place to diminish the production of gold, and in the second place to drive gold out of circulation and into use in the arts?—No, I do not think so. I do not think that the introduction of bi-metallism would affect the working, either of the gold or silver mines materially. They would both be worked as long as they could be worked profitably.

9594. And a very large use of gold in the arts, in fact, does not affect your belief that bi-metallism might be maintained, provided it were agreed to by all the great nations?—No, it does not.

9595. That is assuming that all the great nations come into the arrangement, is it not?—Oh, yes; it must be general.

9596. (*Mr. Birch.*) Including India?—Of course India's consent must be assumed.

9597. And China; would you consider that China ought to come in?—China is most important.

9598. (*Mr. Montague.*) You say that we have now a large command of gold in debt due from foreign countries. We had also a large command of gold when silver was practically fixed in value. Did we then derive any advantage from the demonetization of silver by Germany and other countries?—No, I do not think our position was affected, except in reference to India.

9599. Would the restoration of a fixed ratio put us to any disadvantage?—No; because the present state of things is one which does not affect the dealings of other countries.

9600. I understand you just now to say that we should be under a disadvantage as we have such a command of gold from abroad?—Well, I said we should be under a disadvantage with regard to our gold claims, because it would be no longer a gold claim; it would be a bi-metallic claim, and that bi-metallic claim would be less, intrinsically, valuable than the gold claim.

9601. Would the difficulties you apprehend from adopting bi-metallism disappear if the market ratio of 20 to 1 were adopted?—Well, I look upon bi-metallism, as I have said in my evidence, as a very pretty theory,

but one upon the future of which I can make no practical comment.

9602. Are you aware that Indian banks are afraid to employ their English deposits, or even their capital in India, on account of the uncertainty of silver in the future?—There is no doubt it may be a restraint to them in their operations; that is the inconvenience.

9603. Do you not see a great advantage, therefore, in developing our trade with silver using countries, seeing that we have difficulty in extending our trade with continental countries through their hostile tariffs?—I do not think that, practically, our commercial operations are diminished in volume. They are more difficult to be carried out; there is a certain difficulty in computation; but, practically, all the business which is to be done is done, and will be done, still under either system.

9604. Is there not a tendency for our trade to be diverted to eastern markets rather than to those near at hand, through the competition of Germany and France?—I am not aware of it.

9605. Do we do as much trade with the continent now as we used to?—I have not got the statistics at hand.

9606. In Russia, discount is maintained at and above 4 per cent. Is not that some evidence that the circulation of rouble notes in Russia is kept within the bounds of the requirements for circulation?—It ought to be an evidence, and I think it is, yes.

9607. And in India they cannot fix the circulation on account of the imports of silver being beyond their control?—Why should they control it?

9608. I do not ask why they should control it, but the countries outside of India have the faculty of increasing the Indian circulation by shipments of silver?—That is to say, they have the faculty of paying to India a very valuable consideration for the produce which they buy there. I see nothing to be regretted in that on the part of India. If India is rich in silver India can use those riches in any way she chooses.

9609. Could India re-sell any silver?—Certainly, they could buy gold or anything they want.

9610. Could they sell it outside of India?—Certainly they could.

9611. Could you tell me where?—London.

9612. If you offered silver in London would there be any buyer?—It depends on the extent of it.

9613. What do you think would be the price?—You cannot tell till you try.

9614. But is it not the fact that India is almost the sole buyer?—The chief buyer.

9615. It is assumed, is it not, that if India were to re-sell silver, that nothing like the present price could be obtained?—I have no knowledge upon that subject.

9616. But, assuming that, do you consider it is a disadvantage to India to make her the sole recipient of nine-tenths of the silver produced in the world?—I do not think that the country would complain of enriching herself by selling so much of her produce for silver or anything else.

9617. Do you think that the English public would object to the circulation of bank notes partly based upon silver?—The English public would not refuse bank notes based upon anything which the Legislature sanctioned. If they sanctioned the issue of bank notes upon pewter the country would take them, but that is simply because they would be upon the credit of the country at large.

9618. It has been stated here that people in this country make engagements to pay in gold. Is that a fact, or are not their engagements to pay in legal tender—in bank notes?—It depends on which engagement you speak of.

9619. If a man accepts a bill, say, for 1,000*l.*, is he bound to pay 1,000*l.* in gold when it comes due?—He is bound to pay 1,000*l.* in that material with

*Lord
Addington.*

9 Dec. 1887.

*Lord
Addington.*

9 Dec. 1887.

which the holder of the bill can get 1,000*l.* in sovereigns in the Bank of England.

9620. But there were occasions on which bank notes could not be cashed in the Bank of England?—I do not know when that was. It has not been within my observation.

9621. (*Mr. Barbour.*) What do you think of a proposal which I may tell you has been made more than once, and seriously considered, of introducing a

gold standard into India?—I could not venture to give an opinion upon it at all.

9622. But you say there would be great difficulty connected with bi-metallism. If it came some day to a choice of difficulties, either of establishing bi-metallism or of the adoption of a gold standard in India, and consequently of a large increase in the demand for gold, it might be a question which of the two evils was the less?—It might be.

The witness withdrew.

Adjourned.

APPENDICES.

APPENDIX I.

Mr. ALFRED DE ROTHSCHILD to the CHAIRMAN of the COMMISSION.

New Court, E.C.,
4 July 1887.

MY LORD,

THE Governor of the Bank has communicated to the Court the invitation of the Gold and Silver Commissioners to the Directors to offer evidence on the questions now before the Commission, and I as one of the directors beg to avail myself of that privilege. I trust, however, that your Lordship will excuse me if I do not do so at any great length; to do so would entail entering into a great many statistics, and would likewise mean dealing with details and figures which I would infinitely rather leave in more competent hands. But the broad question of whether the introduction of bi-metallism into this country would be desirable, is one which may be approached even by a humble individual like myself.

I am strongly opposed to any radical change as regards the metallic circulation of Great Britain. In the first place, I hold that the progress of civilisation is towards diminishing the requirement of large amounts of bullion instead of increasing the same, and what better proof can you have in favour of my argument than the existence and perfect working of our Clearing House. That institution shows an average weekly return of one hundred millions sterling, which hundred millions sterling mean that *bond fide* transactions to that extent have taken place without the intermediary influence of bullion or even bank notes.

In the face of such a perfect banking system, or rather such very simple means for the exchange of sums of such colossal magnitude, does it not seem an anomaly to say there is not sufficient bullion in the country; you must make silver a legal tender so as to enable A, at his option, if he owes B, 50,000*l.*, to discharge his debt by delivering at his door so many tons of silver.

As long as the British public has confidence in the notes of the Bank of England, this country will not require any excessive amount of bullion; and the moment that confidence ceases, it is the gold which would be sought for and not the silver.

What would be the position of the Bank of England if bi-metallism were to be introduced throughout Europe? I venture to think, an extremely dangerous one, and if a financial crisis arose, whether from internal or external causes, the Bank would be unable to protect its stock of gold, and would be inundated with silver. This would not, and does not, apply to other countries, because the laws which regulate the statutes of their State banks are not so clearly defined nor so rigorously enforced.

For instance, the Bank of France in ordinary times does not give any really large amounts of gold in exchange for its notes, whilst in extraordinary times it adopts, very promptly, the necessary steps to protect its stock of bullion.

What took place when the late war broke out between France and Germany? The Bank of France not only did not pay its notes in gold, but a quantity of five-franc notes were immediately printed, in addition to which the Bank was authorised to issue more notes than it was legally entitled to according to its charter. This did not prevent, nor would it prevent, the French bankers from drawing bullion away from this market, either by sales of bonds on the Stock Exchange or by getting their bills discounted in the open market here.

As regards Germany, that country has also certainly a gold standard, but it would be difficult, if not impossible, to obtain any large amount of gold from Berlin or from any of the branches of the Imperial State Bank.

Then again, as to Italy, there is a large amount of gold stored away there, but, as in reality it does not see daylight, that country might as well not have departed from its paper currency.

Therefore, to sum up the situation in a few words, London being the centre of the financial world, we have to be doubly careful to protect our stock of gold; but if bi-metallism were introduced throughout Europe, we should have much greater difficulty in doing so, and should be obliged to increase our stock of silver, whether it suited us or not.

Whilst feeling very strongly on these points, there can be no doubt that there are grievances both in India and China in connexion with the silver question, and if anything could be done towards diminishing those grievances it would be extremely desirable.

To find, however, a remedy for both past and present grievances would be difficult, if not impossible, but as regards the former, old contracts in connexion with pensions, &c., might be revised, whilst as regards present grievances, the fact of the rupee having fallen considerably below its original value is not in itself more unfair than the exchange fluctuating between this and any other country. That something ought to be done for India there can be no doubt; but it hardly seems to me a sound argument to say that because a grievance exists in that country it would be advisable to introduce into this country that which might prove a very dangerous experiment.

I beg to remain,
my Lord,

Your Lordship's very faithful
and most obedient servant,

(Signed) ALFRED DE ROTHSCHILD.

The Right Hon. Lord Herschell,
&c., &c.,
President of the Royal Commission
on Gold and Silver Currency.

APPENDIX II.

MEMORANDUM by Mr. J. BARR ROBERTSON on the RISE and the FALL of PRICES in consequence of INCREASE or DECREASE in the VOLUME of the CURRENCY.

Changes in the average prices of commodities are due to two causes, (1) to changes in the quantity of money per head of the population and to the greater efficiency of money through banking and other expedients for economizing money; and (2) to changes in the condition of supply and demand as affecting commodities, irrespectively of changes in the volume of the currency per head of the population, or of the greater or less efficiency of money.

As supply and demand will both vary for each single commodity by itself, the price of each commodity will constantly vary as regards every other commodity. These variations are due to natural causes, and therefore, in this country we have considered it wise not to interfere in any way with the action of supply and demand. The variations in prices due to changes in supply and demand are the chief means by which the production and distribution of commodities are regulated, while currency changes, affect all prices equally, and, therefore, would be shown not in the price of each commodity, but in the index number representing the average prices of commodities generally.

But changes in the quantity of money are due entirely to law, to the law of legal tender. Governments have undertaken to set up a standard of value, but, instead of this standard being regulated so as to provide a money of approximately steady purchasing power, it was in this country arbitrarily fixed in 1816, and with the exception of minor changes in 1844 it has never been altered; so that in the changing conditions of the last 70 years there have been great variations in the quantity of money per head of the population, which worked injustice; and wide fluctuations upwards and downwards in the index number representing the average prices of commodities.

A perfectly just money system would be one of steady purchasing power as regards the average prices of staple commodities, that is, a system with as near as possible a fixed index number, and the nearer we can approach to this the nearer we shall have come to justice in monetary affairs. Under the present system we have at one period a large increase of money, at another a considerable decrease, involving inflation of prices and contraction of prices, and it becomes important to trace out how prices fall in consequence of a deficiency of money, and rise in consequence of an excess of money.

Let us examine, then, how the volume of money in this country has diminished in the last 11 years, and how average prices have fallen in response to the diminution of money. During that period we have not received any net imports of gold; but, on the other hand, we have exported 1,200,000*l.*, besides the amount of gold carried out of the country by travellers, which is much larger than the amount brought in by travellers. If, therefore, we have received 56,000,000*l.* less of gold in the last 11 years than we should have had if we had received during these years the same annual supply as we had in the 10 years 1866 to 1875, the question arises as to how this deficient supply has acted on prices.

The following are the figures in regard to gold in the United Kingdom—

	1866-75.	1876-86.
	10 years.	10 years.
	£	£
Total Imports	190,900,000	152,300,000
Total Exports	140,800,000	153,500,000
Net Imports	50,100,000	—
Net Exports	—	1,200,000

The absence of the gold which ought to have come into the country was felt in two ways, (1) there was none imported to supply the consumption in the arts, and (2) there was none imported to provide for the wear, tear, and loss of coins, and for new coinage. The consumption in the arts was provided for by taking the amount of annual consumption out of the stock of gold coin or bullion. If the consumption in the arts was principally provided for out of new bullion from the bullion dealers, there must have been a corresponding export of gold coin or old bullion, seeing that we exported more than we imported. And this supply for the arts

must ultimately have come almost altogether out of the coinage, because part would be obtained by melting down sovereigns, and the rest must in the end have been taken mainly from the coinage, because in the last 11 years the stock of gold coin and bullion has decreased at least 27,000,000*l.*, that is from 135,000,000*l.* to 108,000,000*l.*, while the stock of bullion has probably not changed much. This caused a steady drain of gold chiefly from the gold money outside of the banks, seeing that the banks when drawn upon for gold coin to export against the imported bullion in the arts, would have to renew their supplies of gold from the general circulation to meet their liabilities, as the fact of gold being withdrawn from circulation would not, in itself, diminish in any way the capital, reserve, or deposits in the banks. That is to say, the withdrawal from circulation of gold for the arts would not affect the deposits in the banks, but the results of such withdrawal leading to lower prices might cause the withdrawal of deposits to meet losses produced by lower prices of commodities. On the other hand, however, there would be an increase of deposits from the savings of the community, and from the special savings which the increased purchasing power of money over commodities would enable the investing classes to effect.

The supply of gold for the arts having been taken from the current stock of that metal during the last 11 years, we have now to consider the exact process by which prices fell in consequence of the decrease in the gold circulation. It is evident that, so far as the capitals of banks and their undivided profits are concerned, these must have remained intact as a whole, and notwithstanding, a gradual diminution in the stock of gold, the reserve of gold kept by the banks in connection with their capital and undivided profits would remain the same, unless they reduced the percentage of gold held against their liabilities.

But the banks receive deposits, and these may be distinguished into two classes, the deposits from investors, annuitants, &c., and those from the mercantile, industrial, agricultural, and landed classes, whose deposits are the working balances of accounts in which the banks discount bills and grant advances. Now, in the case of depositors whose resources beyond their deposits are in good securities, there is no reason whatever why their deposits should have diminished, indeed with the increased command of money over commodities their deposits should have increased. It is evident, therefore, that as good securities have increased in money value during the last 11 years owing to a gradual fall in the permanent rate of interest, and without any regard to quantity of money, and as the deposits of the holders of such securities ought to have increased, the gold reserve in banks against this class of deposits ought to have increased rather than diminished.

With the other class of deposits, those belonging to the trading, industrial, and agricultural portion of the people, the process of contraction of the currency must have very largely diminished their resources, and, therefore, through failures and losses in business, this class of deposits would be diminished, though it must be remembered that these deposits are the mere current balances necessary for carrying on business, and are not deposits placed at the complete disposal of the banks.

This then goes to show that there may be a considerable contraction of the gold currency, and yet little or no change in the gold reserves of the banks.

We must therefore look to the gold circulation outside the banks for the contraction produced by a diminished amount of gold.

While securities, such as consols, and notes held by the banks undergo no change whatever in consequence of a contraction of the currency, low prices for commodities are an invariable accompaniment of a contracting currency.

Let us look at the process by which contraction is effected. The consumers of gold in the arts, carry on their business in times when we have no net imports of gold, by withdrawing sovereigns from circulation, or

causing them to be withdrawn and melted down; or by withdrawing bullion which is potentially coin, seeing that it is in the Bank of England ready to be coined immediately that coin is wanted. If on the other hand, bullion is purchased that is not in the Bank of England, then that is so much that would, but for this purchase have gone into the Bank, as there is no profit in holding gold, seeing that it has one permanent price, namely, the Mint price. Or if it did not go into the Bank, it would be exported, seeing that we are not gaining any new gold by import. In this manner (with no net imports of gold) the quantity of gold in circulation is reduced by perhaps 2,400,000*l.* a year. It is not taken from the Bank of England in large quantities so as to affect the rate of discount, it is not taken from any single fund, but from the circulation generally in the leading cities and towns of the country.

If there are 37,000,000 of people in this country using a certain amount of money for certain transactions in which legal tender money, or money passing as such, is actually used, and if the total amount of such money available for all actual cash purposes is 137,000,000*l.*, then this 137,000,000*l.* of money, or the portion outside of the banks, spread over all these cash transactions, will be distributed on a scale of relative prices that will show the comparative values of all commodities.

On the other hand, if by some sudden operation the 137,000,000*l.* of money were reduced to 100,000,000*l.*, then it is perfectly certain that with the latter amount of money the same cash transactions could not take place except at reduced prices. It would be a physical impossibility to pay the same prices on the same transactions.

There is no more mystery in the method by which money distributes itself over an entire community in proportion to the needs of each person and his ability to supply his money needs, than there is in the method by which all articles are distributed over the country in proportion to the needs of the inhabitants and their ability to pay for the articles. In the fields of commerce, industry, and agriculture there is a change in most wholesale prices of articles every day, and often several times in a day, and at least there is a distinct feeling on the part of the dealers in most articles every day that the market is rather stronger or rather weaker when no change of price takes place. It is also surprising to observe the frequent changes, in many cases daily and even hourly, in the prices of the enormous mass of securities of all kinds. This demonstrates the daily and hourly adaptation of the prices of thousands of millions sterling of wealth to changes in supply and demand as affecting each commodity and each security. If then we see the prices of articles and all securities hourly and daily changing over the whole country, we ought not to feel surprised at the money in the country which every inhabitant and every business firm must have more or less, distributing itself and re-distributing itself with incessant activity in accordance with the total available quantity of money, the demand for it, and the ability of each person to pay for the amount which he demands, that is, by services or some other equivalent.

But with 100,000,000*l.* of money, prices of commodities can no more remain at the same average figures at which they stood when the amount of money was 137,000,000*l.*, than 100,000,000 bushels of wheat could give each individual of 37,000,000 people the same amount of wheat as 137,000,000 would give.

While the currency is being contracted in consequence of sovereigns being withdrawn, it is manifest that the first effect of this is that there is not money enough to carry out the retail transactions at current prices. There will therefore ensue a falling off in the demand for commodities, and this falling off will immediately be felt in the wholesale markets. This diminished demand without any diminution in the supply will inevitably cause a fall in wholesale prices. The fall first shows itself in wholesale prices, but the cause is that there is not enough money to pay the same retail prices for the usual quantity of articles, and thus the current supply of articles can only be disposed of at such a reduction in prices as will enable the normal amount of articles to be paid for by the smaller amount of money available.

We are now reasoning on the basis that as our prices have fallen, prices have similarly fallen in other gold money countries, otherwise we should have had foreign countries sending gold here to purchase at our lower prices. As we have not gained any gold by import in the last 11 years, it is clear that there has been a corresponding fall in prices in all gold standard

countries, and therefore this fall in prices is due to a cause which has been in operation in all the gold-money countries.

The amount of gold in circulation here has diminished, and the amount of the gold standard has diminished in all other gold countries, because the stock of gold in the countries which were on the gold standard in 1870 has had to be reduced so as to give a stock of gold to Germany, the United States, Norway and Sweden, Holland, Italy, &c., which in 1870 were not on the gold standard, and had at that time but little gold.

If, however, instead of gold being withdrawn annually to the extent of 2,400,000*l.*, an amount of 20,000,000*l.* had, let us suppose, been exported from the country in two years to provide for gold coinages in countries adopting gold. This would have involved a diminution of 20,000,000*l.* by export, of 4,800,000*l.* in the arts; and further, there would have been no gold to provide for wear and tear of coin, or for the wants of an increased population, so that prices would have fallen very greatly.

The 20,000,000*l.* of export would have been demanded from the Bank of England. Any foreign country wishing to get gold could sell 20,000,000*l.* of its securities and have the proceeds put to its credit at the Bank. If 20,000,000*l.* were to be demanded within two years, the gold reserve at the Bank being an average amount, the Bank would undoubtedly be compelled to raise its rate of discount, and if the foreign government persisted in withdrawing the gold, a severe monetary crisis would supervene in England, which would certainly require the suspension of the Bank Charter Act.

When the Bank had only its usual gold reserve, say about 22,000,000*l.*, a withdrawal of 20,000,000*l.* for the purpose of being locked up abroad would be impracticable. The Bank would require to call upon the Government to suspend the Bank Charter Act, and it would then refuse to pay in gold and would tender notes instead.

There would, however, be a tremendous strain on the gold circulation. The high rate of discount would diminish applications for discounts, and the banks would refuse new business and would strengthen their position by calling in loans or by reducing them. There would be a movement of gold from the provinces to London, and the Bank of England would use every possible effort to bring gold into its coffers. The operations of merchants, manufacturers, agriculturists, &c., would be restricted, there would be a partial paralysis in all business, money would not circulate so freely as before, there would be a falling off in the demand for commodities, and prices would consequently fall. There would be a diminution in the funds for the payment of wages, there would be short time in factories, the shopkeepers would have less activity in their business, and in the absence of demand, wholesale and also retail, prices would fall until they had adjusted themselves to the contracted currency. And as the fall in prices was due to a permanent contraction of the currency, this fall would be permanent; whereas if the fall were due to some mere temporary monetary crisis or unusual conditions, prices would rise again as soon as the abnormal causes had ceased to operate.

I have now shown how prices fall over a period of years when we have not received any gold by net imports from abroad, by two different operations, (1) by a withdrawal of sovereigns from the gold circulation generally, and (2) by withdrawal of gold coin or bullion from the Bank of England to be exported abroad, which must however be replaced in the Bank by withdrawals from the circulation.

Prices may also fall in consequence of a deficient supply of gold, so that we may import large amounts of gold and yet have falling prices because we do not import enough.

The next question to be considered is, how average prices rise in consequence of excessive supplies of gold. All gold from abroad, whether deficient, normal, or excessive in amount, must practically pass into the Bank of England, because the Bank is the one great customer that is bound immediately to pay cash for any gold that may be offered, and the price is fixed and always the same, and therefore there can be no profit for importers in holding it. The gold that comes into the Bank from abroad and is afterwards exported, does not enter into the present discussion, as it has no real influence on prices, its effect being confined to a temporary increase in the gold reserves of the Bank, and to a temporary lowering of the rate of discount.

The gold which has an effect on prices is that which

remains in the country and passes into active circulation.

An importer of gold having deposited a shipment at the Bank of England gets credit for the value in his account with the Bank, or he may take a cheque on the Bank and pay it into his account at some other bank. If importations of gold take place on a considerable scale, and pass into the Bank, the latter will have to lower its rate of discount, not, however, in the hope of causing gold to be exported, because we are assuming that there is an increased supply of gold, and that it is flowing into all the gold-money countries; but in order that the lower rate of discount may cause a larger demand for discounts. Thus the Bank will get rid of, say, 60 per cent. of the new gold or of notes redeemable in gold. But the money obtained by these discounts must be used for purposes for which money is actually required, because the supply of gold has positively increased. The business of the country is not now being carried on with the same number of counters, so to speak, as before; there has been an addition of counters. If 10,000,000*l.* of cotton, wheat, and tea had been imported there would have been no addition to the money or the counters in which these would have been valued, and by which they would have been distributed and paid for. But if 10,000,000*l.* of gold come into the country there is a positive addition of so much to the money of the country, and these 10,000,000*l.* will very soon, by the processes of trade, exchange, and prices, be so distributed over the country that the business of the country will be carried on by the former currency and these 10,000,000*l.* more. The 10,000,000*l.* must be distributed in certain proportions between the banks and the gold circulation outside of the banks; but as while contraction of the currency is going on, the gold circulation outside of the banks will be reduced more in proportion to its quantity than the amount in the banks will be reduced in proportion to the quantity they hold; so, while inflation of the currency is taking place, the amount of gold which will pass into circulation outside of the banks will be proportionately greater than what will be added to the reserves of the banks.

The effect of having an increase of gold would be that there would be new money competing for employment; merchants, manufacturers, and others would compete for this new money at a low rate of discount, and its use would cause greater competition in the wholesale markets, and, therefore, higher prices, until average prices had risen to the level of the increased amount of money, that is, to a level of prices at which practically it would take the increased amount of money to pay for the same articles and services which were formerly paid for by a smaller aggregate of money.

Over the entire field of commodities and securities the lower rate of discount would at least temporarily compensate for and be the equivalent of higher average prices, and in the higgling of the markets the lower rate of discount would soon be adjusted to a higher range of prices, and this lower rate of discount would continue until the surplus gold beyond the banks'

requirements was driven into the general circulation of the country and automatically distributed.

But in the case of securities (not including, however, companies earning their incomes in trade or in production) the advance in average prices through a low rate of discount would only be temporary, that is, prices would, as a rule, not follow the quantity of money, but would follow the changes in the rate of discount. On the other hand, however, the low rate of discount caused by an excess of gold that must be forced into circulation would cause increased competition over the whole field of commodities, and, therefore, would cause prices to be raised, and as the money was in existence to raise prices, average prices would rise to and remain at the level of the quantity of money in the country, and would thereafter be only very little affected by changes in the rate of discount, so that in general terms it may be said that average wholesale prices of commodities must follow the quantity of money absolutely, while they will be but very little affected, and then only temporarily, by changes in the rate of discount. On the other hand, retail prices will not be affected by changes in the rate of discount, though they will be materially affected by changes in the volume of the currency.

When, therefore, the excess of gold has been, as it were, absorbed in a higher range of retail prices, the money of the country will be adjusted to its uses at that higher range, and average retail prices will not advance further.

It may also be pointed out that increased amounts of money will also cause new enterprises to be undertaken, giving more active employment to labour and setting many unemployed people to work, and all this must give increased demand for materials and for commodities, and thus raise prices, though not to the same extent as if the new money was applied altogether to its present uses only at a higher range of prices.

In conclusion, I may remark that the words "inflation" and "contraction," as applied to the volume of currency, are historical, as they have expressed the experience of civilized nations from the earliest times; and I know of no reason why in modern times increase or decrease in the currency should not have its full effect in prices of commodities, although it cannot be shown separately by itself, as other elements enter into prices. In looking at a grain of wheat, we are perfectly certain that air, soil, rain, and sunshine have gone to its production; but it is impossible for us to compare a grain of wheat of one year's harvest with a grain of wheat of another, and say in what proportions these elements have contributed to its production, or whether one owed more or less to air, soil, rain, or sunshine than another. So with increase or decrease in the currency, we cannot positively say how much change in prices is due to it, as we have not exact statistics; but we can approximately, and we could with tolerable accuracy, if we had reliable statistics; but increase or decrease is a physical fact like soil, rain, or sunshine, and is as completely represented in prices as any of these is in a grain of wheat.

23rd July 1887.

APPENDIX III.

PAPER laid before the Commission by Mr. H. D. MACLEOD.

TO INVESTIGATE THE RELATION BETWEEN THE STANDARD OF VALUE AND PRICES.

Preliminary Remarks.

'This is as complex and perplexing a question as it is possible to propose.

In the first place it may be remarked that there is not, and there cannot be by the nature of things, a standard of value.

The expression Standard of Value arose from a confusion of Smith and Ricardo on the nature of value, which all economists see to be untenable.

What is meant by the question is, what is the relation of money to prices.

Though there cannot be a standard of value, there may be a measure of value.

The distinction between the two expressions arises from different conceptions of the origin and nature of value.

It is a doctrine maintained by several English writers that all value is produced by labour, and in one part of their works, Smith and Ricardo allege that the value of a thing is the quantity of labour expended in obtaining it, and that if a thing could always be produced by the same quantity of labour, it would be invariable in value.

But such ideas are now abandoned by every economist.

The expression Measure of Value proceeds from the conception that the value of a thing originates in the demand of the consumer, and the measure of value is the quantity of the material fixed upon to measure the desire of the consumer to obtain any object.

The measure of value is money and credit.

The superlative complexity of the question consists in this, that by far the larger portion of the measure of value consists of credit, and in order to obtain even an approximate answer to the question it is necessary to ascertain the ratio which money bears to credit.

All economists acknowledge that credit has exactly the same effect on prices as money.

Bank notes, bills of exchange, and banking credits, payable in gold, have exactly the same effects as an equal amount of gold. Bank notes, bills of exchange, and banking credits, payable in silver, have exactly the same effects as an equal quantity of silver. And the value of these metals, with respect to each other, is affected by the credits of all forms payable in each of them, exactly as by equal quantities of the metals themselves.

Moreover, in estimating prices generally, the quantity of inconvertible paper money must be taken into consideration at its current value in specie.

Credit emanates from two sources: (1) merchants and traders of all kinds; (2) Banks.

It is somewhat remarkable that the great scientific principles and mechanism of credit are not to be found in any work in the English language. The modern system of banking and credit was invented by the Romans, and the complete scientific principles of credit were developed by the Roman lawyers, and are contained in the Pandects of Justinian, and are set forth in every Continental treatise on Jurisprudence, but they have not hitherto found their way into any treatise on economics.

In a subsequent section there are exhibited the juridical principles of credit as developed by the Roman lawyers, which have now been enacted by Statute as law in England.

With respect to banking it is somewhat remarkable that there is not in any language an exposition of the actual mechanism of banking, which is of indispensable importance in determining this question. All the common notions of the nature of banking are entirely erroneous. In a subsequent section there is given an outline of the real mechanism of banking.

Having then determined that the measure of value consists of money and credit, it is necessary to consider the various kinds of purchasable commodities, and these are (1), material things; (2), labour or services; and (3), abstract rights.

The question proposed is not only as abstruse and complex as any in physical science, but its difficulty is enormously increased, because there is no agreement among the best known economists as to the meaning of any one of the fundamental terms which are necessary to its discussion.

It is, of course, only one example of the general theory of value; but, unfortunately, economists are at utter discord with themselves, and with each other, on every point in the theory of value.

To give an answer, therefore, to the question which can even approximate to correctness, it is necessary (1) to explain the fundamental terms involved in its discussion; (2), to give an outline of the theory of value; (3), to explain the nature and system of credit; (4), to explain the nature of banking, of which the common notions are entirely erroneous.

SECTION I.

DEFINITIONS.

ON THE MEANING OF THE WORD WEALTH.

Ancient writers for 1,300 years unanimously held that exchangeability is the sole essence and principle of wealth. That everything whatever which can be exchanged, or bought and sold, or whose value can be measured in money, is wealth, whatever its nature or its form may be.

Thus Aristotle says, Nicomach. Eth. B.v. c. 1: *χρήματα δὲ λεγόμενα πάντα ὅσων ἡ ἀξία νομίσματι μετρεῖται.*

By the term wealth we mean all things whose value is measured in money.

This is a good general definition, fitted to form the basis of a great science, and the whole science of economics is to be developed out of this single sentence.

We have next to ascertain how many different kinds of things there are which can be bought and sold, or exchanged, or whose value can be measured in money.

First there are material things of all sorts: lands, houses, money, cattle, trees, &c. which every one now admits to be wealth.

ANCIENT DIALOGUE TO SHOW THAT LABOUR IS WEALTH.

There is an ancient dialogue named the Eryxias, on the nature of wealth, which, as far as I am aware, is the earliest work extant on an economical subject.

Eryxias observed to Socrates that he had seen the richest man in all Sicily. Socrates asked him what he meant by wealth. Eryxias said that by wealth he meant the person who had most money. Socrates then asked him what kind of money he meant, and said that different States had

different kinds of money which could be exchanged in them and therefore were wealth, because they had purchasing power in them, but were not exchangeable in other places, and therefore were not wealth. Socrates showed that money is only wealth in those places in which it can be exchanged, or has purchasing power, anywhere else it is not wealth.

He then asked:—"Why are some things wealth and some things are not wealth?" "Why are some things wealth in some places and not in others, and at some times and not at others?" He then showed that whether things are wealth or not depends entirely upon human wants and desires; that everything is wealth where it is wanted and demanded; that it is not wealth where it is not wanted and demanded. That, in short, things are only *χρήματα* or wealth where they are *χρήσιμα*; that is where they are wanted and demanded.

He then showed that anything else which enables us to purchase what we want and demand is wealth, for exactly the same reason that gold and silver are.

He instanced professors and persons who gained their living by giving instruction in the various sciences. He said that persons got what they wanted in exchange for this instruction, just as they did for gold and silver; and, consequently, he said, the sciences are wealth *αἱ ἐπιστήμαι χρήματα ὄνται*—and that these who are masters of such sciences are so much the richer *πλουσιώτεροι εἰσι*.

Now in instancing the sciences as wealth, that, of course, is a general term for labour, because labour in economics is any exertion of human abilities or thought, which is wanted, demanded, and paid for. Now labour or thought

cannot be seen or handled, but it can be bought and sold; its value can be measured in money, and therefore by Aristotle's definition, it is wealth.

Thus Socrates showed that personal qualities in the form of labour are wealth, and a person makes an income by the exertion of his skill and labour as an advocate, a physician, an engineer, or the manager of a great commercial company, just in the same way as another person makes an income by selling material commodities.

DEMOSTHENES SHOWS THAT PERSONAL CREDIT IS WEALTH.

But personal qualities may be used as purchasing power in another way besides that of labour.

If a merchant enjoys good "credit," as it is termed, he may go into the market and purchase goods, not with money, but by giving his promise to pay at a future time—that is, he creates a right of action against himself. The goods become his actual property, exactly as if he had paid for them with money; this right of action is the price he pays for them; and this right of action is termed a credit, because it is not a right to any specific sum of money, but only a general right against the person of the merchant to demand a sum of money at a future time.

Hence a merchant's credit has purchasing power exactly as money has. When a merchant purchases goods with his credit instead of with money, his credit is valued in money exactly as his labour may be; and therefore, by Aristotle's definition, personal credit is wealth.

So also Demosthenes says: "δυσὶν ἀγαθοῖν ὄντων πλούτου τε καὶ τοῦ πρὸς ἅπαντας πιστεῦσθαι, μείζον ἐστὶ τὸ τῆς πίστεως ὑπαρχόν ἡμῖν."

There being two kinds of "goods and chattels"—money and general credit, the greater is credit, and we have it.

He also says: "Εἰ δὲ τοῦτο ἀγνοεῖς ὅτι πίστις ἀφορμὴ τῶν πασῶν ἐστὶ μέγιστη πρὸς χρηματισμὸν, πᾶν ἂν ἀγνοήσεις."

If you were ignorant of this, that credit is the greatest capital of all towards the acquisition of wealth, you would be utterly ignorant.

Thus Demosthenes shows that personal credit is *ἀγαθὸν* or goods and chattels, and *ἀφορμή*, or capital.

Thus though personal credit, like labour, cannot be seen nor touched, nor handled, it may be bought and sold, or exchanged—its value can be measured in money—and therefore it is wealth.

It is now clearly shown that personal qualities, both in the form of labour of all sorts, and also the form of the credit of our bankers, merchants, and traders, is wealth; and it follows that the credit of the State itself is also national wealth.

ALL JURISTS SHOW THAT RIGHTS ARE WEALTH.

But there is another order of quantities which can be bought and sold, or exchanged, and whose value can be measured in money, and which are therefore wealth by the definition. And it is this order of quantities which requires the greatest attention, because it is with respect to them that modern economists are chiefly at fault, and it is with them that the most important questions in modern economics are chiefly concerned, especially the question before the present Commission; therefore the subject requires to be fully treated.

Suppose that I pay a sum of money into my account with my banker, what becomes of that money? It becomes the absolute property of my banker. I transfer to him the absolute property in the money, but I do not make him a present of it, I get something in exchange for it; and what is that something? In exchange for the money, my banker gives me a credit in his books, that is, he gives me a right of action to demand an equal sum of money from him at any time I please.

This right of action is termed a credit, and it is the price the banker pays for the money; and if I write that right of action down on paper in the form of a cheque, that cheque may circulate in commerce and effect exchanges exactly like so much money, until it is paid off and extinguished.

So if a merchant buys goods on credit by giving in payment for the goods a right of action against himself to demand so much money at a future time, that right of action is the payment for the goods, and the owner of it may write it down on paper in the form of a bill of exchange, and that bill of exchange may circulate in commerce, and effect exchanges exactly like so much money until it is paid off and extinguished.

Thus a right of action written on paper in the form of a cheque or bill of exchange is itself an independent article of property or a vendible commodity, and may be bought and sold exactly like a piece of money, or a horse, or a watch, or any other material commodity; thus, a credit is itself a saleable commodity like any material chattel.

It will also be convenient to state here that this right of action or credit is also termed a debt. The subject of credit and debt will be more fully explained further on. It is sufficient to state here that the words credit and debt are used perfectly indiscriminately, in English law and common usage, to mean the creditor's right of action to demand a sum of money from a person.

But there are a great many other kinds of abstract rights which can be bought and sold or exchanged, and whose value can be measured in money, and are therefore wealth.

Suppose that the State wants money for some public purpose, such as a great war, or to execute some public work, it buys money from any person who is willing to sell it to it, and in exchange for the money it gives the subscribers certain rights to demand a Series of future payments from the nation. These rights in popular language are called the funds, and the public creditors may sell these rights to any one they please. These rights may be bought and sold like any material chattels. They are vendible commodities, and therefore wealth by the definition.

Suppose that any one wishes to subscribe to the capital of a public company, banking, railway, canal, dock, or any other, the money he pays becomes the property of the company in its corporate capacity, and in exchange for the money he receives certain rights to share in the future profits to be made by the company. These rights are termed shares, and the shareholder may sell his right to any one else. These shares may be bought and sold like any material chattels. They are vendible commodities, and therefore wealth by the definition.

Suppose that a trader establishes a successful business of any sort, besides the house or premises in which the business is carried on, and the material goods in his shop, he has the right to receive the future profits to be made by the business. This abstract right is termed the goodwill of the business, and it is part of the trader's assets, over and above the material goods in the shop, and he can sell it for money to any one else. Its value can be measured in money, and therefore it is wealth.

When an author publishes a successful work, he has the exclusive right of publishing the work, and receiving the profits made by it for a certain time. That right is termed copyright, and is a property quite separate from the printed volumes. And the author may sell that copyright to any one he pleases, like a material chattel. Its value can be measured in money, and therefore it is wealth by the definition.

When a professional man establishes a successful business he has the right to receive the future profits to be made by it. This right is called a practice, and he can sell it to any one else. Its value can be measured in money, and therefore it is wealth.

There are also a considerable number of other abstract rights of a similar nature, which can all be bought and sold, and are therefore wealth, which it would be too long to enumerate, as it is not necessary to enumerate them all, but only to direct attention to a particular class of saleable quantities.

Now all these rights cannot be handled nor seen, nor transferred by manual delivery in that form; but they can all be bought and sold; their value can be measured in money, and therefore they are all wealth.

But all these rights may be written down on some material, such as paper or parchment, and then they may be transferred by manual delivery, like any other material chattel; in fact, then, they become material chattels.

And because all these rights can be bought and sold, because their value can be measured in money, all Jurists expressly class them under the terms "wealth," "goods," "goods and chattels," "vendible commodities," "incorporeal chattels," and "incorporeal wealth."

Thus, in the great code of Roman law, named the Pandects, it is laid down as a fundamental definition.

Dig. 50, 16, 222. "Pecuniæ nomine non solum numerata pecunia, sed omnes res, tam soli quam mobiles, tam corpora quam JURA continentur."

Under the term wealth, not only ready money but all things, both immovable and movable, both corporeal things as well as rights are included.

Dig. 50, 16, 6. Nominis et rei appellatio ad omnem contractum et obligationem pertinet.

The term debt and property is applied to all contracts and obligations.

Dig. 50, 16, 21. Princeps bona concedendo videtur etiam obligationes concedere.

The Sovereign in granting "goods" also grants obligations.

Dig. 50, 16, 23. Rei appellatione et causæ et jura continentur.

Under the term property both rights of action and rights are included.

Dig. 50, 16, 49. *Æque bonis admunerabitur si quid est in actionibus nam hæc omnia in bonis esse videntur.*

Rights of action are justly counted as "goods" . . . for all these things are included as "goods."

So Ulpian says : Lib. 34 ad edict. *Nomina eorum qui sub conditione vel in diem debent, et emere et vendere solemus. Ea enim res est quæ emi et venire potest.*

We are accustomed to buy and sell debts payable at a certain event and on a certain day. For that is wealth which can be bought and sold.

So Colquhoun in his summary of Roman law, says that under the term *Merx* is included anything whatever which can be bought and sold, no matter whether it is movable or immovable, corporeal or incorporeal, existent or non-existent, such as a horse or a right of action, servitude, or anything to be acquired, or the acquisition whereof depends on chance.

Thus in Roman law, abstract rights of all sorts are included under the terms *pecunia*, (wealth), *bona*, (goods and chattels), *res*, (property), and *merx*, (merchandise).

The Pandects were published in the year 530 A.D. at Constantinople, but while the official language was Latin, the people were Greek, and the Latin Pandects soon fell into desuetude. They were superseded by Greek translations and treatises, and at last in the ninth and tenth centuries under the Basilian dynasty, they were entirely superseded and set aside as obsolete ; a new digest or revised code was published in Greek, called the *Basilica*, which has remained to the present day as the common law of all the Greek population of the east, and in the *Basilica* these definitions are repeated.

Basil. 2, 2, 204. *τῷ ὀνόματι τῶν χρημάτων οὐ μόνον τὰ χρήματα ἀλλὰ πάντα τὰ κινητὰ καὶ ἀκίνητὰ καὶ τὰ σωματικὰ καὶ τὰ ἀσωματικὰ δίκαια δηλοῦνται.*

Under the term *χρήματα* rights are included.

Basil. 2, 2, 21. *τῇ τοῦ πράγματος προσηγορίᾳ καὶ αἴτιαι καὶ τὰ δίκαια περιέχεται.*

Under the term "goods and chattels" both rights of action and rights are included.

Also in Greek Law abstract rights are included under the terms *ἀγαθὰ* (goods), *οὐσία* (estate), *ἀφορμή* (capital), *οἶκος* (estate), and they are called *οὐσία ἀφάνης*, invisible wealth.

It is the same in English Law. In the old law of Normandy it is expressly said that rights of action are included under the term chattels.

Thus Sheppard says under "chattels" "all kinds of " emblements, cut and growing, grass cut ; all money, " plate, jewels, utensils, household stuff, debts, wood cut, " wares in a shop, &c., &c. , are accounted chattels.

"All right of action to any personal action is a chattel."

So in the reign of Elizabeth, it was resolved by Popham, L.C.J., and the court "personal actions are as well included " within the word ' goods ' in an Act of Parliament [as goods " in possession."

So in another case Lord Hardwicke said : " And debts " come within the meaning of the Act, and would pass in a " will thereby."

Burnet, J., said " A bond debt is certainly a chattel.

Parker, L.C.B., said " But ' goods and chattels ' include " debts things in action are considered goods " and chattels."

In English law all property consisting in mere abstract rights, such as debts, the funds, rights of action including bank notes, bills of exchange, shares in commercial companies, copyrights, patents, the goodwill of a business, a practice, &c. are included under "goods and chattels" "vendible commodities" "incorporeal chattels" and "incorporeal wealth."

The principle which is the basis of the theory of credit and of all incorporeal property, is that every future profit from whatever source it arises, whether from land or from personal industry, has a present value ; and that present value can be bought and sold, or can be measured in money, and therefore by the definition which the ancients unanimously held for 1300 years, that present right, or the present value of the future payment, is itself an independent article of wealth, quite separate and distinct from the future payment itself.

Reflection will show that there is nothing which can be bought and sold which is not of one of these three forms—either it is a material chattel, or it is a service of some kind, or it is an abstract right.

Hence taking money as the type of all material things Labour as the type of services of all kinds

Credit as the type of all incorporeal property ; wealth is seen to be of three forms, money, labour, and credit.

It is thus seen that there are three, and only three, orders of exchangeable or economic quantities, and these three orders of quantities can be exchanged in six different ways :—

1. A material thing can be exchanged for a material thing—such as gold money for corn or jewelry.
2. A material thing can be exchanged for labour—as gold money for labour.
3. A material thing can be exchanged for a right—as gold money for a bill of exchange, copyright, &c.
4. Labour can be exchanged for labour—as when two persons agree to render each other services.
5. Labour can be exchanged for a right—as when services are paid for in bank notes.
6. A right can be exchanged for a right—as when a banker discounts a bill of exchange by giving a credit in his books.

These six distinct kinds of exchange constitute the science of exchanges or of commerce in its widest extent, and in all its forms and varieties.

The law which regulates the exchangeable relations of these quantities is termed the law of value ; and the least acquaintance with the principles of natural philosophy shows that there can be only one grand general law of value which governs all exchanges in all their multiplicity and complexity.

Thus for 1,300 years the ancients held that exchangeability is the sole essence and principle of wealth ; that everything whatever which can be bought and sold is wealth. Now for a thing to be exchangeable there must be a demand for it ; hence ancient writers unanimously held that demand is the sole origin of value. There is not to be found in any ancient writer the trace of such a doctrine, that labour and materiality are necessary to wealth and value. I shall now show that modern writers have at length come exactly to the same conclusion ; and it is by adopting this principle only that the question before the present Commission can be solved.

ON THE DEFINITION OF WEALTH IN MODERN TIMES.

The principle that exchangeability is the sole essence and principle of wealth was unfortunately totally lost sight of in modern times, until at last modern economists have come to the same conclusion.

For many centuries money was held to be the only wealth, which was the cause of numerous commercial wars for centuries.

About the end of the seventeenth century it was seen to be absurd to restrict the word wealth to money alone, and it was extended to mean all the material products of the earth which conduce to the welfare and comfort of mankind.

ORIGIN OF POLITICAL ECONOMY IN MODERN TIMES.

Political economy was founded as a science by a sect of illustrious French philosophers who, in 1759, published a code of doctrine.

They originated the expression " production, distribution " and consumption of wealth," and it is necessary to explain clearly what they meant by this expression, because all the differences of opinion which at present prevail on the nature of economics have arisen from modern writers having completely misapprehended the meaning of that expression as explained by its originators.

The term wealth, the Economists, as this sect were called defined to mean the material products of the earth which are brought into commerce and exchanged, and these only.

They drew an essential distinction between the products which the owners consumed for their own enjoyment, and those which were exchanged. The former, they termed *biens*, the latter only they termed *richesse*.

Hence, as the ancients did, the founders of economics in modern times held that exchangeability is the essence of wealth, as a technical term. But they restricted it to material products only. They refused to admit that labour and credit are wealth, because they said that to do that would be to maintain that wealth can be created out of nothing. They constantly repeated *ex nihilo nihil fit*. They therefore held that the earth is the sole source of wealth.

Now it is contrary to the laws of natural philosophy to admit that exchangeability is the essence of wealth, and then to restrict it to material products only. Bacon repeatedly points out that when the principle or quality on which a science is founded is once agreed upon, it is necessary to search for and include all quantities in the science which contain that quality, however diverse their forms and natures may be in other respects. And as labour and credit are both exchangeable, and can be bought and sold, it is contrary to the laws of natural philosophy to exclude them from the term wealth. The ancients included both labour and credit under the term wealth, as we have seen, in strict conformity with scientific principle.

The terms " production," " distribution," and " consumption " have now to be explained.

They defined production to be the obtaining the raw produce from the earth and bringing it into commerce.

But this raw produce is seldom fit for immediate use; it has to undergo several intermediate processes of manufacture and transport before it is brought to the person who ultimately purchases it.

All the persons engaged in these intermediate processes they termed distributors.

The person who finally purchased the finished product for use and enjoyment, and took it out of commerce, they termed the consommateur, because *consommer* in French means to complete or terminate, and the purchaser is the person who completes or terminates the transaction.

The whole transaction—the bringing the produce into market, the various changes of form and place it underwent, and its final purchase for use or consumption—the Economists termed commerce or exchange.

An exchange, however, may take place between two parties, and distribution was often used as equivalent to consumption. Hence the expressions “production, distribution, and consumption,” “production and distribution,” and “production and consumption” were all equivalent expressions, and never meant anything else, as explained by the Economists, than commerce or exchange.

Production meant supply, and consumption meant demand; and supply and demand constitute commerce or exchange.

Thus it must be carefully observed that the expression “production, distribution, and consumption” is one and indivisible, and it must not be separated into its component terms. It is in the interpretation of this expression that the whole point in the contest between the modern schools of Economists consists. Considering that these two expressions were absolutely identical in their original meaning, the question is, which is the better term for the science in its enlarged state at the present day?

Even supposing that the term “wealth” is to be restricted to material objects only, a difficulty arises with respect to the first expression. The land itself is a saleable commodity; it may be bought and sold. But how are we to speak of the “production, distribution, and consumption” of land? Whereas it is quite usual to speak of the “supply and demand” of land.

Thus, even if wealth were restricted to material things, the second expression is wider, and far more clear and intelligible.

In fact, the expression “production, distribution, and consumption of wealth” imposes a cast-iron limit on the science; and it was intended to do so; while the second expression is expansive, and includes all commerce in its widest extent.

The Economists refused to allow credit to be wealth, but other contemporary writers did.

The first writer in modern times, that I am aware of, who agreed with Demosthenes in classing credit as wealth, was Bishop Berkeley, who says in his *querist*, “Whether ‘power to command the industry of others (*i.e.*, credit) be ‘not wealth.’”

The French mercantile writers also contemporary with the Economists expressly class credit as wealth.

Melou says:—“To the calculation of values in money must be added the current credit of the merchant, and ‘his possible credit.’”

So Dutot says:—“Since there has been a regular commerce among men, those who have need of money have made bills or promises to pay money. The first use of ‘credit, therefore, is to represent money by paper. The usage is very old; the first want of it gave rise to it. It multiplies specie considerably; it supplies it where it is wanting, and which would never be sufficient without ‘the credit, because there is not sufficient gold and silver ‘to circulate all the products of nature and art. So there ‘is in commerce a much larger amount in bills than there ‘is in specie in the possession of the merchants.

“A well managed credit amounts to tenfold the funds of a merchant, and he gains as much by his credit as if he had ten times as much money. This maxim is generally received among all merchants.

“Credit is, therefore, the greatest wealth to every one who carries on commerce.”

So Junius says:—“Private credit is wealth.”

Franklin says:—“Credit is money.”

The Economists were the first to found a science of economics, but they had no practical experience of commerce, and they never made any attempt to exhibit its actual mechanism. And it has now been shown that even in that age, it was seen that their doctrine of excluding everything from the term wealth except the material products of the earth was untenable.

It was, however, perfectly well understood by all writers of that age, that as a positive science economics is the science of commerce or exchanges.

Thus, Condillac published a work, “*Le Commerce et le Gouvernement*,” and he calls it “*Le Commerce or the Principles of Economic Science*.”

Forbonnais, who was an eminent contemporary of the Economists, published the best treatise on commerce in his day, and he calls it “*Economic Principles*.”

ADAM SMITH.

Smith entitles his work “*An Inquiry into the Nature and Causes of the Wealth of Nations*.”

But most unfortunately he never gives throughout the whole course of it any clear idea of what he means by wealth.

At the end of the introduction he speaks of “the real ‘wealth of the country, the annual produce of the land ‘and labour of the society.’”

We have now to examine whether such a definition can be accepted as the basis of economics as a great science.

In the first place, it is observed, that he has omitted the quality of exchangeability from the definition of wealth, which was the very quality which the economists insisted upon.

It is perfectly obvious that the mere definition of wealth as the “annual produce of land and labour” cannot be accepted as a suitable definition of the term, because if it were so, every useless work done would be wealth. If one were to build a pyramid in Salisbury Plain, would that be wealth? The simplest form of the “produce of land and labour” are children’s mud pies. So that if we accept that definition simply, the way to augment the wealth of the country would be to set all the dirty children in it diligently to make mud pies.

The medium price of an acre of land near the Bank of England is about a million sterling. That land is wealth; but how is it the “produce of land and labour?”

Further on Smith classes the natural and acquired abilities of the inhabitants as fixed capital. How are the “natural and acquired abilities” of the people the “produce of land and labour?”

Smith treats labour itself as a vendible commodity, and he has a long discussion on the price of labour or wages. How is labour itself the “annual produce of land and labour?”

Thus Smith has already broken away from the dogmas of the Economists, who expressly excluded labour from the term wealth, and counts labour as wealth because it is a vendible commodity, exactly as the author of the *Eryxias* did.

After, for several hundred pages, filling the minds of his readers with the notion that wealth is simply the “produce of land and labour” he admits that unless a thing is exchangeable, it is not wealth. Thus, after all, he admits that exchangeability is the real essence and principle of wealth.

Further on, under the term “circulating capital,” he enumerates bank notes and bills of exchange. Now, bank notes and bills of exchange are mere rights of action; they are credit. Thus it is seen that Smith expressly classes credit under the terms wealth and capital, which was what the Economists expressly denied.

Now, how are bank notes and bills of exchange—mere rights of action—the produce of land and labour?

Thus Smith has extended the domain of economics. In conformity with what has been shown of ancient writers, he recognises that wealth is of three forms, material things, labour, and rights. Thus while the economists restricted economics to the commerce of material things, Smith extended it to include the commerce of labour.

He admitted that bank notes and bills of exchange are circulating capital, but he never gave any exposition of the great scientific principles and mechanism of the mighty system of credit and banking, which are the department of economics which concern the present inquiry.

He also says that the object of his work is to investigate the principles which regulate the exchangeable value of commodities.

Thus the subject matter of Smith’s first two books is in reality a treatise on commerce, or the theory of value; and his editor, McCulloch, says in a note, this science might be called the science of values.

This is not the place to explain fully the immense services Smith did to economics; but as regarding the present inquiry, and as a treatise suitable to be placed in the hands of students at the present day, it is necessary to point out that its fatal defect is that the first half of the work is entirely founded upon labour and materiality, a being the essence of wealth, while the latter half adopts exchangeability pure and simple. Now, these two fundamental concepts do not coincide, because there may be

many things which may be the produce of land and labour, which are not exchangeable; and it is a notorious fact that there are multitudes of things which are exchangeable, which are in no way whatever the produce of land and labour.

All the most advanced and independent economists of the present day entirely reject labour and materiality as being necessary to wealth and value, and adhere to the unanimous doctrine of ancient writers that exchangeability is the sole essence and principle of wealth; and that everything whatever which can be bought and sold is wealth.

Another fatal defect of Smith's work as a scientific treatise, that it is totally wanting in unity of principle, which was indeed the cause of Ricardo's work.

RICARDO.

Ricardo was the first economist in this country who perceived the necessity of reducing the laws of value to general principles. He calls his work "The Principles of Political Economy and Taxation." The part relating to political economy is nothing but a treatise on prices or on value.

Ricardo, then, understood that political economy is *au fond* the theory of value, in accordance with all writers up to his day. But unfortunately his work is not a treatise on value in general, but only on a very small part of it. He deals only with material things, and only with a certain portion of them—those only which are the produce of human labour. He expressly restricts his investigation to the principles which govern the value of "commodities" which can be increased in quantity by the exertion of "human industry, and on the production of which competition operates without restraint."

Having then excluded all things from his consideration except those which are the produce of human labour, he lays down the dogma that labour is the foundation of all value, a dogma which the slightest consideration will show is utterly untenable, even as applied to material objects, because there are multitudes of material objects which have value which are not the produce of labour at all. However, it will be more convenient to discuss Ricardo's doctrines further on.

The last writer who need be cited in this place is Whately. In his lectures at Oxford he says:—"A. Smith has designated his work a treatise on the 'Wealth of Nations;' but this supplies a name only for the subject-matter, not for the science itself. The name I should have preferred as the most descriptive, and on the whole least objectionable, is that of *Catallactics*, or the science of exchanges."

"Man might be defined as 'An animal that makes exchanges.' . . . And it is in this point of view alone that man is contemplated by political economy. This view does not essentially differ from that of A. Smith, since in this science the term wealth is limited to exchangeable commodities, and it treats of them so far forth only as they are, or are designed to be, the subject of exchange. But for this reason it is perhaps the more convenient to describe political economy as the science of exchanges, rather than as the science of national wealth. For the things themselves of which the science treats are immediately removed from its province if we remove the possibility, or the intention of making them the subject of exchange, and this, though they may conduce in the highest degree to happiness, which is the ultimate object for the sake of which wealth is sought. A man, for instance, on a desert island, like Alex. Selkirk, or the personage his adventures are supposed to have suggested, Robinson Crusoe, is in a situation of which political economy takes no cognizance, though he might figuratively be rich, if abundantly provided with food, raiment, and various comforts, and though he might have many commodities at hand which would become exchangeable, and would constitute him, strictly speaking, rich, as soon as fresh settlers should arrive."

"In like manner a musical talent, which is wealth to a professional performer who makes the exercise of it a subject of exchange, is not so to one of superior rank who could not without degradation so employ it. It is in this last case, therefore, though a source of enjoyment, out of the province of political economy."

Thus up to this time it was perfectly well understood by all economists that, as a positive science, economics is the science of commerce or of exchanges, or the theory of value. The expression production, distribution and consumption of wealth was an extremely awkward one, but still its originators clearly explained that they meant nothing but commerce or exchanges by it.

So long as there was a general agreement as to its fundamental nature there was good hope of progress, because the ideas of its founders could be expanded, modified, developed and rectified.

Everyone of the other great sciences—astronomy, optics, heat, electricity, &c.—have undergone great revolutions of opinion, modification, rectification, and expansion, and have thus been progressive sciences. And so it might have been at the present day with economics, if economists had steadily kept in view the original conception of the science. The first economists considered only the commerce in the material products of the earth. Smith devoted great attention to the commerce in labour, but, with the exception of a few perfunctory remarks on bank notes and bills of exchange, he does not seem to have the slightest idea of the magnitude and importance of the commerce in rights which is the most colossal branch of commerce at the present day, and includes the whole principles and mechanism of credit, banking, and the foreign exchanges.

So long as it was clearly understood that economics is the science of commerce in general, it was perfectly easy to introduce any new branch of commerce which had not been fully developed.

If the early economists had reflected on the nature of rights, if they had observed that Smith himself classes bank notes and bills of exchange as circulating capital, they would have seen that it is absolutely indispensable to discard labour and materiality as necessary to value, and they would have seen that exchangeability is the sole essence and principle of wealth.

It is evident that under the general term of commerce it is quite as easy and natural to treat of the commerce of rights as to treat of the commerce of material products and labour.

THE SECOND SCHOOL OF ECONOMISTS.

Unfortunately an economist of great distinction introduced a fatal change in the fundamental conception of the science, which threw it into utter confusion, and has arrested its progress up to the present time, but from which all the most independent economists are now emancipating themselves.

J. B. Say, in 1803, published his first treatise on political economy, in which he defined it as the production, distribution, and consumption of wealth; but unfortunately he quite departed from the original meaning of that expression, which was one and indivisible, and originally meant nothing but commerce or exchange.

Say broke up the expression into its separate terms, and completely changed the original meaning of consumption and production; for, while the original meaning of production was offering for sale, and consumption meant purchasing, Say used production to mean adding value to anything, and consumption to mean destroying value; and he has separate and independent chapters on production, distribution, and consumption.

Say himself classes instruments of credit, such as bank notes, bills of exchange, the funds, the copyright of a book, a professional practice, and also natural abilities of all sorts, as wealth.

How is it possible to speak of the production, distribution, and consumption of bank notes, bills of exchange, the funds, or copyright, or practice, or natural abilities?

But all these things can be bought and sold, and come under the expression demand and supply, and are perfectly intelligible when economics is treated as the science of commerce.

Say's work has for nearly half a century moulded the continental view of political economy, and most of the usual manuals and treatises are little more than adaptations from it.

It is evident that so long as the fundamental concept of economics is commerce or exchanges, it is a distinct positive intelligible science, the fundamental law of which is the law of value. But when it is broken up into three parts, it becomes utterly unintelligible as a science. It breaks the back of the whole science; it utterly breaks the back of the theory of value.

JOHN STUART MILL.

J. S. Mill was the friend and pupil of Say, and in a general way Mill's system is moulded on that of Say, though he varies from him in certain particulars.

Mill treats political economy as the production, distribution, and exchange of wealth. Now, in the language of the economists, that is simply "exchange" and "exchange."

In the beginning of his preliminary remarks, he says:—"Everything therefore forms a part of wealth which has a 'power of purchasing.'" Now here we have a perfectly

clear and definite conception of wealth, exactly agreeing with that of Aristotle and all ancient writers. This definition includes all the three orders of exchangeable quantities, and if wealth be anything which has purchasing power, the production of wealth must mean the production of anything which has purchasing power.

A little further on, however, Mill says: "The production of wealth, the extraction of the instruments of human subsistence and enjoyment from the materials of the globe."

It is evident that these two ideas of wealth are quite distinct; in the first, Mill makes exchangeability the sole essence of wealth, and in the second he makes it to consist of the produce of land and labour. Is it the fact that everything which can be bought and sold is extracted from the materials of the globe?

Still further confusion appears further on. He says that it is essential to the idea of wealth to be susceptible of accumulation, and that permanence it necessary to wealth. This is another change of idea. This new condition at once excludes labour from the term wealth.

He then says that he considers only material things as wealth; but in close juxtaposition to this he says that the skill, energy, and industry of the working classes (and why not that of all other classes as well?) are wealth. How are the skill and energy of the working classes material and extracted from the materials of the globe?

Mill says that anything which has purchasing power is wealth.

He then says: "For credit, though it is not productive power, is purchasing power."

"The credit which we are now called upon to consider is a distinct purchasing power independent of money."

"The amount of purchasing power which a person can exercise is composed of all the money in his possession, or due to him [*i.e.*, bank notes, bills of exchange, &c.], and of all his credit."

"Credit, in short, has exactly the same purchasing power with money."

Now if Mill says that, "anything which has purchasing power is wealth;" and if he says: "Credit is purchasing power"; then the necessary inference is that "credit is wealth." He also classes bank notes and bills of exchange as productive capital.

It is thus shown by Mill's own statement that credit and human abilities and bank notes are wealth, and how are they the produce of land and labour, and extracted from the materials of the globe?

In a popular manual it is admitted that wealth is anything which is exchangeable, and then soon afterwards it is said that all wealth is the produce of land, labour, and capital.

It is thus shown that the notions of wealth of all economists from Smith to Mill are utterly vague, uncertain, and contradictory.

The fact is that the expression production, distribution, and consumption of wealth, was expressly restricted to the material products of the earth, and, when labour and rights are included under the term wealth, it becomes unintelligible. The whole system of credit and banking consists in the creation, sale, and extinction of rights of action, and how can that be described as the production, distribution, and consumption of wealth?

THE THIRD SCHOOL OF ECONOMISTS.

All the most advanced and independent economists in Europe and America now see that it is impossible to make economics a science so long as the conception of it as the production, distribution, and consumption of wealth is retained.

They now agree that exchangeability is the true essence and principle of wealth; and that everything whatever which can be bought and sold is wealth; and that by adopting this principle all the difficulties and perplexities which beset the subject disappear.

Land, houses, money, jewelry, debts, the funds, copyrights, shares in commercial companies, and labour or services of all sorts, have value for exactly the same reason—because they can all be bought and sold. The interchange of these three distinct orders of quantities constitutes commerce in its widest extent, and in all its forms and varieties. And it is by adopting this conception alone that the great system of credit and banking can be brought within economics.

The fact is, that economics has burst the bonds of the nomenclature of the first economists. A definition which suits the exchange of material products only becomes unintelligible when it is stretched to include labour and rights. The attempt of economists to discuss these subjects while retaining the old definition was hopeless, and only led to confusion. The fundamental concepts of the

economists will no more fit economics in its present enlarged state than the clothes of an infant will fit a full grown man. As economics now embraces all commerce we must entirely reject the narrow and restricted definition of the economists, and adopt that of commerce which includes all exchanges.

Several modern economists have defined political economy to be the science of exchanges. But there is a general dissatisfaction now with that name. Various other names have been proposed. Whately proposed *catallactics*; others have proposed *plutology* or *chrematology*; but such novel terms as these would not readily be accepted. Economic science is so firmly rooted in the public mind that no good would be got by changing it. Moreover, it exactly expresses the nature of the science. Because *oikos* in Greek is absolutely synonymous with *πλοῦτος* and *χρῆμα*. Throughout the whole range of Greek literature, from Homer to Ammonius, *oikos* means property or estate of every description. It includes not only land, houses, and all material property, but all such property as debts, bank notes, bills of exchange, and all other kinds of incorporeal property. It is the technical term in Attic law for a person's whole estate. The science may, therefore, be aptly termed economics; and this name is now being very generally adopted for it. Economics, then, is the science of commerce or exchanges, and it may be defined thus—

Economics is the science which treats of the laws which govern the relations of exchangeable quantities.

By adopting this conception, it is at once seen how economics is a physical science, because it is a science of variable quantities. It is a new order of variable quantities, and the laws which govern this new order of variable quantities must be in strict harmony with the laws which govern the relation of all other orders of variable quantities. Like astronomy, it is a pure science of ratios.

ON THE MEANING OF PROPERTY.

It is now seen that by the acknowledgment of all Economists, ancient and modern, there are three distinct orders of Economic, or exchangeable quantities: (1) Material things; (2) Personal qualities; (3) Abstract rights typified by the terms Money, Labour, and Credit.

We have now to find a general term which includes all these orders of economic quantities. This general term is Property. The true meaning of this word will throw a blaze of light over the whole science of Economics, and will clear up all the difficulties which have been felt about the word Wealth.

Most persons when they hear the word Property, think of some material things such as lands, houses, money, jewelry, &c., as being Property. This, however, is a corruption of the true meaning of the word, and a very modern one too.

Property in its true meaning is not any material things, it means Absolute Ownership.

In early Roman jurisprudence a man's possessions were termed *Mancipium*. In process of time the word was applied not only to the things themselves but to the Absolute Ownership in them.

Afterwards a new word came into use. All the possessions of the family (*domus*) belonged to the family as a whole; but the *Dominus* or head of the house alone exercised all rights over them. Hence this right of Absolute Ownership was termed *Dominium*.

But in process of time separate members of the family were allowed to acquire private ownership of things; and this right was termed *Proprietas*. *Proprietas* therefore in Roman law meant absolute and exclusive ownership, and was synonymous with *Dominium*.

And for centuries this was the meaning of property in English. In all legal text books up till the middle of the last century, Property was invariably used to mean Absolute Ownership, and was never applied to the material thing itself.

This meaning of property was not only understood by jurists, but also by Economists. An early French economist says, "Property is nothing but the right to enjoy . . . there is but one right of property; that is a right in a person, but which changes its name according to the nature of the object to which it is applied."

Thus landed property means rights to land. Funded property means rights to payments from the nation; personal property means rights to personalty; literary property means rights to the profits from works of literature and art.

So when the Socialists wish to destroy property, it is not the material things they wish to destroy, but the exclusive rights which private persons have in them.

Property means absolute, entire, and exclusive ownership. It is the totality of rights which can be exercised over anything. It comprehends the *jus possidendi*, or right of possession; the *jus utendi* or the right of using the thing in any way the owner pleases; the *jus fruendi* or right of appropriating any fruit or profit from it; the *jus abutendi* or the right of alienating or destroying it; and the *jus vindicandi* or the right of reclaiming it if found in the wrongful possession of any one else.

Then there may be property, or rights, not only in specific material things, but also in things which are not material; as also a property or right to things which have not come into existence or possession at the present time, but will only do so at some future time.

Under the words Property and Res is included everything whatever which a person has a right to.

Thus Smith and all Economists show that a man has property in his own labour.

But just as a labourer has property in his own labour, a merchant and a banker have property in their own credit.

Demosthenes, as we have seen, showed that personal credit is *ἀγαθά*, or goods and chattels. And modern Economists and mercantile writers all include personal credit under the term Wealth.

Thus a merchant or banker's credit is wealth or purchasing power to him just as much as his money; and to ruin his credit in just as great an injury to him as to rob him of his money.

Economic quantities or economic rights are of three distinct orders:—

1. Rights, or property, in some material substance which has already been acquired.
2. Rights or property in labour or services.
3. Rights or property in something which is only to be acquired at some future time.

Now we observe that the first and third of these species of property are opposite or inverse to each other. Property regards the past and the future.

But we may buy and sell a right to a specific thing which has already come into possession; and we may equally buy and sell the right to a thing which is only to come into possession at a future time. Property therefore is of opposite qualities.

Now, in all mathematical and physical sciences it is invariably the custom to denote similar quantities, but of opposite qualities, by opposite signs. Hence, if we denote one of these kinds of property as positive, we may as a distinguishing sign denote the other as negative.

Property in a thing which has been acquired is corporeal property, and property in a thing which is to be acquired at some future time is incorporeal property.

Hence, if we denote corporeal property by the positive sign, it is strictly in accordance with all physical philosophy to denote incorporeal property by the negative sign.

But corporeal property and incorporeal property can all be equally bought and sold or exchanged, the value of each kind of property can be equally measured in money, hence in all systems of jurisprudence, each kind is termed *pecunia*, *res*, *bona merx*, *χρήματα*, *πράγματα*, *οὐσία*, *ἀφορμή*, *ἀγαθά*, goods and chattels, vendible commodities, and therefore wealth.

As in all mathematical and physical sciences the whole science comprehends both positive and negative quantities; so the whole science of Economics comprehends both positive economic quantities and negative economic quantities, both corporeal and incorporeal property. By this means we double the field of Economics as usually treated; we do in Economics what those did who introduced negative quantities into mathematics and natural philosophy. And it is by this means only that the theory of credit, banking, and the foreign exchanges, can be rendered intelligible.

DEFINITION OF VALUE.

Economic quantities are, as we have seen, of three distinct orders or species, any one of which may be exchanged against any one of the others.

Now, if at any time any economic quantity A can be exchanged for any economic quantity B, then each of these two quantities is termed the value of the other.

If at any time one ounce of gold will exchange for 15 ounces of silver, then it is said that one ounce of gold is of the value of 15 ounces of silver; which is simply this equation,

$$1 \text{ oz. gold} = 15 \text{ ozs. silver.}$$

Hence value may be said to be the sign of equality between any two economic quantities.

Hence any economic quantity has as many values as quantities it can be exchanged for; and of course if it can be exchanged for nothing, it has no value.

Value, therefore, by the definition, requires two objects, just in the same way as distance and ratio require two

objects. A single object cannot have value, any more than a single object can be distant or equal. If we are told that any object is distant or equal, we immediately ask distant from what? equal to what? So if it is said that a quantity has value, we must ask value in what? It is clear that as it is absurd to speak of a single object having absolute or intrinsic distance or equality, so it is equally absurd to speak of a quantity having absolute or intrinsic value.

It is now agreed that wealth is anything whatever which can be exchanged; and the theory of value denotes the laws of the relations of exchangeable quantities.

ON MONEY AND CREDIT.

We have now to show the true nature of money and credit.

In the early ages of the world there was no money. When persons traded they exchanged the products directly with each other. The exchange of products against products is termed barter, and it is easy to see what inconveniences that would give rise to.

In the times of the Homeric poems there was no money; but at that time as appears from them an advance had been made beyond mere barter. By that time it had been discovered that it would greatly facilitate transactions to refer the products to a common measure of value. It was usual to estimate things as being worth so many oxen.

This reference to oxen, however, as a measure of value, did not in any way imply the use or existence of money. It is quite usual at the present day for persons to exchange products at their estimated value in a common measure, as money, without any actual money being used.

The necessity for money arises from a different cause. If the products exchanged were always equal in value, there would be an end of the transaction, and there would be no need for money.

But it would often happen that when one person required some products or service from some one else, that other person would not require an equivalent amount of product or service from him in return, or perhaps none at all. If then, a transaction took place with such an unequal result, there would remain a certain balance of product or service due from the one to the other, and this would constitute a debt, that is to say, a right or property, would be created in the person of the one who had received the less amount of product or service to demand the balance due at some future time.

Among all nations and persons who exchange, this result must inevitably happen, persons want something from others while these others want nothing, or not so much from them.

In process of time all nations hit upon this plan; they fixed upon some material substance which they agreed to make always exchangeable among themselves to represent these debts.

That is if an unequal exchange takes place among persons, so leaving a balance due from the one to the other, the person who has received the greater amount of service, gives a quantity of the universally exchangeable merchandise to make up the balance, so that the person to whom the balance of product is due, may get an equivalent, or a satisfaction from some one else.

Suppose that a wine dealer wants bread from a baker, but the baker wants no wine from the wine dealer.

The wine dealer takes the bread from the baker, and gives him an equivalent in this merchandise.

The baker perhaps wants meat or shoes, but not wine, having received the merchandise from the wine dealer, he goes to the butcher or shoemaker, and obtains from them the equivalent of the bread he sold to the wine dealer. Hence the satisfaction which was due to him from the wine dealer is paid by the butcher or the shoemaker.

This universally exchangeable merchandise is termed money, and its true nature is evidently to be a right or title to demand some product or service from some one else.

When a person takes a piece of money in exchange for products or services, he can neither eat nor drink it, nor clothe himself with it, it is of no absolute direct use in itself, its sole use is to be a right or title to demand something from some one else, and the person who receives it in exchange for products or services, only agrees to do so because he believes that he can exchange it away again for something which he does want, whenever he pleases. It is therefore what is termed credit.

Thus a London merchant, F. Cradocke in the time of the Commonwealth says:—

"Having now pointed out the inconvenience of these metals (gold and silver) in which the medium of commerce or universal credit hath been formerly placed.

So Edmund Burke speaks of gold and silver as "The two great recognised species that represent the lasting conventional credit of mankind."

Hence we have the fundamental concept of credit—

"Credit is anything which is of no direct use in itself, but which is taken in exchange for something else, solely in the belief or confidence that we have the right to exchange it away again for something else."

Credit is, therefore, the right or property of demanding something to be paid or done by some person. It is the right to a future payment, and it must be carefully observed that it is the name of a certain species of right or property.

Aristotle, Bishop Berkeley, the Physiocrats, Smith, Thornton, Bastiat, Mill and Jurists have seen the true nature of money.

The subject of money and credit is of such fundamental importance, and so much misconception has prevailed regarding it, that we must show that a whole series of writers have seen the identical nature of money and credit.

Thus Aristotle says—

ὑπὲρ δὲ τῆς μελλούσης ἀλλαγῆς (εἰ νῦν μὴδὲν δεῖται, ὅτι ἔσται ἐὰν δεῖται) τὸ νόμισμα οἷον Ἑγγυητὴς ἐστὶν ἡμῖν. δεῖ γὰρ τοῦτο φέροντι εἶναι λαβεῖν.

But with regard to a future exchange (if we want nothing at present, that it may take place when we do want something), money is, as it were, our security, for it is necessary that he who brings it should be able to get what he wants.

So an old pamphleteer, in 1710, saw the same truth. He says—"Trade found itself unsufferably straightened and perplexed for want of a general specie of a complete intrinsic worth as the medium to supply the defect of exchanging, and to make good the balance where a nation, or a market, or a merchant demands of another a greater quantity of goods than either the buyer hath goods to answer, or the seller hath occasion to take back."

So the great metaphysician, Bishop Berkeley says in his *Querist*—

21. Whether other things being given, as climate, soil, &c., the wealth be not proportioned to industry, and this to the circulation of credit be the credit circulated by what tokens or marks whatever.

24. Whether the true idea of money, as such, be not altogether that of a ticket or counter?

25. Whether the terms crown, livre, pound sterling are not to be considered as exponents or demonstrations; and whether gold, silver, and paper are not tickets or counters, for reckoning, recording, and transferring such denominations.

35. Whether power to command the industry of others (*i.e.*, credit) be not real wealth? And whether money be not in truth, tickets or tokens for recording and conveying such power; and whether it be of consequence what material the tickets are made of?

426. Whether all circulation be not alike a circulation of credit, whatsoever medium, metal or paper, is employed; and whether gold be any more than credit for so much power?

See also *Queries* 441, 449, 450, 459, 475, &c.

It is one of the special merits of the Physiocrats that they saw clearly the true nature of money.

Beaudeau says: "This coined money in circulation is nothing, as I have said elsewhere, but effective titles on the general mass of useful and agreeable enjoyments, which cause the well being and propogation of the human race"

"It is a kind of bill of exchange, or order payable at the will of the bearer."

"Instead of taking his share in kind of all matters of subsistence, and all raw produce annually growing, the sovereign demands it in money, the effective titles, the order, the bill of exchange, &c."

And many other writers of the same school expressed the same idea.

So Smith says: "A guinea may be considered as a bill for a certain quantity of necessaries and conveniences upon all the tradesmen in the neighbourhood."

Smith also expressly includes bank notes and bills of exchange under the term money, in which he is not quite correct.

So Henry Thornton, the eminent banker, says: "Money of every kind is an order for goods. It is so considered by the labourer when he receives it, and it is almost instantly turned into money's worth. It is merely the instrument by which the purchaseable stock of the country is distributed with convenience and advantage among the several members of the community."

Bastiat also saw very clearly this great fundamental truth:—

"This seems the time to analyse the true functions of money, leaving out of consideration the miners and importation."

"You have a crown piece. What does it mean in your hands? It is, as it were, the witness and the proof that you have at some time done some work which, instead of profiting by, you have allowed society to enjoy in the person of your client. This crown piece witnesses that you have rendered a service to society, and, moreover, it states the value of it. It witnesses, besides, that you have not received back from society a real equivalent service as was your right. To put in your power to exercise the right when and how you please, society, by the hands of your client, has given you an acknowledgment or title, an order of the State, a token, a crown piece in short, which does not differ from either titles of credit, except that it carries its value in itself (?), and if you read with the eye of the mind the inscription it bears, you will distinctly see these words: 'Pay to the bearer a service equivalent to that which he has rendered to society, value received, stated, proved, and measured by that which is in me.'"

"After that you cede your crown piece to me. Either it is a present, or it is in exchange for something else. If you give it me as the price of a service, see what follows: your account as regards the real satisfaction with society is satisfied, balanced, closed. You render it a service in exchange for a crown piece; you now restore it, the crown piece, in exchange for a service. So far as regards you the account is settled, but I am now just in the position you were before. It is I now who have done a service to society in your person. It is I who have become its creditor for the value of the work which I have done for you, and which I could devote to myself. It is into my hands, therefore, that this title of credit should pass, the witness and the proof of this social debt."

"It is enough for a man to have rendered services, and so to have the right to draw upon society, by the means of exchange, for equivalent services. That which I call the means of exchange is money, bills of exchange, bank notes, and also bankers. Whoever has rendered a service, and has not received an equal satisfaction, is the bearer of a warrant, either possessed of value, such as money (?), or of credit, like bank notes, which gives him the right to draw from society, when he likes, and where he likes, and under what form he will, an equivalent service."

So Mill says:—"The pounds or shillings which a person receives weekly or yearly are not what constitutes his income; they are a sort of ticket or order which he can present for payment at any shop he pleases, and which entitles him to receive a certain value of any commodity that he makes choice of. The farmer pays his labourers and his landlord in these tickets as the most convenient plan for himself and them."

It is so clearly understood that money is in reality nothing more than a right to demand something to be paid or done, that many jurists expressly class it under the title of incorporeal property.

Thus, Vulteijs under incorporeal property, says,—

Nummus in quo non materia ipsa, sed valor attenditur.

Money in which not the material, but the value is regarded.

That is, we desire or demand other things for the direct satisfaction they give us, but we only desire money for the power it has of purchasing other things.

Thus it is seen that all the writers above-cited clearly saw that money and credit are of the same identical nature.

Hence, gold and silver money may be justly termed metallic credit.

The fundamental nature of money is to be a right to demand something else; but the quantity of matter or stuff which is required to represent any amount of debt, or as the equivalent of any commodity against which it is exchanged, will entirely depend upon the general laws of value.

ON CREDIT.

So long as nations continue in a low state of civilisation, all the credit or money is made of some material substance. But when they advance in civilization, they use credit of another form.

Suppose as above, an unequal exchange. Suppose that instead of the general merchandise called money, the debtor simply gives his creditor a promise to render the balance of service due when required. Then the creditor has the right to demand an equivalent at a future time. But that promise is only a right against a particular person, and the

person may die or become insolvent, and unable to fulfil his promise. But money is a general right against the whole trading community.

Hence, money has general and permanent value, but such an order as just described has only particular and precarious value.

This order, promise or abstract right is what is usually called credit; it is of the same general nature, but of a lower and inferior form to money, and as these rights or orders may be bought and sold equally as money, they are termed: *Pecunia*, *Res*, *Bona*, *Merx* in Roman law; *χρήματα*, *πράγματα*, *πλούτος*, *οὐσία*, *οἶκος* in Greek law; goods and chattels, vendible commodities, incorporeal chattels and incorporeal wealth in English law.

The advantage of adopting exchangeability as the sole essence and principle of wealth is now seen. These rights cannot be handled or seen in that form, but they may be bought and sold even in that form with the most perfect facility.

But if they are written down on paper they can be transferred by manual delivery like any material chattels, in fact, they become material or corporeal property. The whole mass of these rights or debts, whether written down on paper or not, are a vast mass of exchangeable property, they are wealth for exactly the same reason that gold is, they affect prices exactly like an equal mass of gold, and they are the subject of the most colossal commerce of modern times.

ON THE DISTINCTION BETWEEN MONEY AND CREDIT.

Money and credit are then "goods and chattels" or "commodities" of the same fundamental nature; they are each the right, or a title, to demand something to be paid or done by some one else.

No one can compel another person to sell him goods in exchange for money or credit. If therefore a person voluntarily takes money in exchange for goods, it is in reality only credit, because he only takes it because he is sure that he can exchange it away again.

But if a sale or exchange has taken place, and a debt has been incurred thereby, public policy requires that the debtor should be able to compel the creditor to accept something in discharge of his debt. It would cause infinite misery if creditors might arbitrarily refuse the offer of payment of their debts. Hence, in all countries the law declares that if a debt has been incurred, the debtor can compel the creditor some definite thing in payment of it.

Whatever that something is which a debtor can compel his creditor to accept in payment of a debt, is termed money or legal tender.

From this it follows that the same things may be money in some cases, and not in others.

Gold coin is money or legal tender in all cases, and to any amount.

Silver coin is money only to the extent of 40s. If a creditor chooses to take payment of a debt of more than 40s. in silver, it is entirely of his own free will.

In England as between the public and the Bank of England, bank notes are nothing but credit. The bank cannot compel any one to receive its notes; and any holder of its notes can compel it to cash them on demand.

Between private persons a bank note for 5*l.* is not money or legal tender for that exact amount of debt. But for all debts above 5*l.*, bank notes are money or legal tender; but even this is only so long as the bank pays its notes on demand. If the bank were to stop payment, its notes would not be money in any case.

In Scotland and Ireland, bank notes are not money in any case.

If two persons are mutually indebted in equal amounts, payable at the same time, each can compel the other to receive the debt he owes in payment of the debt due to him. Each debt is therefore money or legal tender, in respect of the other.

Thus if two bankers issue notes, and each gets possession of an equal amount of the notes of the other, each can compel the other to receive his own notes in payment of the debt due to him.

Or if two merchants issue acceptances payable on the same day, and each acceptance gets into the possession of the other, each can compel the other to receive his own acceptance in payment of his debt.

Or if a banker issues notes, and the merchant issues his acceptance; and if the banker holds the merchant's acceptance and the merchant holds the banker's notes; each can compel the other to receive his own obligation in payment of the debt due to him.

ON THE CHANNEL OF CIRCULATION.

Money and credit represent the balances which arise from unequal exchanges. The total of these balances is the circulation; and Smith and many others term it the channel of circulation.

This channel of circulation is filled with some material, and prices are estimated in pieces of this material.

The quantity of the material which represents any amount of debt, and is equivalent to any amount of products or services, is determined by the general law of value, and need not be adverted to here.

Suppose that gold is used at any time to represent debt, and to fill the channel of circulation; this gold is divided into certain pieces of fixed weight and fineness, termed coins, and prices are estimated in these coins.

Suppose that gold was discontinued as the representative of debt, and silver substituted for it; suppose that pieces of silver were coined of exactly the same weight as the previous gold pieces, and substituted for them as the representative of debt.

Then, as silver is about fifteen times less valuable than gold, it would require fifteen times as many pieces in silver to represent any amount of debt as it would gold pieces, and prices would rise fifteen fold, but other commodities would still preserve the same relations among themselves.

Suppose, again, that silver was taken away as the representative of debt, and copper substituted, and copper coin struck of the same weight as the previous gold and silver ones, and called by the same name, then prices would be estimated in copper; and as copper is about 900 times less valuable than gold, prices estimated in copper would rise to about 900 times the amount in gold, the relative value of all other commodities remaining the same.

Now, as the value of gold in representing debt depends upon the quantity of the gold which represents any amount of debt, it would manifestly follow that, if the quantity of gold were suddenly increased which represented any amount of debt, the value of gold would greatly diminish. And if gold became as plentiful as silver, it would have no more value than silver, and consequently, even while the weight of the coins and their quality remained the same, gold would fall to the fifteenth part of its former value as a purchasing power.

In a similar way, if gold became as plentiful as copper, it would fall to about the 900th part of its former value.

Thus, in a general way, if a certain quantity of stuff of any sort is used to represent any amount of debt at any time, and if the quantity of stuff is greatly increased while the quantity of debt remains the same, it necessarily produces a great diminution in the value of the stuff, and a general rise of prices.

But the quantity of stuff which represents debts, and fills the channel of circulation, need not be all of the same material; it may be partly gold, partly silver, and partly copper, and prices will be estimated by the whole quantity of stuff which fills the channel of circulation, and not by any particular portion of it.

In modern times a new kind of stuff has been employed to a gigantic extent to fill the channel of circulation, and that is credit, or rights of action in different forms.

Thus the whole quantity of stuff which fills the channel of circulation is comprised of gold, silver, copper, and credit, and in several countries paper money. And the prices of commodities are estimated according to the aggregate of all these different kinds of stuff, and not according to any single one.

It has been shown that credits payable in gold have exactly the same value as gold itself, and credits payable in silver have exactly the same value as silver, whereas paper money has an independent value of its own, just like gold and silver.

Hence the creation and use of credit in modern times produces exactly the same effects, and acts upon prices exactly in the same way as an equal quantity of metal, as is indeed acknowledged by every economist, although its true extent has been very imperfectly appreciated.

It will be shown that in England, the quantity of credit which is used in commerce may be approximately estimated at about fifty times the quantity of metallic coin.

Hence a thorough comprehension of the principles and mechanism of the great system of credit is the very foundation of all modern economics; and it is the changes in the amount of credit created which produces more changes in the prices of commodities at the present time than any other causes whatever.

ON PRICE.

When any economic quantity is exchanged for any other economic quantity, each is termed the value of the other. But when one or both of the quantities exchanged is money or credit, they are termed the price of the other. Price is, therefore, always value expressed in money or credit.

The value of money is the quantity of any commodity, whatever its nature may be which can be obtained in exchange for it; the greater the quantity of the commodity, the greater is the value of money; the less the quantity of the commodity, the less is the value of money.

Or if the commodity is taken as the fixed quantity, the less the money given for it, the greater is the value of money; and the more money given for it, the less is the value of money.

Hence—The value of money varies inversely as price.

The expression value of money has two meanings in commerce.

Commerce consists of two great branches, the commerce of material goods, and the commerce of debts; and the value of money is measured in two different ways in these two branches of commerce.

(1.) In the commerce of goods the quantity of money is compared directly with the quantities of goods.

Debts or credits are, as we have seen, exchangeable commodities, which are bought and sold like any material chattels. When commodities are brought into commerce, they must, for the convenience of sale, be divided into certain units. Coals are sold by the ton; corn by the quarter; tea and sugar by the pound; and other things by the ounce.

As credits or debts are saleable commodities, like any material chattels, they must be divided into units for the sake of convenience in commerce.

The unit of debt is the right to demand 100*l.* to be paid one year hence.

The sum of money given to purchase the unit of debt is its price, and the less the price given to purchase their fixed unit of debt, the greater the value of money; and the more the price given to buy the unit of debt, the less is the value of money.

But in the commerce of debts it is not usual to estimate the value of money by the price paid for the debt. As money naturally produces a profit, the price given for the debt must be less than the debt itself. The difference between the price of the debt and its amount is the profit made by buying it; and this difference or profit is termed discount. And it is clear that as the price of the debt increases or decreases, the profit or discount decreases or increases. In the commerce of debts it is always usual to estimate the value of money by the discount or profit it yields.

(2.) Hence in the commerce of debts the value of money varies directly as discount.

This rule embraces both branches of commerce.

The value of money varies inversely as price and directly as discount.

Hence in the commerce of goods the value of money, means the quantity of the goods; in the commerce of debts it means the discount or profit made by buying the debt.

ON EXCHANGE AND SALE OR CIRCULATION.

The exchange of products against products the economists termed an exchange. They only admitted an exchange to be where each side obtained a satisfaction.

An exchange for a product against money or credit they termed a demi-exchange or sale, or circulation.

Hence they defined circulation to be an exchange in which one or both of the quantities exchanged in money or credit.

ON THE MEANING OF CIRCULATING MEDIUM.

The term circulating medium does not occur in Smith. The first instance that I am aware of is in a speech of Mr. Fox's in 1797, in which he complains of it as a novel term, whose meaning was not very well settled.

The meaning of it is, however, perfectly clear. It is the medium used for circulating or buying and selling commodities, and that medium is money and credit. Hence the circulating medium must mean the whole mass of money and credit in all its forms.

ON THE MEANING OF CURRENCY.

All writers [use the term currency as absolutely synonymous with circulating medium; if, therefore, the meaning of one term can be determined that must also determine

the meaning of the other. The meaning of circulating medium is perfectly clear; and this must also determine the meaning of currency.

The meaning of the word currency has given rise to much difference of opinion in recent times; but to a certain period the meaning attributed to the word was well understood in Parliamentary debates, it was always used to mean money and credit in all its forms. Disputes then arose as to its meaning; and, finally, the Bank Charter Act of 1844 was founded on a peculiar definition of it, which will have to be examined hereafter.

The fact is, that the word currency is a technical term of mercantile and constitutional law, which has been repeatedly explained in the Courts of Law.

The following is the true meaning of current and currency in English law:—

It is a general rule of law that a person cannot transmit to another person a better title than he has himself. It is also a general rule of law that if a person has accidentally lost a thing or has it stolen from him he does not thereby lose his right or property in it. He can not only recover it from the finder or thief himself, but also from any one to whom the thief or finder may have sold or pledged it; even though the purchaser paid the full price for it to the thief or finder, and bought it honestly and without the knowledge that it was not the property of the seller. This is called the *jus vindicandi* in Roman law.

But to this rule, money, from the very necessity of the case, was always an exception. If the owner of the money finds it in the possession of the thief he can reclaim it; but if the thief or finder has purchased goods in a shop with it, and the shop-keeper takes the money honestly in the usual way of business, and without knowing that it has been stolen, he may retain it against the true owner, from whom it has been stolen, even if he can identify it; that is, the property in money passes by delivery.

It is this peculiarity in the law affecting the property in money which passes by delivery, which is denoted by the words current and currency in English law.

And when the representatives and substitutes for money, such as bank notes, bills of exchange, cheques, &c., came into use, the *lex mercatoria*, or custom of merchants, applied to the same doctrine or principle of currency to them. They were treated like money in so far as this, that the property in them passes like the property in money. Thus, if they are lost or stolen the true owner may recover them so long as he finds them in the possession of the thief or finder. But if the thief or finder passes them away for value in the ordinary way of business to an innocent holder, that innocent holder acquires the property in them, and may retain them against the true owner, and enforce payment from them from all the parties liable.

This has been decided in a whole series of cases in the Courts of Law (see *Macleod's Banking*, Vol. II., Chap. XV.).

In *Miller v. Race*, bank notes; in *Grant v. Vaughan*, cheques; in *Peacock v. Rhodes*, bills of exchange; in *Georgier v. Mieville*, foreign bonds; in *Wookey v. Pole*, exchequer bills; in *Whistler v. Foster*, all negotiable instruments; in *Shute v. Robins*, banker's paper; in *Goodwin v. Roberts*, scrip for foreign bonds, were all held to possess the attribute of currency: *i.e.*, that in all of them the property passed by delivery, and it was clearly explained that the word currency means negotiability.

In strict law, then, this principle of currency can only be applied to those rights which are recorded on some material. An abstract right cannot be lost or stolen, mislaid, and passed away in commerce. For a right to be currency in law, it must be recorded on some material so as to be capable of being carried in the hand, or in the pocket, or put away in a drawer, or dropped in the street; and stolen from the drawer, or the pocket, or picked up in the street, and carried off by the thief or finder and sold like a piece of goods.

It is perfectly well settled in law that money and all securities for money possess the attribute of currency.

So far, then, as regards law, there is no difficulty, the meaning of the word is perfectly plain. But if the word currency is used to denote a certain class of economic quantities synonymous with circulating medium, a difficulty arises, because there is an immense mass of credit which has produced exchanges, and has circulated commodities, and is therefore circulating medium, which is not recorded on any material at all in such a way that it can be lost or stolen and passed away by manual delivery.

Thus the gigantic mass of banking credits and the book debts of traders have all effected a sale or circulation, and therefore they are all circulating medium; but they are not currency in a legal sense, because they cannot be lost mislaid or stolen and passed away by manual delivery. So

also private debts between individuals termed verbal credits; they only arise out of the transfer of money or commodities, and they exist equally whether they are recorded on any material substance or not. They are equally circulating medium. The private debts among traders affect prices exactly like so much money. Consequently though they are not currency in strict law, they must all be included under that term when used in a scientific sense in economics, synonymous with circulating medium, because those rights of action are exactly the same in their nature and effects, whether they are recorded on paper or not.

In courts of equity it has been repeatedly held that banking credits pass in a will under the term ready money.

In the debates in Parliament up to a certain epoch, it was universally understood that the term currency included money and all forms of credit, although no one attempted to define its meaning.

Thus Lord Titchfield in 1822 said:—"When it was considered to how great an extent these contrivances had been practised in the various modes of verbal, book, and circulating credits, it was easy to see that the country had received a great addition to its currency. This addition to the currency would have the same effect as if gold had been increased from the mines."

ON LORD OVERSTONE'S DEFINITION OF CURRENCY.

It has been shown that up to a certain period in all the Parliamentary debates it was assumed that the term currency included money and credit in all its forms.

It was at the beginning of the century that the first discussions as to the meaning of currency began. Several of the witnesses before the Committee on the Bank Charter Act of 1832 maintained that bills of exchange and banking credits are not currency. This opinion was more strongly maintained before the committee of 1840, and by more influential witnesses.

As Sir Robert Peel adopted the opinions of these witnesses, and the Bank Charter Act of 1844 was expressly founded on their definition, it will be necessary to state these opinions and examine their validity.

It would be too long to state their opinions at length here. They are given in Macleod's Banking, Vol. II., p. 314. It will be sufficient to state their doctrines simply.

Mr. G. W. Norman, Mr. Samuel Jones Loyd, afterwards Lord Overstone, and Colonel Torrens were the witnesses whose opinions prevailed with Sir Robert Peel.

They maintained then, that metallic coin and bank notes payable to bearer on demand alone constitute the currency or circulating medium of a country. They entirely excluded bills of exchange, banking credits, and all other forms of credit from the term.

The criterion they adopted of currency or circulating medium was that which "closed a debt"; they maintained that money and bank notes payable to bearer on demand alone have this attribute.

It has now to be shown what are the necessary consequences of adopting such a definition of currency.

1. When money is exchanged for goods no debt arises; and if it be said that the money closes the debt which would have arisen on the sale of the goods, it may equally be said that the goods close the debt which would have arisen on the sale of the money. Hence the goods and the money close the debt equally on each side. Hence if the essence of currency be to "close debt," the goods are currency for precisely the same reason that the money is.

2. It is quite common in the city to discharge a debt by stock. By this means the debt is closed; consequently, according to this doctrine, the stock is currency.

3. It is quite common in many cases to discharge a debt by a payment in goods. The goods, therefore, close the debt, and, therefore, they are currency.

4. When money is paid for labour or services of any kind it is an exchange. If the money closes the debt on the sale of the labour, the labour closes the debt on the sale of the money; hence on this principle the labour is currency equally with the money.

5. In all cases of barter or exchange of products the goods on each side close the debt which would have arisen without the exchange; therefore, the goods exchanged on either side are equally currency.

Furthermore, we may test the doctrine by cases of paper documents.

6. Two merchants hold each other's acceptance of equal amount, payable on the same day. They then exchange acceptances, and the debts on each side are closed. Hence these acceptances are each currency.

7. A banker holds a merchant's acceptance and the merchant holds an equal amount of the banker's notes. They exchange the obligations, and the debts are closed. Hence each obligation is currency.

8. A person gives his creditor, who deals with the same banker, a cheque on his account; when the credit is transferred to the creditor's account the debt is closed. Hence the banking credit is currency.

9. A person buys a railway ticket. The company is then indebted to him for a journey. When the company have carried him to his destination the debt is closed. Hence the railway journey is currency.

These are some of the remarkable consequences which follow from Lord Overstone's definition of currency. While he gave a definition which was expressly intended to exclude everything except money and bank notes payable to bearer on demand, the necessary consequence of it is to include everything that is exchanged under it.

Lord Overstone said (Q. 3132):—"Will any man in his common senses pretend to say that the total amount of transactions adjusted at the clearing house are part of the money or circulating medium of the country?"

No one would say that a transaction is money; but every mercantile lawyer would say at once that the banking credits transferred are an integral part of the circulating medium of the country.

The fact is that Lord Overstone, and many other bankers as well, perfectly admit that a banking credit written down on paper in the form of a bank note is part of the circulating medium, but they feel a difficulty in admitting that a simple credit is exactly the same whether it is written on paper or not.

Thus it is seen that Lord Overstone's definition of currency entirely fails; and it is absolutely necessary for the due understanding of the subject to remember that credit in all its forms, whether recorded on paper or not, is circulating medium or currency.

THE QUANTITY OF MONEY IN ANY COUNTRY BEARS NO NECESSARY RELATION TO THE QUANTITY OF OTHER GOODS IN IT, NOR TO THEIR PRICE.

It is often supposed that the quantity of metallic money in a country bears some necessary relation to the quantity of other commodities in it, and also that the prices of commodities are determined by the ratio of their quantities to that of money.

Both these notions, however, are erroneous, as a few simple examples will show.

Somewhere about 50 years ago it was a notorious fact that there a very much larger amount of metallic money in France than in England, and yet prices were very much lower in France than in England, and in Scotland there was less metallic money still, and the reason was that at that time there was an extremely small amount of credit in France, and an extremely large amount of credit in England and Scotland, so that the amount of money bore a very much larger ratio to credit in France than in England and Scotland.

The doctrine that an increased quantity of money leads to an increased amount of price in a direct ratio might have some semblance of truth in a very rude state of commerce, where money was brought into direct competition with commodities only. But as soon as the system of credit comes into use, the conditions of the problem are altered.

When the great gold discoveries took place in the fifteenth and sixteenth centuries, the system of credit and banking was in its infancy. The increased quantity of money did no doubt produce a considerable change in the price of commodities, but the best authorities observed that the rise in prices was only one half what might have been expected from the increased quantity of money.

Even in that age a very considerable amount of the increased quantity of money went in the discount of mercantile bills and loans, and it was also observed that a general reduction in the rate of interest took place.

In modern times the difficulty of tracing the connection between an increased quantity of money and prices is rendered infinitely more complicated, because at the present day the increased quantities of bullion are paid into banks in the first instance, and this has a most powerful effect on the rate of interest.

The fact is that the different effects of an increased quantity of money as it is applied to the purchase of commodities, and to the purchase of mercantile bills and loans, is one of the most profound and complex problems in economics, and has never yet been sufficiently investigated, nor even its importance adequately appreciated, and it would be obviously impossible to do so in this brief outline.

Again the quantity of money necessary in a country depends very much on the method in which trade is carried on.

1. Trade may be carried on without money, *i.e.*, by barter; and there being no money, of course there can be no ratio between money and other goods.

2. Even where money is used a very considerable trade is always carried on by barter. Traders deal with each other and exchange goods according to their value in money; in such cases no money is required.

3. The quantity of money in a country depends to a considerable extent on the methods employed in settling debts.

Suppose that two persons are each indebted to the other in 10%. Suppose that each sends to the other to demand payment of his debt; then it would require each to send 10% to the other to pay the debts.

But suppose that the two persons agree to cancel each other's obligations; then no money at all is required, and the debts are equally settled.

Hence the former clumsy way of settling debts would require 20%, the latter would require no money at all. These 20% would have no influence on prices.

When such transactions as these are multiplied on a gigantic scale, as they are in actual practice, especially in the mutual claims of the great banks on each other, it is evident that an enormous quantity of money may be required or not, just as the one method or the other is adopted in practice. The institution of the clearing house was organised for the express purpose of saving the waste of money under the old system of settling bankers' debts.

The exposition of the system of credit given further on will also show how insignificant a part actual money plays in modern commerce.

ON THE MEANING OF DEBT.

The meaning of the word debt has been the source of great perplexity.

It is one of a class of words which originally meant material things, but which in the progress of jurisprudence has come to mean an abstract right, of which we have already seen an example in Mancipium.

Professor H. Nettleship, of Oxford, informs me that in classical Latin the word *debitum* meant the material thing owed.

But in juridical Latin, the word *debitum* is used as synonymous with *obligatio*, and it includes both the creditor's right of action and the debtor's duty to pay.

In process of time the word *debitum* split up into two parts, and in modern jurisprudence it is used to mean both the creditor's right of action, and the debtor's duty to pay separately.

Foreign jurists term the creditor's right of action the active or positive debt, and the debtor's duty to pay the passive or negative debt.

But in English law and common usage, the word debt is used quite indiscriminately to mean both the creditor's right of action, and the debtor's duty to pay, and it requires constant vigilance to observe in which sense it is used.

It is still a very common error to suppose that a debt is money in the creditor's possession to which the creditor has a right, and therefore not in reality the property of the debtor. But this error must be carefully guarded against.

It is expressly pointed out in the Digest—"Obligationum substantia non in eo consistit ut aliquod corpus nostrum facit; sed ut alium nobis adstringit ad dandum aliquid vel faciendum, vel præstandum."

The essence of an obligation does not consist in this that it makes any specific goods our property, but that it binds some person to give something, or to do something, or to be responsible for something.

Thus the (passive) debt is nothing but the personal duty to pay or do something, and has no reference to any specific sum.

So Williams says—"Every person who borrows money on mortgage or not incurs a debt or personal obligation to repay it."

So Gide well observes—"A debt is not the material object, the money, but the juridical object the duty to pay."

By the twelfth century the word debt had already acquired the meaning of the creditor's right of action.

In 1194, Richard I. issued instructions for a judicial visitation on financial matters in which it was ordered,—

Omnia debita Judæorum inbrevientur terræ, domus, redditus et possessiones.

Let all the debts (*i.e.* rights of action) of the Jews be scheduled, their lands, houses, rents, and possessions.

Item quilibet Judæus jurabit super rotulum suum quod omnia debita sua et vadia, et redditus, et omnes res, et possessiones suas inbreviari faciat.

Also let every Jew swear that he will make a true return of all his debts (rights of action), pledges, rents, and all his property and possessions.

In mediæval charters *debitale* was used in the same sense. In one of 1324 it says—

In omnibus et singulis bonis . . . dominiis, baroniis, censibus, redditualibus, debitalibus, servitutibus, homagiis.

In all and singular goods . . . lordships, baronies, revenues, rents, debts (rights of action), servitudes, homages.

In a Statute of Placentia in 1386 it says—

Nullus homo emat vel aliququaliter acquirat aliquod debitum vel nomen.

No man shall buy or otherwise acquire any right of action or debt.

Thus at that period the words *debitum* and *debitale* had acquired the meaning of the creditor's right of action.

The word debt in English had also acquired the same meaning. It is so used in the Statute of Merchants, Edward I., 1283. So in "*Les Termes de la Ley*," published in 1567, debt is defined as a writ or right of action.

So in the Act, 46 George III. (1806) c. 125. s. 3., it is enacted that "one debt or demand may be set off against another."

So Mr. Williams says:—"Within the class of Choses-in-action was comprised a right of growing importance, namely, that of suing for money due, which right is all that is called a debt, debts being formerly considered as mere rights of action."

So as may be seen in any daily paper, the executors of deceased persons advertise for any persons who have "debts, claims, or demands" against the estate.

In the digest of the law of Bills of Exchange, I prepared for the Law Digest Commissioners, I began with this definition—

Credit or debt in legal, commercial [and economical] language means a right of action against a person for a sum of money.

This double meaning of debt is so well known, that it is used in both senses in the same Act of Parliament.

In the Supreme Court of Judicature Act, 36 & 37 Vict. (1873) c. 66. s. 28., sub-sec. 6., it is said—

"Any absolute assignment by writing under the hand of the assignee of any debt or other legal chose-in-action . . . to revive or claim such debt or Chose-in-action" where the word debt means the creditor's right of action.

But in the same section, s. 1. it is said,—"Whose estate may prove to be insufficient for the payment in full of his debts and liabilities, . . . as to debts and liabilities provable," where the word debt means the debtor's duty to pay."

Hence on all economical discussions, it must be understood that the words credit and debt are used perfectly indiscriminately to mean a creditor's right of action, and that the word debt is used equally to mean the creditor's right of action and the debtor's duty to pay.

ON THE MEANING OF CAPITAL.

Smith enumerates as Capital (1.) Material things. (2.) Personal qualities. (3.) Abstract rights.

Now we do not want an enumeration of what things are Capital, we want a definition of what Capital is.

Capital comes from the Latin, *caput*, which is the source of a spring, or the root of a plant, *i.e.*, the source from which increase flows.

So Stephens says in his *Thesaurus*: *Κεφάλαιον*, *caput*; unde fructus et redditus manat.

Capital, the source from which any profit or revenue flows.

So Senior says: "Economists are agreed that whatever gives a profit is properly termed Capital."

This is a good general definition, and the whatever gives a profit must be interpreted in as wide and general a sense as the anything whose value can be measured in money is in the definition of wealth.

Any economic quantity whatever may be used in two different ways:—

1. The proprietor may use it himself for his own personal enjoyment.

2. He may trade with it, *i.e.*, use it so as to produce a profit.

Any economic quantity whatever which is traded with and used so as to produce a profit is termed Capital.

The definition of Capital, then, is: Capital is any economic quantity used so as to produce a profit.

Economic quantities, as has been seen, are of three distinct orders.—(1.) Material things: (2.) Personal qualities: (3.) Abstract rights.

1. Material things. If a person spends his money on his own personal enjoyment, or his household expenses; such money is not used as Capital.

But if he lends it out at interest, or buys goods with the intention of selling them again at a profit, or if he buys into the Funds, or shares in a commercial company, or a practice, &c., or if he spends it in obtaining a professional education, he uses it so as to produce a profit; and money so spent is Capital. So some persons are the owners of large tracts of land on which London is built; this land produces them a very large revenue; it is, therefore, Capital to them.

2. Personal qualities, both in the form of labour and credit, may also be used in either of the above ways.

Labour. If a man digs in his own garden for his own amusement; or if he sings, acts, or gives lectures for the private delectation of his friends; such labour is not Capital.

But if he trades with his labour, and so earns an income, then such labour is Capital.

Thus his talents and abilities are Capital to any one who earns an income as an advocate, physician, surgeon, engineer, manager of a great commercial company, or in any other profession.

So to a "working man" his labour is his Capital; as Smith, Say, and Mill all allow.

So Huskisson said, "He had always maintained that labour is the poor man's Capital."

Mr. Cardwell said to his constituents, "Labour is the poor man's Capital."

A writer in a daily paper, speaking of the Irish peasants, said, "The only Capital they possess is their labour, which they must bring into the market to supply their daily wants."

Speaking of them, the "Economist," said, "They have no Capital but their labour."

So Mr. Froude says in his "Oceana"; "And the land would be in the reach of poor men, who have no Capital except their labour."

So Cardinal Manning said in the "Tablet," "I claim for labour the rights of Capital. It is Capital in the truest sense."

Credit. If a person uses his credit to purchase things for his household consumption or personal enjoyment, he does not use his credit as Capital.

But if a merchant uses his credit to purchase goods to sell again at a profit he uses his credit as Capital.

When a banker discounts a bill of exchange he creates a credit in his books to the amount of the bill, less the discount; that is, he buys one right of action upon his customer by creating a right of action against himself; and he charges exactly the same price, and makes exactly the same profit, by selling the right of action to his customer as if he had bought the bill with actual money. Hence a banker uses his credit as Capital.

3. Abstract rights. When a person invests his money in the Funds, or in the shares of a commercial company; or in a copyright, or a patent, or in the goodwill of a business, or in a practice, &c.; these abstract rights produce a profit to him just as if they were material commodities. Hence they are his Capital.

It has been shown that bills of exchange are "goods and chattels," "commodities," and they are bought and sold exactly like material commodities.

Smith, under the term circulating Capital, includes the goods in a shop and bills of exchange.

An ordinary shopkeeper makes a profit by buying goods from one person, and selling them at a higher price to someone else.

A banker makes profits by discounting bills of exchange, i.e., he buys the bill from his own customer at a lower price, and sells it at its full price to the acceptor; and thus makes a profit.

Hence the bills of exchange in the portfolio of a banker are circulating Capital just in a similar manner as the goods in a shop are.

CAPITAL MAY INCREASE IN TWO DISTINCT WAYS.

Capital may increase in two fundamentally distinct ways—

1. By an actual increase of quantity; thus, the fruits of the earth, cattle, herds, flocks, poultry, increase by adding to their numbers or quantity.

2. By commerce or exchange; that is, by exchanging away something at a lower value and gaining in exchange something that has a higher value in return for it.

Money is used as Capital, and produces a profit by the second of these methods. Money is used as capital by exchanging it for goods which are sold for a higher price than they cost, or by lending it out at interest, or by employing labour and selling its products for a higher sum than they cost, or by expending it in a professional education which produces an income.

Suppose that a trader buys goods for 100*l.* and sells them for 125*l.*, he first replaces his original capital of 100*l.*, and then he has a surplus profit of 25*l.* He has thus used his money as Capital.

If a trader sees that he could make a profit if he had the means to purchase, if he has no money and no credit, he can purchase no goods and he can make no profit.

Suppose, however, he has credit, that is, if the owner of the goods has confidence in his skill, integrity, and character, he may sell him the goods, and take in exchange for them the trader's promise to pay at a future time instead of actual money.

As the payment is deferred, and there is always some risk of failure in payment, the price in credit is always higher than the price in money. Suppose that the price on credit is 105*l.*, then, as before, he sells the goods for 125*l.*. At the proper time he discharges his debt of 105*l.*, and he has a profit of 20*l.* over. He is better off at the end of the operation by 20*l.* than he was at the beginning, and he has used his credit as Capital.

Now as Capital is anything which produces a profit, and as his money and his credit have equally produced a profit, it necessarily follows that money and credit are equally Capital. Credit has produced exactly the same circulation of goods that cash would have done; hence credit is productive Capital exactly in the same way and in the same sense that money is.

Thus the expression that "credit is capital" which has called forth so much dissent in recent times, simply means that commerce is carried on, and profits are made, by credit, i.e., banking credits and bills of exchange as well as by money.

SECTION II.

THE THEORY OF VALUE.

It is now acknowledged that there are three orders of exchangeable or economic quantities, (1) material things; (2) labour or services; (3) abstract rights; and that these three orders of quantities can be exchanged in six different ways.

The value of any economic quantity is any other economic quantity for which it can be exchanged.

The theory of value is the investigation of the laws which govern the relation of these exchangeable quantities.

The complete theory of value comprehends:—

1. The definition of value.
2. The origin, cause, or form of value.
3. The general law of value, or the general equation of economics.

DEFINITION OF VALUE.

Value in its true and original sense is a desire of the mind; it means esteem or estimation. As Glo'ster says in Lear: "In the division of the kingdom it appears not which of the dukes he values most."

So Troilus, in Troilus and Cressida: "For what is aught but as 'tis valued?"

So Henry Esmond says: "There is some particular prize we all of us value, and that every man of spirit will venture his life for."

So J. B. Say says: "Value is a moral quality."

But such value is not an economic phenomenon. To bring value into economics it must be manifested in some tangible form; a person must manifest his desire, demand, or value for something else by giving something in exchange for it to acquire possession of it.

But as one person cannot gain possession of what another person possesses without giving something in exchange for it which he desires, demands, and values, it is evident that for an exchange to take place requires the concurrence of two minds. It is not sufficient that the demand or value should exist on one side only. If one person desires to obtain possession of what another person possesses, it is not sufficient to constitute a phenomenon of value that he alone should desire it; he must offer in exchange for it something which that other person desires or demands.

If a person brought a cargo of wine among a nation of teetotalers, no one would desire or demand it; no one would buy it; among such a people wine would have no value; so among a nation of non-smokers tobacco would have no value; among a nation of vegetarians beef and mutton would have no value. However much a person would wish to sell his product, if no one will buy it, it has no value. For an exchange or a phenomenon of value to take place there must be the reciprocal desire or demand of two persons, each for the product of the other.

When, however, two persons each desire or demand to obtain the product of the other, and when they agree to exchange their respective products, each product may be considered as the measure of the desire of its owner to obtain possession of the product of the other. The two products, therefore, reciprocally measure the desire of their possessors to obtain the product of the other; and when these persons have agreed upon the quantities of their products which are to be exchanged, the two products are said to be of equal value. Each product is the value or the demand for the other.

Hence it is clear that the true origin and cause of value is reciprocal demand.

Thus, let A and B be any two quantities which are exchanged at any instant, then we may say,—

A valet B;
or, A is of the value of B;
or, A = B.

Then B is the value of A in terms of B, and A is the value of B in terms of A.

Thus Aristotle says: "*ἡ δ' ἀξία λέγεται πρὸς τὰ ἑκτὸς ἀγαθά.*"

Now the term value is used in reference to external things.

So it is said in Roman law: "*Res tanti valet quanti vendi potest.*" "The value a thing is what it can be sold for."

So Le Trosne says that value is a new quality which products acquire when men live in society.

"Products acquire, then, in the social state which arises from the community of men among each other, a new quality. This quality is value which makes products become wealth."

"Value consists in the relation of exchange which takes place between such and such a product, between such a quantity of one product and such a quantity of another."

"Price is the expression of value."

Hence all writers up to this time defined the value of a thing to be anything else (external to itself) which it could purchase.

CONFUSION OF ADAM SMITH ON VALUE.

In Book I., Chap. V., is found the origin of the confusion on the meaning of value, which has had such a baneful effect on English economics.

In this chapter Smith begins by saying that the value of any commodity is equal to the quantity of labour which it enables the owner to command or purchase. Hence, if l denotes labour—

$A = l, 2l, 3l, 4l, \dots$

He then says, in the next paragraph, that is the same thing as saying that it is equal to the produce of labour, it enables him to purchase, or, denoting produce by p , we have—

$A = p, 2p, 3p, 4p, \dots$

In the next paragraph he says that the value of anything is more frequently estimated in money than either in labour or commodities, or, denoting money by m —

$A = m, 2m, 3m, 4m, \dots$

In these passages Smith defines the value of a thing to be something external to itself. Hence it is manifest that the value of A must vary directly as l , p , or m . The greater the quantity of l , p , or m that can be got for A, the more valuable A is; the less of l , p , or m that can be got for A, the less valuable is A. It is clear that if any change whatever takes place in the exchangeable relations between A and these quantities, the value of A has changed.

It is clear, therefore, that there can be no such thing as invariable value. Nothing can have invariable value unless the relations of all other things are fixed also.

Directly after the paragraphs above cited, Smith proceeds to search for that single thing which is to be the invariable standard of value.

He says that gold and silver will not do because they vary in their value—sometimes they can purchase more and sometimes less labour and other commodities. Then he says: "But as a measure of quantity such as the natural foot, fathom, or handful, which is constantly varying its own

quantity, can never be an accurate measure of the quantity of other things, so a commodity which is itself continually varying its own value can never be an accurate measure of the value of other commodities. Equal quantities of labour at all times and places may be said to be of equal value to the labourer. In his ordinary state of health, strength and spirits in the ordinary degree of his skill and dexterity he must always lay down the same portion of his ease, his liberty, his happiness. The price which he pays must always be the same whatever the quantity of goods which he receives in return for it (which by Smith's own definition is the value of his labour). Of these, indeed, it may sometimes purchase a greater and sometimes a smaller quantity; but it is their value which varies, not that of the labour which purchases them (!). At all times and places that is dear which is difficult to come at, or which costs much labour to acquire; and that cheap which is to be had easily, or with very little labour. Labour alone, therefore, never varying in its own value (!) is alone the ultimate and real standard by which the value of all commodities can at all times be estimated and compared. It is their real price: money is their nominal price only.

"But though equal quantities of labour are always of equal value to the labourer (!), yet to the person who employs him they appear sometimes to be of greater and sometimes of smaller value."

"Labour, therefore, it appears evidently, is the only universal, as well as the only accurate measure of value, or the only standard by which we can compare the value of different commodities at all times and places."

It is this passage which has given rise to all the attempts to discover an invariable standard of value; and, indeed, to the idea that there can be such a thing at all.

But the utter confusion of ideas in the passage is evident. Smith, in accordance with all other writers, begins by defining the value of a thing to be any other thing which it will purchase. The value of labour itself, therefore, is what it will purchase. And then he says that equal quantities of labour are always of the same value—no matter whether they will purchase 10*l.* or 100*l.*

And it is from this confusion of thought that he maintains that if a commodity is always produced by the same quantity of labour it will be invariable in value. And hence the value of a commodity came to be defined to be the quantity of labour embodied in it, as it were. Which gave a great impulse to the misleading and contradictory term of intrinsic value, which has been the ruin of so much of English economics.

CONFUSION OF RICARDO ON VALUE.

Exactly the same confusion runs through the whole of Ricardo on value.

He begins by saying: "The value of a commodity is the quantity of any other commodity for which it will exchange."

As he goes on, however, he gradually comes to the notion that the value of anything is the quantity of labour expended in obtaining it, and he maintains that if anything could always be obtained with the same quantity of labour it would be an invariable standard of value.

He also says: "The labour of a million of men in manufactures will always produce the same value . . . That commodity is alone invariable which at all times requires the same sacrifice of toil and labour to produce it."

That is, Ricardo says that the value of manufactures is always the same, whether they sell for 100*l.*, or 20*l.*, or 5*l.*, or for nothing.

After beginning by defining and several times repeating that the value of a thing is some other thing for which it will exchange, he ends by saying: "I cannot agree with M. Say in estimating the value of a commodity by the abundance of other things for which it will exchange."

Ricardo, therefore, begins by defining the value of a thing to be something external to it, and he ends by describing it to mean the cost of production or quantity of labour bestowed in obtaining it.

The very first day that Bentham read his book, he wrote to Ricardo to tell him that it was all founded on the confusion between cost and value.

This doctrine that cost of production regulates value has overspread English economics, but it is evidently utterly erroneous. It all arises from Smith in the beginning of his work, and Ricardo arguing from a very small class of facts only, instead of first considering all cases of value before beginning to theorise. Smith, as has been shown, begins his work by asserting that wealth is the annual produce of "land and labour," and Ricardo considers no quantities except those which are produced by human

labour. Now, as will be shown more conveniently further on, the economic quantities which are the produce of human labour are the smallest class of any, and it is utterly unscientific to build up general theories upon one class of cases only, which are utterly erroneous and misleading when applied to other classes.

It has now been shown that the only true definition of the value of anything, is any other thing for which it can be exchanged. And as any one of the three orders of economic quantities can be exchanged for any one of the others, it will be seen that it is entirely erroneous to say that labour is necessary to value.

ON THE ERROR OF THE EXPRESSION INTRINSIC VALUE.

It is, then, to be clearly understood that the value of a thing is always sometimes external to itself.

The unfortunate idea of Locke, Smith, and Ricardo, that the value of a thing is the quantity of labour embodied in the thing itself, gave rise to the misleading expression intrinsic value, which is a contradiction in terms.

Smith, as has been shown, begins by defining the value of anything to be some other thing which it will purchase, and then he suddenly changes the idea of value to be the quantity of labour expended on obtaining the thing itself. This unfortunate phrase intrinsic value meets us at every turn in economics, and has been the cause of enormous confusion.

Thus it is often said that money has intrinsic value, but that a bank note or bill of exchange is the representative of value.

Money no doubt is the produce of labour, but Smith himself says that if money were not exchangeable, it would have no value. How then can the value of money be intrinsic? How can anything have intrinsic value unless it has the things it will exchange for inside itself? Money will exchange for anything—land, corn, houses, jewelry, and each of these is a value of money; but which of these is its intrinsic value.

It is perfectly admitted that a bank note payable on demand is of the value of money, and why is it so? simply because it is exchangeable for money. Hence it is clear that a bank note has value for exactly the same reason that money has and for no other; namely, that they are exchangeable for something else. When money can be exchanged, it has value; when it cannot be exchanged, it has no value; when a bank note can be exchanged, it has value; when it cannot be exchanged, it has no value.

The expression intrinsic value is so common that persons are apt to overlook its incongruity of ideas; it is, however, a plain contradiction in terms, and if we use words of similar import whose meaning has not been so corrupted, its absurdity will be apparent at once. Thus who ever spoke of intrinsic distance or an intrinsic ratio? The absurdity of these expressions is apparent at once; but they are in no way more absurd than intrinsic value. If we speak of the intrinsic value of money we may just as well speak of the intrinsic distance of St. Paul's or the intrinsic ratio of five.

To say that money has intrinsic value because it is material and the produce of labour, and that a bank note or bill of exchange is only the representative of value, is just as absurd as to say that a wooden yard measure is intrinsic distance, and the space between two points a yard apart is the representative of distance.

Hence a credit, whether in a mere abstract form, or as written down on paper in the form of a bank note or bill of exchange, is by the acknowledgment of all jurists, economists, and merchants an article of merchandise or exchangeable commodity, and produces exactly the same effect on prices as money itself.

A STANDARD OF VALUE IS IMPOSSIBLE, BUT THERE MAY BE A MEASURE OF VALUE.

The unfortunate idea that the value of a commodity is the quantity of labour embodied as it were in the commodity itself, originated by Locke, and adopted by Smith and Ricardo in one part of their works, not only led to the misleading expression, intrinsic value, which has been the source of endless confusion in economics, but also to the search for something which is impossible by the very nature of things, namely, an invariable standard of value.

It is as well to explain what those economists mean who want an invariable standard of value.

If we had a British yard and any foreign measures of length before us, we could at once perceive the difference between them, and if we were told the measurements of any foreign buildings, however remote in age or country,

we could, by a very simple calculation, reduce them to the standard of British measurement, and compare them with the size of our own buildings.

Those economists who search for an invariable standard of value want to fix upon single commodity by which they can compare the value of all other things in other ages and countries.

But such a standard is impossible by the very nature of things. Money is indeed termed the measure of value; and so it is in exchanges which are affected at the same time and place. If we are told that a quarter of corn is worth 40s. and that a sheep is worth 40s. at a certain time and place, we should know that they were then and there of equal value.

But such matters are not the result of simple perception by the senses. If a quantity of gold were placed beside a number of other things, no human sense could discover what their value would be. And the most violent changes in their several values might take place in the market without there being any visible signs of such a thing. Value is a mental affection, and values are not perceptible by ocular demonstration, but they must be declared by the communication of minds.

It is not possible to ascertain the different quantities of gold obtained in different ages and countries. If a quantity of gold coins minted in the time of Elizabeth and equal quantity minted in China, and an equal quantity minted in the reign of Victoria, were placed side by side, what human sense could discern the difference in value between them? And yet that is what those economists require who search for an invariable standard of value. They want something by which they can at once decide whether gold is of more value in A.D. 100, in 1400, in 1887, in England, or in China, without reference to anything else.

The only test of value is an exchange, and unless we can effect an exchange there can be no value. How can we exchange an ounce of gold in the year 180 for one in 1580, or in 1887? Value must therefore be a relation between temporary commodities.

If we compare the value of a commodity at one time with its value at another, it is only a comparison of the relation in which it stood at these different times to some other commodity. It is not a comparison of some intrinsic independent quality at one period with the same quality at another period, but a comparison of ratios.

This search after the impossible has arisen from the unfortunate idea of Smith that the value of a thing is the quantity of labour bestowed in obtaining it, which, as has been seen, was adopted by Ricardo. From this it was supposed that if any commodity could always be obtained with an invariable quantity of labour it would be an invariable standard of value. Ricardo admitted that there is no commodity which is always obtained by an invariable quantity of labour, and therefore, for that reason alone, he admitted that an invariable standard of value is unattainable.

An invariable standard of value is, however, unattainable not only for the reason given by Ricardo, but it is itself absolutely impossible by the very nature of things, because value is a ratio, and a single quantity cannot be the measure of a ratio. A measure of length or capacity is an absolute single quantity, but value is a ratio. We may measure a tree with a yard, or a hogshead with a gallon, because they are each of them single quantities; but value is a ratio, and it is impossible to say—

$$a : b : x$$

It is manifestly absurd to say that four is to five as eight.

But when we consider that value is originally a desire of the mind, there may be a measure of value, because any commodity may be fixed upon to measure the intensity of the desire persons have to obtain something else; but even this is only a measure for contemporary transactions, it cannot be a permanent measure extending through all ages and countries.

The measure of value is money and credit. That credit is a measure of value equally with money is evident, because a person measures his desire to obtain something as well by giving a promise to pay at a future time, as by giving money itself.

ON THE ORIGIN, SOURCE, OR CAUSE OF VALUE.

We have now to show what is the origin, source, or cause of value.

It has been shown that there are three distinct classes of quantities which have value, and we have to ascertain what that single cause is which gives value to them all indifferently.

The first thing to be done is to make a complete collection of instances of value.

Now, there are three class of quantities which have value.

1. Corporeal or material property.—Land, houses, money, jewelry, cattle, corn, minerals, &c.

2. Immaterial property.—Labour of all kinds, professional, artizan, agricultural, &c.

3. Incorporeal property.—Rights of action, debts, the funds, copyrights, shares in commercial companies, &c.

We have now to discover the cause of the value of all these different quantities, namely, that single general cause which, being present, value is present; which, when it increases, value increases; which, when it decreases, value decreases; and which, being absent, value is absent.

Now we observe that labour or services and incorporeal property have value, but they have no materiality; hence materiality is not necessary to value, it is only accidentally associated with it in some cases.

It is also to be observed that labour has value, but labour perishes in the very instant that it is performed; hence durability is not necessary to value; it is only accidentally associated with it in some cases.

It is also to be observed that the land upon which a great city is built, cattle, timber, trees, bank notes, bills of exchange, &c. have value, and there is no labour in them; hence it is seen that labour is not necessary to value, it is only associated with value in certain cases.

DEMAND IS THE SOLE ORIGIN OF VALUE.

As ancient writers unanimously held that exchangeability is the sole essence and principle of wealth, and as for anything to be exchangeable there must be a demand for it, they unanimously held that *xpeia*, or demand, is the sole origin of value.

All modern writers on economics were equally unanimous that demand is the sole origin of value up to a certain time.

Boisguillebert, a most distinguished writer, says:—“Consummation (consumption or demand) is the principle of all wealth.” “All the revenues, all the riches in the world, consist in consummation (demand); all the most exquisite fruits of the earth, and the most precious products would be nothing but rubbish if they were not consummés (demanded).”

The Italian Economists are very clear and consistent in showing that human wants and desires are the cause of all value. Genovesi clearly points out that the words *prezzo*, *pregio*, *stima*, *valuta*, *valore*, are words of relation, and not absolute, and that they are not applied to intrinsic qualities. That, though money is the apparent or proximate measure, the ultimate measure to which not only things but their price is referred is man itself. Nothing has value where there are no men.

“Men, however, do not give value to things or services unless they want them. Hence our wants are the first source of the value of all things; and price is the power to satisfy our wants. . . . Nothing has value except in relation to these wants.” He shows that prices are always determined by supply and demand, and he says, “Value is the child of demand.”

So Beccaria says: “Value is a substance which measures the estimation in which men hold things.”

The first economists made all value proceed from demand; and they showed that things which remain without consummation (demand) are without value.

Condillac is also very clear on this point. He shows that all value arises from the mind of man. “This esteem is called value.” “Since the value of all things is founded on the want of them, or the demand, it is natural that a want more strongly felt gives things greater value; and a want less felt gives them less value.” “As soon as we want a thing it has value, and only for that reason.”

All this is so perfectly obvious, that it seems strange that it should ever have been disputed.

ERROR OF THE DOCTRINE THAT LABOUR IS THE CAUSE OF VALUE.

The doctrine, maintained by all ancient writers and by continental economists, that demand is the sole origin of value seems so obvious and indisputable that it is a matter of surprise that it should ever have been doubted. Nevertheless, the doctrine that labour is the cause of value has become very widespread in England, and has had the most disastrous effect on English economics.

Locke, as far as I am aware, seems to have been the originator of this doctrine. In a passage in his Essay on

Civil Government, which is too long to quote here (Macleod's Banking, Vol. I., p. 123), he takes certain commodities, and maintains that their value is just the quantity of labour employed in producing them.

To this the answer is simply that if there was no demand for them they would have no value at all.

Smith begins by describing wealth as the produce of “land and labour,” but he afterwards admits that if it is not exchangeable it has no value; which at once acknowledges that demand is in reality the cause of value.

The fundamental defect of Ricardo's work is that it is not a treatise on value in general, but only on that of material products, and only even of a small portion of these, namely, those which are the produce of human labour. Ricardo expressly limits his inquiry to the material products which are produced by human labour, and then lays down the dogma that labour is the foundation of all value.

The following examples, however, will show that the doctrine that labour is the cause of all value is entirely untenable—

1. An acre of ground near the Bank of England usually sells for about a million sterling. The land has value, it is a saleable commodity, and therefore wealth. But how is its value due to labour?

The land at Charing Cross has very considerably less value than near the Bank of England, and the land at Kensington still less value. How are these differences in value due to labour when there is no labour at all in any of these cases?

As the tide of fashion, population, and wealth sets towards a locality, the ground in it rises rapidly in value; when it is deserted by fashion and wealth, the ground diminishes in value; how is this increase and decrease of value due to labour, when there is no labour at all in either case?

Take the case of cattle, flocks, herds of all sorts, how is their value due to labour?

In the midland counties of England many an oak tree would sell as it stands on the ground for 100*l.*, before any one has touched it. It has been stated that in 1810 an oak tree was cut down at Gelas in Monmouthshire, the wood of which sold for 670*l.* and the bark for 240*l.* How was the value of such tree due to human labour?

A whale was cast ashore on the Firth of Forth; it sold as it lay on the beach for 70*l.* How was its value due to labour?

Some years ago it used to be the fashion for European ladies to imitate their swarthy sisters of Central Africa, and pile large masses of hair, termed chignons, on their heads. While this rage lasted a young girl's hair frequently sold for 5*l.*, 10*l.*, 20*l.*, and even much higher sums. Was the value of the girl's hair due to human labour?

When a fair is held in a country town persons pay a good rent for leave to erect booths and tents on the common. At other times they would not pay anything. How is the value of the space of ground due to labour?

Hence there are multitudes even of material things which have value, upon which no labour was ever bestowed, which shows that labour is not the cause of the value even of material things.

But labour itself has value. If, then, labour is the cause of all value, what is the cause of the value of labour?

A Bank of England note, or a great merchant's acceptance, for 1000*l.* has value. Is that value due to human labour?

When a banker discounts a bill for a customer, he gives him a credit in his books for it. That is, he buys one right of action by creating another right of action; and by so doing he gives value for it. Is the value of the banking credit due to labour?

As the strict logical conclusion of his doctrine that labour is the cause of all value, Ricardo maintains that air, heat, and water add nothing to the value of the crops. If this doctrine be true, it would follow that if we were to plant a vineyard in Shetland, the grapes, if they ever appeared, and the wine made from them, would have exactly the same value as the grapes and the wine produced in the vineyards of France.

Some persons regard Ricardo as a great authority in economics, but when his doctrines are plainly examined in the light of day they are seen to be entirely untenable.

Why have cattle, flocks, herds, timber, trees value? Because there is a demand for them. If all persons were to become vegetarians, the value of cattle, herds, flocks, &c. would at once die off. What gives value to the vineyards of France, California, and Australia? The demand for wine. If the whole world were to become teetotallers, all value would at once die off from the vineyards of France, California, and Australia.

What is it that gives value to labour of all sorts? Simply the demand for it. If there is no demand for labour, it has no value.

Why has a bank note or bill of exchange value? Because the debtor is bound to pay, *i.e.*, demand it, at the proper time.

Convertible paper has the value of gold, because at the proper time it can be compulsorily exchanged for gold. But even inconvertible paper may have value. During the bank restriction the notes of the Bank of England for a considerable period circulated at par with gold. Afterwards, in consequence of the excessive issues of the Bank, they fell to a considerable discount. But still they had a certain value. Was that value due to labour?

In 1874 the notes of the Bank of France were inconvertible, but they circulated at par with gold. Was that value due to labour?

In Russia the inconvertible paper rouble has long been at a heavy discount as compared to silver. But still it has a certain value. Is that value due to labour?

It is perfectly admitted by all economists that an increased quantity of credit diminishes the value of the whole circulating medium. Now, as one part of the circulating medium consists of metallic coin, and the far larger part consists of various forms of credit, how can the value of the whole be due to labour?

The fact is, that only a very small part of material commodities have any labour associated with them at all. And even the value of those which are produced by labour is not due to the labour, but to the demand for them.

Those writers to whom the prevalence of the doctrine that labour is the cause of all value is chiefly due, Smith, Ricardo, and McCulloch, have all contradicted themselves, and admitted that demand is the real cause of value.

McCulloch says: "An object which may be appropriated or adapted to our use without any voluntary labour on our part may be of the highest utility, but as it is the free gift of nature it is quite impossible that it can have the smallest value. . . . In its natural state, matter is very rarely possessed of any immediate or direct utility, and is always destitute of value. It is only through the labour expended on its appropriation, and on fitting and preparing it for being used, that matter acquires exchangeable value, and becomes wealth."

The few examples given above, to which multitudes of others might be added if necessary, show that this doctrine is entirely erroneous.

And the same McCulloch says elsewhere:—"Demand may, therefore, be considered as the ultimate source and origin of both exchangeable and real value, for the desire of individuals to possess themselves of articles, or rather the demand for them originating in that desire, is the sole cause of their being produced or appropriated."

Is it any cause for wonder that economics is in such a deplorable state, and fallen into such general disrepute as a science, when the professed writers on it are in such flagrant contradiction with themselves on its fundamental principles?

Whately, says:—"In this, as in so many other points in political economy, men are prone to confound cause and effect. It is not that pearls fetch a high price because men have dived for them, but, on the contrary, men dive for them because they fetch a high price."

Value, then, like colour, sound, and odour, only exists in the human mind.

It is not labour which is the cause of value, but, on the contrary, value which is the inducement to labour.

Long ago the tribunes of the Commons, said:—"Eo impendi laborem ac periculum . . . magna præmia proponantur."

So Hume, says:—"Our passions [desires or demand] are the only causes of labour."

Persons do not bestow a great deal of labour on producing a thing, and then discover that they want it. On the contrary, they either want it themselves or hope that other persons may want it, and then they labour to produce it.

It is not, therefore, the labour of the producer which constitutes a thing wealth, but the demand of the consumer.

ON THE RICARDO—MILL THEORY OF VALUE.

Ricardo was the first writer in this country who conceived the idea of reducing economic phenomena to general principles, but unfortunately his system is utterly contrary to the fundamental principles of natural philosophy.

It has been shown that though Ricardo's work is a treatise on value, it is not a treatise on the general theory of value in its widest extent, but only on a very small portion of it.

He excludes from consideration all but those things which are the produce of human labour, and then he lays down the dogma that labour is the foundation of all value.

It has been shown that there are vast quantities of material things which have value, and which are in no way the produce of labour; and therefore, that labour cannot be the cause of all value. And even in those things which are produced by labour, it is not labour which is the cause of their value, but the demand for them.

Ricardo divides commodities into three classes:—

1. Those of which the supply is absolutely limited and cannot be increased by human labour. Of these he acknowledges that the value is exclusively governed by the law of supply and demand.
2. Those commodities which can be increased at will by human labour without assignable limit.

Ricardo says that these commodities are divided into two classes:—

(a.) Those which can be increased to any extent at an equal cost of production. Of these he says: "It is cost of production which must ultimately regulate the price of commodities, and not as has often been said, the proportion between supply and demand."

(b.) These commodities which can be increased in quantity at will, but not by equal cost of production like corn and minerals. An increased quantity of corn (or minerals) can always be procured, but the increased quantity is always obtained at an increased cost. In this class of commodities, Ricardo says the cost of obtaining the last quantity produced, regulates the price of the whole quantity.

It is obvious that there are many other classes of commodities besides those mentioned by Ricardo.

Mill accordingly speaks of many other cases, and he divides them into "exceptional cases," "peculiar cases," and "anomalous cases."

Now it is obvious that this method of treating economics is contrary to the fundamental principles of natural philosophy. Mill himself says that economics is to be treated in the same way as the physical sciences. Ricardo and Mill break up economic phenomena into a number of distinct classes of cases, and maintain that there is a distinct fundamental law of value for each of them. But this is contrary to the laws of natural philosophy; for in each one of the physical sciences it is acknowledged that there can be only general law governing all the phenomena of the science.

The doctrine that cost of production regulates value has acquired great hold in English economics, but the slightest reflection will show that it is entirely erroneous. It would be too long to give a full refutation of it in this place. That is done in Macleod's *Elements of Economics*, Chapters VII. and IX.

ON THE GENERAL LAW OF VALUE OR THE GENERAL EQUATION OF ECONOMICS.

Having given the definition of value, and found that its origin resides exclusively in the human mind, the last thing is to ascertain the general law of value or the general equation of economics; that is, to discover a single general law which governs the changes in the exchangeable relation of all quantities, whatever their nature may be, at all times and places.

The acknowledged principles of Natural Philosophy show that there can be but one general law of value. The three orders of economic quantities can be exchanged in six different ways, and the general law of value must govern all these six species of exchange indifferently. The law which governs the exchangeable relations of material commodities must equally govern the exchangeable relations of debts.

Let A and B be any two quantities whatever, material, immaterial, or incorporeal, it is quite clear that their exchangeable relations are contained in the following limits:—

$$\begin{aligned} \infty A &= 0 B \\ &\&c. = \&c. \\ 2 A &= \frac{1}{2} B \\ A &= B \\ \frac{1}{2} A &= 2 B \\ &\&c. = \&c. \\ 0 A &= \infty B. \end{aligned}$$

The meaning of which is, let the exchangeable relation between A and B gradually and continuously change from where the greatest possible quantity of A will exchange for the least possible quantity of B, to where the least possible quantity of A will exchange for the greatest possible quantity of B.

Then the law of continuity says that a quantity cannot pass from one amount to another by any change of conditions without passing through all intermediate degrees of magnitude according to the intermediate conditions.

Hence we may affirm by virtue of the law of continuity—

1. That if it can be indubitably proved that any particular law holds good at any one point in the range of

prices, that same law must necessarily hold good at all points throughout the whole range of prices.

2. That as the symbols A and B are perfectly general, if any law whatever can be proved to hold good in the variation of the exchangeable relation of any two quantities whatever, that law must necessarily hold good in the exchangeable relations of all quantities whatever.

Thus, by the law of continuity, we are enabled to affirm that—

If any law whatever can be proved to be true at any one point in the range of prices between any two quantities whatever, that same law must necessarily be true at all points in the range of prices, and between all quantities whatever.

And, as a necessary corollary from the preceding, it may be affirmed that—

If any law whatever can be proved not to be true with the regard to the relation of any two quantities whatever, that law cannot be a general law of economics.

Furthermore, as it is a universally acknowledged principle of Natural Philosophy that that law only is the true one which explains all the phenomena, it may be laid down as an unquestionable truth in economics that—

If two or more forms of expression will explain or account for any phenomena regarding price, or the change of price, that form of expression only is to be adopted as the true one which explains all the phenomena in the science, and not that individual case or class of cases only.

Now, as the law of cost of production will only apparently even explain one class of cases only, whereas it is evidently incapable of explaining whole multitudes of other cases, it is seen that it is not the true law even in that single class of cases, but that single class of cases must in reality be governed by a general law which explains all cases.

LORD LAUDERDALE'S LAW OF VALUE.

The true way of stating the fundamental problem of economics is this: Let any number of economic quantities have a certain relation to each other at any given time, to find the law which will produce a change in their exchangeable relations. For the law which produces a change in their relations must necessarily be the law by which their relations at any given instant are determined.

Lord Lauderdale says, that of two quantities which may each vary, if we suppose the variation to take place in one of them, the other remaining constant, its value would be influenced by four causes:—

It would increase in value—

1. From a diminution in quantity.
2. From an increase of demand.

It would diminish in value—

1. From an increase of quantity.
2. From a diminution of demand.

As the variation of the other quantity will be influenced by the same four causes, it is quite clear that the variation of both quantities will be influenced by eight independent causes, and if these be connected in the form of an algebraical equation, that will manifestly be the true general law of value, or the true general equation of economics, which determines value in all places and times.

All economists admit that the law of supply and demand, of which the above is the full expression, is true when the prices of things are very low; they also admit that it is true when the prices of things are very high; it is admitted to be true at the extremes of prices, and, therefore, it is manifest that by the law of continuity it must be also true

at all intermediate points in the range of prices; that is, it is universally true.

The general equation of economics is, therefore, a compound ratio of a very complicated nature, and to apply it in particular cases requires a profound knowledge of the circumstances of that case.

This equation is obtained in the same way that all equations on the other physical sciences are obtained. We have determined the independent variables, and they are connected in a general law or formula. This insures certainty to the science, but it is in the last point that the real difficulty arises, namely, in giving precision or numerical amounts to the coefficients. It is quite impossible to say what numerical variations in supply or demand will produce definite variations in value. This has been attempted in some cases, but with no success, as it is impossible to obtain exact numerical data, and, in fact, though the same general law is true, the same absolute variation in supply and demand of various quantities will produce great differences in the variations of their numerical values.

It is this difficulty, or rather impossibility, of giving precise numerical values to the coefficients, that makes many persons suppose that it is impossible to make economics an exact science. It is sometimes supposed that for a science to be an exact one, it is necessary that its laws should be capable of precise quantitative statement. It has, however, been well pointed out, that there is a fundamental distinction between certainty and precision in science. To constitute an exact science, it is only necessary that the reasoning be exact or certain, not that its laws be stated with numerical precision. Different sciences may be equal in certainty, but very unequal in precision. This observation applies very forcibly to economics. Some persons are apt to despise it because its results cannot be brought out with the same numerical precision as those of mathematics. This, however, is an error. In economics the causes of phenomena can be ascertained with absolute certainty, and if we want to produce a given effect, the method of producing it can be pointed out with absolute certainty. This is all that is necessary to constitute an exact science, because the method of producing the result being pointed out with certainty, it has only to be put in force until the required result is produced.

In considering the general equation of economics given above, we see the application of Bacon's aphorism: "That which in theory is the cause, in practice is the rule." No other quantities but demand and supply appear on the face of the equation. It therefore follows that no other causes influence value or changes of value than intensity of demand and limitation of supply.

It is seen that neither labour nor cost of production have any direct influence on value, and if they do so indirectly it can only be by and through the means of affecting the demand or the supply; and that no charge of labour or cost of production can have any influence or value unless they produce a change in the relation of supply and demand.

Thus the labour or cost of production theory of value is entirely disproved, and shown not to be applicable to the question before the Commission.

There only remains, then, the law of supply and demand, as expressed in full above, which is the universal law of value. And, as the question of bi-metallism is only a particular example of the universal law, it must necessarily govern the momentous question before the Commission.

It is a problem of the profoundest complexity to discern how the universal law of value is applicable to the particular case of bi-metallism.

SECTION III.

THE THEORY OF CREDIT.

The theory of the value of land will throw a complete light on the theory of credit.

If we purchase an estate in land for 100,000*l.* say, where is the value for the money? Does it consist in things which are already in existence? Everyone knows that it does not.

When we purchase an estate in land we purchase the right or property not only in the existing products of the land, but also the right to receive these products for ever; that is, to a series of products which will only come into existence at definite intervals of time for ever. That is, we purchase not only the existing products of the land, but also its capacity to produce future products to the end of time.

But though the annual products of the land will only come into existence at future intervals, the right or property to receive them when they do come into existence

is present, and may be bought and sold like any material chattel. That is, each of these future products has a present value, and the purchase money of the land is the sum of the present values of this series of products for ever.

When a purchaser has bought land it may be said to owe him a series of annual products for ever. Hence the right to receive these future products is the credit of the land, because the purchaser only bought it on the faith, hope, or trust that he would receive them.

A trader exercising any profitable business is an economic quantity analogous to the land. He has perhaps accumulated money as the fruits of his past industry, but over and above his accumulated money, he possesses the same capacity, ability, and industry to earn profits in the future, as he has already done in the past, and, of course, he has the right or property in the products of his future industry.

And he may trade in two ways. He may trade with the money he has already acquired, or he may purchase goods by giving in exchange for them the right or property to demand payment for them at a future time, out of the profits which are to be earned in future. Personal character used in this way as a purchasing power is termed credit, and, as has been shown, all economists are now agreed that anything which has purchasing power is wealth, it necessarily follows that money and credit are equally wealth.

Mercantile character, then, is purchasing power, and if a trader can purchase goods, labour, or money with his personal credit, his credit has a value which is measured in money.

Hence mercantile character is wealth or valuable property, and it may be used as capital as well as any material chattels.

A merchant's credit may be damaged and injured by false reports, just as his material goods may be damaged and injured by material violence. To damage a merchant's credit is to injure and destroy his purchasing power, and is just as great an injury to him as to rob him of his money. And he has an action against any one who injures his mercantile character or credit equally as he has against any one who injures his material chattels.

So distinctly is personal character recognised as property in Roman law that it is classed under *jura in re*, and an attack on it is an *injuria*, or the infringement of a legal right.

Hence it must be carefully observed that mercantile character or credit is national wealth.

ON THE CREATION OF OBLIGATIONS.

But as value does not enter into economics unless a person manifests his value or demand for something by giving something in exchange for it, so mercantile character or credit does not enter into economics until the merchant actually exercises his credit by making a purchase with it.

And when a merchant buys goods with his credit, or "on credit," as it is often termed, it is an absolute sale, just as much as if the purchase had been effected with money. He acquires the absolute property in the goods as fully and effectually as if he had paid for them in money.

But at the very instant that the property in the goods is ceded to the merchant a contract or obligation is created between the two parties, the buyer and seller of the goods, which consists of two parts:—

1. The right to demand payment in the person of the seller or creditor.
2. The duty to pay in the person of the buyer or debtor.

These two quantities constitute the contract or obligation or the bond of law between the two parties.

In this contract or obligation the creditor's right of action to demand the future payment in law, commerce, and economics is termed the credit or the active debt.

The debtor's duty to pay is termed the passive debt.

The right of action, credit, or debt is the price or payment of the goods. When a merchant takes a trader's bill at three months in exchange for goods, it is payment for the goods just as much as if it were money. The transaction is a sale or an exchange. The bill is payment for the goods; what the trader has to do is to pay his bill when it becomes due, which is another exchange.

This right of action written down on paper is a saleable material commodity, like any material chattel, and it may be bought and sold, and circulate in commerce, and effect exchanges exactly like a sum of money. It is termed a credit because anyone who buys it knows that he only buys a right of action against a person to demand a sum of money, and not a title to any specific sum of money; and he only buys it in the belief and confidence that the debtor will be able to pay it at the proper time.

It is also carefully to be observed that the debtor's duty to pay a sum at a future time is no subtraction from his present property. For the debt is simply the personal duty to pay, and there is no duty to pay until the day of payment comes.

It is now apparent why economics can only be made a definite science by adopting the fundamental concept of exchanges. The whole phenomena of credit, which are a hopeless puzzle and perplexity while it is treated as the "Production, Distribution, and Consumption of Wealth," become perfectly clear and simple when it is understood to be the science of commerce or exchanges.

ON THE EXTINCTION OF OBLIGATIONS.

It has now been shown that credit is the name of a species of incorporeal property of the same nature, but inferior in degree to money, and that it fulfils exactly the same functions as money as a medium of exchange or

circulation. It is a property cumulative to money; that is over and above money. But credit has its limits, and we have now to investigate the proper limits of credit, and to explain the various methods by which it is extinguished.

The true limit of credit may be seen by the definition of the term; because credit is a promise to pay money at a future time.

The institution of banks and bankers who create currency by means of their credit, either in the form of notes or deposits, gives a great extension to the limits of credit; but the principle of the limit remains the same. Credit always has to be redeemed, and if this can be done the credit has been sound; hence credit is never excessive, whatever may be its absolute amount, so long as it always returns into itself.

Credit being the right to demand a future payment, and the debt being the duty to pay, of course the payment fulfils, discharges, and extinguishes the right as well as the duty; and thus the obligation is absolutely annihilated and extinguished.

Credit being always expressed to be payable in money, it is often supposed that bills and notes are only extinguished by payment in actual money. This, however, is an error; there are several other modes of satisfying a debt besides actual money; and in this country the amount of bills which are paid in money is absolutely infinitesimal compared to those which are paid in other ways.

There are four different methods by which obligations may be extinguished; these are:—

1. By release or acceptilation.
2. By payment in money.
3. By renewal or transfer, or novation.
4. By set-off or compensation.

ON RELEASE OR ACCEPTILATION.

The first method by which an obligation can be discharged is by release, termed in Roman Law, *Acceptilation*.

As the contract or obligation is created by the mutual consent of two persons, it can be cancelled or annihilated by the same consent which created it.

Euler says, that if a man has nothing, and even owes 50 crowns, he has 50 crowns less than nothing; that is, he has nothing, and is under the duty to pay 50 crowns.

Euler also says, that if any one made the debtor a present of 50 crowns to pay his debt with, his property would then be only at the point 0, but he would be 50 crowns richer than before.

Euler is right so far as he goes, but he has only stated one half of the case, because the same result may be arrived at in another way. As any one may give the debtor 50 crowns to pay his debt, we may suppose that the creditor does so. The debtor may then pay the debt by giving the creditor back his 50 crowns, and the debt will be discharged. The debtor, though now possessing 0, is 50 crowns richer than he was before.

The same result may be obtained in a shorter way. Suppose that the creditor instead of going through the double operation of first giving and then receiving back the 50 crowns, simply releases the debtor from his debt. Then the debtors' property would be 0, and he would be 50 crowns richer than he was before.

This example shows that the release of a debt is in all cases equivalent to a payment in money, a principle of the most momentous importance and the widest application in commerce.

So the digest says "*Qui obligatione liberatur videtur cepisse quid.*" "He who is released from an obligation has gained."

So all jurists point out that the release from a debt is under all circumstances equivalent to a payment in money.

The application of this in commerce may be shown.

Suppose that I owe a banker 100*l.*, in how many ways may I pay him?

1. I may pay him 100*l.* in actual money.
2. If I have 100*l.* in his notes, or have an account with him, I may tender him his own notes, or I may give him a cheque on my account. In these two cases I release him from his debt to me, and that is in all respects the same thing as paying him 100*l.* in money.
3. Or I may pay him 50*l.* in money, and 50*l.* in his own notes, and the combined effect of these two is to discharge and extinguish my debt of 100*l.*

Thus I may pay a debt to a banker entirely in money, entirely in his own notes or by cheque, or partly in money and partly in his own notes or by cheque, and the effect of these several modes of payment is absolutely identical.

ON PAYMENT IN MONEY.

All jurists have pointed out that a "loan" of money is in reality a sale or an exchange. The property in the money is ceded to the borrower, and in exchange for it the right

on property is created in the person of the lender to demand back an equal sum at a future time.

Thus, if a person "borrows" 100*l.* at 5 per cent., he in reality buys the 100*l.*, and gives in exchange for it a right of action to demand 105*l.* at the end of the year. This right of action is the credit.

So when a person buys goods on credit, he buys them by creating a right of action against himself to demand a sum at a future time.

In either case, as has been shown, this right of action is an independent article of property, which can be bought and sold, or exchanged like any material chattel, and is termed *pecunia, res, bonum, merx, χρήμα, αγαθόν, πράγμα*, and is "goods," "goods and chattels," "incorporeal chattel."

When the time of payment comes, the creditor brings his right of action to the debtor, and the debtor buys it, just as he would any material chattel. Thus, when a debtor pays a debt, he simply buys up the right of action against himself.

Thus, an obligation is created by one exchange, and is cancelled and annihilated by another.

ON RENEWAL AND TRANSFER: OR NOVATION.

An obligation may also be extinguished by substituting a new one for it. This is termed *Novatio* in Roman law.

Novation may take place in two ways:—

1. When the debtor himself gives the creditor a new obligation, which he accepts in lieu and discharge of the previous one, which is thereby extinguished. The new obligation is the price or the payment of the previous one. This is usually called *Renewal*.

Thus, when a banker agrees to renew the promissory note of his customer, the new note is the payment of, and extinguishes the former one.

If a creditor has a debt owing to him payable on demand, and he agrees to take a note from his debtor payable in three months, the note is payment of, and extinguishes the debt payable on demand; and no new debt arises until the time comes for the payment of the note.

2. A debtor may transfer to his creditor a debt due to him from someone else. If the creditor agrees to receive this new debt in payment of his debt, he thereby discharges his own debtor, and accepts the debtor's debtor as his new debtor.

Thus, where a debtor pays his creditor in bank notes, if the creditor accepts these notes in payment of his debt, he discharges his own debtor, and accepts the banker as his new debtor.

So also when a debtor gives his creditor a bill of exchange on another person.

If the creditor and debtor are both customers of the same bank, the debtor may give his creditor a cheque on his banker. The creditor pays this cheque into his own account, and the banker transfers the credit from one account to the other.

The debtor has thus paid his own debt by transferring to him a debt due to him from his banker.

When the new debtor consents to the transfer of the debt he is said to be *delegatus*; and the transfer of the credit is termed *delegatio*.

This *novatio* or *delegatio* is equivalent to a payment in money.

The Digest says:—"Verbum exactæ pecuniæ non solum ad solutionem referendum est sed etiam ad delegationem."

So the Basilica:—"τὸ ῥῆμα τῶν ἀπατηθέντων χρημάτων οὐ μόνον εἰς καταβολὴν ἀναφέρεισθαι δεῖ, ἀλλὰ καὶ ἐς ἐκταξιν."

The word payment includes not only payment in money, but also the transfer of a credit.

So the Digest:—"Solvit et qui reum delegat." "He pays who transfers another debtor."

It is evident that the larger a bank is there will be more numerous cases of creditors and debtors being customers of the same bank, and of debts being settled by transfers of credit instead of by money.

As will be shown hereafter, bankers have devised an ingenious method by which credits may be transferred from bank to bank exactly in the same manner as they are transferred from one account to another in the same bank. Thus all the banks which join in this institution form for that purpose one huge bank. Thus the more extensive and the better organised the banking system becomes the smaller is the quantity of coin required to carry on commerce.

ON SET OFF OR COMPENSATION.

The last and a most important method of extinguishing obligations is by set off or compensation.

If two persons are mutually indebted in debts payable at the same time, each may claim that the debt he has against the other shall be taken in payment of the debt he owes.

The debts are weighed and set off against each other. This is termed compensation.

The following are examples of set off or compensation:—

1. Suppose two bankers issue notes, and each has got possession of an equal amount of the other's notes; then each banker may compel the other to receive his own notes in payment of the debt due to him.

2. Suppose that a banker holds a merchant's acceptance, and the merchant holds an equal amount of the banker's notes; then each may compel the other to receive his own obligation in payment of the debt to him.

3. Suppose that a banker holds the acceptance of his own customer, then, when the payment becomes due, he simply writes off an equal amount of the credit due to the customer; and thus the mutual debts are extinguished.

4. Suppose two merchants have issued their acceptances payable on the same day, and the acceptance of each merchant comes into the hands of the other; on the day of payment the two merchants exchange acceptances, and the mutual debts are extinguished.

In former times this principle of compensation was adopted to an immense extent on the Continent. Before the bankers discounted bills, there used to be great fairs at the various mercantile centres, Lyons, Antwerp, Brussels, and many others, every three months. Merchants, instead of making their bills payable at their own houses, where they must have kept large amounts of specie in order to meet them, made them only payable at the great fairs. In the meantime their bills circulated throughout the country, and had the same effects as money, and got covered with indorsements. On a certain day of the fair the merchants met and exchanged their acceptances. By this means an enormous commerce was carried on without the use of specie. In fact, commerce might be carried on to any extent without specie if only the respective acceptances of the merchants balanced among themselves.

These various methods of extinguishing obligations without the use of money show how utterly impossible it is to ascertain the relation of the quantity of money to prices, and are sufficient to show that that method is incapable of giving the solution of the problem before the Commission.

ON THE QUANTITY OF CREDIT COMPARED TO THE QUANTITY OF MONEY.

Credit, then, being seen to be a mass of exchangeable property, it is of considerable property interest, especially in the present inquiry, to discover the ratio which money and credit has been to each other in modern commerce.

A good deal of light may be thrown upon this by a return which Mr. Slater made respecting the transactions of his house in 1856.

He showed the proportion in which each million of payments and receipts were made in money and various forms of credit:—

Receipts.		
In bankers' drafts and mercantile bills payable after date	£ 533,596	
Cheques payable on demand	357,715	
Country bankers' notes	9,627	£ 900,938
Bank of England notes	68,554	
Gold	28,089	1,486
Silver and copper	1,486	
Post office orders	933	99,062
		£1,000,000

Payments.		
By bills of exchange	£ 302,674	
Cheques on London bankers	663,672	£ 966,346
Bank of England notes	22,743	
Gold	9,427	
Silver and copper	1,484	33,654
		£1,000,000

This may fairly be taken to represent commerce in general, and it is seen that specie did not form two per cent. of their payments and receipts.

The quantity of specie in the country may be roughly estimated at about 120,000,000*l.*, and, consequently, as there is about fifty times as much credit as money used in commerce, it would appear that there is about 6,000,000,000*l.* of credit in circulation.

This, of course, is only a rough approximate estimate, but it shows the colossal magnitude of credit, and its

supreme importance in modern commerce. This credit produces exactly the same effects, and affects prices exactly as so much gold.

TWO BRANCHES OF THE SYSTEM OF CREDIT.

The preceding observations are sufficient to give a general outline of the gigantic system of credit which has grown up in modern times, and in such a commercial country as this has almost superseded the use of money in commerce. Modern commerce is almost exclusively carried on by the creation, circulation, and extinction of debts or credits, and not by money, and the superlative importance of this in this inquiry is apparent, because these circulating credits or debts have exactly the same effects as prices and production as an equal amount of metallic coin. And the actual influence of metallic coin itself as prices and production can only be estimated by comparing the actual amount of coin with the quantity of credit which is used in conjunction with it.

The system of credit is divided into two great branches, commercial and banking. In the first, merchants buy commodities by means of credits or debts payable at a certain time after date. These commercial debts may circulate in commerce and effect exchanges exactly like

money until they are paid off and extinguished, and commercial debts are always intended to be extinguished when they become due.

The second source of creating credit is banking. Bankers buy money and these commercial debts by creating debts of their own, payable on demand. And there is this marked distinction between commercial debts and banking debts, that while the former are always intended to be extinguished at maturity, the latter are not so. Banking credits are created payable on demand, and must be paid if demanded. But they are not intended to be paid and extinguished. On the contrary, they are created with the hope and expectation that they will not be demanded, but continue in existence and do duty as money. There is no necessity that banking credits should ever be extinguished. They may be transferred from one account to another in the same bank, and from one bank to another to the end of time. It is quite possible that much of the banking credit which exists at the present time may have been originally created by the very first banks founded in this country, and there is no necessity that it should ever be extinguished as long as the banking system continues. Money is a very expensive machine to purchase and keep up, but banking credits cost nothing to create, and they may endure for ever.

SECTION IV.

ON BANKING.

The second great source of the creation of credit is banking.

The common notions of the nature of banking may be stated as follows:—

1. That the word bank comes from the Italian *banco* or *bench*; because as is alleged, the Italian money dealers kept a *banco* or *bench* on which their money was piled.

2. That the business of a banker consists in acting as an intermediate agent between persons who want to lend and those who want to borrow.

3. That the profits of a banker consist in the difference between the interest he pays for the money he borrows, and the interest he charges for the money he lends.

Then Gilbart says:—"A banker is a dealer in capital, or more properly a dealer in money. He is an intermediate party between the borrower and the lender. He borrows of one party and lends to another, and the difference between the terms at which he borrows and those at which he lends, forms the source of his profit."

So in the report of the House of Commons on the commercial panic of 1858, it is said:—"The use of money, and that only, they regard as the province of a bank, whether of a private person, or incorporation, or the banking department of the Bank of England."

These descriptions of banking, coming from apparently such high authority might be supposed to be accurate, nevertheless, they are entirely erroneous.

ON THE MEANING OF BANK.

The Italian money changers as such, were never called *banchieri* in the middle ages, nor was the office of a mere money changer ever called a *banco*.

Mere money dealers were called *cambiatores*, *cambitores*, *campsores*, *speciarii*, *nummularii*, *trapezitæ*, *danistæ*, *collybistæ*, and *mutuatores*, but never *banchieri*; and their places of business were called *casane*, but not *banchi*.

At the present day no person would call a mere money changer, or a person who merely lent out money, a banker.

Formerly there were many persons who acted as intermediaries between persons who wanted to lend and those who wanted to borrow; they were called money scriveners.

At the present day many firms of solicitors act as intermediaries between, persons who want to lend and those who want to borrow. But no one ever called such a firm bankers.

It is evident, therefore, that the nature of the business of a banker is essentially different from that of a money scrivener or a solicitor.

The word bank arose in this way. In the year 1171, the city of Venice was at war with the empires of the east and west. Its finances were in great disorder, and the great council levied a forced loan of one per cent. on the property of all the citizens. Commissioners were appointed to manage the loan, who were called the *camera degli imprestiti*. Such a loan has several names in Italian, such as *compera*, *mutuo*, but the most common is *monte*, a joint stock fund. This first loan was called the *monte vecchio*, the old loan; subsequently two other loans were contracted and called *monte nuovo* and *monte nuovissimo*. In ex-

change for the money the citizens received stock certificates, or credits, bearing interest which they might transfer to any one else.

At this time the Germans were masters of a great part of Italy, and the German word *bank* came to be used as synonymous with *monte*, and was Italianised into *banco*, and the loans or public debts were called indifferently *monti* or *banchi*.

Thus, an English writer, Benbrigge, writing in 1646, speaks of the "three banks" at Venice, meaning the three public loans or *monti*.

Ben Jonson in his *Volpone*, the scene of which is laid in Venice, says:—

"I make no profit in the public bank," meaning, I do not dabble in the Venetian funds.

So the Spanish economist, Olozaga, speaking of these loans says "*el monte Vecchio (banco viejo) . . . el monte-nuvo (banco nuevo)*."

That the word *banco*, in Italian, means a public debt, might be proved by numberless quotations.

Thus, in Florian's dictionary published in 1659, it says: "*Monte*, a standing bank or mount of money, as they have in divers cities of Italy."

So a recent writer, Cibrario says:—"Circa alla teoria del credito, che dissì invenzione di comuni Italiani, è noto che il primo *banco* o debito pubblico fu eretto in Venezia, nel 1171 . . . un monte o debito pubblico fu stabilito in Firenze nel 1336."

Numberless quotations might be made from the Italian economists who always use *monte* and *banco* as synonymous.

The bank of Venice was, in reality, the origin of the funding system, or the system of public debts, it did not for many centuries do what is termed banking business.

This was the meaning of bank when it was first introduced into English.

Thus Bacon, says:—"Let it be no bank or common stock, but every man be master of his own money."

So Gerard Malynes, in 1662, speaks of *mons pietatis* or banks of charity, and says, that in Italy there "*are montes pietatis*, that is, mounts or banks of charity."

Benbrigge in his *Usura Accommodata*, published in 1646, says:—"For their rescue may be collected, *mons pietatis* sive *charitatis* or bank of piety or charity, as they of Trent fitly call it."

Again:—"For borrowers in trade for their supply as their occasion shall require, may be erected *mons negotationis* or bank of trade."

Tolet speaks of two kinds of banks, namely, "*Mons fidei* or bank of trust, which Clement XII. instituted at Rome; he that put his money into this bank was never to take it out again, and received 7 per cent., and of *mons recuperationis* or bank of recovery, in which the interest was 12 per cent." These were simply perpetual and terminable annuities.

Several proposals for forming banks in England were made in the time of Cromwell. Cradocke, a London merchant, says:—"A bank is a certain number of sufficient men of credit joyned together in a stock, as it were, for keeping several men's cash in one treasury, and letting

"out imaginary money (i.e. credit) at interest for three or more in the hundred per annum to tradesmen or others that agree with them for the same, and making payment thereof by assignation, passing each man's account from one to another, yet paying little money." And he says that "the aforesaid bankers may furnish another petty bank (or mount) of charity."

In a little tract entitled "A discourse concerning banks," published in 1697, it says:—"Banks of the second kind, called in Italy monti, which are for the benefit of the income only are the banks of Rome, Bologna, and Milan. These banks were made up of a number of persons who, in time of war or other exigencies of State, advanced sums of money upon funds granted in perpetuum, but redeemable. . . . The third kind of banks which are both for the convenience of the public and the advantage of the undertakers, are the several banks of Naples, the bank of St. George at Genoa, and one of the banks of Bologna. These banks having advanced sums of money at their establishment did not only agree for a fund of perpetual interest, but were allowed the privilege of keeping cash."

The Bank of England was of this last kind. It was a company which advanced a loan to the Government, and received in exchange a perpetual annuity, and was allowed to carry on ordinary banking business as well.

Blackstone says:—"At Florence, in 1344, Government owed 60,000*l.*, and being unable to pay it, formed the principal into an aggregate sum, called metaphorically a mount or bank."

The public debts, popularly called the funds or consols, are legally termed "Consolidated Bank Annuities."

There has been one instance in this country of a bank formed out of the contributors to a public loan merely. This was the Million Bank. This company existed till nearly the end of the last century.

The essential feature of all these banks was to buy money from the subscribers as a mutuum, which thus became the property of the borrowers, and in exchange for the money they issued a credit, or a certificate with a promise to pay interest.

The meaning of the word "to bank" is to issue credit.

ON THE MECHANISM OF BANKING.

A banker is therefore a trader whose express business it is to issue credit.

It has now to be shown how a banker trades.

Suppose his customers pay in 10,000*l.* to their accounts. The money becomes his absolute property as a mutuum. In fact, he buys the money from his customers, and in exchange for it he gives them a credit in his books; that is, he creates and issues a right of action to his customers which entitle them to demand an equal sum of money at any time from him.

This credit, debt, or right of action, is termed in banking language, a deposit.

After such an operation his accounts would stand thus—

Liabilities.		Assets.	
Deposits	- £10,000	Cash	- £10,000

Now, though his customers have right of action against the banker to demand back an equal amount of money to what they have paid in, yet persons would not place money with their banker if they wanted to draw it out again. Nevertheless, some will want to draw out part of their funds; but if some draw out money others will pay money in, probably an equal sum. In ordinary and quiet times a banker's balance in cash will seldom differ by more than one thirty-sixth part from day to day. So that if he retains one-tenth of his cash to meet any demands that may be made upon him, that is ample and abundant in all ordinary times.

If, then, in the above example, the banker retains 1,000*l.* in cash to meet any demands upon him, he has 9,000*l.* to trade with; and it is just in the method in which bankers trade that so much misconception exists.

It is commonly supposed that when a banker has the 9,000*l.* to trade with, he employs it in purchasing bills of exchange to that amount, and that he receives a profit only on the 9,000*l.*; but that is a complete misconception of the nature of banking.

A "banker" never purchases a bill with money, that is the business of a bill discounteur.

A "banker" trades in this way. He sees that 1,000*l.* in cash is sufficient to support liabilities of 10,000*l.*; consequently he argues that 10,000*l.* in cash will support liabilities to several times that amount in credit.

When a "banker" discounts a bill he simply buys a right of action, and he buys it exactly in the same way as he bought the money. That is, he creates a credit, or a debt, or a right of action against himself in his books to

the amount of the bills, but at the same time charging his customer with the interest agreed upon, which is called discount.

That is, he buys a right of action payable at a future time by creating and issuing a right of action payable on demand; and this right of action, credit, or debt is equally, in banking language, termed a deposit, as the right of action he created to buy the money.

Suppose that the "banker" buys 40,000*l.* of commercial bills at three months, and the discount is four per cent., then the sum to be retained would be 400*l.* Consequently, in exchange for bills to the amount of 40,000*l.*, he would create credits, debts, or rights of action, technically termed deposits, to the amount of 39,600*l.*

Hence, just after buying the bills, and before his customers begin to operate on their accounts, his accounts would stand thus:—

Liabilities.		Assets.	
Deposits	- £49,600	Cash	- 10,000
		Bills of Ex-	
		change	- 40,000
	<u>£49,600</u>		<u>£50,000</u>

The balance of 400*l.* being his own property.

By this process the "banker" has added or created 39,600*l.* in credit to the previously existing cash, and his profit is clear. He has not gained 400*l.* on the 9,000*l.* in cash, but on the 40,000*l.* of bills he has bought.

This is the true exposition of the nature of banking. Hence the definition of a banker is clear.—"A banker is a trader whose business is to buy money and debts by creating other debts"

Thus it is seen that the essential and distinctive feature of a "bank" and a "banker" to create and issue credit payable on demand.

A bank is not, therefore, an office for borrowing and lending money; it is a manufactory of credit, which produces all the effects of an equal amount of gold. It is, as Bishop Berkeley said, a gold mine.

To show the enormous effects of banking, and especially its importance in the present inquiry, it may be stated that the Scotch banks in 1886, on a cash reserve of 4,042,376*l.*, maintained liabilities to the amount of 90,781,337*l.*, that is a ratio of more than 22 to 1.

It would have a material bearing on this inquiry if a complete account of the statistics of the English banks could be obtained in as full a form as those of the Scotch banks, but it does not exist. However, the enormous magnitude of the banking system in England may be conjectured, as it has been recently stated that the deposits, i.e., the liabilities in banking credits, of the London banks alone amount to 525,000,000*l.*

These colossal masses of credit which produce all the effects and act upon prices exactly in the same way as an equal amount of gold, show what an important effect on prices banking credits have, and how entirely misleading is the notion that banks are merely offices which borrow and lend out actual money.

ON A COMMON ERROR RESPECTING DEPOSITS.

It is indispensable to notice an error which prevails almost universally respecting the word deposit.

The word depositum is one of that class of words, of which we have already noticed several instances, which originally meant a material thing, and in modern times has come to mean a right.

A depositum in Roman law means anything which is placed in the charge or custody of some person for the mere purpose of safe keeping, and without the property in it passing to him, or his being allowed to use it for his own advantage.

It is part of the business of a London banker to take charge of his customer's plate, jewelry, &c., if required to do so. These things so placed with the banker are a depositum; he acquires no property in them, and he receives no remuneration for so doing.

It is commonly supposed that when a customer pays in money to his account, that it is a deposit, and the banker is supposed to make advances out of his "deposits." These ideas are erroneous. The money paid in is not a *depositum*; it is a *mutuum*; it becomes the banker's property, and he may use it in any way he pleases.

In banking language it is not the money which is the deposit but the credit or right of action which is created in exchange for it, so when a banker discounts a bill, he does it by creating a credit or right of action in his books, and this credit is also called a deposit.

A banker's deposits are his liabilities, and are the price he pays for the money and bills which are his assets.

A deposit is, then, simply a banking credit, and a banker does not make advances out of his deposits, but by creating deposits.

IN BANKING LANGUAGE A DEPOSIT AND AN ISSUE ARE THE SAME.

It must, therefore, be carefully observed that in banking language a deposit and an issue are the same thing. A deposit is simply a credit in a bank's books giving the customer a right of action against it for a sum of money. As soon as the bank has created a credit, or deposit, in its books in favour of a customer, it has issued a right of action against itself. The word issue comes from *exitus* or going forth, and in mercantile law, to issue an instrument is to deliver it to anyone so as to give him a right of action against the deliverer. A deposit is therefore a liability of the bank, and a depositor is a creditor of the bank.

It in no way increases the bank's liability to write the liability down on paper. The liability is created as soon as the deposit or credit is written down in the bank's book, and the liability is only written down on paper in the form of a cheque or banknote for the convenience of transferring the credit or right of action to someone else.

It is, therefore, a fundamental error to distinguish banks as banks of deposit and banks of issue. The only distinction is between banks which buy money exclusively, so that the credit created exactly equals the amount of the money bought; or whether in addition to money, they buy bills of exchange with their own credit, and so create credit in excess of the money they hold.

ON THE METHOD OF UTILISING BANKING CREDITS.

The banker, then, having issued these credits, deposits or rights of action against himself to his customers, they of course cannot transfer them to any one else by manual delivery. In order to be capable of manual delivery they must be recorded on paper, and that might be done in two forms.

1. The banker might give his customer his own notes promising to pay a certain sum to the customer or to bearer on demand.

2. The customer might write a note to the banker desiring him to pay a certain sum to a certain person, or to his order, or to bearer. These, in modern language, are termed cheques.

Bank notes and cheques do not create liabilities, they are merely for the purpose of transferring the liabilities termed deposits, or credits in the bankers books.

From the origin of banking London bankers all issued notes until about 1793, when they gave up the practice of their own accord, though they were not forbidden to do so until 1844. After 1793 credits in London banks were only transferred by cheques.

The banker having created this deposit, the following different results may take place.

1. The customer may draw out the actual money. If he does so it is a resale of money to the customer. The banker buys up the right of action against himself, and his liability is extinguished.

2. The cheque or note may circulate in commerce and effect any number of payments, exactly like money; and it may ultimately be paid in to the account of another customer of the same bank, and the whole series of transactions be closed by the transfer of credit from one account to another.

3. The cheque or note may, after performing similar exchanges, come into the possession of the customer of another banker, and be paid into that bank. So the banker becomes debtor to the customer of another bank. But if the banker A becomes debtor to the customers of banker B, the chances are that about an equal number of the customers of A will have claims against B. If the mutual claims of the customers of each bank are equal, the respective orders are interchanged, and the credits readjusted to the accounts of the different customers without any payment in money. Thus, if the mutual claims of any number of bankers exactly balanced, any amount of business might be carried on without requiring a single coin. This is effected by the organisation of the clearing house described further on.

It is seen from this that so far as economics is concerned, cheques and bank notes stand on exactly the same footing, and that the more extensive the banking system is, the less is the quantity of coin required.

The misconception of the meaning of the word deposit has led to most serious errors regarding the nature of London banking.

Because London bankers do not issue notes, it has been very generally supposed that London bankers do not create credit, but only lend out the money they have placed

with them. But this is a most important error. London bankers create credits in their books, and all their advances are made by creating these credits, just as they always did. The only difference is that these credits are only circulated by cheques.

When it is said that the London bankers have such an amount of deposits, it is commonly supposed that they have that amount of cash to lend out. But the cash a bank has is shown in its assets. These figures do not show the quantity of cash the banks have to trade with, but they show the quantity of business the banks have done, and the liabilities they have created. They are in fact nothing but bank notes in disguise. A sudden increase in banking deposits is simply an inflation of credit, exactly similar to a sudden increase of bank notes. After all the great monetary panics it is invariably observed that banking deposits diminish. This is supposed to be a diminution in cash, but that is an error. After a great monetary panic fewer bills are created, consequently there are fewer bills for the banks to purchase, and if they have no bills to buy they cannot create deposits; hence, this diminution of deposits is not a diminution of cash, it is a contraction of credit.

ERROR OF THE COMMON DESCRIPTION OF BANKING.

From the preceding account of the actual mechanism of banking, it is seen what a complete misconception of it, it is to say, that bankers are merely agents between persons who wish to lend and those who wish to borrow. This is entirely untrue in the ordinary sense of "lending" and "borrowing," because in the ordinary case of "lending" the lender deprives himself of the use of the thing "lent." But when a person pays in money to his banker he does not mean to deprive himself of its use; on the contrary, he means to have the same free use of it as if it were in his own house. He "lends" his money to his banker, but at the same time has the free use of it. The banker employs that money in promoting trade. Upon the strength of it he buys debts with his promises to pay several times exceeding the amount of the cash he has, and the persons who sell him their debts have the free use of the very coin which the lender has the same right to demand. Thus, the "lender" and the "borrower" have the same rights at the same time to demand the same coin. All banking depends on the calculation that only a certain portion of each set of customers will demand the actual cash, but that the majority will be satisfied with the mere promise to pay or the credit.

Banking, like insurance, depends entirely on the doctrine of chances. It is practically possible that a banker may be called upon to pay all his liabilities on demand at once, just as it is theoretically possible that all the lives insured in an office may drop at once, or that all the houses insured may be burnt down at the same instant. A large and sudden demand for money on a bank is termed a run, and a run on a bank is analogous to a pestilence or a conflagration to an insurance office. But all banking and insurance is based on the expectation that these contingencies will not happen. A banker multiplies his liabilities to pay on demand, and keeps by him a sufficient amount of cash to ensure the immediate payment of all claims which are likely to be demanded at one time. If a pressure comes upon him, he must sell some of the securities he has bought, or borrow money upon them.

ON THE CLEARING HOUSE.

Like everything else connected with banking, the clearing house is a subject of profound misconception.

It is usually supposed that the clearing house is an example of the principle of compensation, and that the credits exchanged in it are extinguished. In foreign treatises it is usually called *Maison de Liquidation* or *Compensation*. This, however, is a complete error.

It has been seen that if any number of the customers of the same bank have dealings amongst themselves, and give each other cheques on their accounts, any number of transactions may be settled by the simple transfer of credits from one account to another, without a single coin being required, so long as the receivers of the cheques do not draw out the money.

The clearing system is a device by which all the banks which join in it are formed, as it were, into one huge banking institution for the purpose of transferring credits from one bank to another, just in the same way as credits are transferred from one account to another in the same bank, without the use of coin.

Before the institution of the clearing house, the system that prevailed was this: every banker has every morning claims against his neighbours, and they have claims against him. At the same hour clerks started from each bank to collect the payment due to it in money and notes. When the clerks returned, the credits were readjusted among the

respective accounts. To meet the claims against it, each bank had to keep a large amount in cash or notes. The consequence is that an immense quantity of cash and notes had to be kept out of active circulation for no other purpose than for meeting the bankers' claims against each other.

The Italians devised a plan by which clerks from the respective banks should meet together and set off their claims against each other and pay only the differences in cash. This system was then adopted in Scotland, and afterwards in London.

It is often supposed that in this system, the credits are extinguished, by compensation, but this is an error as may be seen by the following account of its mechanism.

Suppose that a customer of the Commercial Bank has 100*l.* in notes of the Royal Bank paid to him, then he is creditor to the Royal Bank to that amount. He then pays these notes into his account, and constitutes the Commercial Bank his agent to collect them from the Royal Bank and place the proceeds to his account.

Suppose that in a similar way a customer of the Royal Bank has been paid 100*l.* in notes of the Commercial Bank and pays them into his account. He then constitutes the Royal Bank his agent to collect his debt from the Commercial Bank and place the proceeds to his account.

Each bank in such case is debtor to the customer of the other.

The full way of proceeding would be for each bank to send a clerk to the other to obtain payment of its notes in cash. Each bank then having obtained payment, would credit its customer with the amount. In this way it would require 200*l.* in cash to adjust the matter. When this was done, each bank would be debtor to its own customer, and there would be no destruction of credit, which would remain as before.

The transaction however may be effected in a much simpler way. Let the agents of the two banks meet. The agent of the Commercial Bank says to the other, "In consideration of your giving up to me the notes on which I am debtor to your customer, I agree to become debtor to my own customer."

In a similar way the agent of the Royal Bank says, "In consideration of your giving up to me the notes on which I am debtor to your customer, I agree to become debtor to my own customer to that amount."

The clerks then exchange notes. By this means, each bank is released from the payment of its notes, which as has been shown, is equivalent to a payment in money, and each bank enters the amount to the credit of its own customer.

By this means each bank instead of being debtor to the customer of the other, becomes debtor to its own customer, and the use for 200*l.* in cash is saved.

Thus each bank, in consideration of being released from its debt to the customers of the other, creates a new debt to its own customer. Thus, on the whole, there is no annihilation of mutual debts as in the case of compensation, but the creation of new debts in substitution of old ones, which is novation, and the result is that the quantity of debt remains exactly as it was before.

The clearing house is therefore not a *maison de liquidation* or compensation, as is so often alleged, but a *maison de novation*.

Exactly the same result takes place when cheques are used. However numerous the banks may be which join in this system, the effect is the same. Credits are not destroyed, they are only transferred from one bank to the other without the use of coin. The importance of this method may be understood when every year the credits interchanged between the several banks in the London Clearing House alone amount to about 6,000,000,000*l.*, without the use of a single coin. There are besides the country clearing house and clearing houses in all the principal cities of the country and in Scotland.

The saving of coin and notes by this system of clearing must be something enormous, nor is it easy to say how it can be calculated. It is in fact an immense augmentation to the resources of the country, because it releases an enormous quantity of coin and notes, which would have no use but to settle debts amongst bankers, and allows it to be employed in active operation.

ON THE SCOTCH SYSTEM OF BANKING.

It is necessary now to give a short exposition of the system of banking in Scotland, which is very little understood in this country, and is a striking example of an immense superstructure of credit built up on a small basis of bullion.

The Bank of Scotland was founded in 1695, with powers of unlimited issue, both in amount and denomination. It first issued *l.* notes in 1704. It received a monopoly of banking for 21 years. In 1727 the Royal Bank was founded.

In the very contracted sphere of commerce in Scotland, there were not sufficient commercial bills in circulation to exhaust the credit of the banks, and the new bank devised a new scheme for getting its credit into circulation.

It agreed upon receiving sufficient guarantees to open credits in favour of respectable and trustworthy persons. All advances are made exclusively in the bank's own notes.

These credits are granted to all classes of society, to the poor as freely as to the rich. Everything depends on character. Almost every young man commencing business in Scotland, does it by means of a cash credit.

It is by means of these cash credits that the agriculture of Scotland has been almost entirely developed, and all public works are formed.

It has been shown the true definition of credit is the present right or the present value of a future profit, and every future profit from whatever source arising, has a present value, which may be brought into commerce, and bought and sold like any material chattel.

Thus the land and traders are economic quantities producing future profits, and mercantile banking is founded as discounting the future profits of traders.

The system of cash credits is applied in Scotland to discount the future profits of the land and of every public work.

About the middle of the last century the energies of the people were directed to agriculture and commerce. There was abundance of fertile and reclaimable land, and abundance of people, but there was no money to pay wages to persons employed to reclaim the land.

The banks having habituated the people to receive their *l.* notes in all respects as money, threw out branches in all directions. The farmers received leases of their farms, and upon the security of these leases and personal friends, the banks granted cash credits to their farmers, and made them advances exclusively in their *l.* notes. With these *l.* notes, the farmers employed the labourers in reclaiming the land. The notes were employed exactly in the same way as money would have been, and they produced exactly the same effects as money would have done.

It is almost entirely by means of these cash credits that the prodigious progress in agriculture was made in Scotland during the last 130 years.

All public works of every description, roads, canals, docks, harbours, railways, markets, &c., have all been made by means of these cash credits. It was stated that the Forth and Clyde Canal was executed by means of a cash credit of 40,000*l.* granted by the Royal Bank. When the directors of one of these works have got their Act, they obtain a cash credit at a bank, which supplies the necessary funds in its own *l.* notes, and the debt is paid off by the profits of the work.

It is thus seen how credit is applied to the formation of new products equally well as to the transfer of existing ones. Credit is purchasing power equally with money, and it may be applied to the purchase of labour to form new products, equally well as to transfer existing ones. The principle of the limit, however, is exactly the same in both cases; namely, the present value of the future product.

The invention of cash credits, and the *l.* notes by which they are worked, have advanced the wealth of Scotland by centuries, and that is the reason why the people of Scotland always strenuously resist any attempt to interfere with them.

The system of Scotch bankings show how very much more important a part credit plays in modern commerce than actual money, and well exemplifies Daniel Webster's aphorism, "Credit has done more a thousand times to enrich nations than all the mines of all the world."

APPENDIX IV. (A).

Papers put in by Mr. J. C. Fielden.

See Questions 7950, 7982.

Society.		Average Members.	Average Number of Members out of Work.	Average Cost annually.
				£
Amalgamated Engineers	1871-5	41,806	625	19,190
	1882-6	50,639	2,351	57,157
Carpenters and Joiners amalgamated -	1871-5	12,105	173	3,679
	1882-6	23,801	1,179	25,146
Steam Engine Makers' Society -	1871-5	3,524	27	918
	1882-6	4,881	154	3,507
Friendly Society of Iron Founders -	1871-5	11,285	333	7,582

Associated Blacksmiths' Society -	1871-5	1,887	16	403
	1882-6	2,440	193	2,313
Alliance Cabinet Makers' Association -	1871-5	1,140	3	60
	1882-6	1,307	74	1,071

TOTAL MEMBERS, TEN SOCIETIES.					
Average from 1871-5	-	-	98,640	2,150	44,852
„ 1882-6	-	-	139,338	10,063	162,494

Average increase of members - 42 per cent.
Per-centage unemployed - 1871-5 period, 2·18
" " - 1882-6 " 7·22

£
Total support given by these 10
societies to the unemployed in
1871-5 - - - 224,260
Total support given by these 10
societies to the unemployed in the
years 1882-6 - - - 812,470

Based on the experience of the above 10 societies the
number of unemployed in the country would be over
700,000 (seven hundred thousand persons).

J. C. FIELDEN.

APPENDIX IV. (B.).

See Question 7989.

The growth of quantities of raw cotton retained
for consumption in our factories: in periods of five
years:—

Period.		Million lbs.	Increase or Decrease. (Million lbs.)
1866-70 (inclusive)	-	4,955	—
1871-75	-	6,396	Increase 1,441
1876-80	-	6,348	Decrease 48
1881-85	-	7,178	Increase 830

Total increase, 2,223 million lbs.
Increase for 15 years, 45 per cent.

Estimated Population of Lancashire.

1867 - - - 2,600,000
1882 - - - 3,500,000
Increase - - - 900,000
Or 35 per cent.

Comparative Statistics of Cotton Trade.

Engaged in the Cotton Trade.	Spindles.	Looms.	Operatives.	Population of Lanca- shire.
Year 1874 - -	*37,515,000	463,118	479,515	—
" 1886 - -	*42,700,000	561,000	505,000	—
Increase - -	5,185,000	97,882	25,485	—
Per-centage of in- crease.	13·8	21·1	5·3	24
Average annual in- crease (per cent.)	1·15	1·9	·44	2

* Exclusive of those used for "doubling" purposes.

Note.—For that proportion of the population of
Lancashire representing families working in cotton
mills, it may be stated that during the past 12 years
(1874 to 1886) the increase of numbers has been four
times as fast (at the least) as the opportunities of
employment.

The population of Lancashire has increased during
this century as follows:—

Year.	Population.	Increase.	Per-centage of Increase.
1801 - - - -	673,486	—	Per cent.
1811 - - - -	828,429	154,943	23
1821 - - - -	1,052,948	224,519	27
1831 - - - -	1,330,854	283,906	27
1841 - - - -	1,667,054	336,200	25
1851 - - - -	2,031,236	364,182	22
1861 - - - -	2,429,440	398,204	20
1871 - - - -	2,819,495	390,055	16
1881 - - - -	3,454,225	634,730	22

The period 1861 to 1871 was that of the cotton
famine.

The increase between 1871 and 1881 is nearly equal
to the entire population of Lancashire at the beginning
of the century.

APPENDIX IV. (C.)

See Question 8013.

DEAR MR. FIELDEN,

October 15, 1887.

COPIES of two letters received from A. T. Whittle, Esq. (Preston Junction, Bamber Bridge), on the subject of the cost of production in Indian cotton mills.

Spinning Wages.

Analysis.

DEAR SIR, September 14, 1887.
I HAVE the pleasure to place before you the figures promised in our conversation of yesterday:—

Spinning.			
		Pies.	D.
Fuel -	-	3·25	= 406
Wages -	-	7·32	= 915
Stores -	-	2·94	= 367
Interest -	-	3·00	= 375
Insurance -	-	·50	= 62
Depreciation -	-	2·00	= 25
Loss -	-	9·60	= 12
		28·61	= 3·575
or rather under 3½ D.			

Weaving.

		Pies.
Fuel -	-	3·25
Wages -	-	9·02
Stores -	-	2·00
		14·27

Blow room -	-	216
Cards -	-	376
Drawings -	-	201
Frames -	-	859
Ring throistles -	-	318
Mules -	-	1322
Engines, boilers, me- chanics, engineer -	-	842
Reeling room -	-	908
Manager, office clerks, Sepoys -	-	1010
Sundries -	-	1090
		7002

In a Bombay mill the fuel item will vary from 1·95 to 2·50 pies per pound of 20's, yarn and wages from 5·00 to 6·50 pies per pound. Our fuel item is heavy, owing to carriage by rail from Bombay to the factory, a distance of 400 miles.
The above rates are on a production averaged out at 20's.

Winding, warping, sizing, and weaving, cost from 9 pies to 10 pies per pound; the details I have not got with me. I may, however, mention that the size put on ordinary Manchester goods in England is fully 200 per cent. above what we can do in India.
You will note the difference between the cost of ring and mule spinning.

APPENDIX IV. (D.).

Comparative Exports of Cotton Yarn from India and Great Britain to China, Japan, and Hongkong, with Prices of Silver.

See Question 8036.

Total Exports of British Cotton Yarns to all Countries, in Periods of Five Years.

1866-70 (inclusive) -	-	837 million lbs.
1871-75 ,, -	-	1,057 ,,
1876-80 ,, -	-	1,152 ,,
1881-75 ,, -	-	1,274 ,,
Total growth in 15 years -	-	437 ,,
Average annual growth -	-	5·9 ,,

Year.	In millions of lbs.		Silver. (Per oz.)
	India.	Great Britain.	
1876-7 -	7·9	29·8	Pence. 52½
1881-2 -	30·7	47·4	51½
1882-3 -	45·2	34·3	51½
1883-4 -	40·8	33·4	50½
1884-5 -	65·8	38·8	50½
1885-6 -	78·2	33·0	48½
1886-7 -	93·8	26·9	45½

Note.—The exports from 1st April to 30th June 1887 from Indian mills to above markets was 29,700,000 lbs., or at the rate of 119 million lbs. per annum. Increase of exports from India in 11 years was 86 million lbs., or at the rate of nearly 8 millions per annum, whilst the increase in the exports from Great Britain in that period did not reach 6 million lbs. per annum.

APPENDIX V.

(Paper put in by Mr. T. Comber.)

(Question 8149.)

APPENDIX VII.

CIRCULAR LETTER addressed to certain PERSONS in FOREIGN COUNTRIES.

QUESTIONS.

Gold and Silver Commission,
8, Richmond Terrace, London,
August 1887.

SIR,

THE Commission appointed by Her Majesty's Government in the course of last year to investigate the recent changes in the relative values of the precious metals have made some progress with their inquiry, and have taken a considerable body of evidence from persons in this country; but they feel that they would have imperfectly discharged the duty imposed upon them if they had not had recourse to some of the many competent authorities on the subject who reside in foreign countries.

It is, however, obviously impossible to elicit the views of these gentlemen by the usual method of oral examination, and the Commission have therefore drawn up the enclosed paper of questions, comprising the more important points on which they are anxious to obtain the opinion of those who have studied the subject.

Should you feel disposed to assist the Commission in this way, they would be very much obliged if you would favour them with written answers to any or all of these questions.

If, however, you are unable, for any reason, to comply with the invitation of the Commission, they desire me to convey to you their apologies for having ventured to trouble you with this letter.

I forward under another cover a copy of the First Report of the Commission, which has been recently issued.

I have, &c.
(Signed) GEO. H. MURRAY,
Secretary to the Commission.

1. To what do you attribute the fall in the value of silver, as compared with gold, since 1874?
2. What probability is there of a continuance of the fall?
3. To what do you attribute the fall in the wholesale prices of many commodities which has been in progress during the last 10 or 12 years?
4. Has it extended to (a) retail prices, (b) wages and other payments for services rendered, (c) land and houses?
5. Has the fall resulted in any material prejudice to the commercial or general interests of the world?
6. Do you consider that the countries using the gold standard, or any of them, are suffering from an injurious contraction of the currency which might have been obviated or mitigated by an increase in the supply of gold?
7. To what extent and in what way are prices affected by the quantity of the metal or metals used as standards of value?
8. What is the relation, if any, between the supply or quantity of the precious metals and the fluctuations of credit?
9. Has there been during the last 15 years any important development of the system of cheques, bank credits, bills of exchange, or other means of economising the use of the precious metals?
10. Do you consider that an international agreement could be made for the free coinage of gold and silver as legal tender money at a fixed ratio?
11. Is it in the power of Governments to maintain such a ratio if agreed upon; and would the practice of the commercial world follow the law?
12. What would be the effect of such an agreement, if carried out, upon (a) prices, and (b) the production of the precious metals.
13. Do you consider an international agreement for bi-metallism possible on any other ratio than 15½ to 1?
14. Failing an international bi-metallic agreement, what measures could be adopted by the commercial nations of the world for giving increased stability to the relation between gold and silver?
15. It is argued that, in the absence of bi-metallism, the effect of any disturbance of the currency is limited to half the currencies of the world, and thereby increased in intensity. Do you consider this view correct; and, if so, do you think the evil a serious one?
16. If the effect of such disturbances could be spread over all countries, would greater stability of the standard of value be secured thereby?

ANSWERS RECEIVED.

- (1.) M. Pierson (Holland).
- (2.) Professor Nasse (Germany).
- (3.) Professor Lexis („).
- (4.) M. de Laveleye (Belgium).
- (5.) Hon. David A. Wells (United States).

(1.) PROFESSOR PIERSON, President of the Netherlands Bank, Amsterdam.

SIR, Amsterdam, 23rd September 1887.
In reply to your letter of 29th August, I take much pleasure in giving you my views on the subjects mentioned in your list of questions; though I am afraid I shall not be able to tell you anything new, these subjects having been so long and so fully discussed already by the best authorities in political economy.

I. To what do you attribute the fall in the value of silver, as compared with gold, since 1874? I attribute the fall in the price of silver chiefly to increased production. If the coinage of that metal in the mints of Germany, the states of the Latin Union, and Holland, had not been almost entirely stopped, a demand would have arisen quite sufficient to absorb the quantities produced. France, for instance, which prevented a serious fall in the silver-price of gold after the discoveries in California and Australia by purchasing gold and selling silver to a very large extent, would then have purchased silver and sold gold in no smaller quantities. As it was, the increased supply was not met by an increased demand, and a strong depreciation of silver became inevitable.

I may add, that, owing to the peculiar economic condition of India at the period when the depreciation commenced, a large exportation of silver to that country was impossible. Silver has been locally depreciated in India a few years before the general depreciation began.

This requires some explanation. As has been shown by Ricardo,* by Senior in his lectures on the cost of obtaining money, and by Cairnes in his *Leading Principles*,† the value of money, its purchasing power, is not the same in all parts of the globe, and it is liable to local variations. Such a local variation has taken place, as regards silver, in India during the civil war in America, the effect of which was to bring about an unprecedented rise in the price of the greatest Indian article of export, cotton. In consequence of this, the "cost of obtaining money" in India was much reduced; money—silver—was depreciated in India, wages rose. Therefore, when the general depreciation commenced all over the world, it had been forestalled in that part of the globe. India was glutted with silver. But the cause tending to maintain this state of things had ceased to operate; the price of cotton had fallen. Under ordinary circumstances India would have sent back a large portion of its silver to Europe. But the general depreciation prevented her from doing so; and now there were two opposite forces, one tending to produce an export of silver from India to Europe, the other (the fall in the price of silver) tending to produce an export from Europe to India. It has appeared that the latter was the stronger, after all. Yet the exportation could not be so considerable, as it certainly would have been, if cotton had not risen in 1861-65, nor fallen afterwards.

Speaking commercially, not scientifically, this might be stated as follows: The decline in the price of cotton after 1865 rendered the Indian balance of payments less favourable, and thus impeded the export of silver to India to a certain extent.

I subjoin the following table for illustration :—

Average Price of Silver.		Exports of Cotton.	
			£
1861-65	61½ pence.	1865	37 millions.
1867	60½ "	1867	16 "
1874	58½ "	1874	13 "
1879	51½ "	1879	7 "

I will show later on, that cotton is not the only commodity exported by India whose price has fallen when silver began its course of depreciation.

To resume: the fall of silver has been chiefly caused by increased production, but that cause has been rendered more effective—

- (a.) By the monetary measures adopted by Germany, France, &c.
- (b.) By the peculiar economic condition of India at that period.

II. What probability is there of a continuance of the fall? I do not attempt to answer this question. Much depends on the Bland Act being continued or suspended.

III. To what do you attribute the fall in the wholesale prices of many commodities which has been in progress during the last 10 or 12 years? I attribute the fall in the wholesale prices of many commodities, which has been in progress during the last 10 or 12 years, also chiefly to increased production. If you had said, "during the last 14 or 15 years," I should have answered, partly to increased production and partly to the diminution of the quantity of notes, not represented by coin and bullion, circulating in the principal countries of the world. For this latter cause has been very powerful in the first years after 1873, as may be seen by consulting Neumann-Spallart's *Uebersichten der Weltwirthschaft*, Jahrgang 1883-4, page 452, where it is shown that in the six countries named there the amount of notes unrepresented by coin and bullion was :—

—	Reichsmarks.	—	Reichsmarks.
In 1873	7,914 millions.	In 1880	4,772 millions.
" 1874	7,156 "	" 1881	5,532 "
" 1875	6,747 "	" 1882	5,574 "
" 1876	5,931 "	" 1883	5,162 "
" 1877	5,542 "	" 1884	4,930 "
" 1878	5,217 "	" 1885	4,148 "
" 1879	4,856 "		

In the last 10 years, however, the chief cause, in my opinion, has been increased production.

Take, for instance, iron. The entire production in 1877 was 14,032 thousands of tons. In 1883 it rose to 21,528, or 50 per cent. more. Since that year it has fallen off, but it cannot be much less than 19,000.

Or wheat. The United States exported in 1876-7, 136 million bushels of bread stuffs; in 1884-5, 198. Russia in 1876, 53 million hectolitres, in 1884, 77 millions. India in 1876-7, 5,583,000 cwts., in 1885 15,831,000.

Or cotton. The United States crop was 4,400,000 bales in 1876-7, 6,500,000 in 1885-6.

I am aware that a great many people attribute the fall of prices to scarcity of gold. But in the first place, the decrease in the production and the increase in the use of gold have been so little, as compared to the circulating coin and paper in the various countries where the standard is gold, that very little appreciation can have arisen from that cause. And in the second place, the decline of prices would have been much greater than it actually was, if there had existed any serious deficiency of money; for the present fall can almost wholly be accounted for by referring to other causes. I admit that gold must have appreciated a little, but that cannot be much. It should also be remembered that 20 years ago the production of gold was considered to be rather in excess of the demand.

IV. Has it extended to (a) retail prices, (b) wages and other payments for services rendered, (c) land and houses? I am unable to give any information about retail prices and wages, besides that which has been given in the Reports of the Commission on the Depression of Trade.

V. Has the fall resulted in any material prejudice to the commercial or general interests of the world? In so far as it has been occasioned by over-production, undoubtedly. But in so far as it is the result of the extension of railways, it has been highly beneficial. In my opinion, economic progress consists in a continuous fall of prices, while money incomes remain the same or do not decline proportionately.

VI. Do you consider that the countries using the gold standard, or any of them, are suffering from an injurious contraction of the currency which might have been obviated or mitigated by an increase in the supply of gold? This question has been answered, *sub. III.*

VII. To what extent and in what way are prices affected by the quantity of the metal or metals used as standards of value? Only in so far as those metals are a portion of the whole circulating medium. An increase of gold does not operate otherwise on prices than an increase of convertible notes, unrepresented by coin and bullion, or of bank credits. In what way prices are effected? This depends entirely upon circumstances. I am inclined to

* Principles, Ch. vii. † Part iii., Ch. v.

think that a contraction of currency creates a series of depressions in the various branches of industry, and thus gradually produces a general fall of prices and of money wages. But it cannot be said beforehand on what point it will begin to operate. If the contraction were caused by a diminution of the production of gold in Australia, probably the first centre of depression would be in those industries which produce commodities used in Australia. If there were a strong demand for gold brought about by a resumption of specie payments in Russia, the branches of industry working for that country would suffer first of all.

VIII. What is the relation, if any, between the supply or quantity of the precious metals and the fluctuations of credit?

This depends entirely on the way in which the banks of the various countries are managed. They *ought* to be managed in such a way that a drain of bullion does not endanger the convertibility of the notes or the repayment of the deposits. But they *are* not always managed on that principle. Hence no natural relation between the stock of bullion and the fluctuations of credit exists.

IX. Has there been during the last 15 years any important development of the system of cheques, bank credits, bills of exchange, or other means of economising the use of the precious metals?

X. Do you consider that an international agreement could be made for the free coinage of gold and silver as legal tender money at a fixed ratio?

XI. Is it in the power of Governments to maintain such a ratio if agreed upon; and would the practice of the commercial world follow the law?

I do not think there has been.

These questions are very important. Yet I may begin by observing that in this country they are not considered as questions at all. When, nearly 20 years ago, my predecessor at the Bank of the Netherlands, Dr. Meer, in a paper which he read to the Royal Academy of Science, first expounded the new doctrine of bimetallism, we all were a little startled; Dr. Meer being known as belonging to the school of Ricardo and John Stuart Mill, and not much inclined to depart from the old lines in political economy. After considering his arguments, however, we all became converts to his doctrine, which is now generally accepted, and taught in all our colleges and universities. One never hears a dissentient voice. It is considered a mere truism in this country to say that bimetallism, though highly objectionable if applied in a small country, is the best system imaginable if applied, by an international agreement, in a large number of civilized states. We thoroughly believe that it would be a great boon to all nations if this system were adopted by the principal countries of Europe and America. We may be wrong for all that, but I thought it might interest your Commission to know that there is one country, at least, where the doctrine of bimetallism has passed into public opinion. It may also be interesting to mention that it has originated at a time when nobody saw the necessity of its practical application in other countries besides those where it existed. Dr. Meer brought it forward as a mere scientific contribution, never believing, when he did so, that his theory would, within a few years, assume a highly practical character.

Let me briefly review the arguments against bimetallism.

1. Bimetallism, it is said, is contrary to the law of Gresham.

In my opinion it is *based* on the law of Gresham. For the law of Gresham teaches us that people, when they have a choice, always will pay in the depreciated metal, and throw out the other one. This means that if bimetallism were established in Great Britain and Ireland, Germany, the States of the Latin Union, Holland, and the United States of America, any depreciation, either of silver or of gold, as compared to the legal ratio, would lead to an immense demand of the depreciated, a proportionate supply of the appreciated metal; and this demand and supply would continue till the actual ratio were equal to the legal one.

The law of Gresham is an impediment to the proper working of the bimetallic system, so long as that system has only been adopted on a small scale. The demand of Holland, for instance, or even of Germany or France, would never be sufficient to prevent a deviation from the legal ratio, supposing the causes of such a deviation to be very powerful. One particular country, even two or three countries, might be wholly drained of all their gold, and in that case the system would no longer be effective. But all the principal countries in the world *cannot* be drained of all their gold, for

exportation is impossible without importation elsewhere, and if large quantities of gold were accumulated outside the chief centres of civilization, gold would depreciate in those places, and there would be no inducement to export it any longer. The law of Gresham, if I may say so, is the very essence of the new bimetallist doctrine, and it is only because this law has never failed that we may rely on the truth of that doctrine, and feel confident that the system it advocates will work well.

2. The bimetallist doctrine, it is said, is opposed to the first principles of political economy. Prices are regulated by supply and demand, not by international agreement. A treaty between all the countries in the world fixing the relation of value between coffee and wheat would be of no avail; no more can the relation of value between gold and silver be fixed in that manner.

I answer that the law has no influence whatever on the demand for coffee and wheat, on the *relative utility* of those commodities, but that the law has a very strong influence on the utility of the precious metals. No doubt, values are regulated by supply and demand. But the law in this case can so operate on supply and demand as to ensure the maintenance of a certain ratio. By international agreement the *relative utility* of the precious metals may be fixed, and an unvaried relative utility between two commodities implies an unvaried relation of value. If one pound of a certain article is twice as useful as two pounds of another article, the relation of value between those articles will be as 2:1. Hence, it may be said that the bimetallist doctrine is not contradicted by political economy, but is simply a corollary, an inference, from economic principles.

Bimetallists do not propose simply to enact one pound of gold shall be equal to 15½ pounds of silver; but to take such measures as will lead to a permanent relation of value between these metals, by the working of supply and demand.

3. Values, it is said by other people, are regulated by cost of production. So Ricardo has taught us. Therefore, if the relative cost of production is as 20 to 1, the relative value of gold and silver cannot be as 15½ to 1.

I answer, that Ricardo has taught us something else besides; he has taught us that in the majority of cases the costs of production, as regards the different portions of the same commodity, are unequal. The celebrated theory of rent is based on this. From which it follows that it is impossible to account for the price of any article by simply referring to its cost of production; the demand must be considered as well. Suppose 10,000,000 pounds of a commodity can be supplied,

if the price is 10*d.* a pound;

9,000,000	"	"	9 <i>d.</i>
8,000,000	"	"	7 <i>d.</i>
1,000,000	"	"	1 <i>d.</i>

then the price may be either 1 penny or 10 pence a pound; this will wholly depend on the demand.

Now we have seen that under the bimetallic system the two precious metals will be linked together. Hence the value of silver will be raised. This will tend to increase the production of silver up to the point at which it is no longer profitable to increase it any further; and this point will be reached (supposing the ratio to be 15½) when the least productive mines actually worked require an expense of about 60*g* pence per oz. It is quite possible that this increase of production will have the effect of lowering the value of both metals, and, therefore, to render unprofitable the working of certain gold mines which hardly yield any profit under the present circumstances. In other words, it is quite possible that the adoption of the bimetallic system will alter the proportions in which gold and silver are produced. But there is no harm in that; nobody, excepting the owners of gold mines, will be the worse of it. At any rate, it seems evident that the bimetallist doctrine is not contradicted by the cost-of-production principle, if properly understood.

4. It is said, if bimetallism at a fixed ratio is possible, you might fix that ratio at 1:1, or at 1:100, at your pleasure. Clearly, this would be impossible. But then it must also be impossible to maintain a ratio of 1:15½!

I do not believe there is much strength in that objection. Gold and silver are used for other purposes than as coins, and on their relative utility as regards these purposes the law has no influence. Now the demand for gold—I mean the industrial demand—

would enormously increase, if gold were made as cheap as silver; and the demand for silver would enormously increase, if gold were made 100 times as dear as silver. Besides, a ratio of 1:100 would bring the price of silver down to 9 pence an oz., at which price all production would cease, so as to make the article almost disappear from the market; and a ratio of 1:1 would carry it up to 943 an ounce, so as to make it superabundant and render impossible any production of gold. But what does all this prove? Simply that it will be wise to fix the ratio at such a figure, that neither the *production* of any of the metals is unduly stimulated, nor the *industrial demand* either. It matters very little whether the production of silver increases and the production of gold diminishes to a small extent; and the ratio may be fixed at any point between 15 and 20, without any material change being produced in the relative demand for the acts. But it matters a great deal that neither of the metals disappear from the market, and that the demand for neither of them should be encouraged at the expense of the other.

5. An international agreement, it is contended, would not be permanent; it would be made for a certain number of years, and at the end of that period it might not be renewed.

So it might: and, therefore, it will be useful to enlist the support of the principal financial institutions for opposing any desire on the part of the contracting States, not to renew the agreement. Independently of this consideration I have always held that it would be prudent to do so. I do not consider the unlimited coinage of gold and silver a sufficient guarantee for the proper working of the system. In my opinion, it would be wise to impose on all the banks of issue of the contracting States (and perhaps also on the Treasury Department in America) the obligation to purchase gold and silver at fixed prices. The Bank of England, for instance, might be directed to purchase silver at (let me say) 60½ pence an ounce, just at it is now bound by law to purchase gold at 77s. 9d. This would not only tend to dispel all doubts as to the maintenance of the legal ratio, but it would create a strong interest for the maintenance of the whole system. Every bank of issue would be made a national opponent to any measure the effect of which might be a depreciation of silver. And, it may be added, several Governments also, as in Germany and some other countries, the Government shares to a large extent in the bank profits.

But, if the system works well, what motive will arise for departing from it?

I now return to the list of questions.

XII. What would be the effect of such an agreement, if carried out, upon (a) prices, and (b) the production of the precious metals.

and in those where gold is the standard metal.

In the former all prices would fall and, ultimately, all wages, because there would be a rise in the value of the trade dollar, the rupee, &c. This rise would greatly stimulate at first the import trade of those countries, because at the outset prices would still be proportionate to the lower value of the coin, and in this manner the fall would be produced. As to wages, they would not be adjusted, I am afraid, except by means of a strong depression in the export trade and the industries connected with it. It might be a bad time for India, China, &c., but once passed over, a better condition would be arrived at. A country is not benefited either by low or by high prices and wages, but it is benefited by a staple value of its currency.

In the countries where the standard is gold, there would be a temporary enhancement of the prices of certain commodities due to the increased demand for import articles, and the diminished supply of export articles, in India, China, &c. I call it a temporary enhancement, because neither the increase of demand, nor the decrease of supply, would be permanent. After a while both the import and the export trade of Asia would be restored to their previous level.

Whether a rise of prices will ensue in those countries by the effect of other causes it is difficult to prognosticate. Certainly, there will be an increase in the supply of money. Owing to the fall of prices in Asia less coin will be wanted there, and the rise in the price of silver will stimulate the production of that metal. But *in what measure* will the supply of money be increased? Only in such a degree as to prevent any further appre-

ciation of money, or so as to lower its value? And in the latter case, will a small decline prove sufficient or not to check the increase of production of silver and to diminish the already decreasing production of gold? I do not attempt to answer these questions, nor do I think it possible for any one to do so with any degree of accuracy.

Instead of speaking of the future I prefer to add a few observations relating to the past and present. I see by your First Report that some uncertainty exists as to the effect of the fall in the gold value of the rupee on the economic condition of India. I have given some attention to that subject, and wish to say a few words about it.

On page 343 of the Third Report of the Royal Commission appointed to inquire into the Depression of Trade and Industry, you will find a table, laid before the Commission by Mr. Inglis Palgrave, showing the movement per cent. of certain prices. On consulting this paper it appears that the principal export articles of India have been affected as follows:—

	1865-9.	Jan. 1, 1886.
Cotton	100	32
Wheat	100	57
Oils	100	64
Indigo	100	105
Tea	100	81

With the exception of indigo, there is a fall in all these articles, from which I conclude that if the rupee had not declined in value, as measured by gold, a serious fall in the *rates of wages* in India would have been witnessed. Not in India throughout, but in those parts of India which were already provided with canals and railroads when the decline of prices commenced. It would have been impossible for Indian planters to continue their production on the old scale, unless enabled to do so by a fall of wages. A decline of prices, unless compensated by other causes, necessarily entails a decline in the money price of labour, supposing the value of money remains unimpaired.

The fact that the silver-price of labour in India has not changed is often appealed to as a ground for believing that the fall in the value of the rupee is profitable to Indian planters. In my opinion this is a mistake. If the (gold) value of the rupee had not fallen, wages in India would be so much *lower* than they are now, and the position of the planter would be just the same. Instead of saying, as he does, that he profits by the fall of the rupee, the planter would say that he profited by the fall in the price of labour, and to that he would attribute his prosperous condition in spite of the serious decline of cotton, wheat, oils, tea, &c.

Yet it seems to me that we ought to distinguish between the process itself and its consequences. When people speak of the fall of the rupee, it is not always clear what they mean. Do they mean the falling condition, or the fact that a fall *has* taken place? I cannot believe that the Indian planters are at all the better for converting their gold or their bills of exchange on London into rupees at the reduced rate of 1s. 4d. or 1s. 5d. But I believe that the decline in the gold value of the rupee has bridged over or smoothed away a good many difficulties which the falling gold-prices of their produce would undoubtedly have created if the rates of exchange had remained unaltered at 1s. 10d. to 2s. For a reduction in the money rate of wages is always a painful process, not easily resorted to by employers, not easily submitted to by labourers. The necessity of this process has been asserted by the fall of silver, and therefore, *in so far as it has been continuous*, it has rendered some service to India.

If I am not altogether mistaken, this solution of the question is in accordance both with well-established doctrines of political economy, and with the newly observed facts relating to this subject.

XIII. Do you consider an international agreement for bimetallism possible on any other ratio than 15½ to 1?

As international agreement for bimetallism would hardly be possible on any other ratio than 15½. Suppose the ratio were fixed at 18½; this would be to create the necessity for all the States of the Latin Union, Germany, and Holland, to add 20 per cent. in weight to all their silver coins. This would entail an enormous expense. For my own country, especially, the loss would be immense, as we should have to increase, like-

wise, the weight of our silver coins in the colonies. Nobody knows anything about the quantity of these coins, but it must be very large; and no serious idea would ever be entertained of entering into an agreement implying an outlay of money so great as the substitution of these coins by heavier ones would necessitate.

XIV. Failing an international bimetallic agreement, what measures could be adopted by the commercial nations of the world for giving increased stability to the relation between gold and silver?

render its value stable in relation to gold.

XV. It is argued that, in the absence of bimetalism, the effect of any disturbance of the currency is limited to half the currencies of the world, and thereby increased in intensity. Do you consider this view correct; and, if so, do you think the evil a serious one?

XVI. If the effect of such disturbances could be spread over all countries, would greater stability of the standard of value be secured thereby?

cious cause is the issue or contraction of paper money, convertible or unconvertible, unrepresented by coin and bullion. If those issues or contractions are wisely managed, they do no harm; their effect is even beneficial. Suppose a temporary demand for currency should arise in England to the extent of three or four million pounds, then the banks might, during a certain period, increase their loans and discounts, and reduce them afterwards. But when the United States, by the issue of greenbacks, Russia and Austria, by the issue of Government notes, Italy or France, by applying to their banks for large and immoderate advances, which, being granted in notes, produce a drain of bullion from those countries, make the currency of the world redundant, they create much evil. And when after a certain number of years the notes are redeemed, the bank debts repaid, they harm us once more. It may be proved, I believe, that the inflation of 1873 is due in a great measure to the over-issue of paper in France; and perhaps "the serious fall in the value of gold" ascertained by Mr. Stanley Jevons in 1869 was not so much the effect of the Australian and Californian mines as of the American greenbacks, &c.

Of course, nothing can be done in the way of international agreements to render these evils impossible. There will be financial mismanagement so long as the world exists, somewhere. But we can widen the field on which the effect of these evils is spread, and this will be done by bimetalism. It seems to me unnecessary to explain in what manner bimetalism produces this favourable result. It will suffice to quote the well known words used by Mr. Stanley Jevons in his book on money, p. 140:—

"Imagine two reservoirs of water, each subject to independent variations of supply and demand. In the absence of any connecting-pipe, the level of the water in each reservoir will be subject to its own fluctuations only; but if we open a connexion, the water in both will assume a certain mean level, and the effects of any excessive supply or demand will be distributed over the whole area of both reservoirs."

I am not aware that any such measures could be adopted. Steps might be taken tending to raise the value of silver, but nothing except bimetalism will

This view is quite correct, and the evil you speak of is certainly a serious one. The great cause of variations in the purchasing power of money is not so much increase or decrease of production; for those changes, in the majority of cases, are rather limited in amount. The chief and most pernicious

No doubt if a connexion is opened between gold and silver, gold will share in all the variations to which silver alone is subject now; but these variations will be greatly diminished. On the other hand, silver will share in all the variations to which gold alone is liable under the present circumstances, and they are far more numerous and important than is generally admitted. I do not believe very much in a marked scarcity of gold; but I candidly confess that my faith in the stability of gold is not so strong as it was formerly. I fear I have under-rated—and I think the majority of people do still under-rate—the baneful effect of fluctuations in the quantity of notes not represented by coin and bullion. I know that Mr. Fullarton, and other authorities of the school to which he belonged, denied the possibility of an excessive issue of convertible notes; but that is simply a blunder. His argument was that convertible notes, when not wanted in the country where they are issued, are returned to the bank. So they are, indeed, but only to be exchanged for bullion, which bullion, when exported, will increase somewhere the demand for commodities, and thus produce a rise of prices. Let us suppose the Bank of France advances money to the French Treasury to the extent of 1,500 million of francs, in notes. The French currency requiring no increase at that moment, these 1,500 million francs will make money redundant, the rate of exchange on London and other places will rise, and 1,500 million francs in gold will be exported. They may be taken out of the bank, if the bank permits it, and in that case the notes will all come back; the circulation in France, after a short time, will be reduced to its old level. Nevertheless, the supply of gold will have been increased to the full amount of 1,500 million francs.

Whether the notes issued are convertible or unconvertible is quite immaterial; in both cases they will cause a drain of bullion. The question is not whether they are convertible, but whether they are represented by gold. If they are not, their effect must be as has been described.

It is often asked, how will the bimetallic system work, if in one of the contracting States the bank notes are made unconvertible, because issued in too large quantities? I answer, how will the *mono-metallic* system work under those circumstances? A careful examination of the causes which have led to the crisis of 1873 is highly instructive, and nobody who has learned to see in how large a measure the over-issue of paper, chiefly in France, has contributed to that crisis, will be at a loss to explain the depression that followed it.

Of course, if one of the contracting States reverts to the *cours forcé*, it will lend no support to the proper working of the bimetallic system any longer; but if the other States are in sufficient number, the harm will be unimportant, and the effect of the over-issues in the defaulting country on the value of the currency will be less.

These are the considerations which, in reply to your letter, I beg to submit to the judgment of the Commission.

I am, Sir,
Your obedient servant,
N. G. PIERSON.

Geo. H. Murray, Esq.,
Secretary to the
Gold and Silver Commission.

(2.) PROFESSOR ERWIN NASSE, of Bonn.

I. To what do you attribute the fall in the value of silver, as compared with gold, since 1874?

changes in the mint regulations of most civilized States, in which the German Empire took the lead. The States of the European Continent and the United States of America one after the other closed their mints against the free coinage of silver during the 10 years which followed the Franco-German war. Formerly all the silver which came to London from the countries where it was mined could in all these States be converted into legal tender money, and consequently its sale never presented any difficulty. But now, if we except a limited demand for industrial purposes, and for token money, there only remains

The alteration in the relative value of gold and silver is primarily the consequence of

exportation to Eastern Asia. The balance of payments between Eastern Asia on the one side and the European and American States having a gold currency on the other is, therefore, at the present time the point which decides the value of silver.

Among the various events which have limited the coinage of silver and so depressed its value special importance is due to the suspension of the free coinage of silver in France and the other States of the Latin Monetary Union. For in these States not only was it possible to get any quantity of silver coined, but by melting down French gold coins of equal nominal value, a pound of gold could be procured for 15½ pounds of silver at a trifling expense. So long as this operation was possible, that is, so long as there was unlimited

coinage of silver and gold coins circulated in France without any premium, the relative value of gold and silver in general trade could fall but little below the standard of the French monetary law. Even after the Franco-German war the supply of French gold coin was still so large that for several years an exchange of gold coin for silver could have taken place without giving rise to a considerable premium on the 20 franc piece.

Against this enormous contraction of the market for silver it is hardly worth mentioning that the United States resumed the coinage of silver on a limited scale in 1878, that Spain has recently coined a considerable quantity of silver money, and that some few other applications of silver to coinage purposes have taken place in Europe.

To this diminished demand for silver there must be added an increase in the quantity of silver offered in the market.

This has been, in part, of only a transitory nature. The German and Scandinavian Governments offered for sale large quantities of silver derived from coin melted down. The influence of these sales can only be considered as of importance during the years 1876-78, and does not at all explain the present position of prices.

On the other hand the increase in the production of silver seems to be permanent. This would probably, even had there been no change in the mint regulations of several States, have in time caused a certain movement in the relative value of the two precious metals adverse to silver, but that would have been but very slight indeed compared with the movement which set in in 1874.

II. What probability is there of a continuance of the fall? To forecast the future development of the relative value of the two precious metals is more than I can undertake. I confine myself, therefore, to speaking of the main points which are likely to influence this relative value.

First of all the policy of Governments in regard to their coinage will regulate the relative value of the two precious metals. Further steps towards the demonetisation of silver, such as the Repeal of the Bland Bill, the sale of large quantities of silver coin by the Continental States, the restriction or suspension of a silver coinage in British India, would in any case cause a rapid fall in the price of silver to a quite unfathomable degree. The resumption of the free coinage of silver over any considerable part of the world would naturally exert the contrary influence. Were this resumption of the free coinage of silver to take place in States which had a plentiful circulation of gold coin, then the value of gold and silver in the world's trade would approximate to that fixed in the coinage system of these States. This influence would continue so long as gold coin circulated without premium in these States and could be represented by silver as a substitute. So soon as the supply of gold coin approached exhaustion, the influence of the mint regulations of these States on the relative value of the two metals would disappear.

If however the policy of Governments with regard to their coinage remains as it is, then the price of silver will for the future depend, on the one hand, upon the amount of silver produced, and, on the other, upon the balance of payments between countries with a gold currency and those with a silver currency. Amongst the latter the East Indies and China have so prominent a position that, more than all others, they will exercise a preponderating influence. The export of commodities from the East Indies, the extent of the capital transferred thither, the amount of the Government bill sold in London, the requirements of the populations of Eastern Asia either for currency or for hoarding, all these are points which cannot fail to exercise an influence on the price of silver in Europe. All these points, however, are uncertain, and, therefore, so long as they predominate the relative value of gold and silver must continue to fluctuate. A circumstance unfavourable to the price of silver may be found in the fact that in India the hoarding of gold seems to take more and more the place of the hoarding of silver; a favourable circumstance on the other hand is the possibility of a great extension in the circulation of silver coinage throughout the whole of Eastern Asia, owing to increasing trade and further economic development.

III. To what do you attribute the fall in the wholesale prices of many commodities which has been in progress during the last 10 or 12 years?

IV. Has it extended to (a) retail prices, (b) wages and other payments for services rendered, (c) land and houses?

VI. Do you consider that the countries using the gold standard, or any of them, are suffering from an injurious contraction of the currency which might have been obviated or mitigated by an increase in the supply of gold?

VII. To what extent and in what way are prices affected by the quantity of the metal or metals used as standards of value?

VIII. What is the relation, if any, between the supply or quantity of the precious metals and the fluctuations of credit?

IX. Has there been during the last 15 years any important development of the system of cheques, bank credits, bills of exchange, or other means economising the use of the precious metals?

The considerable fall in wholesale prices of most commodities during the last 12 or 15 years is *partly* due to the inevitable reaction from the exaggerated rise in prices during the years 1871-3. After periods of excessive speculation, of too great activity in production, and of high prices, times of industrial depression and low prices necessarily follow.

The movement in prices, however, during the last seven or eight years can certainly not be explained by this. There must be another cause for the great fall of late years.

The phenomenon must have arisen from circumstances which either were connected with the condition

of money, or influenced the supply of, or demand for, commodities; in other words, it will have to be sought for either on the money side or on the commodities side.

Without wishing wholly to deny the influence of the former, still I hold that this fall of prices is *chiefly* the result of *facilitated production* of commodities. The grounds which lead me to this conclusion are the following:—

(1.) In the last 20 years a very great decrease in the cost of production of nearly all important commodities has set in, and this of necessity found its expression in the prices of the commodities, as it was not accompanied by corresponding alterations in the cost of the production of money. The chief cause of the largely facilitated production is to be sought in the largely increased area, over which well-organised agricultural and industrial operations have extended. It is this most important advance which has given a peculiar character to the economic development of recent times. The interior of large continents has been opened up to the traffic of the world by railways, and the natural productive powers of large countries which hitherto were out of the reach of the commercial and industrial nations of the world have thus become attainable and available. The American Civil War, the European wars of 1866, 1870-1, and 1877, having for some time retarded progress in this direction, so much more rapid became progress when these hindrances were removed. In an exceptionally rapid course during the peaceful times of the last 10 years the intelligence and growing capital of the commercial and industrial nations have been applied to the development of these newly opened gifts of nature, and to the application of the labour of less civilized countries to their utilization. Consequently not only European countries formerly shut out from the commerce of the world, but also the interior portions of America, Russia, and India can now deliver at the seaport a whole mass of economic commodities with but little trouble or expense. To this we must add the consideration that transport by sea from all parts of the world to Europe has been facilitated and consequently cheapened in a manner hitherto unheard of and unexpected, by a series of improvements in sea transport. Closely connected with these advances, which are peculiar to quite recent times, there is an unceasing advance in technical skill and economic knowledge. Special progress has been made since the year 1870 in many important industries, such as the working of iron and steel, the preparation of sugar and paper. All this must have depressed the price of nearly all commodities, provided that gold remained a steady standard of value. All this progress, especially the cheapening of transport by sea, and the increase in the area under cultivation has continued even during the last six or seven years; and besides this, over a large part of Europe there have been several exceptionally good harvests.

Against this view it has been urged, that in former times also, namely during the period from 1850 to 1873, great progress in production was made without any corresponding fall in the price of commodities. I will leave it an open point whether in manufacturing industries the advance made during that period was so great as during the last 15 years; but in the production of raw material for food and clothing, in the carrying

trade, and in commerce, it was undoubtedly not so great. Formerly, improvements in manufacture were in their effects upon prices counteracted by the increasing difficulty in supplying the necessary raw material for the use of a rapidly increasing population. A prominent German economist expressed, as the result of careful examination of the change of prices during the present century, an opinion that goods tended to become cheaper in proportion to the amount of manufacturing labour they required, and that they tended to rise in price when the price of the raw material constituted the greater part of the cost of production. At present, however, facilities for production and fall of prices are more remarkable in the production of raw material than in manufacturing. A fall in the price of raw material must, however, exercise a much greater influence on all other prices than a fall in the price of manufacture does. A further difference between these two periods will be found in the fact that during the period 1850-60 perhaps the greatest diminution in the cost of production took place in regard to gold. Although usually changes in the cost of production of the precious metals are slow to exercise any influence on their value, still the revolution caused by the Californian and Australian discoveries was so great that the enormously increased production of gold could not remain without influence as a counter-agent to the tendencies of the general movement of prices.

(2.) In support of the above explanation of the fall in the price of commodities, another circumstance should be mentioned. Wages have not, or at all events not in equal measure, fallen with the wholesale price of commodities. It is true that wages could not everywhere be maintained at the height which they suddenly attained during the period of stimulated speculation which followed the Franco-German war in many parts of Europe and especially in Germany. But compared with either 20 years ago, or 10 years ago, wages have on the whole hardly fallen; rather have they in many cases visibly risen. This contrast in the movement of wholesale prices and wages was, perhaps, more marked in Germany and many other parts of the Continent of Europe than in Great Britain. The industry and trade of Great Britain has of late years lost from various causes many advantages which it formerly possessed over its continental rivals. The difference between English and German wages is slowly diminishing. The latter are approximating more and more to the former. To this, in my opinion, must be attributed the pressure on the English labour-market, which has lately been so marked. In Germany, on the contrary, the Prussian Minister of Agriculture maintained in the recent debates on the new Corp Bill in the German Reichstag, without being contradicted, that agricultural wages had been on the same level since the first years after the Franco-German war. Again, the Factory Inspectors state, in their annual report for 1885 (p. 109, official edition), "Wages have, on the whole, remained at their former height; in some single cases, indeed, they have risen"; and in their report for 1886 (p. 74 of the official edition), "Wages remained, on the whole, at their former height; often, too, they experienced a not inconsiderable rise. A fall in wages has only taken place in isolated cases. But in some cases workmen suffered, because industrial establishments were compelled in consequence of unfavourable conjunctures, either to shorten the hours of labour or to suspend their work entirely." In conclusion, the remark is made, "Instead of the alleged lowering of the price of labour we have to report, taking a wide extent, rather a rise in wages." Similarly, by the same officials, in the five previous years more frequent mention is made of a rise in wages than of a fall. Also, most reports on large industrial undertakings, especially those on mining and iron industries, maintain that since 1878-9 the money wages of the workmen have risen. It would lead us too far to bring together here a collection of statistics on the movement of wages in Germany. But I believe that those who have latterly followed this question in Germany, will be disposed to assent to what I have stated. The same remark will probably hold good in regard to Switzerland and Italy.

This difference between the movement of the price of commodities and the movement of the price of labour, which has now lasted through a series of years, is hard to explain if we attribute the fall in price of the former to circumstances connected with the condition of money. Want of money must in the end make itself felt in all relative prices. The difference requires no explanation if

the diminished quantity of labour required for the production of commodities is the cause of their fall in price.

(3.) Were contraction of the currency the chief cause of the fall in the price of commodities, then in countries which have a gold currency this want must express itself by *high rates of discount*.

All States with a gold currency are States with high economic development. But in these any contraction or surplus of the means of payment soon converts itself into a demand or offering of short loans, and exercises an influence on the rate of discount. The persons, who need means of payment, draw what they require from small or large banks with which they are connected, and deposit their surplus with their banks. Even the very smallest business, in which there can be any question of a fluctuating requirement of the means of payment, is now wont to be in connexion with some savings bank, or bank, or some similar loan society. To these it remits all its available cash in order to earn all possible interest on it, and to avoid the keeping of money, and from these, in case of need, it draws ready money, either as a repayment of deposit or as a loan. The small banking establishments, again, are in close connexion with the great banks as common reservoirs, and pay into them their superfluous cash, or obtain cash from them when they require any large quantity of the means of payment. Thus in the far west of the United States a scarcity of money leads to an increase in bills discounted, loans, &c. in the New York banks; the autumnal demand for money in Scotland is supplied from the Bank of England; in Germany, on the dates when most payments are made, about the middle and beginning of the year the amount of bills discounted by the German Imperial Bank, and of notes issued by it, increases quite regularly. A deficiency of the means of payment must therefore make itself felt in the great banks, and force them to resort to extraordinary raising of the rate of discount, in order to protect their reserves of ready money. In the same way the forwarding of gold which reaches any country from abroad, or is taken from it in order to adjust the international balance of trade, shows itself by an addition to or subtraction from the bank reserves, and consequently this international flow and ebb of gold does not immediately influence the price of commodities, but affects in the first instance the rates of discount, and through them the price of commodities.

On examining the fluctuation of cash reserves and of discount rates of the great banks since 1876 and comparing them with former times, no disturbing circumstance can be discovered which might be attributed to any exceptional scarcity of gold. The gold reserves of the most important banks and treasuries in all the commercial and industrial States rose according to Soetbeer's estimates, from 1,035,800 kg., or about 145 million pounds sterling, in the year 1877, to 1,806,500 kg., or about 252 million pounds sterling, in the year 1885. The average rate of discount for the last 10 years, in nearly all large European banks, has been lower than in former times. Even if this circumstance is not to be attributed to an exceptional surplus of gold, but is due to other causes, still, at any rate, it does not, on the other hand, indicate any scarcity of gold. It is true that during the last 10 years the banks which pay in gold have been repeatedly obliged to protect their stock of gold by raising the rate of discount, but that occurred not unfrequently in former times also, and in the last 10 years milder measures than formerly were sufficient for the attainment of this end. The Bank of England during the years 1875-1886 never raised its discount to 6 per cent., while this rate of interest was reached in seven years during the period 1863-74, and in four years between 1851 and 1862. The Bank of France cannot be brought into the comparison, because it escapes from any unpleasant demand for gold not by raising the rate of discount, but by paying in silver and giving out gold only at a premium. The Imperial German Bank, on the contrary, pays in gold, and is in a peculiarly delicate position, because it holds its reserve to a great extent in silver. Nevertheless there were only four years during the period 1875 to 1886 in which the rate of discount reached 6 per cent. The Prussian Bank, from which the Imperial Bank took its rise, transacted all its business in silver, and had to raise the rate to 6 per cent. in six years of the period from 1863 to 1874. I admit that during the last-named period, war requirements twice contributed to a specially increased demand for money in Germany. During 1875-86, however, occurred the extraordinarily increased demand for gold, caused by the re-establishment of the

gold standard in the United States of America and in Italy, and by certain minor changes in the mint regulations of the commercial and industrial nations. In spite of this no perceptible disturbance of the European money market has arisen during this period, and this I regard as the result, not the cause, of the low position of prices which tended to compensate for the scarcity of circulating media. I also regard it as a sign, firstly, of the quantity of the stock of gold which is able to stand so great and extraordinary a demand for gold; and, secondly, the elasticity of credit, which during the last 10 years has uninterruptedly developed itself. The very slightest shock to credit would have caused far greater disturbance in the money market than the demand for 100 millions of gold for America and Italy. On this subject, however, I shall under the next head submit some further remarks.

(4.) By commercial and industrial nations gold is in these days required, apart from its uses in manufactures, for two purposes only, firstly, for such payments in home trade as are too large to be made in silver coin, and too small to be made in bank notes, cheques, and the like; and, secondly, for the settlement of the international balance of trade. With good organisation of banking and credit systems, the requirements for these two purposes are reduced to a minimum, compared with the bulk of the transactions which both in home and foreign trade are adjusted without recourse to gold. This is not the place to describe the system of payment which depends on credit. Its different incidents can all be reduced to the fact that in place of cash payments claims are transferred, that is, debts circulate in the place of gold and silver money, and at last are set off the one against the other. But, although the demand for gold for these two purposes is insignificant compared with the bulk of the transactions among the industrial and commercial nations, still it is subject to fluctuations, and, therefore, every country requires a reserve of gold for temporarily increasing the requirements for small payments, and for payments abroad. This cash reserve is to be found principally in the European States in the great central banks which constitute the basis of the whole edifice of credit.

Now, it is not necessary that this reserve should always preserve an equal proportion to the bulk of the transactions, which are effected without recourse to gold coin. On the contrary, the money transactions can expand largely, whilst the gold reserve of the country remains the same, and as a rule there is a tendency to counteract any scarcity of gold by improved or increased application of methods of payment based on credit, and by greater economy in reserves of money which are lying idle. I will adduce a few examples of this tendency. Is not the difference in the amount of money transactions in different periods of the year very great? Nearly everywhere times of commercial dullness alternate with times of brisk exchange of commodities and large and frequent payments. In the country, in which I live, the difference in the need of media of payment at different seasons of the year is perhaps exceptionally great. But this regular requirement is fulfilled without any great difficulty by the Imperial Bank and some other small banks issuing more notes some weeks and allowing a small amount of their cash reserve to enter into circulation. The amount of the bills discounted by them increases, and private depositors withdraw a corresponding amount. Consequently disturbances in the commodity market do not arise. No trace can be seen of any periodical change in the prices of commodities corresponding to this change in the demand for money. As a rule, not even a rise in the rate of discount takes place in consequence of this periodical demand. In the years 1879, 1881, 1883, 1884, 1885, 1886, and the note circulation of the Imperial bank in each case, reached its maximum on the 31st of December, immediately before the great increase in payments at the beginning of the new year. But only in one of these years, 1886, did the maximum of the rate of discount coincide with this increased demand for money. In England the maximum of home requirements for media of payment falls, as far as I know, in the autumn, and the money market is more disturbed by it than is the case in Germany. But even there not a word has been uttered of any periodical fluctuation in the price of commodities, and; moreover, its influence on the rate of discount could easily be obviated were the Bank of England permitted to issue 1*l.* notes, and were they made legal tender throughout the United Kingdom. In that case, too, credit would without any

difficulty be able to undertake the equalisation of the fluctuating demand for media of payment.

This tendency and this capability of credit is visible also in non-periodical or irregular fluctuations of the demand for means of payment. As a rule, credit is developed proportionately with business, and gives its aid with wonderful elasticity towards the making of payments and economising of metallic money.

Now, in this way it appears to me that two important historical facts find their explanation. First, the great fluctuations in the annual production of the precious metals since the discovery of America have on two occasions only, exercised a marked influence on the value of the precious metals, namely, in the second half of the 16th century, and during the period from 1850-73. In both cases a total revolution of the conditions of production, in the 16th century of silver, and in 1848-51 of gold, took place. All other changes in the conditions of production have had no clear or recognizable effect upon the prices of commodities. Second, in the last three decades before the discovery of the Californian and Australian goldfields, in spite of the diminished production of silver and the great increase of population, and of the circulation of money, still the prices of commodities in the world's markets fell either not at all, or very slightly, and, on the contrary, over the greater part of the European continent a very considerable rise in the prices of nearly all commodities and of wages took place. The growing economy in the use of gold and silver money through developing credit counterbalanced the enormous and ever increasing demand for media of payment.

It is true that opposite views have been expressed. It has been maintained that the diminution of the American output of silver which occurred in the third decade of this century was the cause of the fall in price of many commodities which took place during that period. Some have, indeed, maintained the view that during the whole of the first half of this century in consequence of an insufficient production of the precious metals, a gradual rise in their value and a fall in the money value of all commodities arose.

But the considerable fall in the money value of many commodities after the year 1820 is sufficiently explained by the diminution of the cost of their production, which began after the great French wars, and next by a succession of good harvests following a series of indifferent harvests during the first 20 years of this century. During the war, production was on all sides interrupted and oppressed with various burdens, after the war not only did these hindrances disappear, but there also commenced a period of the most marvellous progress in production (*vide* Tooke, History of Prices, Vol. II., p. 346 onwards). A general fall of all money values during the whole of the first half of the century I am not disposed to admit, for in by far the greater part of Europe, in all inland districts, a considerable rise of prices can be traced during the period from 1800 to 1850. English political economists who maintain the contrary, have nearly always looked upon England or London as the centre of the world's commerce, and are apt to forget the gradual levelling of the difference of money value in Europe which resulted from the improvement of all means of communication by the growing traffic.

The tendency of credit to counterbalance a growing deficiency of metallic money, has also been remarkable during the last 12 years. In many countries a considerable progress in economising the use of gold has taken place during this period (Question 9).

I confine myself to producing some proofs of this progress from Germany; as regards other countries others will be better able to judge.

In Germany a system of deposit accounts began at the Imperial Bank in 1876. Since then the amount of deposits in the Imperial Bank has grown to more than 350 million marks (17½ million pounds sterling). Of these deposits the owners or depositors can at any time avail themselves by means of cheques, and make their payments throughout the whole empire without any expense. Whilst in this way these deposits furnish the ready money reserves for the depositors, they are not kept by the Imperial Bank in the form of ready money. The bank utilizes them not only according to usual banking principles; but also the reserve of cash which the bank necessarily holds for sundry repayments of deposits, can, according to the wording of the bank law be reckoned in with its other cash reserve and the total sum regarded as cover for notes. The bank law does not trouble itself about the cover for deposits, but

regards the whole cash reserve as destined only for cover for notes. With the increased total amount of its cash reserve, the bank consequently increases the amount of notes which it can issue without any impost, although its cash reserve has to serve as cover both for notes and deposits. This measure of the Imperial Bank has, moreover, still further contributed to increase the custom of making payments by means of cheques, and to extend it into wider circles. There have sprung up in the great centres of commerce clearing-houses for cheques, which ten years ago were quite unknown in Germany. To this must be added the progress made in the absorption and utilization of the very smallest reserves of money. The savings banks have been perfected during the last few years, and above all, in the country parts they have been further extended. There are now scarcely any peasants left in Germany who keep ready money on hand to any considerable amount, and in families in which a few decades ago every child possessed his money box filled with gold and silver pieces, now every child has his savings bank book.

From all that has been set forth above it will be understood that I am disposed to trace the cause of the fall in the price of commodities, less to the altered condition of money than to the facilitated production of commodities.

V. Has the fall resulted in any material prejudice to the commercial or general interests of the world?

If, as I have striven to prove, the general fall of the price of commodities in wholesale trade chiefly is caused by economy in the labour required for the production of commodities, or, what is the same thing, by greater efficiency of human labour, then this circumstance must in the long run prove most highly beneficial to all human interests. An advance has been made which is thoroughly analogous to all other economic improvements, discoveries, and inventions. For all economic improvements consist, as has often been said, in the last instance, in economy of labour, or in the increased superiority of man over the outer world. Especially to manual labourers who have no property must this circumstance prove of benefit, and as a matter of fact it has improved their position in the most important industrial and commercial nations. The rate of wages has fallen either not at all or not in the same ratio as the price of food and clothing of the labourer. The share of the national income, on the contrary, which the propertied classes receive in the form of rent and interest, has become smaller. For the opening up of extensive and fertile tracts of land in the interior of the continents of the northern hemisphere, and the lessening of the cost of transport, have depressed the rents in the countries of ancient cultivation and dense population; and, moreover, interest on capital has fallen under the influence of universal peace and increasing wealth. In this way there is being brought about a great transfer of the income of the nation, which the philanthropist can but greet with joy. But even the most desirable economic development must, if very rapid and sudden, be accompanied by losses, and these losses may have such an extent that an industrial depression succeeds, and thus a period of great economic progress may be found to be a period of widely spread calamity. For every sudden shifting in production and consumption necessarily leads to the temporary throwing out of employ of capital and workmen. An altered distribution of the national income, even when in itself of a happy nature, and when it does not on the whole decrease the national income, must always bring about an alteration in the direction of consumption. In the same way an unexpected fall in prices causes a whole mass of undertakings, which were founded in reliance upon high prices, to become unprofitable. Frequent and unexpected losses, moreover, occurring in well planned undertakings, deter people from new ventures, and produce a feeling of insecurity, such as during the last few years has taken hold of the whole industrial world. A slower alteration of prices would, therefore, in my opinion, have been better.

It is very probable that a continuance of the extraordinary production of gold, such as that which took place in the years 1850-1860, or a free coining in all European States of the increasing out-put of silver, would have exerted a counteracting influence to the depression of prices. Perhaps in that case the prices of commodities would have fallen somewhat less, and wages would have risen somewhat higher, and thus similarly favourable results could have been gained for the working classes, with a higher level of prices, and without so great an industrial depression. But it seems to me

more probable that there would have been, from time to time, as was the case from 1850-73, periods of over-stimulated enterprise and over-speculation, which would have raised prices for a certain time, without in the long run preventing their fall; for such times are followed by commercial crises and the sudden shattering of credit, in which the prices of commodities often fall still lower than they had previously risen. The unstable progress of production, moreover, caused by over speculation, and the consequent depression is so great an evil for the whole economic and moral life of the people, and under it the labourers suffer so heavily that I would not exchange it for the industrial depression and losses under which, in these latter years, the commercial and industrial people of Europe have suffered.

X. Do you consider that an international agreement could be made for the free coining of gold and silver as legal tender money at a fixed ratio?

An international agreement for the purpose of the free coining of gold and silver as legal tender money

at a fixed ratio I should regard as a happy circumstance, if its punctual observance and its continuance were assured. Whether these two great aims can be permanently secured, seems to me in the highest degree uncertain, and therefore I cannot advocate any such international arrangement.

I maintain that a growing preference for the use of gold for purposes of money clearly manifests itself among all industrial and commercial peoples. When once people have learnt to recognise the charm of gold coins they will not do without them. The substitution of gold for silver coins in France, between 1850 and 1860, caused scarcely any opposition in public opinion, but when, from 1871 to 1874, the supplanting of gold coin by silver began, opinion was unanimous that that was not to be borne. At present the circulation of the old silver coins, to which in former times people took no objection, is everywhere impeded. The silver dollars, the 5-franc pieces, the German thalers, are continually collecting in the coffers of the central banks, or of the State, notwithstanding all the trouble that is taken in all these countries to put them in circulation. Newly coined silver pieces would certainly meet with the same fate as the old ones. Every new coining would increase the reserve of silver in the central banks and treasuries, if these had not the right to refuse them. That, however, would be a very dangerous condition for the money and credit system of a country such as England, Germany, or France, if the cash reserve in their central banks, the only available cash reserve of the country, consisted wholly or mainly in a money reserve, the value of which partly rested on the fragile basis of an international agreement. In order to avoid so dangerous a position, the bank authorities would have to take precautions, by all manner of means, to drive away silver and to attract gold, and it is probable that the State treasuries would support them in these endeavours, as is indeed now the case in France, Germany, and other countries. I apprehend a secret struggle for gold would at once begin between the banks and the State authorities, so soon as the date of the international agreement were decided. For what guarantees would people have for the continued and honourable fulfilment of the agreement on the part of all the contracting States? Even in times of peace it would be hard to prevent obstructions to the free coining of silver, still less is it possible to say what would happen in time of war, when all agreements between the combatant States are annulled. It is maintained that the well understood interest of all the States would ensure the punctual carrying out of the agreement, and make its repudiation impossible. But do nations really allow themselves in their international relations always to be guided by their well understood interests, and not very often by prejudices or national hatred? Do we not often see a people doing itself an injury in the hope of imposing a still greater injury on another nation? At the outset the silver would be very unequally divided between the contracting States; trade would make, later on, a still more unequal distribution, and hence the different States would have an unequal interest in the maintenance of the agreement. All this would, in my opinion, readily lead at first to complaints of disloyal carrying out of the agreement, and of over-reaching by foreign nations, and, finally, to an open repudiation of the convention. Those States which had taken silver in larger quantity into their circulation, or into the cash reserves of their central banks, would be severely injured in the order of their money system.

XI. Is it in the power of Governments to maintain such a ratio if agreed upon; and would the practice of the commercial world follow the law?

Should the agreement be concluded between the most important commercial and industrial States, and actually be carried out, then the fixed relation of gold and silver would also necessarily rule in the commercial world, because everybody by the coining of silver and the melting down of a corresponding amount of gold coins could procure gold for silver at the agreed relative value. Only the loss by melting, the cost of coining, and the loss of interest which would be entailed by these operations could give to gold a trade value a trifle above that fixed by the agreement. As soon, however, as it grew impossible to withdraw gold pieces from circulation for melting down without expense in any quantity, then the relative value of the two metals would diverge from that fixed by the agreement. Gold coins would circulate at a premium, and the intention of the international treaty would be frustrated.

The possibility of some such development cannot in principle be denied; whether and when it would operate would depend—

- (1.) On the demand for gold, either for hoarding or for currency, in the countries which at present have only a very small circulation of gold money or no gold money at all. How much gold would for these purposes disappear from the circulation of the States which concluded the agreement, and have at present a sufficient circulation of gold money? The latter are only a small part of the whole world which makes use of the precious metals. In the vast districts in which silver or paper form the ruling medium of payment, people would certainly be glad to strengthen their supply of gold, either in order to have a convenient circulating medium, or for hoarding purposes. At present gold is kept in the well-to-do States with a gold currency by means of their monetary laws. After the conclusion of the agreement it could be replaced by silver in these countries. It cannot with exactitude be forecast how it would then be divided in the world.
- (2.) On the use of gold for industrial purposes. How important this use is, late researches have sufficiently proved.
- (3.) On the relative production of the two precious metals. A further reduction of gold production, a further increase of silver production, could in the course of time cause gold coins to come into circulation less and less frequently, silver coins more and more plentifully, so that in order to retain the former, a premium above their legal value would have to be paid. The relative amount of the silver and gold produced will be greatly influenced by the relative value of the two precious metals that may be fixed in the international bimetallic agreement. The rate of 1:15½ must stimulate the production of silver more than one of 1:20.

XII. What would be the effect of such an agreement, if carried out, upon (a) prices, and (b) the production of the precious metals?

An international bimetallic agreement would, in my opinion, have a tendency to raise prices. In this respect it seems to me that the immediate increase of the metallic legal tender money in the industrial and commercial States would be of far less moment (for it could operate only very slowly) than the moral effect which this proceeding would exert on the reviving of speculation. I fear, indeed, that the conclusion of the agreement would, unless political disturbances intervened, be the signal for a period of exaggerated commercial activity and over-speculation, which would end in a crisis of trade and credit. A rise in prices thus induced would be only transient. To what extent a lasting rise in prices would ensue, cannot, in my opinion, be predicted with any exactness. I believe, however, on the grounds I have stated, that the influence on the raising of prices would, in the long run, be inconsiderable.

XIII. Do you consider an international agreement for bimetallicism possible on any other ratio than 15½ to 1?

A bimetallic agreement on the basis of a ratio of 1:20, would have many less considerations against it, and much more prospect of permanence than one on the basis of a ratio of 1:15½.

A ratio of 1:20 would cause less disturbance in the commercial relations between gold and silver currency countries. For people have now for many years been accustomed to a similar relative value in the trade of these countries. Now a rapid rise of the Indian exchange to the relative value of 1:15½ would produce a disturbance similar to that caused at the

time of the sinking to 1:20. The wildest speculations on the rise in price of silver and on alterations in the price of commodities would be the consequence of any such artificial raising of the price of silver within a short space.

With a ratio of 1:20 there would be less apprehension of any considerable stimulus to silver production, and in case of the ceasing of the agreement the fall of the price of silver would not be so severe. The contracting States would therefore run much less risk with this relative value than with one of 1:15½. Throughout the whole world the want of confidence in the maintenance of the silver value fixed by the agreement would be much less if something like the present relative value were agreed upon, than if the value of silver were again artificially screwed up. The more general the confidence felt in the maintenance of the silver value agreed upon, the less would be the weight of the arguments adduced against the bimetallic agreement.

It is true some of the contracting States would, with a ratio of 1:20, not obtain certain advantages which would come to them with a relative value of 1:15½.

If the ratio of 1:15½ were accepted, the United States of America would have the advantage of recoining their silver dollars, so far as they are in the possession of the Treasury, with a considerable gain. For they were coined at the ratio of 1:16. The silver dollars which were in circulation would be melted down by private persons at a profit. That the United States would choose the other plan and have its gold dollars made more heavy in order to attain the relative value of 1:15½, seems on various grounds, and particularly from the cost of the operation, quite improbable. Thus it would come to pass that the only State which, untroubled by the fall in price of silver, has gone on coining silver and drawn great profit by it, would then obtain a further financial gain from the international agreement. The United States would further be in the enviable position of entering into the Convention without any stock of silver currency, with an exclusive gold circulation, and be less burdened with a dead weight of silver coins than other States, as, for instance, Germany, which has made great financial sacrifices in order to diminish its stock of silver money. The injustice of this result might possibly impede the conclusion of the agreement on the ratio of 1:15½.

Germany, the Netherlands, and the States of the Latin Monetary Union would, if a ratio of 1:20 were decided upon, have to renounce all hope of seeing their 5-franc pieces and thalers, which, owing to the depreciation of silver have been reduced to the position of token-money, once more converted into coins of full value. Germany, however, could easily give up this advantage, for the amount of its thalers is so small that their retention as token-money can cause no serious apprehension; France, Italy, Belgium, and the Netherlands, are all, in consequence of the large amount of their silver coins, so much interested in the upholding of the present value of silver, that they would hardly refuse an agreement on the basis of a relative value of 1:20, especially if they were able to place confidence in the permanence of such an agreement, and could not obtain the still greater advantage of a convention on the basis of 1:15½.

XIV. Failing an international bimetallic agreement, what measures could be adopted by the commercial nations of the world for giving increased stability to the relation between gold and silver?

The means which, apart from an international bimetallic agreement, might be taken in order to give greater fixity to the relative value of gold and silver, might have for their object either to assure a greater application of the use of silver, or to induce a greater economy in the use of gold.

A somewhat larger employment of silver for coining purposes could be secured if the commercial and industrial nations agree to issue no small paper money and no small gold coins.

People will be slow to give up the convenience of a gold coin or paper note of the amount of 10 shillings, francs, or marks, but smaller gold pieces or paper notes could be very well withdrawn from circulation. In England, it is true, no new application for silver would be created by this, but in the States of the Latin Union, in Germany, and in the United States, the silver coins which are lying in the banks or treasuries, would partly enter into circulation. The money market would

by this freeing of the banks from silver coin become somewhat less sensitive; but as regards the price of silver, there would be very little help given by it. Of greater importance would be the entrance of Austro-Hungary and Russia into such a convention; but this can scarcely be counted upon. Every step by which the two last-named States would get rid partly or entirely of their depreciated paper currency, would be favourable to the value of silver. For neither Russia nor Austria, it seems to me, as far as I am able to judge, can substitute a gold currency for their paper money. If they wish to have a metallic currency they can only have a silver currency. At present there is no prospect of either Austria or Russia adopting a silver currency. In the course of time, however, people in both countries will perhaps begin to see that silver is still a better medium of payment than a depreciated paper money.

Greater economy in the use of gold for mint purposes could be attained, in my opinion, by an extension of the circulation of bank notes.

In England, Germany, and some other countries, the central banks could issue notes of small amount down to 1*l*. If the banks held a reserve of gold equal to a part—say half the amount of the small notes in circulation—the metallic basis of the whole money system would not be weakened by such an issue, but strengthened. For the demands made on the increased cash reserve of the banks would be smaller instead of greater. The inland drain of gold would either disappear, or at any rate become less and occur less frequently, if the banks, in all cases in which an increase of small payments or a crisis in credit necessitated a corresponding increase of currency for small payments could pay out small bank notes instead of gold. For the exportation of gold a larger cash reserve would be available, and hence a rise of the discount rate in order to protect the reserve would be less often required. In Great Britain and Ireland a further economy of gold could be made if the notes of the Bank of England were universally received throughout the whole United Kingdom. The periodical flow of gold to Scotland could by that means be avoided. The United States of America have more than any other country the opportunity of introducing economy in the use of gold by improvements in the issue of bank notes and paper money. Were they to determine upon the foundation of a central bank, and to entrust to it the cash reserves of the Treasury as well as to allow a certain freedom in the issue of notes, their currency would gain a greater elasticity more suited to its varying needs. Thus, it seems to me, many irregularities of the American money market would be obviated, which now arise from the storing up of gold in the Treasury at Washington, and from the varying needs of American trade for media of payment.

XV. It is argued that, in the absence of bimetallism, the effect of any disturbance of the currency is limited to half the currencies of the world, and thereby increased in intensity. Do you consider this view correct; and, if so, do you think the evil a serious one?

XVI. If the effect of such disturbances could be spread over all countries, would greater stability of the standard of value be secured thereby?

It seems to me not unreasonable to suppose that the effect of any disturbance in currency, in the absence of bimetallism, is limited to half the currencies of the world, and that consequently when great disturbances arise, the money market may be more intensely affected than would be the case were

the bimetallic system universally introduced. Much weight, however, I would not attribute to this circumstance. The area of the gold currency comprises nearly all the commercial and industrial nations of the world, and as their currency is based on highly developed credit, its elasticity is so considerable that disturbances in the metallic circulation of one country have only a very small influence on all the rest. This appears to me to be proved by the experience of the last few decades. For the last thirty years, gold has been the international medium of payment between the most important commercial nations, and greater disturbances in the circulation of gold money than have taken place in the last thirty years can scarcely occur. The suspension of cash payments in the United States, in 1861, in Italy in 1866, in France in 1870-71; the adoption of a gold currency by Germany and Scandinavia; the resumption of cash payments in France, Italy, and the United States; one would have thought that every one of these events must have shaken the money market in the other commercial States, and yet in every case the only result of these events was a moderate rise in the rate of discount. Every crisis which shakes credit, such as that which occurred in the Autumn of 1857, or that in May 1866, spreads much more quickly and in a more destructive manner throughout all countries of the whole world, whether they have a gold, silver, or paper currency, than any one of the so-called disturbances of the metallic circulation. Against such crises of credit which arise from over speculation and exaggerated commercial and industrial activity, an important means of protection is, in my opinion, the extension of the gold currency in commercial States. For during a period of exaggerated and unsound rise of prices and speculation the cash reserves gradually disappear from the banks. With a gold circulation this drain will, as a rule, be quicker and more powerful than with a bimetallic currency. In the latter case the banks can meet the drain of cash by always making their payments in the less demanded metal. With a gold currency the banks have not got this means of help. Moreover, a gold drain is likely to have more intensity than a silver drain, because, in these later times, gold is the precious metal most in demand. The rapid drain of their cash reserves compels the banks at an earlier period to meet an unsound rise of prices by a rise of discount, and thus it prevents the evil from reaching the height which creates a destructive crisis. I do not then deny that the money market, or to speak more precisely the loan market, would gain greater stability with bimetallism than with a gold currency, but I do not regard this an undoubted gain, for I hold the greater sensitiveness of the money market with a gold currency to be a valuable safeguard against unsound and unstable rise of prices and the crises which are its sequel. A gold currency exercises the same wholesome and correcting influence, which England by Peel's Act, and other nations by similar restrictions of free movement in the conduct of their central banks, have sought to provide.

ERWIN NASSE

Bonn, October 1887.

(3.) Professor LEXIS, of Göttingen.

I. To what do you attribute the fall in the value of silver, as compared with gold, since 1874?

The fall in the value of silver is beyond doubt the consequence of the coincidence of the various causes which were enumerated in the Report of the English Silver Committee of 1876. Two of these causes have been but transitory in their working, viz., the unwonted increase of supply caused by the silver thrown on the market by Germany up to 1879, and, on the other side, the unwonted diminution in the export of silver to India which has continued for some years. We must regard as permanent causes of the depreciation, firstly, the almost continuous increase in the production of silver for the last 20 years, which latterly amounts to more than double the annual average of the years 1866-1870, and secondly, the diminished use of silver in consequence of its exclusion from the coinage system of several important countries. This last fact, however, has a far greater importance than all other causes of silver depreciation together, for if it were possible, as formerly, to have silver freely coined in Paris, Brussels, Berlin, and elsewhere, and so to have an unlimited exchange for money of generally recognised value, then an increase in the supply of silver would simply cause an increase in the coinage of silver money, and consequently the influence of the increase in supply would be more or less perfectly counteracted. It was, besides, of the most decisive importance that the States of the Latin Union by limiting and finally stopping their coinage of silver completely set aside the action of the machinery of their double currency, which had up to that time served to keep the relative value of gold and silver approximately stable. Before then silver had always been able to find in France, Belgium, and Italy not only a market that was constantly open but also a fixed price in francs; in other words, any quantity of silver could be changed according to a fixed scale into a money which was legal tender all over a large and rich area; and moreover, even outside this area it had no depreciation to fear, as the circulation of francs was backed in France alone by a large gold reserve.

It may, therefore, be fearlessly maintained that had the States of the Latin Union determined to continue the unlimited coining of silver after the year 1873, as France after the year 1851, in spite of the warnings of many authorities, continued its coinage of gold without restriction, then the other causes of the depreciation of silver above mentioned would at least have been almost completely neutralized for a series of years, and the price of silver would only have fallen slightly.

Similarly, had America also coined as many standard dollars as has been actually the case, it would beyond doubt have been quite sufficient to maintain the value of silver if in France and the other states of the Latin system an additional sum of 100 to 120 million francs yearly had been coined into silver currency. There would then in the years 1874-1887 have been coined in these countries a surplus of 1,600 to 1,700 million silver francs. The continuous inward flow of silver would certainly have caused an outward flow of gold from the Latin States, but according to the experience of the reverse movement of the precious metals which took place in France in the years 1850-1869 it may be assumed that the amount of gold exported would be far from reaching that of silver imported. It is true that under these conditions a premium of varying amount on gold would have asserted itself in these States, i.e., in the open market there would be a certain deviation from the legal rates ($15\frac{1}{2}$ to 1), but in consequence of the very large reserve of gold in those countries, and especially in France, the premium up to the present time would hardly have risen higher than the maximum rate attained in the time of Louis Philippe before the Californian discoveries, which gave rise to a relative value of about 16 to 1.

If, however, the Latin double currency, working without hindrance, very probably would have maintained nearly the old price of silver up to the present

day, on the other side it is true that its influence must gradually have grown weaker if in the future the production of silver continued to increase and the production of gold as hitherto went slowly down. Silver money would then, in spite of the legal system, have attained a predominance in the Latin States, gold would have completely disappeared, if not entirely from the country at any rate from ordinary currency, payment for notes and exchanges would be made only in silver, and in order to retain the gold a premium would have to be paid, rising higher and higher by reason of the gradually growing absolute and relative abstraction from the gold reserve.

The mechanism of the double currency would be powerless against this rise in gold unless some considerable increase in the gold production were to ensue, and that is certainly not to be expected. But after all, under our hypothesis, the relative fall in the value of silver would ensue not only much more slowly and with fewer violent oscillations than has actually been the case, but the depreciation would have been far from reaching the point which it now actually has attained, because silver would then, in an important group of countries, have maintained an unimpeded and increasing application as a money metal.

II. What probability is there of a continuance of the fall?

If the United States and India continue their coinage of silver to their former extent, then with the present relative production an average price of 44 to 45 pence for the ounce of standard silver may be maintained. In this computation sight has not been lost of the fact that in consequence of events in the trade of Eastern Asia there have been exceptions on the one side up to 42 and on the other side up to 47 or 48 pence. That the price of silver for a very considerable time was fairly maintained at 51 pence, and only in 1886 was reduced by a new blow to the above-mentioned average, may be explained by the following. Not till 1885 did speculators begin to give up the hope of some general regulation in favour of silver on the part of Germany or other States, so that now for the first time the normal price has asserted itself. Were, however, the United States to suspend the coinage of silver dollars, then the balance between production and consumption would be again wholly upset. Nearly a quarter of the whole annual production of silver, which hitherto has been retained in America owing to artificial appreciation, would then come as an ordinary commodity upon the world's market and would have to find a sale, thus lowering prices regardless of consequences, either in trade in Eastern Asia or for industrial purposes. Whether the price would then fall to 35 or 30 pence or even lower still can naturally not be foreseen. And it is quite impossible to estimate how far the depreciation of silver would go should a suspension of coinage in British India deprive silver of what now is its most important market.

III. To what do you attribute the fall in the wholesale prices of many commodities which has been in progress during the last 10 or 12 years?

The fall in price of many commodities in wholesale trade may be attributed to various causes, of which each is of special importance to special branches of production. The most important of these are:—

- (1.) The competition of newly-opened districts in which certain products, such as grain, can be grown with much less cost than in Europe. This competition has become possible chiefly through the building of great railways in America and India, and through the cheapness of sea freights.
- (2.) The considerable increase of large industrial factories, not only in the original industrial nations, but also in those which were formerly more or less backward. Their custom is now being more and more withdrawn from the former.

- (3.) The stimulation to the export of agricultural products from Eastern Asia in consequence of the depreciation of silver, and, from the same cause, the impediment to the import of European articles of industry into these countries.

The first cause operated more especially in depressing the price of wheat owing to American competition, which, during the last 10 years, has attained an extraordinary extent. It may be argued that the export of wheat from America has considerably decreased of late, and, *e.g.*, in the fiscal year 1885-86 it amounted to only 58 million bushels as compared with 153 million in the year 1879-80.* How then has it come about that it is exactly in that year 1885 that the price of wheat fell lower than ever? To this it may be replied that it does not depend upon the quantity of wheat which America actually delivers in Europe but upon the quantity in hand or quickly procurable, which in case of an increased demand could be at once delivered at the low price quoted. The harvests in Europe were, of late years, comparatively good, and their increased yield, as compared with the years 1879 and 1880, had to find a market by competing with the American wheat. This was effected by extensive lowering of price, which injured the producer both in America and Europe. But whilst the European farmer very frequently failed to recover the cost of production at these prices, the wheat grower of the American West only lost a possible extra profit. For him even the low price leaves a normal profit over, and so at these prices they keep on pressing upon the European market with the whole of their producing power. The theory of Ricardo, according to which the price is equivalent to the cost of production under the most unfavourable conditions (including the normal interest on capital), only holds good on the supposition that the more favourably situated classes of producers are already fully engaged to the extent of their whole producing power. If, however, one of these favoured classes can further extend their production, then it rules the market, and fixes the lowering of price, be its actual sale great or small, *i.e.*, whether it compels the less favoured competitors to suspend their production or to sell at a loss.

Analogous to the fall in the price of wheat is the extraordinary fall in the price of copper which has continued until October 1887. In the western territories of the United States, especially in Montana, new and rich copper mines have been opened, and through their output the American production rose from 40,000 tons in 1882 to 74,000 tons in 1885. As simultaneously the great Spanish mines increased their output, this extraordinarily augmented quantity of the metal could only find a sale by a reduction in price, which, in the end, fell to two thirds of the former average price. Many of the smaller and less productive mines were certainly obliged to close operations; but the diminution in production caused by this was inconsiderable, compared with the constantly increasing quantities thrown upon the market by the larger works in spite of the considerable reduction in their profit.

Over-production, which, in the case of copper, has been caused by the opening of new mines, has, in the case of many branches of industry, arisen simply from the fact that large manufactories, iron works, and other businesses have been started whose power of production far exceeds the present demands of the market. The more favourable the conditions of production of such an undertaking the more will it strive to bring to the market a quantity corresponding to its actual power of production, and even if this cannot be done, yet it co-operates in causing a depression of prices under which the less favoured undertakings can earn no profit, or indeed suffer actual loss. Of these latter, some fall to the ground, but precisely those whose production most contributes to the result will not allow themselves to be crowded out, but continue their operations even when they are without profit owing to a glut of the market. These are the large industrial *joint stock companies*. Their directors have an immediate interest in keeping the undertaking in operation, even although it yields no dividend, and the shareholders are quite content, provided there be no deficit to be covered; and even in this latter case, they prefer as a rule to issue preference shares and to take them up themselves, rather than to go into liquidation, in which case they would probably lose their whole capital. In this way industrial over-production, *i.e.*, a competitive struggle and a standard of prices which renders a great part of the commodities produced to be

produced without the usual profit or even to be sold at a loss, may become chronic, and there appears to be no other means of protection against it than conventions between the great producers. These have latterly been frequently attempted, although their action has rarely had any lasting result.

The influence of over-production on prices is naturally intensified by the fact that it has arisen simultaneously in all industrial countries, and that many countries whose industries are less well developed impede the import of foreign manufactures by protective duties.

Finally, as regards the influence of the depreciation of silver, it operates on export and import in countries with a silver currency, just as the depreciation of paper money does in countries where there is a paper currency. Those who have lived in one of the latter know from daily experience that even considerable movements in the premium on metallic money exert for a considerable time no noticeable influence on the retail price of inland products, on wages, and on rents. This is the case too with regard to the movement in value of the rupee as compared with gold, even though this fall in the Indian currency has arisen from quite other causes than (*e.g.*) that of Russian paper money.

Were, then, the exchange value of the rupee to go further back still in India, so far as regards labour and the ordinary products of the land, it would maintain for some time the same purchasing power. These products, therefore, if valued in gold can be produced at a less cost, and consequently they can be sold in the gold-currency countries either at a greater profit or, if lower prices are necessitated, at all events with the normal profit.

The first case will only be of a transient nature, for competition will soon cause the extra profit, which at first may be regarded as a kind of premium on exportation, to disappear from the difference in value. Especially in the case of wheat, a commodity which is thrown upon the European market in such superfluity, the depreciation of the rupee can only serve to induce a lowering of prices for the Indian product in Europe by which it forces a sale for itself. Therefore the difference in the price of wheat in London and Bombay is not greater than it would have been under the former value of silver after allowance is made for cost of transport and traffic. The Indian wheat growing districts which have now become opened up by railways possess through this difference in value as well as through their natural advantages for production a still further advantage, so that they must be classed on the European market with the most favourably situated competitors who in the matter of lowering of prices are able to go the furthest of all. An opposite effect is produced on the importation of the products and manufactures of the gold-currency countries into India and China, owing to the depreciation of silver. The wages and the nominal income of the great mass of the population there are expressed in silver and have risen either very little or not at all. The population of India is now therefore not in a position to pay any more rupees for English cottons than in the time when silver was of full value. For the English exporter, however, a similar amount of rupees now yields in gold 30 per cent. less than before, and he must therefore either suffer a diminution in his sales or lower his prices calculated in gold to correspond to the depreciation of silver.

Finally, mention must be made of yet another universal cause of the fall in price of many commodities which arises from the aggregate of these single causes. The latter have caused many necessary elements in production, such as raw materials, machinery, and the like, to become much cheaper. In consequence the cost of production of many other commodities has in turn been reduced, both those which had already been independently affected and also those with which this was not yet the case. Owing to the present keen competition in all branches such a reduction of the cost of production must again in its turn lead to a reduction in the price of the product. Further, in every branch of industry great efforts are being made to compensate the loss of profit by the introduction of economical improvements in management, more suitable machinery, and the like. These improvements contribute a factor to the depression of prices, and moreover one which in time to come will still exert an influence. There is thus being adjusted a new system of relative values based on a lower level of prices, and in it only those will find themselves in a satisfactory position who are not dependent on the past owing to too high expenditure on capital or debts.

* The importation of flour has certainly increased, but only from 6 to 8 million barrels.

The above-mentioned causes appear to me to fully account for the fall in the price of commodities, especially when we see that, owing to combinations which counteract these causes, in certain commodities an upward movement of prices can be caused, as has been the case latterly with copper and tin.* Considerations of currency come therefore, in my opinion, into our problem only so far as the depreciation of silver stimulates export from Eastern Asia and depresses import into this great trading district. The assumption that the depreciation of prices rises from a scarcity of gold and a consequent rise in the value of gold, seems to me not yet to be justified by the facts. In America, France, Germany there are, besides the gold coins, immense sums of silver money, paper money, and uncovered bank notes, and these media of circulation are fully equivalent to gold in value owing to public or private credit, and therefore in the fixing of prices they have the same influence in commerce as a corresponding amount of gold money would have. No one can maintain that in these countries there is any dearth of media of circulation. The United States coined from 1877 an annual average of 48 million dollars in gold, considerably more than was coined in the period from 1851-1860, in which the annual average was only 33 million dollars. Besides this there are annually about 28 million standard silver dollars which enter into circulation as such or are made available in the form of silver certificates. Except France during the years 1851-1860 no country has so largely increased its stock of metallic money as have the United States in the decade from 1877 to 1886, and yet prices in that country have manifested the same movement as they have in Europe.

In France for the latter years we find in the vaults of the Bank a cash reserve of 1,100 to 1,200 million francs in gold and a like amount in silver of legal tender. Besides this the note circulation amounts to 2,600-2,700 million francs, and is therefore covered to the extent of nearly a half in gold, and nearly five sixths in metal. Were there an increased demand for circulation there could be—political quiet and peace being assured—an issue of 500 to 600 million francs more in notes covered by the existing cash reserve without causing thereby the least injury to credit.

In Germany too there can be no talk of any dearth of circulation so long as the Imperial Bank holds a cash reserve of 650 to 750 million marks in gold and silver, which is treble the sum which before 1870 was quite sufficient for the Prussian Bank. Nearly three fourths of the amount of the notes issued by the Imperial Bank and the other banks of issue are usually metallically covered, and therefore the issue of notes could, if it was only a question of the credit of the notes, be increased by a sum of some hundred million marks on the present cash reserve. The Bank Act which imposes a duty on uncovered notes when the issue exceeds 385 million marks would certainly restrain such an additional issue, but would never in any way prevent it were the needs of commerce seriously to require such an issue.

In England people talk of a scarcity of gold when the reserve of the Bank diminishes and consequently the official rate of discount is raised. These, however, are only symptoms of the sensitiveness of the English money market, chiefly caused by the unelastic organisation of the Bank according to the Peel Act. There is no evidence from it that it is occasioned by a universal scarcity of gold, for we find that in the year 1857, the period of most active gold production, the reserve of the Bank of England was lower and its rate of discount higher than has ever been the case in the last 10 years. Similarly, we find a sharp stiffening of the rate of discount and a large diminution of the reserve in the year 1873—the period when the prices of the commodities were highest.

Certainly the aggregate reserve of gold in England has of late years experienced a diminution owing to excess of its export over import and to its application to industrial purposes. This fact depends partly on the extension of the gold currency system in that now there is a more complete adjustment between England's gold reserve and that of other countries. But, besides this, it must be noted that England has always striven to do with the smallest possible cash reserve, and all its arrangements have been made with this end in view. Owing to the retarded flow of business a portion of its gold reserve became superfluous, and also the amount of payments through the Clearing House decreased.

* The prices of lead and zinc also had previously risen.

The departure of a certain amount of gold must, therefore, be regarded not as the cause but the effect of depression in trade. In any case there is no justification for the statement that England possesses less circulation than are normally required, as we see that the average rate of discount remains very low, and owing to substitutes of other kinds, especially to the facilities of the Clearing House, there is less use made of metallic money than was the case in former years. But even if England had really lost too much gold, the fall in the prices of commodities could not be attributed to it, because it is a universal phenomenon to be observed even in the countries which receive gold from England or in other ways have increased their cash reserve at its expense.

A low rate of discount is not of itself a proof of a superfluity of circulation, but only of an accumulation of unplaced and movable capital. When, however, this coincides with large cash reserves in the banks, as has been for many years the case in France and Germany, then a proof may undoubtedly be seen in this coincidence that there is no truth in the assertion of the existence of a dearth of money operating to depress prices. It is certainly possible, and indeed probable, that in the future, if the circle of gold currency countries is enlarged, or the production of gold further decreased, that scarcity of gold and consequent appreciation of gold as compared with commodities might be occasioned. I believe, however, that this circumstance could be at once detected in the rise of permanent and increasing premium on gold in those countries which, like France and the United States, have concurrently with gold a large silver circulation and much paper money or great power of extension in their issue of bank notes. Hitherto, however, in these countries but few and transient premia on gold have been paid which can well be accounted for by temporary conjunctures.

IV. Has it (the fall in prices) extended to (a) retail prices, (b) wages and other payments for services rendered, (c) land and houses?

A further argument against the assumption of a universal rise in price of gold may be found in the fact that the depreciation of prices has confined itself almost exclusively to commodities in wholesale trade; and even in these not without considerable exceptions. Only in the case of single articles, e.g., sugar and petroleum, have retail prices followed to any great extent the movement in wholesale prices; in the case of most commodities on the contrary, especially in the case of bread and meat,* only a very slight cheapening or none at all has occurred in retail trade.

The wages of the industrial classes have on the whole gone back but slightly, and are still higher than they were in the year 1870. Agricultural labourers have almost completely maintained the rise which they gained in the years 1872-3. The wages of servants show a continuous rising tendency, and even services of a higher class, e.g., those of artists and medical specialists, are on the whole more highly remunerated than formerly. The same holds good of theatrical representations, concerts, and the like. Moreover, the increased discrepancy above mentioned between retail prices and the depressed wholesale prices can partly be accounted for by the higher value of the services rendered in connexion with retail trade. Besides, the glittering ornamentation of shops and the higher rent paid in good localities frequently contribute to the same end. Farms and land in the country have more or less fallen, still not so extensively as might have been expected from the lowering of rent. This may be explained from the fact that the return from State and other good securities has also fallen, and therefore the factor of capitalisation has risen in favour of the land property. Certainly if land is sold by auction under a forced sale it often realises only a very low price, but in ordinary free traffic on the other hand the ground landlords hold out for comparatively high prices. The prices of houses have on the whole not fallen although building materials are cheaper. House rents in Berlin have, it is true, not been able to keep at the extraordinary elevation which they attained there under exceptional circumstances in the year 1872; but in general in the German towns, although there is a great deal of building in nearly all of them, they have for the last 10 years remained about the same.

Certainly, in Germany, people, and especially the middle classes, have the impression that during the

* The wholesale price, too, of meat, that is, the price paid to the growers, has fallen in Germany but slightly.

period of pretended increase in the purchasing power of money, cost of living has become greater for them. The Government too has given expression to this opinion by recognising a rise in the stipends of its officials as justified thereby.

V. Has the fall resulted in any material prejudice to the commercial or general interests of the world?

If we consider the present movement of prices in the aggregate from the standpoint of universal economics then we are hardly justified in saying that it has done harm to humanity. The powers and treasures of nature in newly opened districts have been pressed into the service of the civilised world, and an immense apparatus of railway, steamers, machines of every description has, in consequence of the keen competition of its owners, rendered to human society its mechanical services for an unwontedly low price. The profits of capital have diminished, but on the other hand the value of human labour, including all kinds of services, has risen rather than fallen. The fall in the price of wholesale commodities has been prejudicial to certain classes and groups; but other classes must have benefited to an equal extent, and, if these latter are not the consumers, then it must be the middlemen in trade or the classes which work directly for the public. Amongst these many during the last decade have attained to prosperity, especially bakers, butchers, publicans, and, in many towns, masons and others employed in building. Symptoms of general economic pressure are certainly not to be found in Germany. The number of new buildings is, as was said, very large in many towns, and the new houses are if not in every case very tastefully built, still erected with a far greater attention to luxury in the way of decoration and comfort than was formerly the custom. The public places of amusement are more frequented than ever, the number of tourists increases every summer; all watering-places and summer resorts are full to overflowing. New necessities of existence and requirements of luxury are always extending in wider circles, and the feeling mentioned above as to the increased expense of living is undoubtedly closely connected with this increase of the superfluous things which are regarded as necessities.

Although meanwhile humanity in general has suffered no economic injury through the fall in prices, still on the other hand it is possible that one particular country may have received more harm than benefit from this evolution. England, perhaps, is in this condition, because so far as its industry is concerned, this lowering of prices is bound up with increased competition abroad and the loss of a part of its foreign trade. It is possible also that in a specified country the operation of a lowering of prices even when, regarded purely arithmetically, it balances itself in gain and loss, may still give rise to a division of wealth which from the social point of view seems less desirable than the former. In Germany it would be regarded as a very deplorable change and an injury to the common weal if the independent smaller landowners who work their own ground were ruined by the low price of grain and their farms conglomerated into the "latifundia" of the great capitalists.

VI. Do you consider that the countries using the gold standard, or any of them, are suffering from an injurious contraction of the currency which might have been obviated or mitigated by an increase in the supply of gold?

As has already been argued, the fall in the price of commodities cannot, in my opinion, be attributed to scarcity of media of circulation nor to a scarcity of gold. Still less cannot be maintained that in consequence of insufficient import of gold trade has been injured by a high rate of discount. As a matter of fact the official rate of discount of the Banks of England and France, and of the German Imperial Bank, taking the average of the years 1877-1886, has been lower than in any former decade, and in the private discount market this is true in a still higher degree. The maximum quotations, too, of the official rates have in the last decade not risen so high as formerly. The Bank of England did not in this period raise its rate above $5\frac{1}{2}$ per cent., whilst we find for 1873, *e.g.*, a maximum of $8\frac{1}{2}$ per cent., for 1872 $6\frac{1}{2}$ per cent., for 1866 10 per cent., for 1865 7 per cent., for 1864 9 per cent., for 1857 $9\frac{1}{2}$ per cent. The Bank of England is compelled owing to its legal organisation, not by any general scarcity of gold, to enter from time to time upon a struggle for gold; it has, however, as we see, been obliged in the time of the richest gold production to enter upon this struggle with much severer measures than in the last decade.

VII. To what extent and in what way are prices affected by the quantity of the metal or metals used as standards of value?

The amount of the precious metals used for money purposes stands in no fixed and specified relationship to the prices of commodities, although in general it is indubitable that *very great* alterations in its amount may in the end conduce to depreciation or appreciation in the value of the metals as compared to commodities in trade. What under given circumstances really happens depends upon the particular nature of those circumstances. It is possible for a considerable increase in the metallic money of one country to take place without prices rising; conversely too a considerable and general rise of prices may occur without any increase in the cash reserve of a country, or even simultaneously with a diminution of the cash reserve. For instance, the gold and silver reserve of the United States was considerably increased from 1878 to 1887, and for all that prices there as in Europe have gone back. France on the other hand had in 1873 prices quite as high as other countries, although it had lost more than 600 million francs in metallic money owing to the payment of the war indemnity to Germany. England and other countries too had in 1872 and 1873 to pay gold to Germany, and still prices rose in their markets as well.

A general rise of prices always takes place when there is a general upward movement of the economic conditions of life caused by great speculative activity or rapid business advance. If the real conditions of an extension of production and commerce are recognizable then business without any difficulty whatever finds for itself in one form or other the necessary auxiliaries for the circulation. A large reserve of metallic money is to this extent favourable to a rising movement in prices, in that it affords a surer base to the mechanism of credit and facilitates its extension to a further extent than would be practicable with a smaller cash reserve. On the other hand a mere increase in the metallic reserve is in itself not in the position to cause an improvement in the economic relations of a country. What is the gain if, *e.g.*, England sells commodities in America at a loss and receives in exchange for a part of these exports not cotton or other American products but gold? If business languishes in a state of stagnation then this gold will make no difference in the position; it will be stored up in the bank and so change a certain number of formerly uncovered notes into covered notes, or take the place of other auxiliaries to the circulation whose application will be correspondingly reduced. The Bank of England in July 1879 had a cash reserve of over 35,000,000*l.*, whilst only 29½ million of notes was issued to the public, for which in consequence there was a surplus cover of nearly 6,000,000*l.* And yet this quantity of gold in spite of a very low rate of discount did not suffice to give any movement to business, for the temporary improvement of prices which occurred shortly afterwards proceeded from the American market and was in no way produced by the offer of gold by the Bank of England.

VIII. What is the relation, if any, between the supply or quantity of the precious metals and the fluctuations of credit?

Fixed relations between addition to the quantity of the precious metals and extension of credits are not to be discovered. A large cash reserve in a country may operate in causing a part of the auxiliary means of credit in business to be crowded out, or, more especially, in confining the extension of such auxiliaries. So, for instance, in France, a country which still of all European countries possesses the largest metallic cash reserve, the cheque and Clearing House system is but little developed. Under other conditions, on the other hand, a large cash reserve may favour a proportionate extension of credit, as was undoubtedly the case in Germany, for instance, in the years 1872 and 1873. Just so we find in the first years after the discovery of gold in California and Australia, an exceptional extension of credit in Europe coinciding with a great increase in the metallic money. This was specially the case in speculative matters until the crisis of 1857 gave a check.

I have already given the reasons above for considering that the movements of the rate of discount of the Bank of England, and consequently the extension and contraction of the willingness of this institution to give credit, are not immediately caused by the general economic relations of the import of gold, but depend upon causes which ensue from the Bank Act,

IX. Has there been during the last 15 years any important development of the system of cheques, bank credits, bills of exchange, or other means of economising the use of the precious metals?

In Germany the use of auxiliaries to the circulation which save the currency has made considerable progress. Especial mention must here be made of the development of the "giro" system in the Imperial Bank, a system of deposit and payment which embraces the whole empire, inasmuch as the depositors can avail themselves of the branch offices (over 200) as well as of the head office. The aggregate amount of this business, which in 1876 was quite inconsiderable, has since then steadily grown. In the year 1886 it had reached the amount of 28,820 million marks. Besides this the Imperial Bank has in connexion with many other banks instituted Clearing Houses in nine towns, through which in 1886 payments to the amount of 13,356 million marks were made.

X. Do you consider that an international agreement could be made for the free coinage of gold and silver as legal tender money at a fixed rate?

An international agreement for the free coinage of gold and silver according to a fixed relative value would in my opinion be possible if England were unconditionally to enter into this bimetallic convention, and so allowed an unrestricted coining of silver currency money according to the accepted value.

XI. Is it in the power of Governments to maintain such a ratio if agreed upon; and would the practice of the commercial world follow the law?

A general agreement as to the relative value of the two precious metals on a given ratio, if accepted by England, the United States, Germany, France, Italy, and other States for their coinages, would exert a much stronger influence on the relative value obtaining in free trade than did the French double currency system formerly. If the bimetallic union were to fix upon the old French rates as its basis ($15\frac{1}{2}$ to 1), then silver would undoubtedly in a very short time rise to $60\frac{7}{8}$ pence for the ounce of English standard fineness, because any amount could be made to realise this value by the most important mints. How long, however, the value of silver as compared with gold could be maintained would depend upon the relative production of the two precious metals. The theory of bimetalism has silently taken for granted what certainly corresponds to actual experience hitherto, that both precious metals will again be subjected to periodic increase and decrease of production. For it would certainly always be possible by means of a bimetallic system to support a metal which was temporarily threatened with depreciation in consequence of an increased supply, until, by a considerable diminution in its production, or a great increase in the production of the other metal, a reverse movement occurred. If, however, the production of silver steadily increased (even with diminishing celerity and not above a certain fixed upward limit) while that of gold continued slowly to decrease and approximated to a downward limit, then even a world-wide bimetallic union could not maintain in the open market the former relation of value between the two precious metals. The amount of silver money to hand in the bimetallic states would then reach very soon the double, then the treble, and more of the supply of gold money, silver money would then become the actual general measure of value, the representative of the standard value of the country, and gold would as compared with it reach to a premium, the amount of which could by no manner of means be limited by the bi-metallic organisation which would then be working with empty hands. For such an organisation can prevent the sinking of a plentiful product but not the rise of a metal which is becoming scarcer. Now, however, the production of silver in spite of fall of its price has continued for a long series of years to increase more and more, and now, reckoned in the old value, it has attained to an annual amount of 550 million marks. All this goes to show that in consequence of the improvement of means of transport in the American mining districts and of the progress made in the technique of metallurgy, together with the practically inexhaustible wealth of ore in North and South America, the production of silver will still further increase. A rise in the price of silver would also immediately bring with it a marked increase of production since at present great quantities of poor ore are set on one side which, with silver at a higher price, would be smelted with profit.

On the other side the production of gold has for 20 years kept slowly receding and now it reaches an annual average of only 400 million marks. It is precisely on the part of bimetalism that the arguments have been exposed which make probable

the continuance of this retrograde movement, and show that discoveries such as those in California and Australia in 1848 and 1851 are not to be expected. I believe indeed that quartz mining is capable of greater development, but it is in any case very probable that the annual yield of gold will fall within a short time to 350 million marks and later perhaps still further. On the other hand, according to Soetbeer's estimate, there is now an annual consumption of 250 million marks of gold either in the form of new bars or of coin for industrial purposes, and this amount will most probably be increased by degrees as the population and prosperity grows. Besides this, there is an annual flow of about 70 million marks to India which is either melted down or hoarded there. Even at the present moment, therefore, the greater part of the annual production of gold is not devoted to any permanent monetary purpose. The more this annual production diminishes the more will its use as a material for money decrease in importance; indeed, it might well be possible that in the end the annual requirement of gold for industrial purposes would equal the amount annually yielded. But long before this point had been reached the trade value of gold, consequently in the bimetallic union the premium on gold, quite independent of any influence exerted by a legal relative value, would be able to rise, because the industrial demand for gold would have become by far the most important. But in the form of coin, too, gold would acquire a greater preference in proportion as the amount of silver money was increased. If the old prices were restored the annual production of silver would certainly exceed 600 million marks, and it would then, after fulfilling all the needs of industry and Eastern Asian trade, leave over 300 million marks which must be coined into silver money in Europe and America. Thus, in 20 years, the amount of silver money would have been augmented by more than 6,000 million marks, whilst the supply of gold coin would have increased only by a few hundred millions. Such an increase of metallic money would, it is true, be in itself neither excessive nor injurious to humanity, especially if some of the countries which now have a paper currency were to resume cash payments; but the official relative value of the two precious metals would, under such circumstances be made wholly illusory by a premium on gold which would rise slowly indeed, but surely, and with no limit to its height.

XII. What would be the effect of such an agreement, if carried out, upon (a) prices, and (b) the production of the precious metals?

If the former relative value of the two precious metals were restored by the formation of a bimetallic union, which regulation, however, according to what I have just mentioned, could only be carried through, so far as free trade is concerned, for a not very long series of years, then, owing to the permanent increase of silver money, which would finally become the actual standard of value, certainly slowly increasing depreciation in the value of money as compared with commodities would set in. For the whole development of modern trade is directed towards the object of making an increasing number of business transactions possible by means of balancing and accordingly limiting the use of actual money. Germany and France, for instance, are continually striving to make the use of metallic money dispensable to the same degree that it already is in England. If, however, in spite of this a considerable and indefinite coinage of silver throws a continual increase of metallic money into circulation, and does this coincidentally in all lands of economic importance (which will prevent the escape of the surplus), then this fact in combination with the existing tendency towards a decrease in the demand for money will cause a gradual sinking of the value of money as compared with marketable commodities.

As, however, the production of gold will in all probability decrease, we may assume that the aggregate of coinages from new gold and silver in 20 years would still not be greater than it was in the years 1850-1869, and the operation of this increase of money on prices would in future probably be smaller than in the above-mentioned period, because it would now take place with a far greater quantity already on hand, with a greater population, and with a larger bulk of saleable commodities. Should Russia or Austria replace their paper money by metal, which certainly could only be done with a wider application of silver; then, as above stated, the influence of the increase of money would be still more considerably weakened. I have already discussed the influence of the restoration of the former relative value of the precious metals upon the production of silver.

XIII. Do you consider an international agreement for bimetallicism possible on any other ratio than 15½ to 1?

The adoption of an international bimetallic relative value approximated to the present price of silver about 20 to 1 or 21 to 1 would be much more commendable than the return to that which exists in the Latin Union. The production of silver would in that case experience no exceptional stimulation, and gold would retain the advantage in value which has accrued to it from its increasing scarcity. It is true if the production of silver continued to increase and that of gold further decreased then even with this raised relative value of gold there must in the end arise an ever increasing premium on gold. But the point of time, when the official relative value would be definitely superseded by that of trade, would certainly, by the adoption of the new relative value, lie in a far more distant future than it would where the old relative value retained.

England would, perhaps, be the easiest to win over to this form of bimetallicism, Germany would then perhaps also decide for it; but France and the United States would probably fight against a bimetallic system with depreciated silver value with all their strength. For both countries possess enormous sums of silver money coined at the relative value of 15½ to 1 and 16 to 1, which by the new system, even if gradually introduced, would have to be recoined at a heavy loss, a loss which in France might amount to 600 million francs. In America there is a further consideration, the important group of those interested in silver who would raise an energetic opposition to any such official and final recognition of the depreciation of silver. Consequently for the practicability of the realisation of this relatively most durable form of bimetallicism there are no practicable prospects in view at present.

XIV. Failing an international bimetallic agreement, what measures could be adopted by the commercial nations of the world for giving increased stability to the relation between gold and silver?

Any permanent fixity of the value of silver can only be occasioned by the assured use of that portion of the metal which is not applied to industrial purpose and export to Eastern Asia as material for money by as many mints as possible. Isolated coinages even if they amounted to more than 10,000,000*l.* or 20,000,000*l.* would only temporarily raise the price of silver and consequently only produce fluctuations which in the interests of trade are not at all desirable. If, supposing the continuance of the American coinage of dollars, it were possible for the European mints still to work silver, at the present price, to an annual amount of 3,000,000*l.*, as a maximum sum, then this price would probably from time to time be exceeded, but a further sinking would hardly occur. As, however, the European States which have gold currency would not likely determine upon a coinage of silver currency, even in limited sums, it appears to be more practicable for these states to organise to a certain extent an official trade in silver with the intention of maintaining the value of this metal above a certain boundary and keeping as far as possible stationary. Let us suppose England, Germany, France, and other states declare themselves ready to buy at any time silver at a price which even under the present relative value might easily be still further exceeded. This they would do by means of paper money, which would be based on gold currency and covered by the silver so bought. Then at once in every official place of deposit there would be some millions of marks collected whilst the price would be prevented from falling below the official quotation. This collection of silver would, however, scarcely ever reach a burdensome or considerable amount, because the price fixed for purchase would be, as was said, fixed somewhat low, namely, under the mean of the fluctuations of the last few years. A temporary brisk demand for Eastern Asia or for industrial purposes would then cause a rise in the price of silver, which, however, would be at once combated by heavy sales on the part of the places of deposit, and so compressed within the narrowest limits. These sales could be made to work against gold as well as against the funded paper money; in the first case the still outstanding paper money would be fully, or, indeed—on account of the small profit on its sale—more than fully covered by gold by the deposit stations. Should the whole amount of the silver bought be absorbed by the sales, then the operation would have to be begun again at a higher buying price. If, on the contrary, in spite of a cautious choice of the initial

buying price, an excessive collection of silver occurred, then certainly that price would have to be lowered, and the state would then, through the depreciation in value of its reserve of silver already in hand suffer a loss at least for a time, but that might be equalised by the profit which later on it might make when prices were better. The initial price would have to be so chosen that a fall of this kind must appear exceedingly improbable. Moreover, the danger of such an excessive accumulation of silver would be reduced for each individual state in proportion as more states participated in the carrying out of this system. With an increasing diminution of the production of gold, the silver-covered paper money, by which the principle of gold currency would not be attacked, would become a very useful substitute for gold, and therefore could be issued to a considerable extent without any detriment being to be feared from it and from the accumulation of silver connected with that issue.

XV. It is argued that, in the absence of bimetallicism, the effect of any disturbance of the currency is limited to half the currencies of the world, and thereby increased in intensity. Do you consider this view correct; and, if so, do you think the evil a serious one?

The double currency during the rule in France had the effect of keeping the two precious metals closely within bounds during fluctuations in their relative value. Especially but for the equalising influence of this system would the depreciation of the value of gold as compared with silver in the 50 years have been much more considerable. Conversely, as has before been remarked, the fall of silver would have been almost wholly postponed for several years, perhaps indeed up to the present day, had France and the states in its coinage union been able to maintain the double currency with unlimited coinage of silver. The stability of the relative value of the two precious metals is a matter of advantage for the economy of the whole world, for large and frequent fluctuations make trade between the gold and silver currency countries a gambling speculation, and produce the artificial advantages partly for export and partly for import of which mention has been made above.

XVI. If the effect of such disturbances could be spread over all countries, would greater stability of the standard of value be secured thereby?

When the influence of a great and sudden increase in production, whether of silver or of gold on the relative value of the two metals, is weakened or altogether neutralised by a double currency system, then at the same time the influence of the disturbance is extended over the whole mass of gold and silver money of all countries, and consequently on the whole greater stability in the money value is maintained. For all sudden and immediate influences on money have relatively greater power than have quantitatively equally great influences which assert themselves but slowly and through manifold intermediaries.

For the future deviations in the increase of the production of gold and silver, as hitherto they have actually occurred, are hardly to be expected any more. Our knowledge of the geographical distribution of gold and silver is, it is true, not yet perfect, but it is sufficiently advanced to justify the assumption that the production of gold will steadily *diminish*, although, perhaps, not to an unlimited extent, whilst the production of silver will still further extend. An internationally fixed relative value for the two metals is only in a position to be able to protect silver which is produced in greater quantities from a corresponding depreciation, but it is not able to prevent the rise in value which gold by reason of its gradually increasing scarcity attains. An *everlasting* relative value could therefore under such circumstances never be fixed; such a relative value, however, as corresponded with the present price of silver would enable a sufficient fixity of this price to be maintained for a long series of years.

If, moreover, America continues for some years longer to coin silver dollars, then, perhaps, the silver question will practically and simply be settled by the United States being compelled owing to their supply of dollars to go over to actual silver currency. Then perhaps other States would again be more friendly to silver, and so the necessity of applying this metal once more in some way in larger quantity as the material for money for most countries in view of the probable future diminution of the production of gold would be practically more and more recognised.

Göttingen, 1st December 1887.

DR. W. LEXIS,

(4) M. EMILE DE LAVELEYE, Professor of Political Economy at the University of Liège.

I. To what do you attribute the fall in the value of silver, as compared with gold, since 1874?

It is perfectly evident that the fall in the value of silver as compared to gold is *entirely* due to the legislative measures that have been adopted by different States, *i.e.*, firstly, the adoption of the gold instead of the silver standard by Germany and the Scandinavian States, and, secondly, the suspension of the coinage of silver by the Latin Union, to begin with, and afterwards by all other countries, save India and the United States.

If the coinage of silver had not been abandoned, this metal would not have lost in value through increase in its production. As all silver now produced finds readily employment, and that no stock of it accumulates anywhere, is it not quite clear that had the mints of Germany, of the Latin Union, and of America been kept open, they would very easily have absorbed the surplus production? As a kilogram of silver will always fetch 200 francs in standard money at the Paris mint, it is quite certain that the price of silver would have maintained itself at about 60½*d.* per oz., precisely as during the time that the bimetallic system was in vigour in France.

II. What probability is there of a continuance of the fall?

Will the fall in the value of silver continue? That depends on America. If the Bland Bill is repealed a fresh fall is inevitable.

III. To what do you attribute the fall in the wholesale prices of many commodities which has been in progress during the last 10 or 12 years?

The fall of the price of certain commodities is due to the increase of their production, to improved facilities for transport, to the advance made in machinery, and to a general amelioration in all modes of fabrication and manufacture; but a *universal* fall in prices, affecting all produce, even that which is in no way touched by the afore-mentioned causes, can only be explained by a general reason, and this general reason must necessarily be monetary contraction.

Indeed, simple common sense alone would solve the question. Between the years 1850 and 1870 all prices rose, and economists agree in attributing this rise to an increase in the production of gold. Since 1873 just the contrary has occurred. The production of gold has steadily diminished, and silver is no longer allowed to make up the deficiency, a fact wholly without precedent in economic history. The coinage of moneys, so active formerly, has now almost ceased, while, at the same time, the exchanges effected are far more numerous than they used to be. All economists, without exception, teach that when cash diminishes, *ceteris paribus*, prices fall, and it is quite certain that since 1873 the stock of gold in Europe has immensely decreased, partly from the exports of gold to America and partly also because industry is ever absorbing a portion of the monetary stock.

The present production of gold is clearly insufficient. It is estimated to be about 18,000,000*l.* or 19,000,000*l.* annually. According to Burchardt's and Soetbeer's very careful statistics, trade yearly absorbs about 12,000,000*l.* in gold, due allowance being made for remelting; the extreme East has of late years taken about 4,000,000*l.*; the losses from wear and tear, shipwrecks, hidden treasures, and such like, amount to at least another 1,000,000*l.* There remains, therefore, at *most* two millions sterling to face the fresh demand for coin, which the immense increase in exchanges all over the world gives rise to.

As population and business steadily increases in the two principal gold producing countries, the United States and Australia, these keep for themselves all the precious metal they produce. In England between 1879 and 1884 the gold coined amounted to 7,922,830*l.*, during the same period the coinage of gold in Australia was 24,112,000*l.* and in the United States 231,000,000 dollars (46,000,000*l.*) The coinage of gold in the States exceeded the production by 150,000,000 dollars, and this excess was of course supplied by gold from the outside world.

The consumption by trade combined with the monetary requirements, more especially if the Bland Bill were repealed, would absorb all the gold produced in America, and the more so that this demand would be ever steadily increasing owing to the rapid growth both of population and riches.

It would be the same in Australia and in the extreme East. Europe would, therefore, have only Russia to look to in the future for her provisions of gold.

At the present moment all European countries, with the sole exception of France, have not sufficient gold in circulation. In England, indeed, this scarcity is an acknowledged fact. "Ten years ago," says the "Economist," "the disposal of the London Stock Exchange was estimated by a competent authority to be about 4,000,000*l.*; at the present time it is far below that, when a demand for a million of gold absolutely carries off this sum from the market, and detains it elsewhere, there is a sensible pressure on the exchange." ("Economist," February 4th, 1886.) This strange state of things to which the "Economist" here refers was again perceptible this autumn 1887, and is still felt while I write these lines.

Italy has already lost a considerable portion of the gold which she procured at such heavy cost, when payments in cash were recommenced there. Gold is everywhere at a premium from 2 to 4 per thousand in Paris and in Belgium, even at 8 at this moment (October 1887), from 2 to 3 per cent. in Spain, from 16 to 18 per cent. in Roumania. Holland, though a very rich country, has scarcely any gold in circulation, payments being effected in either silver or notes. Germany is lacking in gold to complete her monetary reforms, and Austria and Russia and all Eastern Europe have no gold in circulation. The scarcity of gold is indeed an undeniable fact, observable on all sides at the present time, and destined to become more and more apparent.

It may be objected that gold is not yet absolutely wanting; this is true to a certain extent, because, as prices fall when gold becomes scarce, the quantity of money always appears sufficient.

This is a special economic phenomenon. It may be maintained that there will always be a sufficient supply of gold, because all prices fall when the means of exchange are diminishing, and therefore a greater number of exchanges can be effected with a less supply of gold. Theoretically, cash might be reduced to a minimum, and it would still suffice, because prices would fall proportionately. And indeed the less plentiful it is the more abundant would it appear, for, as the lowering of prices would render all business slack, the non-employed capital would be deposited in banks. This has been the case during the last few years.

It is very easy to prove beyond a doubt that the marked and universal fall in prices is not due solely to an increase of production and to improved methods of transport. Between 1850 and 1870 the railway development and the application of steam made greater progress than during the last ten years, new inventions of all kinds in the industrial world rapidly succeeded each other, and yet during that time production immensely increased and prices rose. Between 1870 and 1885 economic progress was also considerable, but less than during the previous period, and nevertheless prices fell to a lower level than in 1850. How then can it be denied that monetary contraction was the cause of this. According to Mr. Sauerbeck, production in England between 1850 and 1870 increased 2½ per annum, and between 1870 and 1885 1½ only; while prices rose during the first-mentioned period from 18 to 20 per cent., and fell during second 30 per cent.

IV. Has it (the fall in prices) extended to (a) retail prices, (b) wages and other payments for services rendered, (c) land and houses?

The fall in prices has been general, but wages have not been so much affected, for the motives already indicated by Adam Smith.

V. Has the fall resulted in any material prejudice to the commercial or general interests of the world?

creditors, companies, share holders and holders of mortgages, and benefits people with fixed revenues; or, in other words, as Stuart Mill puts it, the active portion of society lose and the non-active are gainers; but the effects of the fall, while it is actually taking place, are still more serious. All transactions and enterprises payable at fixed terms are exposed to an inevitable loss, and this is most discouraging to public initiative. Hence the stagnation in business now observable. The capital put into the fresh undertakings started each year has diminished by one half. The reverse takes place during a period of expansion: all prices rise, profits are therefore assured.

Another serious drawback to the present situation is that as the ratio of value between gold and silver has become uncertain since the bimetallic system no longer exists in France, all commercial relations with countries where the silver standard is admitted are subjected to an *alea* which is most unfavourable to sound trade.

VI. Do you consider that the countries using the gold standard, or any of them, are suffering from an injurious contraction of the currency which might have been obviated or mitigated by an increase in the supply of gold?

formerly, the office of standard money. As gold alone has now to replace the two metals, as far as coinage is concerned, all countries fight for it, and the total quantity existing is insufficient. Hence the struggle for gold now taking place. As M. Bismarck says, the blanket is not wide enough!

VII. To what extent and in what way are prices affected by the quantity of the metal or metals used as standards of value?

and the amount of credit or metallic means of exchange, due allowance being made for the rapidity of circulation of these means.

VIII. What is the relation, if any, between the supply or quantity of the precious metals and the fluctuations of credit?

than in France, although England has certainly one half less than France, but taking into account the monetary situation of a country, the influx or exports of gold act momentarily on the rate of interest, because in order to maintain sufficient cash in hand banks must raise their rates of discount when gold is being absorbed elsewhere. For example, we know that the Bank of England regulates the rate of discount by the influx or drainage of gold, but the interest on capital is fixed by the abundance or scarcity of capital, not of money.

IX. Has there been during the last 15 years any important development of the system of cheques, bank credits, bills of exchange, or other means of economising the use of the precious metals?

I think he is right. The clearing house operations have certainly diminished.

X. Do you consider that an international agreement could be made for the free coinage of gold and silver as legal tender money at a fixed rate?

tender money at a fixed ratio.

In theory it is unimportant whether prices are high or low, but practically a fall affects all long-standing

affects all long-standing creditors, companies, share holders and holders of mortgages, and benefits people with fixed revenues; or, in other words, as Stuart Mill puts it, the active portion of society lose and the non-active are gainers; but the effects of the fall, while it is actually taking place, are still more serious. All transactions and enterprises payable at fixed terms are exposed to an inevitable loss, and this is most discouraging to public initiative. Hence the stagnation in business now observable. The capital put into the fresh undertakings started each year has diminished by one half. The reverse takes place during a period of expansion: all prices rise, profits are therefore assured.

Gold standard countries also suffer to an equal degree from the evils here above referred to, and all this would have been avoided if silver

had been allowed to fulfil, as formerly, the office of standard money. As gold alone has now to replace the two metals, as far as coinage is concerned, all countries fight for it, and the total quantity existing is insufficient. Hence the struggle for gold now taking place. As M. Bismarck says, the blanket is not wide enough!

All economists agreed that price depends on the relation existing between the mass of articles to be exchanged

The amount of money does not determine the facility of credit. For instance, credit is more general in England

Mr. Robert Giffen is of opinion that during the last fifteen years there has been no great increase in the means of payment, cheques, bank credits, and bank notes, and

No one can question the possibility of an international agreement for the free coinage of gold and silver as legal

XI. Is it in the power of Governments to maintain such a ratio if agreed upon; and would the practice of the commercial world follow the law?

automatic and perfectly natural, and consequently it would impose itself upon the commercial world. If for one kilogram of silver, $\frac{16}{15}$ fine, I can obtain from the mints of the Latin Union 200 francs in standard coinage, and from the mints of all other States, England, Germany, and America, an equivalent amount, it is quite certain that I should not choose to sell it under this price. Silver would therefore maintain itself at its usual value of 60½ or 60½ per oz., as during the 70 years when France alone had adopted bimetalism, without this country having once to attempt any interference as to its price or relative value. The self-acting result of the free coinage of the two metals is one of the least clearly understood sides of the problem.

XII. What would be the effect of such an agreement, if carried out, upon (a) prices, and (b) the production of the precious metals?

stock of gold or silver to flow into the mints, but it would stop their fall and would insensibly be productive of a certain rise. As the price of silver would increase its production would also increase a little.

XIII. Do you consider an international agreement for bimetalism possible on any other ratio than 15½ to 1?

For the ratio between gold and silver it might, perhaps, be well to adopt the American 16 to 1, but the French 15½ has been in vigour so long that it seems almost to impose itself. It is the basis of all contracts between States of the Latin Union, and in Spain, Germany, and Holland, and all Eastern Europe. Besides, America would as readily adopt the 15½ ratio as the 16. And if the ratio were once established by international contract it would impose itself.

XIV. Failing an international bimetallic agreement, what measures could be adopted by the commercial nations of the world for giving increased stability to the relation between gold and silver?

chandise, subject, like all other merchandise, to varying and limitless changes in value.

XV. It is argued that, in the absence of bimetalism, the effect of any disturbance of the currency is limited to half the currencies of the world, and thereby increased in intensity. Do you consider this view correct; and, if so, do you think the evil a serious one?

relations are now such that the entire world forms one great market. The fall in prices has been universal and has been productive everywhere of great suffering, ruin, and loss.

XVI. If the effect of such disturbances could be spread over all countries, would greater stability of the standard of value be secured thereby?

agreement, sudden disturbances would no longer take place and changes brought about by increased or diminished productions of the mines would be very gradual, almost insensible, as they would extend over such vast territory. After the year 1850 bimetalism in France, by assisting the absorption of about 260,000,000*l.* in gold, prevented the too great depreciation of this metal and arrested the rise in prices. It acts like a parachute, and even such monometallists as Michel Chevalier and Jevons admit this.

Governments would not impose the ratio they adopted, but the effect of their adoption of a certain ratio, let us say 15½ to 1, would be automatic and perfectly natural, and consequently it would impose itself upon the commercial world.

If for one kilogram of silver, $\frac{16}{15}$ fine, I can obtain from the mints of the Latin Union 200 francs in standard coinage, and from the mints of all other States, England, Germany, and America, an equivalent amount, it is quite certain that I should not choose to sell it under this price. Silver would therefore maintain itself at its usual value of 60½ or 60½ per oz., as during the 70 years when France alone had adopted bimetalism, without this country having once to attempt any interference as to its price or relative value. The self-acting result of the free coinage of the two metals is one of the least clearly understood sides of the problem.

A treaty establishing international bimetalism would produce no immediate results on prices for there is no great stock of gold or silver to flow into the mints, but it would stop their fall and would insensibly be productive of a certain rise. As the price of silver would increase its production would also increase a little.

For the ratio between gold and silver it might, perhaps, be well to adopt the American 16 to 1, but the French 15½ has been in vigour so long that it seems almost to impose itself. It is the basis of all contracts between States of the Latin Union, and in Spain, Germany, and Holland, and all Eastern Europe. Besides, America would as readily adopt the 15½ ratio as the 16. And if the ratio were once established by international contract it would impose itself.

Failing an international bimetallic agreement, I know of no measure which could give stability to the price of silver. If it cannot be freely coined, it becomes mere merchandise, to varying and limitless changes in value.

The disturbances of the currency were produced by the proscription of silver, but they are not confined to certain countries. They affect all, to a greater or less degree, because commercial relations are now such that the entire world forms one great market. The fall in prices has been universal and has been productive everywhere of great suffering, ruin, and loss.

If all the great commercial powers were to come to an international bimetallic agreement, sudden disturbances would no longer take place and changes brought about by increased or diminished productions of the mines would be very gradual, almost insensible, as they would extend over such vast territory. After the year 1850 bimetalism in France, by assisting the absorption of about 260,000,000*l.* in gold, prevented the too great depreciation of this metal and arrested the rise in prices. It acts like a parachute, and even such monometallists as Michel Chevalier and Jevons admit this.

(5.) The Hon. DAVID A. WELLS.

I. To what do you attribute the fall in the value of silver, as compared with gold, since 1874?

high civilisation, through the process of evolution, that gold is the best instrumentality for effecting exchanges and measuring values. The movement in favour of a gold standard, and the partial disuse of silver in such countries, has been brought about, in my opinion, through the same influences that prompt the substitution, regardless of cost, of new machinery for old, if the minimum of gain can be thereby effected in the production and distribution of commodities.

II. What probability is there of a continuance of the fall?

I do not apprehend a further decline in the value of silver as compared with gold. On the contrary, I look for a gradual advance in its value, and eventually a return to a parity of value with gold. My reasons for such opinions are briefly as follows:—

Silver is the coin medium for countries of comparatively low prices and wages and limited exchanges (and these mainly internal or domestic). Such countries embrace more than one half the world's present population; and as they progress in civilisation and increase their exchanges, which is a condition of progress, a larger *per capita* demand for silver coin will follow. A comparatively small *per capita* increase must create a demand that will ultimately greatly advance the value of silver.

III. To what do you attribute the fall in the wholesale prices of many commodities which has been in progress during the last 10 or 12 years?

To conditions affecting their supply and demand. If any, or all other causes have contributed to the remarkable decline in wholesale prices since 1873, the influence exerted has, in my opinion, been very inconsiderable. I doubt if any one can name one commodity which has notably declined in price in recent years, for which satisfactory evidence can be adduced to the effect that such decline has been occasioned by any appreciation in the value of gold.

IV. Has it (the fall in prices) extended to (a) retail prices, (b) wages and other payments for services rendered, (c) land and houses?

The decline in wholesale prices has affected retail prices to some extent, but not proportionally. Wages have everywhere tended to advance. The same is true in respect to other payments for personal service, salaries, &c. Land, generally, outside of large centres of population has not advanced in value. House rents in the United States does not seem to me to have varied much in recent years.

V. Has the fall resulted in any material prejudice to the commercial or general interests of the world?

The remarkable and continued fall in prices since 1873 has occasioned what is popularly termed "*depression of trade*." An analysis of what is involved in this expression shows that it cannot mean that trade has been restricted or has declined in volume, for the world's trade or exchanges measured by quantities has gone on progressively increasing during the whole period of depression, and is probably larger at the present time than at any former period in the world's history. Many people, however, have made less money in trade in recent years than before, in consequence of such depression, and many have lost money. But apart from such disturbances (which are temporary), if the fall of prices has been mainly due, as I believe to be the fact, to natural and permanent causes, namely, the increased power of mankind on the work of production and distribution, then the result by creating greater abundance and bringing a larger amount of the same within the reach of the masses with a less expenditure of labour or money has been one of the greatest of blessings.

VI. Do you consider that the countries using the gold standard, or any of them, are suffering from an injurious contraction of the currency which might have been obviated or mitigated by an increase in the supply of gold.

I fail to find any evidence that any countries using the gold standard have suffered or are now suffering from any contraction of currency.

VII. To what extent and in what way are prices affected by the quantity of the metal or metals used as standards of value?

VIII. What is the relation, if any, between the supply or quantity of the precious metals and the fluctuations of credit?

of credit.

IX. Has there been during the last 15 years any important development of the system of cheques, bank credits, bills of exchange, or other means of economising the use of the precious metals?

whereby the use of the precious metals has been economised.

X. Do you consider that an international agreement could be made for the free coinage of gold and silver as legal tender money at a fixed rate?

gold and silver as legal tender money at a fixed ratio; but I do not think any such agreement is probable.

XI. Is it in the power of Governments to maintain such a ratio if agreed upon; and would the practice of the commercial world follow the law?

XII. What would be the effect of such an agreement, if carried out, upon (a) prices, and (b) the production of the precious metals?

useless to speculate as to results if the contrary should happen.

XIII. Do you consider an international agreement for bimetallicism possible on any other ratio than 15½ to 1.

would be manifestly the part of wisdom to adopt such a ratio as would occasion the least disturbance to the mass of the then existing coinage. Under existing circumstances it would seem to me to be folly to attempt to establish either an international ratio of 15½ to 1 or any other ratio.

XIV. Failing an international bimetallic agreement, what measures could be adopted by the commercial nations of the world for giving increased stability to the relation between gold and silver?

stability to the relation between gold and silver which would not be likely to result in more mischief than good.

XV. It is argued that, in the absence of bimetallicism, the effect of any disturbance of the currency is limited to half the currencies of the world, and thereby increased in intensity. Do you consider this view correct; and, if so, do you think the evil a serious one?

XVI. If the effect of such disturbances could be spread over all countries, would greater stability of the standard of value be secured thereby?

has been due to the forced issue of redundant and irredeemable paper money, or debased coin, and has been local in its influence. The present experience is due to a depreciation in the value of one of the precious metals with reference to the other, and extends to many countries in different degrees. In all this there is, however, nothing unprecedented or in the nature of the unexpected, and there is no good reason for supposing that the disturbances which have characterised the trade of Europe with India and the East during recent years from fluctuations in the price of silver have been any different in kind than, or as great in

No opinion that I care to here express.

I do not believe that any permanent relation exists between supply of the precious metals and fluctuations

There has been during the last 15 years a great development in the United States in the use of cheques, bank credits, bills of exchange, and other instrumentalities

It is certainly within the possibilities that an international agreement could be made for the free coinage of gold and silver as legal tender money at a fixed ratio; but I do not think any such agreement is probable.

If such an agreement should be once entered upon, I do not believe it could be long maintained, because the conditions on which the permanence of such a ratio would depend are not within the control of Government, and are certain to vary.

Not believing that any such agreement as indicated in question No. 10 could be made or maintained, it seems

If an international agreement for making gold and legal tender at a fixed ratio could be entered into, it

would be manifestly the part of wisdom to adopt such a ratio as would occasion the least disturbance to the mass of the then existing coinage. Under existing circumstances it would seem to me to be folly to attempt to establish either an international ratio of 15½ to 1 or any other ratio.

In default of an international bimetallic agreement, I do not see what measures could be adopted by the commercial nations of the world for giving increased

stability to the relation between gold and silver which would not be likely to result in more mischief than good.

All the disturbances which have accompanied the change in the relative values of gold and silver are, in my opinion, the same in character as have always accompanied the use of a depreciated fluctuating currency; with this additional and novel peculiarity, namely, that while, heretofore, depreciation of currency

degree, as those which characterised the trade of Europe with the United States from 1861 to 1879, or which characterise to-day the trade of the outside world with Russia, whose currency is depreciated and fluctuating. "If trade can go on profitably with countries having an inconvertible paper of a widely fluctuating kind and the rest of the world, *a fortiori*, it can go on between gold and silver-using countries." Such disturbances constitute obstacles in the way of trade or exchanges, but trade soon accommodates itself to them, and the volume of business soon resumes its former flow in a continually increasing ratio. This has been the world's experience in the case of the recent

decline in the relative value of silver; the disturbances from which have, in my judgment, been greatly exaggerated, and have resulted mainly from apprehension, or *scare* of what might happen, but which has not happened. Future generations will, I believe, include in one category the alarms which have prevailed, and the dolorous predictions which have been made in recent years by reason of the decline in the value of silver with those which a century or two ago were consequent upon the appearance of comets, and the action of international conferences will be likely to have as much of influence in respect to the one as the "Bull" of the Popes had upon the other.

DAVID A. WELLS.

Norwich, Connecticut, U.S.,
December 1887.

ANALYSIS OF EVIDENCE.

MR. S. WILLIAMSON, M.P.:

Is engaged in trade with Chili and California, 5945-49.

Increased use of the gold standard has been injurious by lowering prices and interfering with exchange, 5950-58.

Explains obstructions to trade with silver-using countries, 5954-58, 5983-86, 5996-97, 6015-16; and to investments in those countries, 5954-55.

Difficulties of the situation are increased in Chili owing to the existence of inconvertible paper currency, 5957-60, 5998-6006, 6015-16.

Inducement to countries now using inconvertible paper to resume specie payments, if there were a fixed relation between gold and silver, 5960-61.

Alleged advantages arising from increased trade with silver-using countries have been exaggerated, 5962-65, 5979-81, 6017-24.

Difficulties of the Indian Government, 5962, 5987-95.

Probable effects on trade of the Indian Government borrowing in silver, 5966-68.

Thinks that the growth of our national wealth in recent years has been exaggerated, 5969-74; depreciation of shipping property, 5970-73.

Proposed remedy of bi-metallism is merely a reversion to a state of things which existed previous to 1874, 5975-78.

Difference between the apprehensions current in the time of the gold discoveries and at the present day, 6007-14.

MR. J. BARR ROBERTSON:

Statistics showing net import of gold into this country from 1858 to 1875, and net export since that date, 6028-42, 6105-7.

Opinion as to mode in which the increased quantity of gold in the earlier period was disposed of, 6043-87.

Statistics as to import of silver into this country and India, 6088-6101, 6108-9.

Imports of gold into India, 6102-4.

Estimate of money in circulation in the United Kingdom, 6111-32, 6179-81.

Fall of prices consequent upon reduced circulation, 6133-38, 6149-63, 6179-.

Relation between rate of discount, currency, and prices, 6139-48, 6189-94, 6239-66.

Estimate of circulation in India, and its effect upon prices, 6164-77.

Currency demands of the United States and other countries, 6195-6208.

Effect of the Indian Council Bills upon the silver market, 6279-86.

Maintenance of the bi-metallic system of the French Mint from 1803 to 1873, 6209-6209.

Effects of the appreciation of the standard on the different classes in the country, 6267-78.

Does not think that bi-metallism will maintain a sufficiently stable standard of value, 6287-92.

Proposal to issue inconvertible paper in sufficient quantities to maintain the standard at one level, 6293-6304.

MR. THOMAS COMBER:

Is engaged in trade between Lancashire and India, 6305-8.

Statement of what he understands to be the bi-metallic proposals, 6311-12.

Remarks on the possibility of establishing and maintaining a fixed ratio, 6314-70, 6563-75, 8136-9, 8273-80, 8309-11.

Experience of France and India in this respect, 6314-35.

Explanation of the steadiness in the relative values of the two metals down to 1873, 6336-42, 6568-72.

The fixed ratio will diminish the production of gold and stimulate that of silver, 6343-66, 8293, 8307-10, 8323-31.

Summary of objections to bi-metallism, 8264-71, 8306-8, 8320-48.

Position of England and India as affected by the appreciation of gold, 6371-85, 6602-20, 8140-6.

Alleged depression of trade may be due to other causes besides appreciation, 6386-8; causes of the fall of price of wheat, 6388-6408, 8147-80.

A fall of prices not necessarily injurious, 6409-15, 8196-8212, 8272, 8315-19; stability of the standard is, however, desirable, 6416-18, 8309.

Effect of appreciation on those who have to make fixed payments, 6419-26; and on the wage-earning class, 6426-51, 8181-92.

Extent to which prices would be affected by bi-metallism, 6452-91; effect upon the trade of silver-using countries, 6492-7.

Investment of capital in silver-using countries, 6498-6518.

Production of wheat and cotton in India as affected by the fall in silver, 8213-64.

Alleged unsettlement of trade with silver-using countries, 6519-57; position and difficulties of the Government of India, 6558-628, 140-6.

Is opposed to any action being taken by this country; but thinks bi-metallism might be adopted by other countries, 6577-89.

MR. B. W. CURRIE:

Existing standard of value is in his opinion satisfactory, 6646, 6713-25, 6838; thinks the evils arising from the alleged scarcity of gold, such as a fall of prices, have been much exaggerated, 6647, 6736-38, 6752, 6757, 6894-99.

Prices are affected by other causes, such as extension of credit, 6647, 6758-96.

Statistics showing extension of banking facilities, &c. in recent years, 6648-52, 6665-66.

Effect of supply of gold on prices, 6682-97, 6846, 6900-1.

Remarks on alleged scarcity of gold, 6652-57, 6663-64, 6894-99; connexion between the rate of interest and the supply of gold, 6658-62, 6754-56, 6884-93.

Is aware of the inconvenience caused to the Government of India by the alteration in the relative value of gold and silver, but would deprecate any attempt to remedy it by legislation, 6667-68.

Effect upon our trade and industries of the fall in the value of silver, 6769-96, 6844-45, 6847-83.

Objections to bi-metallism, 6669-74, 6739-44, 6841-42.

Functions of Government as regards currency, 6838-40.

The financial and commercial supremacy of this country due in a great measure to the existing standard, 6669-70, 6698-6712, 6753, 6797-6809, 6843.

Traditional preference of the people for gold rather than silver, 6671-74, 6745-51, 6810-24, 6835, 6902-7.

Effect of reduced cost of production on the supply of silver, 6675-81.

Effect upon England of the bi-metallic system in France, 6727-34.

Remarks as to alleged steadiness of the relative value of gold and silver previous to 1873, 6721-24, 6828-32.

MR. H. L. RAPHAEL:

Bi-metallic arrangement practicable if agreed to by the United States, France, Germany, and England, 6909.

Doubts whether the agreement would be maintained very long, 6910, 6975-81, 7026.

Other objections, 6918-19, 7027.

The only possible ratio is 15½ to 1, 6911.

Difficulties of re-coinage, especially in India, 6911-17, 7013, 7057.

Effects of bi-metallism at 15½ to 1 on the supplies of the precious metals and upon trade generally, 6918-19.

Doubts if the financial supremacy of England is very largely due to her gold standard, 6920-23.

As to adoption of gold standard by Germany, 6923-30.

Causes of the fall in silver since 1873, 6931-34, 6998-7011, 7024.

Probabilities of a further fall, 6935-36, 7014-16; effects of a suspension of the Bland Act, 6937-39, 6990-97; abolition of the duty on silver plate, 6940.

Losses caused by the fall in silver have been chiefly temporary and not permanent, 6941-45, 6982-89.

Circulation of coin in the United States, 6946-47.
 Difficulty of obtaining gold in the banks of France, Germany, and Italy, 6948-50.
 Causes and effects of the fall of prices since 1874, 6951-63, 7030-46.
 No scarcity of gold in this country, 6964, 6969; mode in which prices are affected by quantity of gold, 6965.
 Connexion between the rate of discount and quantity of gold, 6966-74, 7047-54.

SIR EVELYN BARING, K.C.B.:

Effects of the fall in exchange upon the people and Government of India, 7068; and upon the employes of the Government, 7116-23.
 Difficulties of imposing new taxation, 7069-85, 7103; and of obtaining necessary capital for productive public works, 7086-89.
 Industrial effects of the fall in exchange in India, 7090-7100, 7109-13, 7167.
 Serious results of a further fall, 7102-6.
 Opinion as to the practicability of bi-metallism, 7108, 7124-73.

MR. H. D. MACLEOD:

Prices are affected by credit in all its forms equally with gold, 7177-78, 7192-7206, 7233-62, 7301-98.
 Relation between prices and quantity of bullion depends upon the organisation of credit in a country, 7179-80, 7186-91.
 Recent fall of prices due to contraction of speculative credit, 7209-16, 7286-94; and increased production, 7220-21.
 True relation between prices and bullion, 7224-32; and between credit and bullion, 7271-94, 7387-98.

MR. H. WOLLASTON BLAKE:

Is a director of the Bank of England, 7399.
 Alleged scarcity of gold has been much exaggerated, 7402-3, 7422; is not necessarily shown by a fall of prices, 7404.
 Accounts for fall in several articles independently of scarcity of gold, 7406-8, 7500-25; no fall in wages, 7409-15, 7501-5.
 Causes of the fall in silver, 7416.
 Effect of the fall on the people and Government of India, 7417-21; and on the producers in India and this country, 7450-57.
 Objections to bi-metallism, 7423-25, 7470-9, 7530-53.
 Impracticability of maintaining the ratio between the two metals, 7470-83, 7486-99; contracts would still be made payable in gold, 7484.
 Relation between prices and the quantity of gold, 7428-41.
 Annual production of gold is too small in proportion to the whole mass to affect prices, 7442-48.
 Effect of bi-metallism in distributing fluctuations in the amount of currency over the whole world, 7423-24, 7446-49.
 Effect of the general adoption of a gold standard in the world, 7461-67.

MR. J. C. FIELDEN:

Is engaged in the cotton trade, and is intimately acquainted with the position of the working classes connected with that trade, 7571-7576.
 The benefits of the fall in prices have been only partly secured by the working classes, 7577-7607, 8004-8005, 8081, 8082, 8119-8128.
 Comparative condition of the working classes at different periods, 7608-7620; unsatisfactory character of the usual tests of their condition 7621, 7971, 7979.
 Statistics of recent reductions in wages, 7621-7636, 7990-7994.
 Condition of the cotton industry and of the population engaged in it, 7638-7669, 7671-7673, 8079, 8080; condition of other trades—the engineers, 7674-7679; the iron moulders, boiler makers and iron shipbuilders, iron founders, 7680-7686; reports from Sheffield, Wolverhampton, the Potteries, 7684-7690, 8114-8118; coal miners, 7691-7700; building trades, 7700; woollen trades, 7988, 7989.

Summary of the position of ten large trade societies, showing number of members, number unemployed, &c., 7950, 7982, 8083.

Comparative growth of population and employment, 7955-7961, 7980, 7991-8003.

Consumption of raw cotton at different periods, 7972-7977.

Check to the development of the cotton industry dating from about 1874, 7961-7981.

Ascribes this to Indian competition consequent on the depreciation of silver, and to the fall of prices in the East, 8006-8012.

Statistics with regard to comparative cost of production in India and England, 8013-8035.

Competition of India in neutral markets, 8006-8008, 8035, 8036.

Comparative growth of Indian and English cotton trade, 8036.

Cotton trade of America, 8070-8077.

Advantages to England and India of restoring the former value of silver, 8037-8045, 8103, 8129-8135; opinion as to the ratio which should be adopted, 8050-8059.

Disadvantages of the separation of standards, 8046-8049, 8055.

Difficulties of trade with the East owing to fluctuations in exchange, 8046, 8060-8069.

Effect upon existing contracts of restoring the value of silver, 8091-8097.

MR. WILLIAM FOWLER:

Opinion as to the alleged scarcity of gold, 7703-7721, 7774-7800, 7889-7902, 9062-9066, 9147, 9167-9171, 9295-9311.

Fall of prices explained by other causes than appreciation of gold, 7704-7705, 9135-9146; illustrations showing how the fall in prices can be explained by alterations in supply, improved processes, competition, cheap transport, &c., 7749-7753, 7764-7773, 7805-7848, 8349-8354.

Causes of the fall in silver, 9114-9131, 9295-9306.

Existing supply of gold, 7705-7717, 9147.

Possibility of fixing and maintaining a ratio between the two metals, 8357-8376, 9273-9291.

Differences of opinion as to the ratio and the number of countries necessary for the proposed agreement, 8357-8367, 8420, 9267-9272.

Effect of Russian and Indian supplies on the wheat trade, 8377, 8398-8403, 9092-9104.

Effect of the rate of exchange on production and export, 8381-8397, 8435-8446, 8482-8504, 9067-9079, 9092-9104, 9183-9253, 9321-9341.

Effect on the bimetallic arrangement of an increase in supply of one of the metals, 8414-8434, 8447-8453, 8560-8571.

Comparative advantages of the existing market ratio and that of $15\frac{1}{2}$ to 1, 8420-8434, 9270-9272.

Doubts whether bimetallism would add to stability of the standard, 8447.

Probable effects of bimetallism on the commercial position of this country, 8414, 8447-8466, 8473-8481, 9112-9122, 9293.

Extent of the inconveniences caused by the existing system, 8467-8481, 8512-8559, 9173-9265.

Summary of objections to bimetallism, 9112-9122, 9267-9294.

Summary of views as to the questions submitted to the Commission, 9123-9294.

MR. HERMANN SCHMIDT:

Is engaged in business in the City of London, 8572.

Believes that the increased purchasing power of gold is due to the fall in the value of silver and the dislocation of the ratio between the two metals rather than to the greater demand for gold, 8573, 8710-8713; and does not arise to any great extent from cheaper production, transport, &c., 8599-8632, 8731-8736.

Explains how gold prices generally have been affected by the depreciation of silver, 8576-8598, 8783-8788, 8794-8800.

Prices have also been affected by a decrease of the total volume of currency in the world, 8592-8594, 8674-8693, 8789-8793.

Increased burden of contracts, debts, &c. owing to the appreciation of the standard, 8633-8661.

Difficulties in carrying on trade owing to fluctuations in exchange, 8626, 8627, 8822-8827.

As to the choice of a ratio between gold and silver, 8663-8670, 8780, 8832-8838.

Effect of breaking the ratio on the Indian demand for silver, 8689-8693.

Observations with regard to the system of index numbers, 8694-8709.

Effect of bimetallism on our foreign investments, 8714.

Stimulus to production and export caused by a depreciated currency, 8715-8730, 8760-8764, 8805-8808, 8817-8819.

Explanation of the fact that while silver has depreciated in Europe, it retains its purchasing power in the East, 8743-8759, 8802-8804.

Probable effect of restoring the ratio in the production and use of the two metals, 8766-8775, 8781, 8782, 8820, 8828, 8829; effect on prices of the adoption of the existing ratio, 8815, 8816.

Course that will probably be adopted in America under present circumstances, 8809-8814.

LORD BRAMWELL:

Probable effect on the use of the two metals of allowing contracts to be made for payment in a specified metal, 8842-8845, 9019-9027, 9039-9043.

Thinks that the Gresham law might be defeated by a sufficiently large combination of bimetallic Powers, 8847, 9043, 9044.

Burden of proof lies upon those who maintain that bimetallism would be preferable for this country, 8847.

Injustice of any measure that would arbitrarily raise prices, 8847-8849, 8881-8883, 8968-8971, 8995-8999, 9028, 9029.

Doubts the fact of the alleged appreciation of gold, 8850, 8885-8897, 8924-8927, 8944, 8972.

Effect of the appreciation on the rate of wages, 8973-8881.

Effects of bimetallism at the existing market ratio, 8852-8864.

Effect of bimetallism in removing the difficulties under which trade with silver-using countries is now carried on, 8865; and upon the interest arising from our foreign investments, 8866, 9047-9050, 9053; on the production of the two metals, 8959, 8960.

General objections to bimetallism, 8866-8870, 8982-8994, 9015-9018.

Argument that the financial and commercial position of this country is due to its standard, 8871-8880.

Difference between the circumstances existing now and at the time when the change of standard was made in this country, 8898-8917.

Increased consumption of gold for industrial purposes, 8915-8919, 9001, 9005.

The future of gold as an efficient standard of value, 8920-8922, 8947-8952.

Reasons why the relative value of gold and silver has altered, 8923, 8924, 8962-8966.

Difficulty of the Government of India under present circumstances, 8929.

Silver mono-metallism, 8936-8943.

Probability of the ratio, if fixed, being adopted and maintained, 8931-8935, 8954-8958, 9001-9008, 9019-9026, 9030-9035, 9039-9044, 9054-9056.

Advantages of a gold over a silver standard, 9009-9014.

Legal tender law in California, 9022-9024, 9033.

MR. DANIEL WATNEY:

Views as to the alleged appreciation of gold, 9372-9376; and its effect on prices, &c., 9392-9406, 9437, 9438, 9473-9486.

Effect of the quantity of money on prices, 9377-9386, 9491-9497.

Alleged bonus on the export of wheat from India, 9387, 9498, 9499.

Objections to bimetallism, 9407-9432, 9456-9471, 9504-9518.

Suggestions for increasing the economy of gold, 9433-9455.

LORD ADDINGTON:

Puts in a paper expressing his views, 9520-1.

Admits difficulties of existing situation, but has no remedy to suggest, 9522-3, 9584, 9569-71.

Comparative advantages of silver and gold as standards of value, 9524-32.

Probable effects of fixing a bi-metallic ratio, 9575-88, 9592-9601.

Difficulty of fixing a ratio, 9535, 9573-5, 9588.

Difficulties of two separate standards have been exaggerated, 9536-9, 9551-5, 9603-16.

Effect on gold prices of a depreciated currency, 9540-50.

As to the alleged bounty on the production of wheat in India, 9557-68, 9590-1.

GOLD AND SILVER COMMISSION.

S E C O N D R E P O R T

OF THE

ROYAL COMMISSION

APPOINTED TO INQUIRE INTO THE

**RECENT CHANGES IN THE RELATIVE VALUES
OF THE PRECIOUS METALS;**

WITH MINUTES OF EVIDENCE AND APPENDICES.

Presented to both Houses of Parliament by Command of Her Majesty.

L O N D O N :

**PRINTED FOR HER MAJESTY'S STATIONERY OFFICE,
BY EYRE AND SPOTTISWOODE,
PRINTERS TO THE QUEEN'S MOST EXCELLENT MAJESTY.**

And to be purchased, either directly or through any Bookseller, from
**EYRE AND SPOTTISWOODE, EAST HARDING STREET, FLEET STREET, E.C., and
32, ABINGDON STREET, WESTMINSTER, S.W.; or
ADAM AND CHARLES BLACK, 6, NORTH BRIDGE, EDINBURGH; or
HODGES, FIGGIS, & Co., 104, GRAFTON STREET, DUBLIN.**

1888.
